some time past the Royal Horticultural Society has had under consideration a scheme for the restoration, as far as possible, of the horticultural industry in the countries invaded by the enemy. This has now taken concrete form, and Their Majesties the King and Queen have consented to become patrons of the War Horticultural Relief Fund. The King has opened the fund with a donation of £100, and the Royal Horticultural Society has given £1,000. Other sums subscribed up to date bring the fund up to £2,977 15s. 1d., a beginning that augurs well for the success of the scheme. Already an opportunity has presented itself for extending

a small measure of help to Serbia, and £500 has been entrusted to a Special Commissioner, who is now in Serbia and using it for assisting the horticultural needs of the small cultivators. The need for assistance will be very great, and we earnestly hope that our readers will subscribe to the fund as liberally as possible. Subscriptions should be sent to the Secretary, Royal Horticultural Society, Vincent Square, Westminster, London, S.W.

THIS IS A BEAUTIFUL TREE FOR AN ISOLATED POSITION.

the 20th inst., price twopence. As there is always a large demand, we advise readers to order well in advance any extra copies required.

A Beautiful Early Flowering Broom.—A bush of the pale yellow-flowered *Cytisus præcox* now in full flower prompts a note on its usefulness at this season. The plant in question is over four feet high and as much in diameter, its myriads of slender green shoots being so full of blossom as to make it a mound of pale gold. Three years

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

The Growth of Primroses.—The accompanying illustrations show the growth of a Primrose over the best part of four months, the photographs having been taken at half monthly intervals from January 1 to Primrose Day. Though perhaps infrequently promoted to formal cultivation, its long period of flowering, as shown in the photographs by its succession of blossoms, might make it more effective in brightening our gardens than many of the very transient blossoming plants so frequently chosen.—JOHN H. WILLIS, *Norwich*.

Wasps and Fruit.—Will you please allow me a little space to discuss the question of wasps? I think we all look upon such things as enemies as soon as they do us a little harm, and do not trouble to look for the good they are doing. We should ascertain what they live on all the time there is no fruit about, especially when they are bringing up their young, which they feed almost entirely on insects. Who has not seen them on various trees—especially the Plum tree when it has been badly attacked by aphids and the leaves rendered almost black—eating up the larvæ. Now, to protect fruit, get some Lyle's Golden Syrup, mix it with boiling water, put it in bottles, and place them on the trees. Be sure the mixture is a little sweeter than the fruit one wants to protect, whether it is Pear, Plum or Apricot. One will not then have cause to find fault with the wasps. I hope my gardening friends will

Wild Fritillaries.—A few more words about Fritillaries. I went into the fields the other day and found them almost stripped of flowers. Children and others were carrying them away in basketfuls, and there were hardly any blooms left. Happily, there is one place at least where they are protected, and it was a delight to see them in the meadow of Magdalen College, Oxford—

House in Stirlingshire. That such a supremely attractive garden should exist within the darkening precincts of a vast commercial city is an inspiration to the thoughts of the lover of Nature, not less than to the energies of the botanical horticulturist."

Narcissi in the Grass at Castlemilk, Scotland.—Not within many miles can one see such a grand display of Daffodils in the grass as at

Castlemilk, Lock-
erbie, the property of Sir Robert W. Buchanan Jardine, Bart. It would be rash to hazard even a guess at the number of bulbs, but it must be enormous, and they are being constantly added to. Years ago they were planted on both sides of a

THESE ILLUSTRATIONS REPRESENT THE GROWTH OF A PRIMROSE PLANT IN ABOUT SIX WEEKS.

thousands of chequered flowers, with here and there a white one. It is a drawback to have to look at them through an iron railing, but we may be grateful for its protection.—F. A. STURGE.

A Beautiful Garden in Scotland.—The Rev. David R. Williamson of Kirkmaiden writes to us as follows on May 7 from Morton Villa, Airdrie, N.B.: "Yesterday afternoon I paid a memorable visit to the gardens of Pollok House, the residence of Sir John Stirling Maxwell, which is situated in an extensive park on the very confines of 'the Second City of the Empire.' Lady Stirling Maxwell, who, like her gifted father, Sir Herbert Maxwell of Monreith in Wigtownshire, is an earnest and even enthusiastic amateur horticulturist, was fortunately at home, and showed me what I cannot but consider as the loveliest Tulip garden I have ever seen. As the sunlight at the time of my visit was brilliant, it was a veritable blaze of flower-light of varied yet grandly harmonising colours, and the effect of the sunlit vista of luminous flowers was splendidly impressive. Yet perhaps

long avenue and in many other parts of the grounds. At that time more formal planting was in vogue, and consequently the groups and masses are more often in uniform lines and groups than we would care for. Gradually, however, the troublesome and protracted task of removing and replanting in an informal way is being tackled by Mr. John Jeffrey, the gardener at Castlemilk, and some of these replanted groups are now of the most delightful kind. Annually, besides some bought and planted out at once, the Narcissi which have been forced are planted out and soon recuperate. The flowers, as a rule, are large and handsome, and there one can see, for example, the grand old trumpet variety *Horsfieldii* in superb order. Emperor, Empress, Golden Spur, *Poeticus ornatus*, Mrs. Langtry and many more of the older varieties are in great numbers, while smaller, but still large groups of King Alfred, Mme. de Graaff, Glory of Leiden and other of the newer varieties are doing well and will soon increase. 'It is no light task to lift and replant

THESE REPRESENT THE SAME PLANT AS SHOWN ABOVE IN THE LATER STAGES OF ITS DEVELOPMENT.

try this and report the results.—E. ROBINSON. [As our correspondent evidently believes in trapping wasps when the fruit is ripe, we do not see what objection there can be to killing queen wasps, and so preventing hordes later on. The good they may do while feeding their young is infinitesimal compared with the damage done to fruit.—ED.]

an even more exquisite series of artistic pictures was presented by the garden walls, completely festooned by the most effective combinations conceivable of the rarest rock and alpine flowers. A charming picture of this uniquely beautiful floral scene appears in Sir Herbert Maxwell's book on 'Scottish Gardens,' executed with pastel crayons by Miss Mary H. Wilson of Bantaskine

so many Narcissi, but Mr. Jeffrey has reason to be satisfied with the improvement he has effected in this way.—S. A.

Undesirables in the Rock Garden.—In reply to "E. B." (to whom I make my best Court curtsy for his compliment; I thought all men agreed that we "women have no sense of humour") I do not "eschew exotics," provided they thrive.

It is "feeble foreigners" I do not want. I have protected my "hedge of sorts" from my neighbour's cattle by putting Quickset against the barbed wire first. But oh! it is my own dear donkey Angelina (by name, but not by nature) who has sampled some of the "sorts." She is clever and wicked, and I could tell many stories of her misdoings, but THE GARDEN is *not* the place for stories about donkeys.—ANNE AMATEUR.

I have been much interested in the various letters on undesirable plants for rockeries. I have got a fairly large one, and my experience is that there are many places in the rock garden not quite suitable for the more delicate kinds, but which, when planted with Arabis, Aubrietias, Vinca, Cerastium, &c., result in a perfect riot of colour. I have a large, very carefully prepared moraine and other rockeries with the soil suitable for, again, other treasures; but though, these parts appeal to the eye of the collector, the ordinary everyday visitor turns away from these to the wilder side, attracted by the rich colouring and growth of the "undesirable plants." I take it the ideal rock garden is, if we take the Alps for our model, a brilliant sheet of colour, softened by the grey stone which peeps through and though we struggle and toil to make the "miffy mimps," as Farrer calls them, give that effect, the result is usually much stone and little plant. Therefore I say again that we ought not to despise easily grown plants. "A." speaks rather disparagingly of Vincas. I wonder if he has ever seen one given to me three years ago, nameless, a deep claret purple, very dwarf and of slow growth. After three years it has not covered a foot of ground. At this moment it is a mass of flower not 2 inches off the ground.—N. S. C.

I am glad to remake the acquaintance of "Alpinist" in a recent issue of THE GARDEN, and I read his letter on page 207 and his various remarks with interest. I cannot help remarking that his "vegetable doormat" of Arabis albidiflora must look remarkably fine in the early spring, so long as it is not used for the purpose of ordinary doormats! However, that is beside the point. My object in again taking pen and paper is to convince readers that Cerastium and Arabis are not undesirable plants. Your correspondent "Alpinist," I notice, speaks of them as "out-of-bound customers," and here he is quite right; but by methods previously outlined (see issue March 13, page 122) I keep these out-of-bound customers within bounds. "Alpinist" and I, it is quite clear, have different ideas on alpine gardens. I think from his letters he must reside and do rock gardening miles from any large town; but I do not know, as he does not give his address. If he does live in the country, then he will find that a very great many choice things will grow which we, who live near a large city of iron and steel works, have not the time, money or patience to grow, for so often we have failed. I find that a number of the stronger-growing Saxifrages, Sedums, alpine Phloxes, Veronicas, &c., do quite well on my pieces of rock garden; but for covering large areas and for scrambling down over the larger stones in the rock garden Cerastium tomentosum is ideal. Likewise the double Arabis. Here we have several pieces of rock garden which we cover with this, as we find it grows better than anything else here. Our worthy Editor, however, saw fit to question my remark about the double Arabis growing quicker than Cerastium; but it is true that it does. Again, with the Aubrietia.

"Alpinist" in a previous communication told us that this is not an unmixed blessing in an alpine garden. Certainly not, in a garden where everything will grow. If I lived right out in the heart of the country, far away from manufacturing towns and smoke, I should not allow Cerastium tomentosum, double Arabis, nor strong-growing Aubrietias, &c., in my rock garden. And I should also uproot some of the strongest Saxifrages, Sedum acre, S. album, and many another plant. But here it is different. We have to rely on what will grow and be very showy, and try new things as and when we can; and we keep these in bounds by cutting back, or, in the case of a few, by division in the autumn or spring. Vincas are only undesirables if they are allowed to become so. Many alpine gardeners will tell me that Alyssum saxatile is an undesirable of first merit, as it grows rather strongly; but this is used freely here by myself and other rock gardening friends, and is kept in hand quite easily. I do not believe that townsfolk (who often attempt a bit of rock garden), nor some country rock gardening folk who have no large gardening pockets, could do without these plants, and many people here would be even more sorry than I to do without Cerastium. It grows quickly, it flowers freely, and it covers up the often ugly stones of rock gardens made by those who do not know their work. I use it for covering slopes and small banks in the rock garden. With regard to Campanula rapunculoides, "Alpinist" had better write us a little article about this plant next autumn or in the spring of 1916, for I do not think any rock gardener would care to plant such a fearsome grower as this is, according to "Alpinist," without due thought and full knowledge of its colour of flower. With regard to "Alpinist's" final question, "Why will people grow these out-of-bound customers when they can get more interesting plants like Androsaces, Saxifrages, &c.?" May I point out that people do grow these and other far more interesting plants. But for covering rough rock walls, or scrambling down among the larger stones in the rock garden, or for draping a suburban wall garden, give me double or single Arabis, Aubrietia and Cerastium tomentosum.—E. T. ELLIS, *Weetwood, Ecclesall, Sheffield.*

Pollination of Hothouse Plants by Bees.—Plants in their natural habitats are usually pollinated either by means of insects or by the influence of the wind. When placed under glass, however, artificial means of pollination are resorted to, these usually being "tapping," the camel-hair brush or a rabbit's tail. Messrs. Dobbie and Co. of Edinburgh are, however, demonstrating that, even under glass, pollination can be effected by natural means. A long house filled with Cinerarias for seed production has within it at one end two hives of bees, while at the other end is a group of Hyacinths to attract the bees and keep them on the move. I am told that the bees under these conditions perform the work of pollination very effectually.—CALEDONIA.

FLOWERS FOR HOT, SANDY SOIL.

THE SUN ROSES.

IT is a rather curious fact in these days, when nearly everyone is more or less interested in gardening, that certain families of plants which used to be favourites with our forefathers are to a very great extent neglected and forgotten. Such an one is the Helianthemum or Sun Rose, the typical species of which is a native of our hillsides and sandy waste places. Although this in itself is nothing much to look at, its small, none too clear, yellow blossoms being very fugacious, it has given rise to many beautiful garden varieties which embrace a number of charming art shades of red, yellow, cream and white. In the early years of the nineteenth century there is little doubt that these garden forms of the Sun Rose were thought highly of and given their rightful place among other plants; but now it is the exception rather than the rule to find them in even those gardens for which they are specially adapted.

One often hears the complaint that a garden is too sun-scorched and dry to grow the ordinary kinds of plants well, and it is in just such places as these that the Sun Roses ought to be planted with a generous hand. When at their full development, they rarely attain a height of more than a foot, and where there is a hot, sandy bank, with, possibly, rocks jutting out here and there, nothing could be better adapted for clothing it. At Kew there is a fairly good collection grouped on such a bank not far from the large Flagstaff and the Berberis Dell, but I believe that in one or two private gardens, where these little dwarf shrubs have been tended with studious care, varieties are in existence that easily eclipse the best to be found at Kew. The greatest flush of blossoms is obtained towards the end of May and during June, but some flowers will be found much later in the season. Even when devoid of blossom, the neat tufts of, in many varieties, glaucous foliage are pleasing to the eye, and well in keeping with more or less arid surroundings.

Fortunately, the cultivation of Sun Roses does not call for any great amount of skill. The secret of success appears to be young plants, the most successful cultivators rarely keeping those that have been in existence four summers. For this reason frequent propagation must be undertaken. The raising of seedlings is not difficult, and by this method a great and oftentimes pleasing variation is secured among the young plants, and occasionally one that is a decided improvement on its parents. The seed ought to be sown in shallow, well-drained boxes of sandy soil as soon as ripe, generally about the end of August, the boxes being stood in a cool frame or greenhouse for the winter, so that severe frost can be kept away from the seedlings, which can be planted out the following April, preferably into a nursery bed, where they may stay for one year before going to their permanent places. The most general method of propagation, however, and one that ensures faithful reproduction of any special plant, is by means of cuttings. These are best taken early in September, and ought to consist of well-ripened young shoots slipped off with just a little heel of the older wood attached. After removing the lower leaves, these cuttings are firmly planted around the sides of small, perfectly drained pots filled with

THE RARE HARDY CHINESE SHRUB *OSMANTHUS DELAVAYII* FLOWERING IN THE GLASNEVIN BOTANIC GARDENS.

sandy soil. In turn these are plunged to their rims in ashes in a cold frame, where they remain all the winter, those that root being placed in the flowering beds in April. As the names given to varieties are by no means fixed, no good purpose would be served by giving a list here, but names and colour descriptions can be found in a few nurserymen's catalogues. Is it too much to hope that these charming and useful little hardy shrubs will once again come into vogue and find a home in the many gardens where, owing to drought and sun, "nothing will grow"? H.

NOTES FROM GLASNEVIN.

ONE of the most striking plants in flower out of doors at Glasnevin in late April was a hardy Spurge (*Euphorbia Sibthorpii*), which is one of the few members of the genus *Euphorbia* worthy of a place in the flower garden or its precincts. It is a strong-growing species, hailing from Greece, and sends up numerous sturdy stems, clothed with narrow, green leaves, to a height of about five feet. The terminal foot of each stem consists of the inflorescence, the attractive part of which is the bracts, and these, being of a bright greenish yellow, a strong plant carrying many heads is very attractive.

On the rock garden there was quite an endless variety of plants in full flower, a fine patch, several feet across, of the beautiful *Arabis brevifolia* being especially bright. At a distance this plant resembles *A. cilicica*, but its flowers are of a much richer pink, and its foliage is much greyer and more hairy. Close at hand in a peaty corner a healthy colony of *Primula Auricula Alexandra* was in full glory, each plant carrying numerous umbels

of large flowers of the clearest yellow. Here, too, *Omphalodes cornifolia*, perhaps better known as *O. cappadocica*, was just beginning to open its welcome blue flowers, and seemed to be quite as well at home in the damp peat as its neighbour *Primula muscarioides*. Carrying spikes of violet blue flowers on wiry stems some 4 inches high, this uncommon *Primula* is quite a pleasing little plant, though by no stretch of imagination can it be termed showy. It has, indeed, received an apt specific name, for the inflorescence, both in colour and appearance, closely resembles that of a *Muscari*. In the lower part of this peat-bed, and associated with a splendid clump of *Sanguinaria canadensis* in full flower, was a glorious patch of the old-fashioned *Hose-in-hose Polyanthus Sparkler*. This rather uncommon Primrose bears flowers of a bright crimson with a yellow eye, and is quite the showiest of the *Hose-in-hose* varieties.

Higher up, in a drier part of the rock garden, the delightful *Primula marginata* Linda Pope was in great beauty, its soft mauve coloured flowers being produced with the greatest freedom. The leaves of this *Primula* are of a pleasing green, and are prettily edged with a silvery powder, which gives the plant an attractive appearance even when not in flower. Several brightly coloured varieties of *P. ciliata* were flowering very freely, *P. c. superba* and *P. Mrs. J. H. Wilson* being especially good; while in a shady corner not far away, the comparatively new *P. Julia* was flowering very freely. In a shady nook, under the branches of a young Pine, a thriving tuft of *Ranunculus montanus* was in its glory. On sturdy stems, just above the tripartite leaves, this alpine Buttercup carries golden yellow flowers, each almost an inch across.

In the moraine quite a goodly selection of plants were in flower, one of the most interesting being a healthy plant of the queer-looking *Saxifraga porophyll* (*S. Frederici-Augusti*) with numerous flower-stems. The quaint little *Thlaspi limosellifolia* was at its best, while a small tuft of the rare *Saxifraga Vandellii* carrying numerous large, clear white flowers was very beautiful.

Others noted in flower included the minute *Draba imbricata*, *D. bryoides*, *Anemone Halleri* and a small plant of the rare *Primula integrifolia* with one inflorescence.

Close by the edge of the moraine a sturdy plant, some 4 feet high, of *Osmanthus Delavayii* presented quite an attractive appearance. From top to bottom this newly introduced Chinese shrub was thickly studded with clusters of clear white, tubular flowers, each about half an inch long and carried mostly at the ends of the branches. Among other peat

loving plants at the eastern side of the rock garden *Rhododendron racemosum* was flowering with the greatest freedom. This species is quite a dwarf grower, only reaching about three feet to four feet, but carries innumerable trusses of small rosy white flowers. *R. dasycarpum*, one of the many species collected by Mr. E. H. Wilson in China, was just unfolding its flowers, and the large number of unopened buds betokened a brave display for several weeks. The wide open flowers of this useful species were of a light pink, the interior of the corolla being flushed with crimson spots. A small plant of *R. flavidum* close by, about a foot high, was carrying clusters of pale primrose yellow flowers, each flower being about an inch across.

Leaving the rock garden and passing up to the herbaceous border—gay with spring flowers—a large colony of the charming *Narcissus Johnstonii* growing in short grass under the branches of a massive Larch catches the eye. Many people complain of being unable to grow this *Daffodil*, but here at Glasnevin it flowers splendidly every year, and increases steadily if slowly. The varieties *King of Spain*, with the frilled trumpet, and *Queen of Spain*, with the perfectly cylindrical trumpet, have been interplanted, and make a pleasing combination when in flower. There were, of course, a great many other interesting plants to be seen at this time, but lack of space forbids detailed mention of these. S. ROSE.

ROMULEA ROSEA.

THE fine plant of *Romulea rosea* illustrated on this page is a native of South Africa, and is growing under a south wall in the Bittell Vicarage gardens. It delights in a sunny aspect, and grows to about fifteen inches high. With its grass-like foliage and its deep rose flowers springing up from the base and clustered between its foliage it makes a fine sight during its flowering period, which is March and April. JOSEPH ETTLE.

ROMULEA ROSEA, A RARE SOUTH AFRICAN PLANT, GROWING IN CANON ELLACOMBE'S GARDEN.

DAFFODIL NOTES.

BY THE REV. JOSEPH JACOB.

THE BIRMINGHAM SHOW (Continued).

BY no means exhausted the notable flowers in my list last week. Although the number of very remarkable outstanding novelties was limited, there was a large batch, taken in the aggregate, of first-rate new varieties, all of which deserve mention.

Bridget (A. M. Wilson).—A Poet of great merit, distinguished by wide, smooth, imbricated segments and a large green eye, which has a deep red edge an eighth of an inch in width. D, $3\frac{1}{2}$; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $\frac{1}{2}$.

White Mere (Engleheart).—A very distinct and refined Giant Leedsii. As Mrs. Robert Sydenham is to the trumpet class with regard to their coronas, so is White Mere to the Lord Kitcheners, Empires, H. C. Bowleses and others of that ilk. It passed from the hands of the raiser because it was so very much admired by the Rev. W. Wilks when first shown at Vincent Square in 1912. The corona is long and of small diameter. It is neither expanded nor flanged, and of a pale primrose. The perianth is flat and right-angled. D, $3\frac{1}{2}$; S, $1\frac{1}{2} \times 1$; C, $1\frac{1}{2} \times \frac{1}{2}$. It keeps wonderfully flat in the garden.

Felspar (Copeland).—An effective Giant Leedsii with a sharply cut, somewhat pointed ivory perianth and a yellow expanding corona. It received an award of merit for the garden. D, $3\frac{7}{8}$; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $\frac{1}{2} \times 1\frac{1}{2}$.

Primrose Dame (P. D. Williams).—A pretty triandrus hybrid of a pleasing tone of lemon. Almost a self, but the corona is slightly deeper in shade. The whole flower is beautiful, clear and clean-looking. Diameter of the flower, $3\frac{1}{2}$ inches.

Somerset (Ware).—A deep yellow Ajax variety, large, but refined-looking. The overlapping perianth is slightly undulating, but the surfaces of the segments, which are decidedly pointed, are smooth and flat. The trumpet is flanged. D, $4\frac{1}{2}$; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $1\frac{1}{2} \times 2$.

Melpomene (Batson).—I first saw this two years ago at the Devon Show at Barnstaple, and I was glad to renew my acquaintanceship again at Birmingham. It is a pretty, taking flower—an incomparabilis with a white perianth and a yellow cup, which is flushed with orange red, increasing in depth of colour as it nears the brim. D, 4; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $\frac{1}{2} \times \frac{7}{8}$.

Silver Dawn (Bath).—A Giant Leedsii of excellent appearance, with a flat, pointed perianth and an expanding pale citron corona. A large flower. D, $4\frac{1}{2}$; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $1\frac{1}{2} \times 1\frac{1}{2}$.

THE LONDON SHOW, APRIL 27.

There were a large number of Daffodils in the Hall. One could not help thinking of the corre-

sponding show last year, when there was hardly one. With the exception of such *extra* late varieties as Moonbeam, I wonder if I have ever had so many still in the bud stage on May 1. When I cut my few flowers for the Birmingham Show on April 19, I had great difficulty in getting enough good Leedsii varieties sufficiently out to gather. My experience explains the wealth of bloom on this occasion.

Messrs. Barr and Sons received a gold medal for a very fine exhibit. Now that they have two growing places, Penzance and Taplow, and also because their seedling harvest is in full swing,

and Mr. P. R. Barr. On this occasion the cup was given to Mr. P. D. Williams of Lanarth, St. Keverne, Cornwall. He was one of the first to follow in the footsteps of Engleheart and begin seedling-raising on his own account. Many exquisite varieties stand to his credit. Among them I may mention Beryl, Mrs. W. O. Wolseley, Conqueror, Seville, Tudor, Tennyson, Kestrel, Robespierre, Macebearer and Kittiwake. He is the present president of the Midland Daffodil Society. I congratulate Mr. Williams upon this recognition of his enthusiasm.

The Division of the Leedsii.—This has now received the sanction of the Council. I find there is a strong feeling to keep to the old designations, so that, although nothing was actually said about names at the committee meeting, I take it that Giant Leedsis and Leedsis will be the official titles of the two new classes.

The Disqualification of Cræsus.—The bottom of the mistake was the change of tone that takes place in so many varieties as they age. The perianth of Cræsus begins life as a yellow and ends as a primrose or even a pale primrose. "Hence the Pyramids." The committee gave Cræsus an equal first prize, and no doubt Mr. P. D. Williams will have had official notification of the same before these lines are in print. I believe it is the intention of the Council to issue a new Classified List before the end of the year, so as to bring in the new division of the Leedsii, and make some necessary alterations in the pigeon-holing; e.g., Cænone, which is a Leedsii, is now classed as an incomparabilis. It seems to me the opportunity might be taken to make a few verbal alterations in some of the definitions. In Divisions 2B and 3B the word "whitish" is too elastic, and something more definite would be better. But no doubt the matter will be thoroughly gone into when the committee meet.

AWARDS.

Eleven varieties were "up" for awards. Of these,

Cædmon (Barr), a Poet of the highest order, received a first-class certificate. It is one of the best of Engleheart's raising, and is of equal value in the garden and

on the show tiers. The eye has a well-defined rim of red. A striking flower. D, $3\frac{1}{2}$; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $\frac{1}{2}$. See illustration on page 234

Mary Copeland (W. F. M. Copeland) first appeared at Birmingham last year, where it created a great sensation. The segments of the flower are flat and even, and the split-up corona appears in pleasing bits of coloured corona between them. It received an award of merit.

Marseillaise (Chapman).—A pretty flower of medium size with a good white Almira-like perianth. The eye is of a cool lemon tone, with a narrow rim of red. The whole is very symmetrical. D, $2\frac{1}{2}$; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $\frac{1}{2}$. Award of merit.

NARCISSUS WHITE KING, A BEAUTIFUL GIANT LEEDSII THAT RECEIVED AN AWARD OF MERIT ON APRIL 27. (See page 234.)

they are able to "put up" a great display all through the season. Messrs. F. H. Chapman, Limited, Messrs. J. R. Pearson and Sons, Messrs. R. H. Bath, Limited, and a well-known amateur of "Kent, Surrey and Sussex" fame, Mr. J. A. Nix, all had highly meritorious collections.

The Barr Cup.—On this Tuesday the most important event to chronicle was the award of the Barr Cup, which was instituted to keep green the memory of the late Peter Barr, and is held for one year by those whom the committee considers have done special good work of any kind for the flower. The previous holders have been the Rev. G. H. Engleheart, Mr. E. M. Crosfield

Distich (Chapman).—This also received an award of merit. It certainly has a very yellow-toned perianth, so much so that I doubt if it will ever go to a proper Poeticus white. It was a striking flower in a bunch, as the majority of the broad red rims are. There was considerable discussion as to the relative merits of this variety and the last.

White King (Mallender).—A good flat Giant Leedsii, which has already been described this year, when it was shown at Birmingham in the winning twelve in the open Leedsii class and also in the single blooms, where it took second prize, beating, among others, Empire. It gained a unanimous award, and can be recommended for either showing or for the garden.

SOME OTHER NOVELTIES.

There were no very outstanding varieties staged on this occasion.

Queen of Dawn (Barr) had a perianth of a peculiar tone of pinkish buff, which looked very pronounced where the segments overlapped. The cup resembled that of Warley Scarlet. The whole flower was round and flat. D, 3; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $\frac{3}{4}$.

Lamancha (A. M. Wilson).—A yellow, large-cupped variety—2A. The perianth was considerably lighter in colour than the cup, which was a pure yellow self, much expanded. D, $3\frac{1}{2}$; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $1 \times 1\frac{1}{2}$.

Gothelney (A. M. Wilson).—A good long-stemmed flower with pure white petals, rather long and pointed, and a flattened corona of an unusual shade of cinnamon yellow. Division 3B. It is a fast increaser, and should prove most useful and effective for cutting. D, $3\frac{1}{2}$; S, $1\frac{1}{2} \times \frac{3}{4}$; C, $\frac{3}{4}$.

Sea Horse (Haydon).—This is not a very new variety, but so far it has not often appeared in public. It was, however, well shown by Mr. Herbert Chapman at this meeting. King Alfred is not "in it" as a show flower when "up against" Sea Horse. The two feature each other very much, but Sea Horse has a bolder and more refined appearance. The colouring is as nearly the same as it is possible to be. I like the wider flange and the broader segments, joined as they are to a delightful smoothness of texture. D, 4; S, $1\frac{1}{2} \times 1\frac{1}{2}$; C, $1\frac{1}{2} \times 1\frac{1}{2}$.

Horizon (Chapman).—One of the small, pretty little reddish-cupped flowers that always look so pleasing in a bunch with a back to it, that is, when their faces can be fully seen. The perianth is white and reflexes. The corona or cup is widely expanded, and is of a suffused orange and red colouring. D, $2\frac{3}{4}$; C, $\frac{3}{4}$.

Garden Daffodils.—I fear some readers will be saying that I have not said very much about varieties for the garden in this season's notes. I hope next week to deal with this side of the Daffodil somewhat fully.

NOTES ON CARNATIONS.

Perpetual-Flowering Varieties Outdoors.

The time has arrived when old plants of Perpetual-flowering Carnations may be planted out to bloom throughout the summer and autumn. Last year, in addition to the usual old and good sorts, I planted a large number of varieties, most of which were quite satisfactory, but none excelled or equalled for profusion of bloom Mrs.

it will well repay to plant in a compost, as the gardeners of the nineteenth century did with their choice flowers, or at least make the soil rich enough with unstimulating manure to carry the plants through the stress of July and August. It is always a safe proceeding to make the soil firm in which Carnations are planted, and in the case of old Perpetual-flowering varieties a basin should be made round the base of each plant for the reception of water, which should be applied with unfailing regularity until the plants have got a hold of the

soil. A plan that always gives satisfaction is to make this watering part of the duty of one of the men, say, every second day, at a stated hour, giving instructions as to how much is to be applied to each. These somewhat meticulous orders impress the workman with the idea that it is important not to break the rule, and he takes care not to do so; whereas a general order fails to make the same impression. Other work is not unlikely to cause him to overlook this particular task, and probably more than once, to the detriment of the plants. These produce an enormous quantity of bloom, and they have the further advantage that no better autumn cuttings are available than those from Perpetual-flowering varieties grown in this way.

Old Plants to Flower Next Winter.—In a former note I mentioned that I purposed growing on a number of old plants for next winter's flower production. A few dozen plants were cut down, and are at present breaking nicely; these will provide nice shapely plants. Others will be reduced in height as soon as the demand for flowers is over, which will not be yet, and all will be grown on with the aid of manurial dressings.

Continuity of Flowering.—It is wonderful how long a time this section of Carnations will bloom. Several nice plants which I did not care about throwing away last autumn have been producing flowers continuously since September, 1913; not small blooms either. The measures I adopted were the giving of plenty of manure to the plants and an occasional thinning of the shoots, and cutting back those which had become bare. Some plants

exhibited a sharp attack of rust in the spring. These were sprayed with a lime-sulphur solution and then syringed with clean water. The one application has kept the foliage free from further infection. Aphis is the chief cause of trouble after this, and where the plants cannot be fumigated, the best insecticide is Tobacco powder, repeating the application whenever the vanguard of the troop is observed. The plants may also be sprayed with Extract of Quassia; but I do not care to syringe young plants, and prefer the first named. Tynningham, N.B. R. P. BROTHERSTON.

NARCISSUS CÆDMON, A NEW POETICUS VARIETY THAT RECEIVED A FIRST CLASS CERTIFICATE ON APRIL 27. (See page 233.)

F. Burnett. If this has a fault, it is that it flowers too profusely. Triumph was also fine, and, for a scarlet, St. Nicholas made quite a glow. Mary Allwood, Lady Northcliffe and others of that type are all satisfactory. One serious drawback to Carnations, which extends to border sorts as well, is their inability to stand rain and a period of damp weather. Once established, they delight

Soil Preparation.—Naturally, plants that have been flowering since September must have something more substantial than ordinary soil, and

MYOSOTIS OR FORGET-ME-NOT.

THERE is never much difficulty in growing Myosotis, but the method I have now adopted for several years has given such good results that I feel justified in passing it on to fellow-growers. We usually grow somewhere about three thousand plants yearly, and, naturally, want them to be the best possible. As we have a very pleasing variety, we keep to our own stock, saving seed from them as early after flowering as possible. But this saving of the seed at home means some loss of time, which

By the end of March they nearly meet, and in a few weeks commence to flower, each plant throwing a hundred or more flower-stems. When fully in bloom they form a dense mass of blue, which looks well alone, but supremely so when forming a carpet to well-chosen varieties of Darwin Tulips.

The gathered seeds, procured as early as possible, are sown as soon as ripe in drills 1 foot apart. By sowing thinly and allowing this space between the rows, the plants may be left until planting-time, when, lifted in clumps and planted more closely than the self-sown plants, they will give almost as good a display. I rely mainly on the self-sown seedlings, but sow to make doubly sure of having sufficient. By

the last few years, has taken possession of the town of Salisbury. It is generally believed to have come from a packet of seed purchased by a lady in the usual manner at a store, and cultivated in her garden. While unable to vouch for the truth of the story, I certainly remember photographing two small clumps of it some years ago as a curiosity, which at that time represented the amount of its progress in a wild state, and at the present time it is in possession of a large portion of the vacant ground. Its phenomenal growth is all the more interesting in the fact of its not being a native of this country, its true home being South America. At the commencement of its career here it consisted of a mixture of white, pink and red blooms, but

COSMOS NATURALISED BY THE ROADSIDE IN SOUTH RHODESIA.

tells on the size of the plants by bedding-time. By leaving the plants in the bed till the end of May, they naturally seed themselves, and after the summer plants are put in the beds the seedlings will be found coming up in various parts. These are carefully guarded from the hoe until they are of sufficient size for removal. They are then taken up and planted in lines on a piece of vegetable ground vacated by early Potatoes. I usually make the rows 1 foot apart, but a considerable saving of space could be effected by setting the rows 6 inches apart and missing out every tenth or twelfth row. Here they will make large yet compact plants, and will bear putting into the beds in October or November at a distance of 12 inches to 15 inches apart.

pulling out white forms and those of undesirable habit, I have now a variety which comes fairly even in character of growth and time of commencing to flower. WILLIAM F. ROWLES.

COSMOS NATURALISED IN RHODESIA.

THE following letter and accompanying illustration appeared recently in *Country Life*. They will, we think, prove interesting to many of our readers who are acquainted with Cosmos as grown in this country:

"I am sending by this post a photograph of the ordinary garden flower, Cosmos, which, during

during its rapid progress the red blooms have died out to a great extent. It has for years been cultivated at the Cape as a garden flower, but has never been known to extend to the surrounding country.—H. J. RUMBLE, *Salisbury, South Rhodesia*.

"[The letter and illustration sent by our correspondent are most interesting. *Cosmos bipinnatus* has for many years been grown as a garden plant in this country, but as it does not commence to flower until late in the autumn, when it is quickly killed by frost, it is not a favourite. During recent years an early flowering race has been obtained, and these are very useful plants in England. We have not, however, heard of them becoming naturalised.—Ed.]"

THE MODERN SNAP- DRAGON.

HERE is a subtle charm about the Snapdragon or *Antirrhinum* that only a few other hardy flowers possess. As a flower, it is by no means a new-comer to our gardens, because it was well known to Gerard as long ago as 1597, though it is true he only mentions four varieties in his historical Herbal. Illustrations of the flower in those remote days, and in the later days of Parkinson, show us that the upper petal was very pointed and the lip or lower petal much narrower than they are in the numerous varieties that grace our gardens to-day. Of popular names the *Antirrhinum* has enjoyed many, and about

quickly occupy as proud a position in our gardens as the ubiquitous Sweet Pea. Although the value of these plants for the outdoor garden has long been recognised, and particularly where the soil is poor, or for the tops and crevices of old walls, they have not until the last year or two been regarded as flowers for the conservatory. A splendid group, exhibited at one of the Royal Horticultural Society's fortnightly meetings in 1913, had been flowered under glass, and since then quite a number of exhibits have been staged. It is true the spikes are rather longer than one would wish, but this difficulty could be overcome by growing the dwarf or Tom Thumb section. An interesting point about the flower-spikes grown under glass is that the lower flowers are retained until those almost at the top of the spike have fully opened. This is stated to be due to the fact that bees are not allowed

the seed, and the whole then well rammed into the crevices of the wall and kept watered until the seedlings are fully established. In early autumn seed may also be sown in a bed to provide plants for flowering early the following summer, though most gardeners prefer to sow in slight artificial heat at the end of January or early in February, and thus secure plants for placing in beds and borders towards the end of May. Although the Snapdragon is strictly a perennial plant, it is usually grown as an annual or biennial on the lines before indicated. If it is desired to keep old plants over the winter, they ought not to be cut down during the autumn, but left with their tops intact. The soft, unripe shoots will be killed by frost; but if these are pruned away in spring, the hard, woody branches will quickly break into new growth and commence to flower some time in advance of the spring-sown seedlings. As a rule, however, the

flower-spikes from these old plants are not so large and bold as those from young ones. In the days of long ago the Snapdragon was largely increased by means of cuttings, these being made from young shoots in early autumn. Such care is now taken in saving seed, however, that this course is not necessary, except in very special circumstances, as all good colours can be relied upon to come true from seeds. Moreover, seedlings usually possess greater vigour than plants raised from cuttings. As already stated, varieties are now exceedingly numerous; but it may be useful to mention a few that are specially good. If I were allowed to grow only one Snapdragon, it would be Cottage Maid. Its flowers are a delightful combination of rose pink and white that reminds me forcibly of Apple blossom. Moonlight has flowers of apricot yellow flushed with red; and other excellent sorts are Brilliant (vivid carmine), Crimson King (rich glowing crimson), coccinea (brilliant scarlet), Yellow Queen and White Queen. All belong to the tall or intermediate section, and all look very charming when cut and placed under artificial light. In the North of England and Scotland varieties with striped flowers are largely grown for exhibition; but in Southern districts preference is given to those of less bizarre appearance.

S. X.

A NOBLE SPECIMEN OF THE WILD CHERRY GROWING IN CUMBERLAND.

1688 it was generally known as Calf's Snout, later variations being Lion Snap, Toad's Mouth and Cat's Eye. Unlike a great many other flowers of olden days, the Snapdragon was not considered to possess any special medicinal properties, though in some rural districts it was regarded as a charm against supernatural powers.

With such a history it is little wonder that the modern forms of the Snapdragon find a happy home in most good gardens. Apart from their old-world associations, the plants give us flowers over a very long period, a point that gardeners of olden days considered to be the best reason for growing them on an extensive scale. In quite recent years hybridists have given us some very beautiful and wonderful art colour shades, and if only they could impart a pleasing fragrance to the blossoms, the modern Snapdragons would

access to them, a point that all good cultivators will fully appreciate.

But, after all, the modern Snapdragon is essentially a plant for the outdoor garden, and those who would have a brilliant display next autumn should secure plants without delay. A great many good nurserymen supply well-rooted and thoroughly hardened seedlings suitable for planting in beds and borders, and the present is an excellent time to put them in. Rich, heavily manured soil must be avoided. The Snapdragon flowers best on rather poor soil that contains some old mortar or lime, and in preparing the bed it is advisable to incorporate some of this with the soil. A foot apart each way is a good distance for the plants. For old walls it is much the best to sow seeds, any time during August or early September being the best period of the year for this. A little good soil should be mixed with

preference is given to those of less bizarre appearance.

A LARGE SPECIMEN OF THE WILD CHERRY.

ONE of the most beautiful of our native trees is the wild Cherry or Gean, *Prunus Cerasus* or *Cerasus vulgaris*. The accompanying illustration represents one of the largest specimens we have seen. This is growing in Cumberland, two miles north-east of Penrith, and when in full bloom is a very beautiful sight. The girth of the trunk 5 feet from the ground is 9 feet, this being practically the same thickness from the earth up to 12 feet, at which point the branches emanate. This wild Cherry is supposed to be one of the parents of our cultivated fruits.

POND WEEDS AND COPPER SULPHATE.

DURING the last fortnight we have had numerous requests for particulars of destroying weeds on ponds, and we therefore reprint an article on the subject that appeared in our columns a year or two ago. "For several years past a considerable amount of trouble has been caused by the presence of a slimy-looking scum upon the surface of ponds, lakes, tanks and reservoirs in various parts of the country, and requests are constantly being made for information regarding a method of treatment which is likely to eradicate it without injuring Water Lilies and other aquatic plants and fish. The scum is caused by various kinds of Algæ, low orders of plant-life allied to the Sea-weeds, including species of such genera as *Anabæna*, *Spirogyra* and *Ulothrix*. It is not only in the British Isles that these or allied kinds of Algæ cause trouble, for they are prevalent on the Continent, in America, the Malay States and elsewhere. In some countries much trouble has been caused by their presence in reservoirs of water intended for domestic purposes, for, in addition to the loathsome appearance of affected water, it has frequently an abominable stench, and numerous experiments have been conducted at considerable expense with a view to obtaining a cheap method of cleansing the water without making it detrimental to animal or human life. Some of the Algæ form a considerable amount of growth below the water, and one common kind is popularly called Flannel-weed on account of its matted, thread-like growths. In the first place, people tried to rake all this growth out of the water, but that only created a temporary relief, and after a few weeks the water was as bad as ever. Neither did cleaning out lakes and pools prevent the recurrence of scum; therefore attention was directed to finding a poisonous chemical which could be applied in small enough quantities to kill the Algæ without injuring other plants, fish, animals, or human beings. A good deal of experimental work was conducted in America and other countries, the Americans, perhaps, being to the fore. As a result of these experiments it was found that the most satisfactory chemical to use was copper sulphate, and that salt has now been taken into general use for that purpose. Highly poisonous in its action, one part to 1,000,000 parts of water is sufficient to kill the Algæ, but one part in 750,000 parts of water causes no injury to Water Lilies nor to fish. In fact, the Americans report that gold-fish and minnows live indefinitely in a concentration of one part to 200,000, whereas some of the coarser kinds of fish will stand a one in 50,000 concentration, but certain delicate kinds are killed in a one to 500,000.

"Regarding its action upon animals and human beings, it is argued that in a one in 1,000,000 solution, 50 quarts of water a day would have to be drunk before an amount of copper would be absorbed to cause any unpleasant action, and that after a few hours have elapsed from the time that the copper sulphate has been used, there would be very little in suspension in the water, as a large percentage combines with the Algæ or is otherwise precipitated.

"From this there is really little to fear from the use of such a poisonous substance, providing it is used with care. In the first place, a careful calcu-

lation must be made of the holding capacity of the pond or lake to be treated. Then the weight of the water may be taken at about sixty-two and one-third pounds to the cubic foot, and the copper sulphate used in proportion. It may be applied to the water in two ways—either dissolved in a little water and sprayed over the surface of the area to be treated, or tied in a canvas bag and drawn through the water until dissolved. When spraying the surface, it is as well to keep the mixture away from the leaves of Water Lilies, or it will probably burn them; once diluted with the water, however, it does not cause harm. On no account must it be used stronger than one part in 750,000, and it is better to adopt the one in 1,000,000 concentration.

"In a Bulletin on the subject published by the American Department of Agriculture, it is said that Watercress beds are regularly treated in some parts of America without injury to the Watercress. An instance is also given of a Kentucky reservoir containing 25,000,000 gallons of water, from which in July, 1903, the smell became unbearable owing to the presence of various kinds of Algæ. This was treated with copper sulphate at the rate of one part in 4,000,000 parts of water. The Algæ was killed in two days, and the smell gradually disappeared. In addition to being used for killing Algæ, it is said that a concentration of one part in 100,000 kills typhoid and cholera germs in from three to four hours, and mosquito larvæ die in a concentration varying from one in 100,000 to one in 200,000. As a rule, about two applications a year may be expected to keep the water clean."

ROSE-GROWING IN TOWN GARDENS.

IN a former article a brief allusion was made to the benefits derived from keeping a diary of the Rose garden. The records thus obtained are both interesting and useful. Unless one has some information to guide one, it is difficult to say off-hand when a particular Rose is likely to be in flower; but by referring to one's notes, if these have been regularly kept, it is soon seen that Dorothy Perkins, for instance, should commence flowering freely between July 15 and 20. A garden in which this variety forms a chief feature will therefore be at its best about that time, and it may be advantageous to know this beforehand.

Dates of Flowering.—The flowering season of his climbing Roses is one to which the gardener looks forward with joy. Carmine Pillar is usually the first to make its appearance, about the end of May. The first week in June generally sees Alberic Barbier, Conrad F. Meyer, Aglaia and Jersey Beauty in flower, while during the second week we may expect Mrs. W. J. Grant, Tea Rambler, Tausendschön, Edmond Proust, Gardenia and a host of others. Mme. Alfred Carrière, Trier and Alister Stella Gray do not often appear before the third week of June. Blush Rambler generally flowers early in July, while Dorothy Perkins, Lady Gay, Excelsa and Hiawatha are among the last to put in an appearance about the middle of the month. The times given are, of course, merely approximate, and will vary according to the district and the aspect of the Rose garden, as well as the earliness or lateness of the season; but if the grower has kept his own notes,

two of these factors are known, while the third will seldom put one more than a day or two out in the reckoning.

Rose Mrs. Edward Mawley.—Mr. Edward Mawley has elicited the views of a number of leading growers upon "How to succeed with the cultivation of the Rose Mrs. Edward Mawley." These are given in the "Rose Annual" for 1915, and are of much interest. We learn, what most of us had long suspected, that the variety is one which goes back, and plants can seldom be kept for any length of time. It is such a beautiful Rose, and so useful to the exhibitor, that all who show, even on a small scale, will endeavour to have a plant or two. It is disappointing, therefore, to learn that the only effectual way of getting over its bad habits is by renewing one's stock. The blooms are best from maiden plants, and most of our authorities state that it is best on standard or half-standard trees. A possible explanation of its diffidence in growing is that it is one of the many delicate kinds which find our climate too cold.

P. L. GODDARD.

GAULTHERIA TRICOPHYLLA IN A WELSH GARDEN.

THIS is one of the plants which likes this moraine and never fails to produce a good crop of berries. I believe the reason why it fails in so many gardens is because it lacks natural moisture. When that is the case, plants may grow freely, but even if they flower, few, if any, berries are produced. A steep slope from west to east among large parallel slabs of slate has been the home of this Gaultheria for the last eighteen years. No sun can reach the plants except during the afternoon in June and July. In March or April I give a good top-dressing of peat and sand, and plenty of water, if necessary, from May to September. This, however, is seldom required. In March of last year I divided some very old tufts and replanted with fresh soil. The season could hardly have been more unfavourable, yet every plant produced berries in June and July. Three years ago I made a plantation in what appears to be a suitable position—the north side of rocks deeply sunk in peat. The plants could not have done better, and now cover a space of nearly 3 feet by 15 inches. In 1913 there were a few berries; in May and June of 1914, plenty of flowers, and later some berries. The berries are seldom produced until the growths are 5 inches or 6 inches in length. No seedlings have ever appeared. In 1911 and 1912 a large quantity of seed was ripened, which I distributed among various nurseries and private gardeners, but no seedlings resulted. The berries have only once been taken by birds. The wood-pigeons evidently mistook them for *Berberis Darwinii*. Another plant which has been particularly good here for about twenty years is *Pachystigma Canbyi*. I had no idea what it required in the way of soil or position, and planted it in a chink of natural rock facing east. This chink is at the most 8 inches deep, and was filled with peat or leaf-mould. The plant is protected from the sun by tall Heaths and Cotoneasters, and is now about two feet across. The tiny flowers are red. An *Aubrietia* is beyond the capacity of this garden. I have tried every sort of soil and aspect, especially during the last few years, without success.

Coed Derw, Bettws-y-Coed.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Planting Young Vines.—If it is intended to renew a house of Vines which are now ripening their fruits, the soil should be prepared for making the border, placing it under cover to keep it in good condition. This will greatly facilitate the work when the time arrives for doing it. The young Vines will have been rooted from eyes which were planted in pots or turves in February. If they are growing in pots, do not allow them to become potbound, but give them a shift into larger pots. This method of planting young Vines involves a considerable amount of labour during the busy season, but it has the advantage of getting them established the same year as the old Vines are taken out.

Recently Planted Vines.—Vines which were planted early in April must be encouraged to grow freely. Artificial heat must be used only at night-time or during the absence of sun. Keep the atmosphere humid by damping down the bare surfaces in the house frequently. Admit plenty of air during warm, congenial weather, but close the house early in the afternoon after spraying the foliage with rain-water. Stop the side growths at the second or third leaf, and secure them to the trellis. The leaders may be stopped when they have covered about one-third of the trellis. Young Vines which have been planted during recent years must not be overcropped. A mulch of light manure should be placed over the border to encourage roots to the surface.

Thinning Grapes.—This important work must not be delayed, as the berries swell quickly at this time of year. As soon as the bunches have set, the work should be persevered with. Some varieties ought to be more severely thinned than others. Those bunches which have a loose habit must have their shoulders looped up with raffia in order to bring out their true character.

Plants Under Glass.

Humea elegans.—Seeds of this beautiful plant may be sown now. Sow in pans of light, fine soil, and place them in moderate warmth. When the seedlings are through the soil, keep them growing steadily in a light position. Do not hasten growth by the use of too much artificial heat. This is the cause of many failures in the cultivation of this useful plant. It is a great advantage to save one's own seed, which is very plentiful when the plants have finished flowering in the autumn.

Cinerarias.—A sowing of these useful greenhouse plants may be made now. The seeds can be germinated in a house of moderate warmth, but during all stages of growth cool conditions must be provided. A good batch of the stellata type should be grown, as these have a much greater decorative value than the larger-flowered variety.

Primulas.—Another sowing of Primulas may be made now. These can be grown under slightly warmer conditions than the Cinerarias till they are established in their flowering pots, after which they may be plunged in ashes in a cold frame.

Lilium speciosum.—Batches of retarded bulbs of this beautiful Lily should be hastened into flower as they are required. They may safely be subjected to hard forcing, provided a moist atmosphere is maintained. The bulbs which are growing in cold frames will now have made sufficient growth to require the support of stakes. As the pots become filled with roots, stimulants must be afforded, increasing them in strength as growth advances.

The Flower Garden.

Plants in Tubs.—In some gardens specimen plants in tubs are used extensively in the general scheme of flower gardening. A great many species may be utilised for this purpose, notably scented-leaved and Ivy-leaved Pelargoniums. Of the former type, Clorinda is one of the best. Mme. Crousse of the latter type makes an excellent display all through the summer and autumn. These are easily established in tubs, and will last for years if given liberal treatment during the growing season. Other plants which may be used for tub gardening are Hydrangeas, sweet-scented Verbenas, Fuchsias, Myrtles, Marguerites, Calceolaria amplexicaulis and Sweet Peas.

Sweet Peas.—The staking of the plants must be done before there is danger of damage from strong winds or heavy rains. If ordinary stakes are used, the work must be done as neatly as possible. A mulch of rotten manure will be of great benefit, should a long spell of dry weather set in. The latest batch of plants must be put out as soon as they are ready, and twigs placed to each plant to support it till the permanent staking is done.

The Hardy Fruit Garden.

Peaches and Nectarines.—Where fruits have set thickly, many of those which are badly placed may be removed, but it will be unwise to do the final thinning till stoning is finished. Should the Peach leaf-blight appear, remove the affected leaves and spray the trees with Medela. During a continued spell of dry weather the trees will need water, giving plenty of stimulants to old-established trees carrying heavy crops.

The Kitchen Garden.

Seakale.—The crowns will now be growing freely, and it will be necessary to remove all the surplus growths, leaving only one to develop.

Celery.—The first batch of Celery may now be planted out. If the trenches were prepared two or three weeks ago, they will be in good condition for planting; but should the soil be loose, it ought to be made firm by treading. Give the plants a good watering after being put out, and spray them daily till they become established.

Tomatoes.—Plants intended for putting out at the end of the month must not be allowed to become starved in their pots. If they are not already potted into 6-inch pots, this should be done at once. Plants which are fruiting under glass must be liberally fed with manures. Pot on later plants and keep them growing near to the glass in a light structure. If there is the least evidence of the white fly on the plants, fumigate them with a nicotine compound.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Onions.—Any weeds appearing among the young Onions should be carefully pulled out, then the soil between the rows lightly hoed. A dusting of soot will stimulate them, as well as help to keep off any attacks from the Onion fly.

Lettuce.—Continue to make fortnightly sowings of both Cos and Cabbage varieties. To keep up a continuous supply, a few of the thinnings may be dibbled in; these will generally turn in about a week later than the plants not disturbed.

Carrots.—To ward off attacks of Carrot fly, give frequent dustings of soot in the early morning when the plants are covered with dew. Keeping the bed firmly trodden and frequently hoed is also a check to this troublesome pest.

Turnips.—Larger sowings can be made now to furnish nice, succulent roots during the summer. Snowball and the various Milan varieties are best for general garden cultivation. The Turnip fly is troublesome during most seasons, but particularly in dry ones. The best preventive is to sow the seed on a piece of ground where there is plenty of moisture; then, should the weather be very dry, watering could be resorted to as a means of keeping the crop free from this pest.

Early Globe Beet should be thinned as soon as the plants are large enough to handle, weeds must be kept down, and the ground hoed over carefully.

Chicory and Dandelion.—These two vegetables are indispensable during the winter when a regular supply of materials for salad has to be maintained. Sow now in drills 18 inches apart.

The Hardy Fruit Garden.

Strawberries.—Young plants which were late in being put out will benefit from applications of liquid manure, if well diluted. If dry weather prevails, it is very important, especially on sandy soils, to see that they never suffer from want of

water. Neglect in this matter usually shows itself in a poor crop of fruit the succeeding year.

Blossom Protection.—Plums and other stone fruits being now mostly set, any protecting material should be removed to let the fruit and foliage have all available light and exposure.

Insect Pests are numerous in many fruit gardens, and must be kept in check by timely spraying with some of the excellent mixtures so much advertised. Fruit crops can in some cases be doubled in quantity, besides being of better quality, by careful attention in this respect.

Fruit Under Glass.

Successional Vineries.—Less artificial heat will be required than was the case with earlier houses. If the vineries are closed sufficiently early to secure a good amount of sun-heat, only a moderate warmth in the hot-water pipes will be necessary—just sufficient to prevent the temperature dropping below 60°. The days being now longer, with more sunshine, there is naturally quicker evaporation of moisture from the borders. Watering must therefore be attended to in time. When possible, it is a good plan to water a Vine border, adding stimulants, just when the thinning of the Grapes is in progress or nearly completed.

The Flower Garden.

East Lothian Stocks.—If plants were raised from seed sown in January and pricked out in frames during March, they should be ready for planting where they are to flower. Maggots sometimes attack them, so that it is advisable to keep a few plants in reserve for replacing those which are lost.

Violas and Pansies should be planted where they are to form part of the summer bedding. Seed-pods must be constantly removed to encourage freedom of flowering.

Wallflowers.—Unless very small and dwarf plants are required for any special form of spring bedding, the main batch should now be sown. If the ground is very dry, it will hasten germination if the seed drills are watered before sowing the seed. Do not sow too thickly, or the plants will be injured when they are being separated for pricking out later.

Mixed Plants or Bulbs.—Where any "rogues" have appeared, either among flowering plants or bulbs, labels should be secured to them while they are in flower, to prevent them reappearing in their wrong place another season.

Roses.—The plants now growing freely will benefit from frequent hoeing, to keep the surface of the beds or borders loose. If liquid manure is available, a moist day should be chosen on which to apply it.

Herbaceous Borders.—Several plants, such as Pæonies and Anemones, should be staked before the wind is allowed to break them down. Try to conceal the stakes as much as possible, and avoid bunching up the plants, trying to leave them with as natural an appearance as possible.

Plants Under Glass.

Tuberoses.—More bulbs may be introduced into heat to succeed the early batch, remembering to water them very sparingly until growth has fairly commenced. The early batch must be kept free from green fly, which is usually troublesome.

Flower House.—Most of the forced flowering shrubs, such as Azaleas, Pyrus and Prunus, will be over, and they should be replaced by batches of Pelargoniums, Fuchsias, Campanulas in variety and Hydrangeas. Should any of these plants be infested with insect pests, they must be fumigated before removal.

Pot Roses.—As Roses for cutting will soon be available from plants growing outdoors, only sufficient plants should be kept growing indoors to keep up the supply until that time. Plants brought out from a house where they have been protected from bright sunshine by blinds will naturally suffer somewhat when they are first exposed. If possible, choose a site where they are protected from north and east winds; yet they must not be shaded in any way. They succeed best when the pots are plunged to the rims in the ground or ashes, as then the soil does not dry up nearly so quickly.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

THE HOLLY.

THERE are few gardens which Holly does not help to brighten during winter. The bright red berries ripen early, usually in September and October, and it is not uncommon, especially when a mild winter occurs, to find them hanging on the trees in March, and during the whole of the time they have been responsible for a fine display. The colour is the brightest, of course, in country places, where the atmosphere is not heavily charged with smoke; but the Holly is not at all a bad plant for town gardens. The common kind is the most conspicuous, and really the most appropriate for planting in the woodland; but there are many sorts to choose from for garden adornment.

In the case of a tree that has been grown so widely for so long a period as the common Holly, it is only to be expected that distinct breaks from the type should occur at one period or another, and such breaks have been fairly common, either in the form of sporting branches or seedlings. These breaks were taken advantage of by those concerned in commercial horticulture, especially about the end of the eighteenth century, with the result that we have had handed down a large number of garden varieties, which exhibit all sorts of peculiarities of form, habit and colouring. These varieties last century were added to, with the result that there are now about a hundred sorts to select from.

Many of these, however, are more strange than beautiful, and cannot be recommended for cultivation except in places where full collections of trees are desired. When selecting Hollies for planting, the buyer requires to give consideration to the fact that some kinds never bear fruit; that is, certain trees bear male flowers only and others female. Occasionally male and female flowers may be found on the same tree, but it is a rare occurrence. Those who wish for a select dozen fruiting varieties of the common Holly (*Ilex Aquifolium*) cannot do better than choose the following: *I. A. camelliæfolia*, a handsome shrub of pyramidal outline, with large dark-coloured leaves, armed with very few spines. *I. A. ciliata major*—this is also a green-leaved sort which has the margins edged with fine teeth. *I. A. integrifolia* is distinguished by many of its leaves being quite spineless. Unfortunately, a form of this is grown which bears male flowers only. It is indistinguishable except when in flower. *I. A. Marnockii* is a large-leaved form, *I. A. pendula* is distinguished from the type by its weeping branches, and *I. A. fructu-luteo* by its golden fruits.

Variegated-leaved varieties may be had in *argentea marginata*, *argentea marginata pendula* and *argentea medio-picta*, Handsworth Silver with silver variegated leaves, and *aurea marginata* and *aurea medio-picta* with golden variegated foliage. Useful male-flowered varieties will be found in *Silver Queen*, *Golden Queen*, *donningtonensis*, *ovata* and *laurifolia*. Among large-leaved kinds, *I. platyphylla* fruits very freely, while *Wilsonii* has handsome foliage and bright red berries, and *nigricans*, *altaclarensis* and *Shepherdii* male flowers. The foliage in each instance is, however, handsome. With this selection a garden can be enlivened through the dull days of winter and a set of handsome specimens may be developed.

W. DALLIMORE.

INSECT ENEMIES OF VEGETABLES.

TIMELY MEASURES OF REPRESSION.

THE gardener must be ever alive to the possible depredations of insect enemies, and experience will prove to him the advantage of using every phase in the cultivation of a crop for purposes of adopting some deterrent measure.

Only by such steady and sustained effort can the fullest meed of success be won. Sound as this principle is, it must not be assumed that any modification is to engender futility. There are times when, by the adoption of some specific combative measure, most far-reaching and beneficial results can be secured. This is particularly evident at this time of the year. The revival of the active phases of insect life is almost, and in many instances quite, spontaneous with that of vegetable growth. The individuals of any species are now, or will soon be, bent on the perpetuation of their kind, and where there are now thousands, there will shortly be billions. If, therefore, nothing has yet been done to anticipate and, if possible, prevent this dangerous increase where noxious insects are concerned, then prudence counsels effort in this direction without delay. What may be done now and during the next few months is indicated in connection with the most serious and very general insect pests here mentioned.

The Carrot Grub.—No vegetable crop germinates more freely or promises better in its early growth than the Carrot. At the same time, no hardy vegetable is, as far as its future well-being is concerned, regarded with more misgiving by the cultivator. So general and insidious is the pest that attacks it that a gardener may feel justifiable pride should he secure a clean crop of roots. The grub, as is generally known, is the larva of a fly which deposits its eggs near the crown of the young Carrot in May or early June, according to the climate and latitude. A good many of the combative measures recommended aim at the prevention of this egg laying by the use of liquid sprays containing such mineral oils as paraffin, carbolic acid, &c. Of these the paraffin $2\frac{1}{2}$ per cent. solution is the most effective. The spray is prepared by dissolving a few ounces of soft soap in half a gallon of boiling water, and, while boiling, stirring in $2\frac{1}{2}$ pints of paraffin. By thorough stirring a mass of butter-like consistency can be obtained, which can be dissolved and diluted as required. The merit of these unpleasant smelling sprays lies in their regular and frequent application rather than any other factor. Paraffin, a quarter of a pint to a gallon of sand or similar fine material, is found, when dusted weekly between the rows, to be useful in keeping the fly away. For simplicity and effectiveness, however, the writer has found nothing better than mulching between the rows—after a preliminary thinning and hoeing—with lawn mowings or other short organic matter.

The Onion Maggot.—This pest is not quite so general as the Carrot grub, but where it does occur it is quite as troublesome. In many districts spring-sown Onions are out of the question owing to their liability to attack, and growers have recourse to transplanting plants raised out of doors in the autumn or under glass in February. Leeks, too, are susceptible to attack. The life-history of the fly that gives rise to the maggot is practically

identical with that of the Carrot fly, and here again the most effective preventive measures are those designed to prevent egg deposition. The paraffin emulsion applied weekly as a gentle spray has been found excellent. The part usually selected for the deposition of the eggs, *i.e.*, the neck of the plant, is fully exposed to the solution, and this no doubt accounts for the effectiveness of the treatment. Many growers aim at the prevention of egg deposition by covering the bulb with fine soil. This cannot, however, improve the keeping qualities of the bulb, and a more efficient alternative would be to dust the bulbs thoroughly with soot and lime in the proportion of one part of the former to two of the latter.

The Cabbage Root Fly.—Another troublesome pest with a life-history similar to the two already dealt with, and giving rise to grubs or maggots which are particularly destructive to young Cauliflower or Broccoli. The principle of rotation seems to avail but very little in securing immunity from this pest, since plants are seriously attacked even when put out on land entirely new to the Cabbage family. The plants are often attacked in the seed-beds, and rigid examination of the seedlings should be made before transference to their cropping quarters. Liberal dustings of lime and soot, or paraffin and sand around the newly planted subjects will act as a deterrent. Without being able to vouch for it, however, it is probable that the American method of placing a disc-like collar of thick paper a few inches in diameter around the stem of the Cauliflower as close to the soil as possible would prove the superior method of keeping this pest at bay.

The Celery Leaf Fly.—The operations of the leaf-mining maggot of this fly are familiar to most growers of Celery. Though not so fatal in its effects on the plant as is the case of the insects previously noted, even a mild attack depresses physiological functions, and good quality or size cannot be expected unless combative measures are adopted. In the case of a slight attack, or where the quantity of Celery grown is not great, the crushing of the larvæ between the finger and thumb is the surest means of keeping in check a pest that is annually increasing. The larger methods aim once more at the prevention of egg deposition on the part of the female fly, and dusting the leaves with soot and lime when moist with dew, or, again, spraying with paraffin emulsion or Quassia solution, proves effective.

Of the four insect enemies dealt with, there are several generations annually; but, excepting the Celery fly, it is only the earliest or earlier that prove of serious import. The winter is passed in the pupal state in the soil, or sometimes in the refuse of the crops preyed upon.

Morpeth.

C. W. MAYHEW.

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish expert advice.

The Editor welcomes photographs, articles and notes, but he will not be responsible for their safe return. All reasonable care, however, will be taken, and where stamps are enclosed, he will endeavour to return non-accepted contributions.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

The Editor will not be responsible for the return of artistic or literary contributions which he may not be able to use, and the receipt of a proof must not be taken as evidence that an article is accepted. Publication in THE GARDEN will alone be recognised as acceptance.

Office: 20, Tavistock Street, Covent Garden, W.C.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

VIOLAS DISEASED (S. W. N.).—The Violas are attacked by the fungus *Puccinia violæ*, and it would be well to remove and destroy by burning all those which show the fungus now. Spray the other plants with a rose red solution of potassium permanganate, or with Bordeaux mixture, as a precaution against the spread of the disease. The "insects" are really mites of the genus *Trombidium*, and do no harm to plants, feeding rather on animal matter.

TREES AND SHRUBS.

PEACH WITH SMALL FLOWERS (Dunkerry).—The flowers were all single, and it appears likely that the plant in question is a seedling and not a double-flowered kind at all. The curling leaves may be due to aphids, although that cannot be decided without seeing specimens.

COTONEASTERS AND PELARGONIUMS FOR INSPECTION (H. W.).—There is nothing upon the shoot of *Cotoneaster* which you send to account for the death of the plant. The green mould is not a parasite, and if the conditions are moist enough, the mould is likely to be found on any roof or post. The death of the plants may have been brought about by ungenial soil surroundings, or possibly they are attacked by scale insects, which should easily be discovered if the living shoots are examined carefully. Several scale insects occur on *Cotoneasters*. The *Pelargoniums* are suffering from having either been allowed to become too dry or having been kept in too dry an atmosphere for some time; or possibly they have been fumigated while moist or in the daytime. There is no fungus disease or insect attack present.

ROSE GARDEN.

ROSE SHOOTS DAMAGED (Dum Spiro Spero).—The Rose shoots appear to have been injured by frost or cold east winds, but fumes from tar might cause damage of this kind. We do not think dust from tarred roads likely to be damaging after the roads have been washed a few times by rain, as the detrimental constituents are either volatile substances or those soluble in water. The *Aralia* leaves are certainly looking unhealthy, and present the appearance of plants which have been attacked by red spider during their growth.

ROSE CUTTINGS IN FRAME (J. D. L., Duns).—If the cuttings are not very closely planted in the frame, the best plan would be to allow them to remain where they are, and transplant to their permanent quarters next October. Of course, in this case you would take the glass covering away as soon as spring frosts are over, and allow the little plants to obtain the natural rains. But supposing you have another frame that can take some of the plants when potted, or, better still, a cool greenhouse, you should pot the cuttings off at once, supposing they are rooted, which could be ascertained by trying one or two first. Use a sandy compost and pot into 3-inch pots, providing each with a few crocks. Be careful to pot firmly, and see that the plants have a good watering at once. By adopting this course you could, if desired, plant the Roses outdoors in July. By that time, the soil being warm, they would make rapid growth. It would be best to remove all the flower-buds as they appear this season.

THE GREENHOUSE.

PRIMULA LEAVES ATTACKED (E. W. D. B.).—The *Primula* foliage appears to have been attacked by minute insects called leaf-hoppers. These are frequently troublesome in greenhouses, disfiguring the foliage and to some extent checking growth. The best method of dealing with them is to fumigate the houses thoroughly.

MOSS ON SEED-POTS (Puzzled).—If a true moss, it is most frequently due to an excess of applied moisture, and generally to a moisture-pervaded atmosphere and to the close, ungenial conditions existing. It is also due to the presence of the seeds of the moss in the soil, which, encouraged by the moisture and close conditions, soon become active, often to the detriment of a batch of seedlings. In the case of seeds which take months or even a year to

vegetate, it is best to bake or heat the soil sufficiently to destroy animal and vegetable life, a precautionary measure which, with great care in watering and perfect drainage, usually leads to the best results. It has been found a good plan, too, to avoid watering such seed-pots overhead, immersing the pots in a pail of water to near the seed-sowing level once every week or ten days being a much better way. Then, by covering the pot with a sheet of darkened glass, you should not be troubled to any great extent.

FRUIT GARDEN.

APPLE SHOOTS FOR INSPECTION (J. J.).—Your Apple is attacked by woolly aphid or American blight. Your best plan would be to spray the tree forcibly with paraffin emulsion wherever the pest is to be seen, and repeat the treatment if necessary. The parts on the stem might with advantage be scrubbed with emulsion.

HOW TO GROW MELONS IN A FRAME (M. Hamilton).—Make the manure-heap of three parts of horse-manure and litter (straw) and one part of leaves. Let them heat, and turn over twice to let the rank heat escape. It will take two good cartloads to make the heap. It should be larger all round by a foot than the frame. The best soil to use is turfy loam, adding a quart of bone-meal to each bushel of soil. In the first place, lay a bushel of this soil in the middle of the frame, the top of it to be 10 inches from the glass. Put two plants at a distance of 4 inches apart, pressing the soil firmly all round them. Pinch out the centres of the small plants as soon as they have made five leaves. This will induce side shoots to form. Select two of the strongest from each plant and train them on the surface of the soil. As soon as these have attained a length of about fifteen inches, pinch the hearts out of them to induce them to form side shoots. It is these side shoots which will bear the flowers and fruit. As soon as you can secure three or four female flowers open on these shoots at the same time, fertilise the stigmata or centre columns of the flowers with grain pollen taken from the anthers of the male flowers. This should be done on a sunny day, when the pollen is dry. As soon as the young fruits are set, keep the frame warm by not giving too much air, and close about 3.30 p.m., after syringing the plants, to conserve the heat of the sun. Slightly open the frame again the next morning about 7.30 to admit a little air. Cover with mats when the nights are cold, and add a little more soil to the border from time to time as the soil becomes full of roots. Keep the soil moderately moist, giving less water as the fruits approach ripeness. Thin out the young shoots, to prevent overcrowding of foliage, by cutting back to within three buds of their base. The fruits should be placed on small inverted flower-pots to expose them to the light.

KITCHEN GARDEN.

POTATOES FOR INSPECTION (J. W. Y.).—The Potatoes are attacked by the skin disease called scab. Avoid too much lime in the soil in which the Potatoes are to grow. The disease in no way damages the Potatoes for use, although it injures their sale. The "greens" we do not know a name for, but they can be readily raised from cuttings.

ONIONS GOING SOFT (F. H. Bull).—The Onions are not attacked by any parasitic fungus, but have probably become soft as a result of having been grown too vigorously last year. Possibly more nitrate of soda or other nitrogenous manure was used than was wise, or the soil in which they were grown was too rich.

MISCELLANEOUS.

VARIOUS QUESTIONS (L. Harrison).—Doubtless you have given your *Niphetos* Rose too much water. Stir the soil on the surface and apply less water, but increase the temperature if possible. We find it best to sow seed of *Alyssum Carpet White* in the open ground during April and early May. The *Antirrhinums* will flower this year, though they will be a little late. Please send your full address when writing again.

GRUBS FOR NAMING (H. G. S.).—The grubs sent are those of the *St. Mark's* fly, *Bibio* sp. They rarely do much harm in gardens, though when abundant they may attack the roots of plants for a time. They usually feed on decaying vegetable matter. In any case, they will soon be turning into chrysalides, and when the flies emerge is the best time to endeavour to reduce their numbers. The two-winged flies appear about *St. Mark's* Day, but are rather late this year. They are either black or red, sluggish in their movements, and may be readily captured among flowers by the aid of a butterfly net on bright days.

NAMES OF PLANTS.—J. Lailey.—1, *Odontoglossum luteo-purpureum*; 2, *Odontodia roosefieldense*; 3, *Odontoglossum triumphans*.—A. E. L., Bowes Park.—*Cardamine trifolia*.—P. O'B.—*Pyrus floribunda atrosanguinea*.

BOOKS.

My Shrubs.*—In this book Mr. Eden Phillpotts gives an account of the shrubs grown in his garden either at the present time or in years

* "My Shrubs," by Eden Phillpotts, with fifty illustrations. John Lane, The Bodley Head; price 10s. net.

gone by, together with interesting facts concerning them which have from time to time claimed his attention.

Unfortunately, he does not tell us where his garden is situated, therefore the results of his experiments with rare and semi-tender subjects are less valuable to the general public than they would have been had he observed less secrecy in that respect. From certain observations in the text we gather that the garden of which he writes is somewhere in Devonshire, but even that favoured county offers a considerable range of climatic conditions, and it is only from the character of certain shrubs mentioned that we are disposed to imagine the garden as being situated in or about Torquay or some similarly favoured neighbourhood. Plants belonging to nearly four hundred genera are mentioned by the author; and although the book cannot lay claim to any scientific merit, it is written in such a way that people who have no knowledge of the subject will read it with interest. People, on the other hand, who have gardens in the milder parts of the country will find it a good guide in the selection of suitable shrubs.

The following gives an idea of the way in which the various genera are treated:

"*Cytisus* in a myriad forms I should welcome, but there is no room for many of these beautiful stragglers. *C. præcox*, however, is here, and *C. purpureus incarnatus*, with pink flowers, succeeds as a standard. *C. racemosus*, the fragrant, attains to great size, and appears to be perfectly hardy in our Western gardens, and *C. Ardoini*, the smallest I know, will prosper on a moraine with the least Saxifrages. *C. schipkaensis* is a little white beauty from the Schipka Pass. This I have loved and lost, for the snails loved it even better than I."

From this it will be seen that the actual descriptive information of the plants mentioned is very meagre, but, as in many other instances, the story is told in a fascinating manner. In many instances rich touches of humour are found. Thus, in writing of the flowers and spiny branches of *Colletia cruciata*, the author says, "they are sweet; but smell *Colletia* with care, or he will stab you in a tender place." *Datura* is dismissed as follows: "Over *Datura* I draw a veil. We do not get on, and are therefore better apart." The description of *Salsola* runs: "*Salsola fruticosa* lacks charm, but I am giving this new shrub rope to hang itself. It may surprise me yet." (This, by the way, is a very old shrub). About *Embothrium* the author writes: "I have no fitting place for *Embothrium coccineum*, that prince of flowering shrubs from the Andes. I think the plant did its best with me, and a very vigorous piece, 6 feet high, that came from Cornwall, flattered hope awhile in a cool corner amid things larger than itself. But *Embothrium* could not conquer the crumpled rose-leaf in his lot, and he could not tell me what it was; and so he died—I dare say of my ignorance. Thrice have I tried him; thrice have I failed with this glorious plant. But he thrives to west and east of me, reaches to arboreal dimensions, and decks himself in early summer with a flame of fire."

The book is well printed on good paper, and the numerous full-page illustrations are excellent in every way. While we cannot recommend the book to people who wish for critical information on shrubs, it may well serve to while away an idle hour, and should find a place on the drawing-room table.

THE GARDEN.

No. 2270.—VOL. LXXIX.

MAY 22, 1915.

NOTES OF THE WEEK.

Narcissus White King.—In our issue of May 8, page 225, we inadvertently credited the Rev. Joseph Jacob with being the raiser of this Narcissus. As stated in Mr. Jacob's notes on page 221, it was raised by Mr. J. Mallender, Scrooby, Bawtry, Yorks. It has not passed into the hands of Messrs. Pearson.

An Effective Combination for the Wild Garden.—How very effective some of our wild flowers look when growing among some of our well-known garden plants, particularly in the wilder parts of our gardens! At the present time a large mass of the Greater Stitchwort (*Stellaria Holostea*) growing among *Muscari* Heavenly Blue is very charming.

A Handsome Flower-Bed.—We were interested last autumn by a large bed of the beautiful *Calceolaria amplexicaulis* intermixed with *Salvia patens*, the latter making a striking contrast with its bright blue flowers against the beautiful soft lemon yellow of the former. It seems a pity that this somewhat neglected *Calceolaria* is not more often grown, for it is without doubt the best of the whole genus for bedding purposes, remaining in bloom the whole summer until destroyed by frost. Both *Salvia* and *Calceolaria* can be planted at the end of May.

The Bird Cherry.—Of our native flowering trees few are more beautiful than the Bird Cherry, *Prunus Padus*. Just now the slender branches are clothed with racemes of small white flowers, which create a beautiful effect in the more open parts of the woodlands, especially in association with dark-leaved trees. The Bird Cherry will thrive in almost any kind of soil. Its fruit, which is small, black and very bitter, was at one time used for flavouring brandy and home-made wine. The double-flowered variety is often seen in gardens, but a better form is that known as *Watereri*. This often has racemes of flowers 8 inches in length, and is a very beautiful tree.

A Rare Primula Flowering at Wisley.—During the past few days a plant of *Primula vincaeflora* has been flowering on a small rocky mound in the open at Wisley. We believe this is the first time a blossom has opened outdoors in this country, and, naturally, the plant has attracted a great deal of attention. Two pot-grown plants in flower were shown before the Royal Horticultural Society by Professor Bayley Balfour on September 23, 1913, when the species received an award of merit. The illustration on the next page gives a good idea of the shape of the flowers and character of the foliage. The bloom is pale violet in colour, deepening considerably towards the centre. Seed was collected by Forrest in 1905 in the Lichiang mountains of Yunnan, and introduced through Messrs. Bees, Ltd.

Sir Daniel Morris, K.C.M.G., D.Sc.—It is with pleasure we publish on this page a recent portrait of Sir Daniel Morris, who has for so many years taken an active interest in the Royal Horticultural Society. It was in February, 1888, when the society was in very low water, that he was elected hon. treasurer, a position he occupied until 1892, when other calls on his experience rendered it necessary for him to retire. He was one of the original recipients of the Victoria Medal of Honour in Horticulture when it was instituted in 1897, and in 1909 he was made a honorary life Fellow and also a member

SIR DANIEL MORRIS, K.C.M.G., D.SC.,
V.M.H.

of the Council, where his quiet, unobtrusive work is highly appreciated by his colleagues and the Fellows generally. At the annual general meeting of the society last year he proposed a resolution in favour of the establishment of a national research and experimental station at Wisley, work in connection with which is now being pushed forward with all possible speed. Apart from his activities in connection with the Royal Horticultural Society, Sir Daniel has been a very active worker. From 1876 to 1879 he was Assistant Director of the Royal Botanic Gardens, Ceylon; 1879—1886, Director of the

Botanical Department, Jamaica; 1886—1898, Assistant Director of the Royal Gardens, Kew; and 1898—1908, Imperial Commissioner of Agriculture in the West Indies. Since 1910 he has been president of the Bournemouth Horticultural Society, and he also occupies the position of president of the Bournemouth Natural Science Society. Just recently he has edited an illustrated natural history of Bournemouth and district, a publication that is much appreciated by residents. As though these items were not sufficient outlet for his energies, Sir Daniel is a Justice of the Peace for the County Borough of Bournemouth.

Treatment of Newly Planted Shrubs.—Deciduous flowering and evergreen shrubs that have been recently planted must be well looked after at this time of the year by affording water at the roots, should the weather be at all dry. Although they may have the appearance of being established plants and are making growth, which is frequently due to stored-up sap, this does not necessarily mean that the roots are in a state of activity. Neglect at this time often proves fatal, whereas a little assistance given means success. Newly planted evergreens will be considerably benefited by an occasional syringing of the foliage during dry weather.

Some Attractive Little Irises.—*Iris pumila* and its varieties are now very pretty with their varying shades of blue and yellow, particularly the variety *azurea*. This provides a distinct and welcome bit of colour when seen in a large group. The plants are sometimes used as an edging to walks and in other positions, where they take up very little room. *I. nudicaulis* and *I. olbiensis* are also suitable, and make up a pretty array of dwarf Irises that are both cheap and good, as well as easy to grow. They are particularly useful for the rock garden, and are easily raised from seeds, many of them flowering the following year.

A Beautiful Wallflower and Tulip Combination.—During the last fortnight we have been enjoying a rather unique combination of Wallflowers and Tulips. These are growing in a bed beneath the dining-room window. The Wallflower is Sutton's Fire King, a new and distinct shade of rich orange scarlet; and the Tulip, Miss Ellen Willmott, a pointed, primrose yellow flower. The latter was planted, at the suggestion of the Rev. J. Jacob, with some trepidation; but the effect has been very beautiful, and admired by all who have seen it. The Tulips would be better if a week earlier, as the Wallflowers were fully open nearly ten days before them. The effect is one to note now in the garden diary for use next October.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Hardenbergia comptoniana.—This spring-flowering Australian twiner is highly suitable for training up a rafter or tall pillar in the conservatory. It is a leguminous plant, and its bright purple flowers, freely borne on the slender, pendulous shoots, are suggestive of a glorified Vetch. A compost of peat and loam, with the addition of some sharp sand and charcoal, is what it likes. This plant has a good many synonyms, the most common being *Glycine comptoniana* and *Kennedyia macrophylla*.—CALEDONIA.

A Bramble for the Rock Garden.—*Rubus arcticus*, a diminutive Arctic Bramble, is a gem for the rock garden, although it is not often seen. Its dainty, rose pink blossoms are produced on slender stems a few inches high, and the small serrated leaves form an appropriate setting. *R. arcticus* is often difficult to establish, but when once at home it never fails to put forth its tiny growths upon the first signs of spring. It prefers partial shade and a moist, peaty soil; and if it is slow to start, it will usually spread by degrees annually in such a rooting medium. A light top-dressing early in the spring is beneficial, and nothing but good results will follow a light damping overhead after hot days in the summer. This cannot be described as one of the most showy plants, but it is a particularly interesting one, and its bright, bronze-tinted foliage in the autumn is not the least of its charms.—J. GARDNER.

Classes for Miniature Daffodils.—In his recent report of the late Midland Daffodil Show and of the interesting "talks" at the dinner which followed, the Rev. J. Jacob tells us that some of our Daffodil friends from the Antipodes expressed the opinion that in this country mere size of bloom received an appreciation to an extent which rather submerged refinement and other aspects of excellence, and that it would tend in a measure to counteract this tendency if at our shows we had what were termed "pigmy" classes, open only to, say, flowers not exceeding 3 inches in diameter. Undoubtedly shows have the tendency to relegate to the background many of the most charming but smaller varieties of a flower, success on the show stand being generally with the battalions of the biggest. And this holds good, more or less, all along the line, whether with Daffodils, *Chrysa themums*, and even, in a measure, *Roses*. I have seen "table decorations" at shows which at home no lady of taste, including the prize-winner herself, would tolerate upon her table. As matters stand at our shows—and one must often include the trade exhibits—little opportunity for selection of suitable varieties for purposes other than exhibition is offered to those who do not desire to exhibit, but merely to decorate their homes. And what more suitable for this purpose, and especially for our table decoration, than some of the smaller but most refined and lovely varieties, of which *Cirlet* and *Eoster* may be taken as examples? I think that there are a great many in this country who share the views of our Antipodean friends, and that the

creation of classes for these "miniature" Daffodils at our shows would add largely to a more popular knowledge and appreciation of the Daffodil outside the sphere of exhibition. Of course, precautions would have to be taken in such classes to prevent the inclusion of small blooms of known large-flowered varieties; but preventive measures to deal with this, I think, remote possibility should not be beyond the powers of an expert schedule committee.—CHARLES E. SHEA.

The Evergreen Oak (*Quercus Ilex*).—One can scarcely think of a wood or plantation, however modest its dimensions, where the good Old English Oak (*Quercus Robur*) is not represented, and in the vicinity of homesteads a few other species of the deciduous Oaks, such as the Scarlet Oak and the Hungarian Oak, are to be met with. But one seldom comes across the Evergreen Oak, of which there are a good many forms. The type *Quercus*

THE NEW PRIMULA VINCEFLORA NOW FLOWERING OUTDOORS FOR THE FIRST TIME AT WISLEY. (See page 241.)

Ilex has two qualities to recommend it: it is a true evergreen, and it can either be allowed to develop into a fairly tall tree or be so kept within bounds as to form a fine shrub. One of the best I have seen is at Granton House, Midlothian; another is at Gartmore, Perthshire.—CALEDONIA.

Garden Daffodils.—Now the dear Daffodils are, alas! nearly over for this year in my garden (where I grow forty or more of the cheaper kinds), it is a good time to take a review of them, especially as I planted no new bulbs last year, for when the war broke out in August, I, like many others, decided to forego my principal personal "wanities," which in my case are new books and bulbs and old lace. So I sternly "turned away mine eyes from beholding" book and bulb catalogues or antique curio shops. I expected, therefore, that my borders would be somewhat bare

this spring; but the old bulbs (like other "old 'uns" now) seemed on their mettle, and the garden has been almost as golden gay as usual. The three freest-flowering have been *Mme. Plomp*, *Sir Watkin* and dear old *Barri conspicuus*. Others that have also done well are *Narcissus minor*, *P. R. Barr*, *Vesuvius*, *Frank Miles*, *Autocrat* and *grandis*. Really, when I survey them all, I feel much the same as when once, in my early days, some indiscreet person asked me which of all my wide family circle I loved most. And I gasped out, "Oh! I love—I love them all best—every one, for something different from the rest."—ANNE AMATEUR.

A Noble Group of *Ailantus glandulosa*.—The *Ailantus* is now widely distributed, but it is seldom a group of this tree can be found equal to that which, till last January, could be seen at The Friars, Aylesford. The garden there was made at the end of the seventeenth century in elaborate Dutch style, then in vogue. Much has reverted to primitive Nature of late years, but the ideal situation of the garden is obvious, sloping gently to the south and closed in by high ground on the north and east, with terraces along their whole length. Yew trees now fill most of the north terrace, but the orangery still occupies the centre, while the *Ailantus* group closes in the west end. This group consisted of seven, or nine if two are counted a short distance away towards the farm. Of the latter, one has fallen, through a gale last winter, and two of those on the terrace. The average height of the whole group would be over sixty feet each. One at least was over seventy feet high. I measured two of those which had fallen, and found the girth of one at 5 feet from the ground was 8 feet 6 inches. The other at 2 feet from the ground was nearly the same. One of those still standing has a girth of 10 feet 6 inches, 4 feet from the ground. I was told they were being cut up for firewood, which is regrettable, as the timber, though light and soft, is valuable for cabinet-work and, as in these specimens, remarkably free from knots. As the *Ailantus* was introduced from China in 1751, and did not become common till the close of the century at least, the age of the *Ailantuses* at The Friars cannot be much more than 150 years. There are a few other remarkable trees at this old-world place on the banks of the Medway, once a

celebrated house of the Carmelite Friars, and, with Preston Hall on the opposite side of the river, in scenery of surpassing beauty; but with the exception of some Yews dating from before the Reformation, they were planted with the *Ailantuses*. These include a Tulip Tree, one of the largest in England, but decaying; several False Acacias of great size; a Wych Elm over sixty feet high, which is very unusual for that variety of Elm; a Cedar of Lebanon, with its lower boughs on the ground and covering a wide radius; and others.—HURSTCOT.

Dahlias on a Trellis.—A trellis running across the mixed flower garden here is furnished with climbing *Roses*, but, as is usually the case, there are always blank spaces between the plants at the bottom of the trellis. For some years past I have utilised these spaces by training up the wires surplus plants of Dahlias, and as the effect

produced has been generally admired, I pass on the suggestion. Little Othello, which the Editor recommended in his notes in *THE GARDEN* of October 17, 1914, is well represented here, and deserves to be widely cultivated. In a position such as I have indicated each plant should have a good-sized pit dug out for it, and have the benefit of a couple of spadefuls of rich compost. Dahlias here on October 19, 1914, were in almost perfect condition.—CHARLES COMFORT, *Midlothian*.

Apple Cox's Orange Pippin Grafted on Irish Peach.—Although Cox's Orange Pippin succeeds fairly well here in the heavy, cold soil, it gives a lot of trouble owing to the way the branches canker; but with care and attention this evil is combated. Some ten years ago I grafted trees of Irish Peach with Cox's Orange Pippin. They have succeeded amazingly, grown well, bear freely, and do not exhibit the slightest sign of canker. Under these conditions it is safe to assume that the double grafting of this Apple on to Irish Peach, which was formerly worked on the free or seedling stock, has a distinct advantage. Anything that can be done to increase the satisfactory production of full crops of this highly prized Apple is time well spent, as there are so few English Apples worthy of culture after the season of Cox's Orange Pippin is past.—E. MOLYNEUX, *Swanmore*.

Sparrows Attacking Gooseberry Flowers.—I read with interest the note on this subject and the letter signed "O. N. E. Another" in your issues of May 1 and May 8 respectively. I must say many of my plants have been great sufferers this season. Carnations, Pinks, Polyanthus, Violas and even Aubrietias have been attacked, and the Rock Pinks, too, have not escaped the sparrows' ravages. I have seen them this week also plucking the Apple blossoms. I am afraid it is not moisture the sparrows are after. I have for many seasons had a dish of water—a 10-inch shallow earthen pan—placed on the lawn, freshly filled every day. Thrushes, starlings, robins, tits, finches and sparrows all take advantage of this, both for drinking and bathing. I may say it is placed on the ground, and, although cats abound in the neighbourhood, it is quite evident the birds fear very little from them, as one can easily recognise the call of danger from Mr. Sparrow while Mrs. Sparrow has a drink. The birds are fed every day with crumbs, and suet is fixed upon all the fruit trees for the tits, which do no harm, but remove caterpillars galore from the trees and shrubs. For their kindness in this direction I provide some neat nesting-boxes, which they readily occupy. Thus I am afraid the sparrows are not seeking moisture when they ruin choice Carnations and other plants. It is probably the flavour of the various morsels that attracts their palates.—BIRD LOVER.

The Cultivation of *Lupinus polyphyllus*.—I have read with interest the contribution by "Garden Steward" on page 206 of your issue for May 1. I should like, however, to remark on one point, and that is that "by the autumn, when the young plants were dug up to be transplanted in their permanent quarters, they had made roots several feet long . . ." In the earlier part of his letter "Garden Steward" says, "for three summers I saved seeds, which germinated well," so presumably the seedlings which "had made roots several feet long" by the autumn were obtained from seeds sown in the summer. Of course, I do not know his soil. He does not say where he resides, but I think there must have been something more than bacteria

in the soil with which he dressed his seedlings and nursery beds, if in three or four, or even six months they developed such long roots. Our Lupines here (Sheffield) do not possess roots 2 feet long after two or three years' strong growing; but then, of course, coal measure (which, as we all know, can be very tough) underlies our soil. Moreover, might I ask your correspondent how he discovered his seedlings had roots several feet long? Here we find it very difficult work digging up a plant with roots 2 feet long, even on well-cultivated soil. Perhaps "Garden Steward" has a very light, easily worked soil, which he can trench 4 feet to 6 feet deep. Even so, to dig up seedlings with roots several feet long would be no easy matter, since a considerable portion of the adjoining land would have to be excavated first with the spade. If his soil is *very* good, I should think he might possibly get in that time roots 18 inches to 24 inches long, though this is unlikely; but the length "several feet" must be an exaggeration.—E. T. ELLIS, *Weetwood, Ecclesall, Sheffield*.

Rock Gardening.—Oh dear! It appears I have roused the rock gardeners' ire. (Can it be the "grains of truth" in my letter full of "chaff" that have so offended them?) I have chuckled wickedly at their attacks. It is great fun. To "M. H." I reply that I wrote on "rock gardening as represented by its votaries," and as an ignoramus who read their letters to obtain information. I live in the country "far from the madding crowd," so have *not* seen "many hundreds" of rock gardens, but only a few, including the large rock and water garden of a florist (well known at the Royal Horticultural Society's shows) and some three or four exhibited at the Royal Horticultural Society, which latter, I presume, show rock gardening in ideal perfection. Perhaps I have been unfortunate, for the rock gardens I have seen certainly combine to give the impression that "the game is not worth the candle." Rock gardening does seem to me to have something wrong about it. It is not frankly formal and artificial, like "bedding," which (though I do not enjoy it myself in small gardens) certainly has its place in large ones, private and public. But rock gardens, judging from many photographs and from those gardens I have seen, are more or less miserable attempts (and failures) to imitate Nature—a "make believe" (always a detestable thing). And some of the letters were horrid! Fancy the writer who has "no use for Arabis, save as a vegetable doormat"! I love its great snowdrifts—just now one of the glories of my garden—and it is simple enough to cut it well back after blooming. Its fault to him apparently was that it "grows and blows freely." If it were *hard* to grow, he would probably prize it. I grow most of the rampant herbaceous plants "M. H." names. An acquaintance who scarcely knows a Cabbage from a Cabbage Rose remarked to me, "I do enjoy the great splashes of colour in your garden." That is what I aim at. I do not like little "niminy piminy" dabs everywhere. My garden of twelve years' standing is full of masses of colour for ten months every year. It does not yet "require a pickaxe" when any plants increase beyond bounds. Why? Being so lucky as to have many gardening friends, I pack a hamper full "of sorts" and send it to someone who has a suburban garden, and who is glad to get some strong, healthy clumps of roots from Aunt Anne's country garden.—ANNE AMATEUR.

DAFFODIL NOTES.

BY THE REV. JOSEPH JACOB.

Varieties with a Garden Future.—I hasten to carry out the promise I made in my last notes and write about garden varieties. Two difficulties at once present themselves. I must not occupy my space by gilding refined gold, or, in other words, I must not write of those that have already established their reputation; and, on the other hand, I must be very careful to avoid recommending varieties about which less is known than warrants a man saying that they have a reasonable prospect of a future. In so many cases one would like to sit a little longer on the gate and watch their behaviour, for nothing is more certain in matters pertaining to horticulture than that the air above and the soil beneath that part of the earth's surface which we call a garden affect for good or ill all therein contained.

What to paint on the signpost is a serious problem. With the best intentions in the world the direction may be wrong; hence I feel one cannot be too careful in giving advice. I would like to point out one or two general considerations before passing on to deal with particular individuals. Frequently a variety, more especially in the earlier days of its existence, seems to resent any transference and, when it comes to our garden, takes two or three years before it settles down. I have had remarkable instances of this in my time. One that happened this year will suffice. It must be five, if not six, years ago since Mr. Poupart gave me a few bulbs of Ovid (Poet) for trial. They at once went sick, as we say; and they remained in that condition until last spring, when they seemed to have become convalescent, while this year they appear to be in the best of health, and I have three or four rows in my beds of Poets, all looking extremely well.

The reverse happens now and again. One has worked up a nice little stock of this or that; then one year we find they have gone wrong, to our intense chagrin and disappointment. It seems to be impossible to account for such behaviour, more especially when we know that with our friend "A. B." the same variety continues in perfect health. Should such a thing happen as the going wrong of Barri conspicuus, it does not very much matter. Its reputation has for a long time been firmly established, and such an incident does not affect it. When, however, a variety is struggling to make a name, it is very different. In the following list I believe I have included none but what may be purchased with every confidence.

Golden King.—A deep yellow trumpet Daffodil. The flower is of medium size, and is borne on a good stem which elevates it above the foliage. It keeps a good shape and lasts a long time. The plant increases quickly.

Bernardino.—This is bound to become extremely popular, both for cutting and for the garden. There is something exquisitely beautiful in the deep ruddy apricot of its large cup surrounded by a not too stiff, somewhat undulating perianth. The colour fades in the sun, but even when it has gone we are left with a beautiful decorative flower. The plant has a magnificent constitution and is a rapid increaser.

Florence Pearson.—I have long noted this down as full of promise, and I have said that in time it will take the place of Mme. de Graaff in our borders. Unfortunately, Mme. de Graaff is

not a good laster, either when cut or when growing. Florence Pearson is, and, moreover, it is a more important-looking plant on account of its height and size. It should not be planted in the shade, as it has a tendency to weak ankles; but in most years this is not noticeable if it is growing in an open position.

Queen of Hearts is a fine, tall Barri or small-cupped Daffodil. I can speak with considerable

"That," and the finger was pointed to Acme. "Now, which next?" I would say. There was much hesitation and considerable divergence of opinion. I wanted, of course, everyone to say the one I liked; but, to be quite candid, they did not. Some did. Some chose Eagle, which I mention as a flower which grows in a sort of amphibious way, both in water and on myself. A deep, dark-eyed Cassandra describes my general

Buttercup is a very beautiful Jonquil hybrid, a very free bloomer and quick increaser. It looks like a very deep yellow coloured trumpet variety not by any means large, but of a quite presentable size. Some of the blooms measured have had a diameter of $3\frac{1}{4}$ inches, but an ordinary well-grown one would be a little less. It flowers late, is a rapid increaser, floriferous, of a good height, and with a Jonquil scent. It is a charming flower for cutting.

The President (Wheaddon) stands out well in any garden with its large, flat eye and fine, broadly segmented perianth. The flowers rise well above the foliage and make a good show in a border. The cup is yellow and the perianth a very good white. It is a variety that ought to be better known. It blooms on the late side of the season.

The Hon. Mrs. J. L. Francklin is one of the very best of Pearson's big Leedsis for garden purposes. The cup begins life quite yellow, and to a great extent retains this character to the end. I do like these yellow-centred Leedsis; there is something very pleasing in their appearance—what, I cannot exactly say, but it is a something which one never gets in an incomparabilis. The plant is vigorous and free, and a particularly rapid increaser in my garden. I have a beauty coming on with a cup in which the colour passes away in the lower part, but is retained in the upper. I always seem to couple the two together in the garden, and I mention my chick here to call attention to these partly yellow centres.

Whitewell is one of the finest garden plants among the Daffodils when it does really well. I have heard of gardens where it does not appear to do so; hence I must apologise for naming it. My excuse

is that it is so effective with its great, deep yellow eye and broad, imbricated, ivory perianth that now it has come down in price it ought to be given a trial. It likes light soil, and should be lifted yearly and replanted at once. It has been specially good with me this year.

A NEWLY MADE GARDEN AT SANDBOURNE, WORCESTERSHIRE.

THERE are some who are deterred from undertaking the making of a new garden by the idea that it will be many years before there can be any enjoyable result. But this is by no means the case, and it is hoped that these notes and illustrations may show the faint-hearted that their fears on this account are groundless. Not four years before the photographs were taken this site was a bare, sloping field without any distinctive feature whatever. It was decided to form a garden in several successive terraces, each level having a retaining wall for planting of the local red sandstone which could be quarried on the upper part

A DRY WALL AND BORDER IN A NEWLY MADE GARDEN.

confidence about this, for three years ago I swapped a little collection of fine varieties for three bulbs of this, with the condition attached that I was not to part with any for two years. It got planted in due course, and rather to hide my seeming extravagance I had it labelled Christopher. So Christopher it has been to Whitewell Rectory ever since. A beautiful, tall, taking row of an unknown appeared this spring—Christopher. I had temporarily entirely forgotten its change of name, but I felt I had a real good thing, and my judgment was confirmed when I remembered its true name. It is a prolific increaser, a good tall plant, a free bloomer, and a most pleasing flower. It must be planted, like any other all-red cup, in a position where it is shaded from the sun. One cannot disguise the fact that practically all red cups and red edges burn, but they are so beautiful in an unfaded condition that no one would wish to banish them from their gardens. All such must be specially provided for. They are worth it.

Acme comes to my mind in this connection. It is one of the most satisfactory and most pleasing of all Poets, and when in its first flush of youth it has a beautiful red eye. I made a little collection of about twenty varieties of Poet Daffodils in an outbuilding this year. Visitors were taken to see it and asked which one they liked best.

impression of it. Acme is a fine doer, a quick increaser, and bears a pretty little bloom with an eye of almost strawberry and cream red, when the latter ingredient is none too plentiful. It is well worth finding a suitable position for. It is one of Mr. Engleheart's children, but has been brought up at Lissadell. Its behaviour now it is out in the world does Sir Josslyn great credit.

Kingsley is, to my own way of thinking, one of the best of all Poets. It has a fine flower, with a large rimmed eye of the ornatus style, and a rather undulated perianth. It increases fairly quickly, is a tall grower, and so far has always done extremely well.

Pedestal is one of those wonderful flowers which keep their shape to the end. It is a large bicolor incomparabilis of the type of Lady M. Boscawen. One particular reason, however, why I mention it in this list is its late flowering habit, which makes it so useful, apart from its intrinsic merit as a flower.

Northern Light.—This is a flower which has something of the character of Blackwell, but the cup is more of an orange and it blooms later. It is a strong, free grower, and I find it keeps its colour fairly well. It has the merit of being low priced compared with the majority in this list. It is a large-cupped Daffodil (2A).

of the ground. The terraces have been formed of different widths, according to the steepness of the ground and with the consideration of moving as little earth as possible. Where a twist occurred in the shape of the hillside, suggesting that the lower terraces would have to take a different general line from those above, the difficulty was got over by forming one nearly in the middle as a sharp wedge. A wider space below gave room for a Rose garden, differently shaped; while the natural conditions of upper portions were put to suitable ways of adaptation, so that, instead of presenting difficulties, they actually offered advantages by suggesting ways of treatment that gave a pleasant variation from the more straightly terraced spaces. The borders illustrated here and on the front cover were planted less than three years ago; the intention of the design and arrangement of plants was admirably carried out by Mrs. Wakeman Newport under the happiest circumstances of her own good taste and knowledge of plants and the sympathetic enthusiasm of her excellent gardener, Mr. Packham. Where some extra filling seemed to be wanted, they knew exactly the kind of plant or shrub the place required, and placed it rightly, with the best possible result to the whole.

The pictures are different views of one of the two opposite borders on one of the levels that has a width of something over 30 feet; a 9-foot grass path has borders of 12 feet wide each side, planted mainly for June effect with a careful arrangement for colour. At one end the flowers are pink, purple and white; here are China Roses, pink and purple perennial Lupines and some white Tree Lupines, Irises with colouring inclined to pink, such as the fine pallida variety Queen of the May; the fine purple Crane's-bills, Geranium grandiflorum and G. ibericum; pink and white Pinks, and Arenaria montana. About two-thirds of the way along the whole length of 180 feet there is a distinct break in the colouring, the pinks and purples giving way to yellow and white. Here are bushes of Golden Privet with white and yellow Lupines and Irises, and a good filling of the useful plant Peltaria alliacea, about eighteen inches high, with masses of small white bloom on spreading, flattish heads, something of the character of white Alyssum. Here also are drifts of suitable foliage plants; the rich green and large leaves of Rumex alpinus and the handsomely spotted Pulmonaria saccharata. The wall at the back is planted to suit the colouring and character of the border below with Pinks, Southernwood, Iberis, Nepeta, the dwarf shrubby Veronica buxifolia and Scotch Briars. The middle of the back of the border and wall had been intended for Tamarisk, whose soft effect of grey foliage would have made a good ground for the flower colouring, but, knowing that it did not suit the garden, Mrs. Wakeman Newport cleverly substituted the useful grey-leaved shrub, Atriplex Halimus, planting it in the wall, where it is growing luxuriantly.

GERTRUDE JEKYLL.

THREE GOOD SHRUBBY CALCEOLARIAS.

THERE are few gardens in the country where some of the varieties of Calceolaria are not used as bedding plants. But, apart from the bedding varieties, a few of the shrubby species are extremely interesting and useful for garden embellishment in the milder parts of the country. Calceolaria alba is a very fine white-flowered species growing to a height of 3 feet, with clusters of white flowers freely produced and narrow, serrated foliage. C. violacea is a delightful species from Chili, with small, helmet-shaped flowers of a pale violet colour, spotted with deeper violet, which are most profusely produced during May and June. This is a good species for training to a wall—and in a sheltered situation will attain a height of 6 feet—or for a sunny nook in the rock garden, where it will make much more sturdy growth. An ideal position would be near the top of the wall garden, at such a height to allow the inside of the flowers to be seen from below. This is a really charming plant, not easily forgotten if once seen in flower, but hardy only in the milder districts. Here it stands the average winters on the rock garden without protection. C. integrifolia is another species from Chili, of great value in the more sheltered spots or by the sea. This, like the preceding, makes a handsome wall plant,

THE LABURNUMS.

ALTHOUGH the Laburnums are among our commonest flowering trees, they are rarely overlooked when selections of subjects are being made for new positions, for they are everybody's plants, are perfectly hardy and can be grown throughout the country, always blossom well, while their habit and light growth admit them into the smallest garden. There are two principal species, L. vulgare and L. alpinum, both natives of Europe; while a third and much inferior species, L. caramanicum, from Greece and Asia Minor, is also sometimes grown. Then there are numerous hybrids and varieties which are useful, and indeed necessary, for garden decoration.

Cultural Hints.—Although the Laburnums thrive in a great variety of soils, they perhaps prefer a good loam to any other. Propagation of the species is easily conducted by means of seeds, which ripen freely, while the varieties and hybrids are grafted or budded upon stocks of the species they most closely resemble. Planting may be carried out at any period between early October and late March, and care should be taken to obtain as many as possible of the roots at their full length, for they are often short of fibres,

LUPINS AND IRISES IN A NEWLY MADE GARDEN.

soon covering a large space, and has the advantage of continuing to flower for a long period. Flowers yellow, smaller than many of the bedding varieties, but produced with the greatest freedom from July until October. The above-named species also make good shrubs for the cool greenhouse. All are easy to propagate by inserting cuttings in autumn under a bell-glass or in a cold frame.

Logan Gardens, Stranraer.

R. FINDLAY.

except at the extreme points. Pruning needs carrying out with care, for, while young plants may be pruned without injury and no harm happens by cutting back wood of two or three years of age, wounds made by the removal of old branches heal with difficulty. A point to remember with regard to Laburnums is that both seeds and young wood are poisonous, and fatal cases have occurred by children eating the seeds.

Laburnum vulgare is the common Laburnum. It is found wild in the mountains of Central and Southern Europe, where it forms a tree 15 feet to 30 feet high, with a trunk 6 inches to 12 inches in diameter. Under cultivation it is sometimes rather larger. Its leaves are made up of three oval leaflets, while its yellow flowers are borne in pendulous racemes 6 inches long, which have been very aptly likened to chains of gold. The flowering period is early May. Several forms have been given varietal names. Of these, aureum,

finer inflorescences, which mature about a fortnight later. It grows 20 feet to 30 feet high, and has usually a wider head than the other species. As in the case of *L. vulgare*, several distinct forms of *L. alpinum* have been given varietal names. *Grandiflorum* is a very distinct form, with exceedingly long inflorescences; *autumnale* usually bears a second crop of flowers in September; *pendulum* has weeping branches; while *Latest* and *Longest* produces racemes between 12 inches and 20 inches in length. Between the two species there are

plant has thus been perpetuated, and we have now a tree bearing ordinary Laburnum leaves and branches, with racemes of yellow flowers and racemes of purple flowers, while here and there about the Laburnum branches appear, like "witches' brooms," tufts of branches of *Cytisus purpureus*, which bear typical leaves and flowers of the *Cytisus*. The plant is fairly common, although its history does not appear to be well known, for almost every year specimens are sent for an explanation of the peculiarity of growth and

A TREE OF THE COMMON LABURNUM PLANTED IN FRONT OF DARK-LEAVED EVERGREENS FOR CONTRAST.

with golden leaves; *pendulum*, with pendent branches; *semperflorens*, which blooms a second time during the late summer; and *Alsingeri* are some of the most distinct.

L. alpinum.—This is also found wild in the Central and Southern parts of Europe, and appears to be naturalised in some parts of the British Isles; in fact, it is known by the common name of Scotch Laburnum. It is quite distinct from the common kind, both by reason of its darker-coloured and larger leaflets, and its longer and

several hybrids, notably *Parksii* and *Watereri*. Both are excellent, free-flowering kinds.

L. Adamii is a very interesting tree, for it originated as a graft hybrid. For a very long period it has been the habit to graft *Cytisus purpureus* upon stocks of *Laburnum vulgare*, and on one occasion, in 1825, a nurseryman at Vitry, near Paris, noticed a peculiar growth on a plant which had been so grafted. This growth was watched, and as it kept its distinct character, it was in turn worked upon other stocks. The

flowers. A similar graft hybrid followed grafting *Mespilus* upon *Cratægus*, the progeny producing three distinct types of leaves, flowers and fruits.

L. caramanicum is the third cultivated species. It is found wild in Greece and Asia Minor, and in this country forms a straggling shrub 5 feet or 6 feet high, with small, *Cytisus*-like leaves and terminal heads of yellow flowers, borne during late August or September. Its late flowering season is its one redeeming feature, but for general culture it is not recommended.

W. D.

REVIEW OF THE SPRING SHOW AT CHELSEA.

ALTHOUGH the space at the disposal of exhibitors had been curtailed this year, the Royal Horticultural Society's Spring Show, now being held in the grounds of Chelsea Hospital, must be regarded as a great success. The reduction of space was in some respects advantageous, inasmuch as exhibitors were only able to show the very best of their flowers, fruits or vegetables. Visitors also were able better to grasp the more salient points. Unfortunately, the weather on the opening day was

willingly rendered, without which it would have been impossible to have reported the show so promptly.

ROCK GARDENS.

While it was not to be expected that the rock gardens, which, since the great International Show, have been the most fascinating feature of the Chelsea exhibition, would this year be forthcoming in all the super-excellence and lavish display of former years, they are to be seen to-day on a scale which but half a decade ago would have commanded the highest praise. Indeed,

ranged a dozen or more of these rock garden exhibits, more uniform in size than in former years, yet large enough—they each occupy a superficial area of about two hundred and fifty feet—for all purposes, and, with much to admire, we commend them to the notice of our readers.

Starting at the Embankment end of the famous Lime Avenue, we come first to an admirable arrangement by the Guildford Hardy Plant Nursery (Mr. Upton, proprietor). Ever the home of choice alpine, the nursery has sent some of its choicest plants—plants that impress at sight. Of such, one of the most striking is a fine colony of *Sempervivum rubicundum*, a handsome form

THE ROCK AND WATER GARDEN ARRANGED BY MESSRS. R. WALLACE AND CO.

exceptionally wet, which made conditions, both overhead and underfoot, exceedingly unpleasant. The report that follows has been written by experts in the various branches of horticulture represented, and will, we hope, prove a lasting record of a wonderful show held at a time when the nation is engaged in war. To the Rev. W. Wilks, secretary of the society; Mr. S. T. Wright, superintendent of the show; Mr. Frank Reader and other officials of the society we are indebted for assistance so kindly and

they merit this to-day, not merely from the stand-points of beauty and the object-lessons they afford, but also as demonstrating the grit and enterprise which have made them possible at a time of unprecedented national stress. Moreover, because of the studious work and correct interpretation of Nature in such matters, which to the expert eye is obvious at a glance, pointing the way, like finger-posts, to more elaborate work, the best of them fulfil every purpose for which exhibitions were established, viz., the advancement of horticulture; hence they merit all praise. Near the Embankment side of the exhibition are

with reddish crimson, green-tipped leaves. Other good members of the same group also freely colonised are *S. arachnoideum* Lageri and *S. a. l. rubrum*, two of the more striking of the Cobweb Houseleeks. *Anemone globosa*, with reddish, though small, flowers, is another plant to look for. The blue-flowered alpine *Phlox* (*P. Douglasii*) is very beautiful, and *Oxalis enneaphylla rosea* is also very choice. *Iberis jucunda*, *Erodium trichomanoides*, and a fine colony of *Anthemis Aizoon*, also known as *Achillea ageratifolia*, are of great beauty. Important shrubs in the group include *Cytisus decumbens* (yellow), *Potentilla*

MESSRS. PULHAM AND SONS' ROCK AND WATER GARDEN, SHOWING GROUPING OF DWARF SHRUBS AND ALPINES.

Veitchii (white), *Cytisus purpureus albus* and *Lonicera nitida*. *Cryptomeria elegans nana*, a pigmy 9 inches high, will be found quite charming. The rock employed is sandstone.

Adjoining this is an effective piece of work by Messrs. R. Tucker and Sons, Oxford, who are using the coral ragstone of their district in quite medium-sized blocks. It is not the rocks, however, so much as the array of choice plants that appeals, and the specialist will linger long and admire much. Items of special import hardly likely to be overlooked are *Pentstemon Davidsonii* (of glaucous, prostrate habit with almost scarlet flowers), *Pinguicula reuteriana* (pink flowers, a great rarity), *P. alpina* (white, very beautiful), *Dryas Sundermannii* (a lovely plant with creamy buds and white flowers of superb form and substance), *Primula pulverulenta rosea* (a modest name for a really glorious variety), *Phlox Douglasii* (blue), *Oxalis enneaphylla rosea*, *Origanum Dictamnus* (very fine) and the very charming *Hypericum katschianum*, whose glaucous leafage, pinky stems and golden yellow flowers render it ideal for the rockery. Then, in low-lying places the visitor will note groupings of *Primulas* and *Globe-flowers* (*Trollius*), and anon a turfed incline leading to a miniature pasture aglow with *Gentian*, *Orchis*, *Primula* and other suitable things. Much more may be had for the seeking, and, happily, amid a more or less natural environment.

Messrs. Whitelegg and Page, Chislehurst, will be found to have a most attractive exhibit at this point, erring, perhaps, just a little on the lavishness of the floral display. However, the material is excellent and well placed. One of the most charming bits, which is not likely to be overlooked, is a drift of the pink-flowered *Cortusa villosa*, while *Saxifraga sanguinea superba*, the best of the red Mossies, will be found aglow with colour. *Saxifraga Aizoon rosea* is neatly and naturally tucked into crevices, while *Silene acaulis flore pleno*, wedged between sandstone blocks, will be seen in better flower than usual. Quite charming, too, is the Oak Fern (*Poly-*

podium Dryopteris), which, threading its way amid the rocks in cooler places, suggests a long tenancy. *Primula Unique* is among the finer things, and of this a superb mass catches the eye at once, though not less good or imposing will be found the ample colonies of *Primula Veitchii* and *P. pulverulenta*.

Messrs. Pulham and Sons, Newman Street, Oxford Street, have one of the boldest pieces of rockwork, and, as usual, have disposed the rocks to considerable advantage. It is composed of Lancashire stone, a limestone rock in some respects

approximating to the Cheddar limestone, though bolder and more picturesque than that usually employed. Within the prescribed area rock gardening of more than one phase is to be seen, waterfall and pool and the miniature paved walk being some of them. In shady and cool places will be found the rare *Darlingtonia californica* with *Trilliums* and *Cypripediums* in variety; a little higher up, a colonised bank of *Ramondia pyrenaica* is both at home and suggestive, as also is a nice grouping in flower of *Saxifraga Cotyledon pyramidalis* and the ever-welcome and indispensable *S. longifolia*, which though out of flower is attractive. Then, *Saxifraga Aizoon rosea* is playing a good part in rock fissure and on sunny slope, while *Lewisia*s in variety and *Gentiana verna*, of exquisite blue colour, are disposed in places suited to their well-being. Contrasting with the grey rock, in fine array is *Azalea rosæflora*, while elsewhere *Daphne Cneorum* is lighting up a station with its rich pink trusses in scores. Even the pretty Scaly Fern, *Ceterach officinarum*, has not been omitted from the dry niches it favours as a wilding, while *Primulas japonica* and *pulverulenta* in damp places show to advantage. Suitable plants adorn the water and waterside. Well-flowered *Wistaria* elsewhere add pictorial effect.

Messrs. R. Wallace and Co., Colchester, have achieved so much fame in rock gardening during recent years that one naturally expects to find their work as near perfection as is possible within the limits of the exhibition arena. This year, in common with all other exhibitors in this department, they are working within certain prescribed limits, yet they are compressing therein much ideal work and not a few essential phases. They are employing Welsh mountain limestone, a rock of grey colour approximating to the Yorkshire stone, yet demonstrating an even greater sympathy with vegetable life than this by the natural accumulations of moss and other minute herbage it embraces. To the alpine plant grower there is no more

BEAUTIFUL STRATIFIED LIMESTONE IN MESSRS. KENT AND BRYDON'S ROCK GARDEN.

welcome sign than this. The stone, too, minus the moss, is highly decorative. Features to which we would direct special attention are a dripping well garnished with the rich green of *Scolopendrium*, than which nothing could be more appropriate or desirable in garden work, and the contrast is excellent; and a rocky streamlet which presently topples into a miniature, low-placed pool. Each of these is suggestive and in good taste, though at sight, we imagine, the correct disposal of the rock generally will catch the eye of the expert before all else. This, indeed, is worthy of study alone. Plants are here, too, in considerable force, variety and beauty; and among these a fine lot of American Cowslip (*Dodecatheon*), *Daphne Cneorum*, *Onosma alba rosea*, *O. taurica*, *Oxalis enneaphylla*, *Saxifrages* in great variety, *Androsace Chumbyi* and *Lithospermum* are affording colour effect and charm in their rightful places. The association of rock and shrub we regard worthy of special study, and direct our readers' attention thereto. The rock-clinging nature of *Juniperus sinensis procumbens* is very pleasing; and quite attractive, too, is *J. s. aureum*, also the Table Pine (*Pinus Tanyosho*). *Cotoneaster congesta* is a rock-draping shrub of more than ordinary merit, and the positions these occupy should be carefully noted.

Messrs. Waterer, Son and Crisp, The Arcade, Liverpool Street, and Bagshot, Surrey, have a rock garden of more than ordinary interest, it being well conceived and in the grey limestone which appeals to all. Quite recently Messrs. Waterer have been giving at the fortnightly meetings of the Royal Horticultural Society evidences of their skill and taste in rock garden construction and grouping; hence none who have seen these exhibits will be surprised at the fuller measure of success achieved at Chelsea, with greater scope at their command and amid a more suitable environment. In a sentence, it is a piece of work where good taste, thoughtful and intelligent work, and natural planting go hand in hand. This kind of thing, while eminently fitted for the exhibition arena, would be also perfectly natural in the rock garden at home. This side of the subject is worthy of special study. But there are choice plants our readers must not miss. Space precludes our giving a list of them, and the enumerating of a few must be as finger-posts to the rest. *Lewisia*s, for example, include *oppositifolia*, *rediviva*, *Howellii* and the rare *leeana*. *Phlox Douglasii* is very charming. The fine blue bells of *Campanula Allionii* must not be overlooked; it is among the alpine gems. On an equal footing for choiceness, and surpassing it as a novelty, is *Æthionema Warley Rose*, the most lovely of its class; its rounded heads of deep rose, less than half a dozen inches high, as bright a thing as any rock garden could contain. *Subulata Phloxes*, *Mazus reptans*, an array of *Saxifrages* and others capable of floral display will not fail to catch the eye.

Mr. Clarence Elliott, Stevenage, is another well-known rock gardener whose exhibit merits more than a passing glance. Here will be found deftly arranged and associated with Cheddar limestone not a few choice or highly meritorious

plants. Particularly striking are *Rubus parvus*, a bright-leaved New Zealander which catches the eye at once. *Heuchera tiarellodes* is quite elegant. *Matthiola pedemontana* is very good in colour, though less striking than the orange red of *Cheiranthus Newark Park*. Quite beautiful, too, is a great colony of the blue and white *Aquilegia glandulosa*. *Campanula Stevenii alba* is, we believe, only to be seen here; it is a lovely plant, albeit not pure white. *Daphne rupestris*, *Onosma taurica*, *Phlox nivalis*, *Gentiana verna*, *Primula sibirica*, *P. Unique* and *Myosotis rupicola* are all beautiful, though the greater colour masses of *Auricula Mrs. Robinson* (a fine yellow), *Phloxes*, *Aubrietias* and *Daphne Cneorum* will catch the eye before some of these.

Messrs. Piper, Bayswater, have a very beautiful rockwork exhibit in Yorkshire stone, an outstanding structural feature being a tiny rivulet leading to a rock pool. The disposition of the rock is good, and the work generally well executed. Compared with some, the planting is quite modestly done, yet with pleasing results. *Oxalis enneaphylla*, *Gentiana verna*, *Silene Hookeri*, *Viola*

he has hardly reached his past standard of perfection in planting. Hitherto his planting efforts have been as fascinating and so replete of good taste as the disposal of his rocks was true to Nature. Features of interest include a pretty water-course and pool, with midway path and inclining drift, and with these are associated *Dodecatheon*, *Trillium*, *Funkia*, *Androsaces*, *Oxalis enneaphylla*, *Mossy Saxifrages* and much besides. The greatest flower picture is created by a wondrous mass of *Gentiana acaulis*, and none of our readers are likely to miss what is unmistakably much the greatest feast of this unique plant in the entire exhibition. Small plants of *Pinus Cembra* and others are usefully employed.

Messrs. Kent and Brydon, Darlington, who hitherto have displayed more than an elementary knowledge of rock gardening, have on this occasion surpassed all previous efforts by an exhibit which for skill and thoughtful work is well-nigh perfect. Cascade and pool, moraine and mountain meadow are among the features which catch the eye at once, while their thoughtful treatment will impress the visitor after a more critical inspection. In

BOLD ROCKWORK GROUPING BY MESSRS. WHITELEGG AND PAGE.

bosniaca (very beautiful), *Patrinia palmata*, *Androsaces* in variety, *Saxifraga lantoscana superba* and *Erodium corsicum* are worth seeking. The Umbrella Pine (*Sciadopitys verticillata*) is effectively employed. An adjoining piece of work displays the showier alpine masses.

The Misses Hopkins, Shepperton-on-Thames, have an effective rockery arrangement, and are the only lady exhibitors in this section. Here will be found not a few good things, of which a fine central group of *Primula japonica* is in close proximity to a rock pool. *Gentianas verna* and *acaulis*, *Onosma taurica*, *Geum montanum*, *Androsace sarmentosa*, *Cornus canadensis*, *Ramondias* and *Ledum palustris* are some other things that are employed with good effect.

Mr. J. Wood, Boston Spa, has already achieved such fame in rock gardening that only the most artistic work is expected of him. This year, however, while he is giving a very clear demonstration of his skill in this department, employing the ever-fascinating weathered limestone, which is also prettily garnished with moss, we think

domestic affairs we are told that it is "the little things that make the home"; in rock gardening it is the attention to details and a true interpreting of Nature in respect thereto that invests it with its greatest charm. Only an artist in rock gardening or a Nature student would have placed the Black-ribbed Spleenwort (*Asplenium Trichomanes*) in rocky chinks in the cascade high above the water's reach, yet with other minute Ferns it garnishes and plays a pretty part. The bold, low-down grouping of *Trillium* and *Cypripedium* constitutes a picture of rare beauty, while the alpine meadow is aglow with *Gentian*, *Primula frondosa* and other suitable plants. The moraine has its complement of rare *Dianthi*, *Eritrichium* and the like. *Pinguiculas* abound in wet and spongy soil, while *Edraianthus serpyllifolius* and *Ramondias* are playing a part usefully and well. *Maianthemum bifolia*, with its pretty white spires of flowers, is delightfully foiled by the Oak Fern (*Polypodium Dryopteris*), while excellent use is made of *Juniperus tamariskæfolia*, a trailing rock shrub of great charm. Wrenside (Westmorland)

EFFECTIVE GROUPING AND PLANTING BY MESSRS. WATERER, SON AND CRISP.
THE STONE USED HERE WAS EXCELLENT.

limestone is that employed, and nothing could be more pleasing. This fine exhibit is near the Embankment entrance.

Messrs. Cheal and Sons, Crawley, have rockwork composed of Sussex sandstone, and are employing free-flowering plants in masses, of which the alpine Phloxes, Aubrietias in variety, Mossy Saxifrages, Phlox Laphamii, Onosma taurica, Phlox pilosa Brilliant and others are freely employed. Some charming Acers are here, and Genista aphylla is aglow with yellow flowers.

ALPINE PLANTS IN TENTS

For the convenience of our readers, we are treating of these apart from the rock gardens in the open, and all will be readily found in the large tent, even amid the flower feast which is there displayed.

Mr. H. Hemsley, Crawley, is showing a charming variety of hybrid alpine Snapdragons, also such good things as *Dianthus neglectus*, *Daphne fioniana*, *Gentiana verna*, together with Saxifrages, alpine Phloxes, *Matthiola valesiaca* and others. *Silene tomassiniana* is very pretty.

Messrs. W. H. Rogers and Sons, Southampton, have a lovely batch of the scarlet-flowered *Ourisia coccinea*, than which, for a cool place, there is no more beautiful alpine. *Vaccinium mortiniana* (with rosy bells), *Gaultheria procumbens*, *Viola bosniaca* (very beautiful), *Myosotis rupicola*, *Primula sibirica* and *Meconopsis integrifolia* are all good and worth seeking.

Mr. A. J. Allgrove, Middle Green, Langley, Slough, has some of the choicest things and not a few novelties. Of the latter, *Aquilegia ecalcarata*, with rosy flowers, is very charming, though the great feature of the group is alpine Primulas. Of these, there are *P. luteola*, *P. sibirica* and its variety *chinensis*, *P. bulleyana*, *P. Unique*, *P. Veitchii*, *P. cockburniana* and several besides. Very beautiful and striking, too, are *Meconopsis pumilus*, the white-flowered *Anacyclus formosa* and the beautiful mauve-coloured *Lathyrus pubescens*.

Messrs. W. Cutbush and Sons, Highgate, N., are associating many beautiful alpines with other flowers. *Erinacea pungens* (a lovely mauve-flowered rock shrub), *Phlox nivalis*, *Thymus ericanoides*, *Onosma taurica*, *Edelweiss*, *Daphne Cneorum*, *Tulipa persica*, and many Primulas, Saxifrages and Androsaces are worth seeking in the group.

Sir Everard Hambro, K.C.V.O., Hayes Place, Hayes, Kent (gardener, Mr. J. Grandfield), is contributing some of the choicest and best-grown alpines the show contains, not in fragmentary bits but in ample specimens, demonstrating beauty and worth. Of such are *Asperula suberosa*, a mass of its pinky, tubular flowers, which, above minute woolly tufts, appeals at once. *Armeria cæspitosa* is full of bloom at an inch high. *Androsace helvetica* is of the best of its tribe. *Haberlea virginalis* is one of the gems of its race, chaste and beautiful withal. *Pentstemon Davidsonii* (scarlet flowers or prostrate, glaucous stems), *Erinacea pungens*, *Lewisia Cotyledon* and *L. Howellii*, *Oxalis adenophylla*, *Helichrysum frigidum* and a host of the choicest Saxifrages will afford the alpine plant lover food for thought and reflection for many days to come. Miniature shrubs are pleasingly associated.

Dr. Macwatt, Morlands, Duns, N.B., is showing quite a unique lot of alpine Primulas, of which the reddish *P. Parryi*, *P. muretiana*, *P. The General*, *P. Juliae* (a lovely mass), *P. secundiflora* (virtually a crimson-flowered *P. sikkimensis*), which, with *P. modesta* (a fairy Primrose with rosy flowers), *P. tosensis* and *P. Darialica* (all miniatures with rosy flowers), are very charming. Small seedling plants of the rare *P. Reinii* are also on view.

Messrs. T. S. Ware, Limited, Feltham, have a fine bank-like arrangement of alpines, including masses of *Lithospermum*, *Anthyllis montana*, *Æthionema grandiflora*, *Asperula suberosa*, *Gentiana verna* (a lovely bit of colour), *Saxifraga lantoscana superba*, *Androsace villosa*, *Achillea rupestris*, *Asperula capitata* (a pretty species with pinky flowers), together with *Dodecatheons*, Primulas, *Mitella diphylla*, Mossy Saxifrages,

Daphne Cneorum and a host of other things in goodly groups that will command attention at once.

Bees, Limited, Liverpool, have a fine exhibit near the Embankment end of the large tent, and here will be found some of the choicest hardy plant novelties the exhibition contains. We make a point of directing our readers' attention to *Anemone rupicola*, a new Chinese species with flowers as large as those of the Japanese Wind-flower, yet more perfect in contour and with greater solidity of petal. The sepals are rosy lilac, the petals pure white; the plant, as shown, not more than a foot high. *Weldenia candida*, *Roscoeia cautlioides*, *Primula secundiflora*, *Sedum pilosum*, *Potentilla nana argentea* (yellow) and *Erinacea pungens* are other new and choice things meriting attention. In addition, *Celmisia spectabilis argentea*, *Malvastrum coccineum*, *Aquilegia glandulosa*, *Incarvillea grandiflora* and *Oxalis adenophylla* are plants that appeal by their presence alone. Primulas are good and plentiful in a group which must be studiously inspected.

Mr. Maurice Prichard, Christchurch, Hants, is staging a remarkable lot of pot-grown alpines, the admirable specimens telling their own tale. A great feature of the group in blue and white is *Aquilegia glandulosa*. *Androsace Chumbyii* is very charming. *Clematis montana Perfection* is a rose-coloured variety and very beautiful. Saxifrages are in plenty, choice and rare sorts of the greatest beauty. *Pentstemon Scouleri* is most effective, while *Globe-flower*, *Ramondia*, *Dodecatheon*, many *Sempervivums* and Saxifrages will be found in perfection.

Mr. G. Reuthe, Keston, Kent, is also staging many choice alpines with rare flowering shrubs, and here will be found many good things in both departments. Of the alpines the visitor should seek for *Rhododendron fastigiatum* (a miniature of a few inches with violet-coloured flower trusses). *Haberlea virginalis* is an exquisite white-flowered alpine, like a small *Streptocarpus*. *Daphne arbuscula* is a lovely species from Transylvania with rosy lilac flower trusses. *Anemone alpina sulphurea* is very charming. *Daphne Verlotii*, *D. striata*, *Lewisia Howellii*, *Sisyrinchium filifolium*, *Cytisus Beanii*, *Oxalis enneaphylla major* and *Rhododendron glaucum* are others to be looked for with interest. There are many beautiful Saxifrages, together with choice shrubs, to be found in this exhibit.

Mr. W. Wells, jun., Merstham, has a choice lot of alpine Phloxes, *Incarvillea grandiflora*, together with Sedums, *Lithospermums*, Saxifrages, Aubrietias and *Daphne Cneorum*, all of which are being shown in free masses.

Mr. J. Douglas, Great Bookham, is showing a delightful lot of alpine and show Auriculas at the extreme southern side of the large tent. No exhibitor of this or any other time cultivates these plants with so much skill as Mr. Douglas, hence the plants merit attention.

FORMAL GARDENS.

Mr. E. Dixon, West Hill Nursery, Putney, has arranged a formal garden of unusual pattern, a sunk garden almost circular in outline, in which paved walk, wall garden and the like have all been efficiently treated. Irises adorn the higher parts of the border, while many alpines and other suitable plants enter into the scheme in their proper order. A sundial in the midst is also to be noted.

ORCHIDS.

The Orchid exhibits comprise eleven groups running along the north and south ends of the Large Tent. Chelsea Show is famous for its fine collections of Orchids, and although the war has probably affected Orchid-growers more seriously than any other class of horticulturists, the show is not unworthy its traditions. The exhibits from Belgium will be sorely missed, and Messrs. Sander suffer more than most in the impossibility of keeping in touch with their Belgian nurseries. The graceful sprays of *Phalænopsis rimestadtiana* are lacking, too, from many exhibits to which in the past they have given finish and charm. This is one of the plants largely grown on the Continent and now excluded. The two exhibits specially worth mention are the fine groups from Sir Jeremiah Colman and Mr. Gurney Fowler. They show what can be done by enthusiastic amateurs, and we should like to see more amateurs enter the field, even if on a smaller scale.

Messrs. Armstrong and Brown, Tunbridge Wells, occupy the first position from the entrance at the north end of the tent. A handsome centre-piece of the *Brasso-Cattleyas* Lord Kitchener and Veitchii is flanked by masses of *Lælio-Cattleyas* Fascinator and Aphrodite and some lovely forms of *Odontoglossum crispum* and *Odontiodas*. As specimens the *Odontoglossums* Epicaste, Coronation and Aglaon should be looked for, and particularly the altogether unique plant of *Cœlogyne pandurata*, nearly six feet from back to front. The brilliant *Masdevallias* give a splash of vivid colour. The albino *Lælia purpurata* Ashtonæ is a fine plant.

Sir Jeremiah Colman, Bart., Gatton Park, Reigate (gardener, Mr. J. Collier), wins distinction with the quality of so many of his fine home-raised seedlings, as well as for something original and telling in his arrangement. Prominence is given to a grand plant of the Necklace Orchid (*Cœlogyne* (dayana), which is overhung with the

loose sprays of the purple and chocolate *Odontoglossum thompsonianum*, which is always shown well from Gatton. The hybrid *Cymbidiums* are grand. The late-flowering *Dendrobium regium*, the white *Cattleya Mossiæ* and the fine forms of *Cypripedium callosum* Sanderæ also stand out, but the most brilliant pieces of colour are the scarlet *Odontiodas*, loveliest and most brilliant of which is perhaps Lady Colman.

Messrs. J. Cypher and Sons, Queen's Road, Cheltenham, turn to admirable use a square ground space on the opposite side of the gangway. One expects something characteristic in the tasteful arrangement of the exhibits of this house, and is not disappointed. The generous use of tender foliage forms a delicate tracery of greenery, against which the flowers show to greatest advantage. An arch of *Asparagus Sprengeri* is richly furnished with heavy trusses of the orange and white *Dendrobium thyrsiflorum* and the bright yellow, light sprays of *Oncidium marshallianum*. *Odontoglossums* are used as corner-pieces, with *Cattleyas*, *Miltonias*, &c., on the lower ground. Some of the few sprays of *Phalænopsis rimestadtiana* found in the show are included here.

Messrs. Charlesworth and Co., Hayward's Heath, Sussex, have a rich, distinctive piece of work, this outstanding in its wealth of forms and glorious warm colouring. Yellow and rose are not colours that one would associate at first thought, but see the effect in the centre here of the bright yellow sprays of *Oncidium marshallianum* thrusting out from the dense rose mass of a rich form of *Miltonia vexillaria*. *Oncidium concolor* carries on the yellow to the base of the group. The left wing and right wing respectively are collections of *Odontoglossums* and *Odontiodas*. Between are held many beautiful specimens. The airy *Oncidium phymatochilum* (a yard through) and a good plant of *Cœlogyne dayana* are given places of honour. *Cattleya Skinneri* is a specimen plant. There are some beautiful albinos, *Odontoglossum crispum* *Xanthotes*, *Cattleya Dusseldorffii* *Undine*

and *C. Skinneri* alba. Among the new Orchids, the Grand Duke Nicholas, King Albert and the Queen of the Belgians give their names to *Odontoglossums*. The last, with its fine shape and beautiful markings, we found the most pleasing, although smaller than the others.

Messrs. Sander and Sons, St. Albans, suffer heavily from lack of communication with their Belgian house, but the exhibit is not unworthy one of our premier houses. The grand masses of *Lælio-Cattleya hyeana* are one of the striking things in the group, under the heavy-flowered trusses of *Dendrobium thyrsiflorum* at either wing. The central bank is more varied, and to that extent less effective decoratively than in some of the groups, but plant after plant merits attention for its individual beauty. A plant of *Miltonia vexillaria* G. D. Owen carries four spikes and sixteen flowers. *Lycaste giganteum* is perhaps a finer plant than has ever been staged before. There are several fine pieces of *Brasso-Cattleya digbyano-Schröderæ*, *Cymbidium Pauwelsii*, *C. lowianum aureum*, *Odontiodas* and *Odontoglossums*. Among the new things, one should make a point of seeing *Brasso-Lælio-Cattleya Wotan* and *Lælio-Cattleya Goldstar*. Old, indeed, but what more charming among Orchids than the plant of *Oncidium pulchellum* here?

Messrs. Flory and Black, Slough, who have acquired the exclusive stocks of Orchids of the late firm of James Veitch and Sons, Limited, have an interesting group at the south side of the tent. In one sense it is the most beautiful of the exhibits, for in no other group is each individual plant given so clearly its full value. We realised the restraint necessary for this when we saw box-loads of fine plants pushed under the tabling, for which room could not be found without doing injustice to something already in place. There are many good things here. *Brasso-Cattleya Thorntonii* *Euphemia*, in the very centre, under the *Lælio-Cattleya hyeana*, is magnificent. The new *Disa Blackii*, derived from *Luna* and *grandiflora*, is

SIR EVERARD HAMRO'S WONDERFUL GROUP OF SAXIFRAGAS AND OTHER ROCK GARDEN PLANTS IN POTS

quite the nicest hybrid *Disa* in cultivation. *Lælio-Cattleya canhamiana* alba magnifica, an unnamed yellow *Lælio-Cattleya* with crimson lip, and some very fine forms of *Lælio-Cattleya Fascinator* and *Cattleya Tityus* also deserve mention. It is of interest to note here how the *Cypripediums niveum* and *bellatulum* and the finely veined *Anæctochilus* have been given subsidiary positions under plants of *Odontiodas*, &c., to indicate their shade-loving propensities.

Messrs. Mansell and Hatcher, Limited, Rawdon, Leeds, show a group distinctive in its arrangement, with a fine central feature of *Cattleya Mendelii*; but the large, suspended stands of *Miltonia vexillaria* to right and left of it rather obscure the bays of *Dendrobium thyrsiflorum* behind. The rose, orange and pink in the new finely blotched *Odontioda Enchantress* deserve special attention. *Odontoglossum Phoebe* is a brilliantly spotted plant. Among other good things we noted *Lælio-Cattleya dominiana*, fine specimens of *Cattleya Skinneri alba*, *Odontioda Bradshawia*, and an interesting set of seedlings of *Miltonia bleuana*.

flowered, are the only representatives of this old plant that we saw in the show.

Messrs. J. and A. McBean, Cooksbridge, Sussex, stage a group which stands out as one of the finest pieces of bold colouring in the whole show. The wonderful roses, oranges and scarlets of the *Odontiodas* in the centre are specially fine, only increasing the softness of the buff and pink of *Cymbidium pauwelsiana* and the brown and yellow of *Oncidium macbeanianum* on either hand. The vigour and fine character of the latter hybrid are specially worth attention. White *Cattleyas* are very good here, *Undine*, *Mossiaë-Wagneri* and *Brenda* particularly. *Lælio-Cattleya Heliuss* is a lovely distinct apricot-shaded novelty. We also noted the large blotched *Odontoglossums* and *crispum* seedlings. Of the *Odontiodas*, to mention only one, *Bruce*, standing alone, is perhaps best worth singling out.

Messrs. Stuart Low and Co., Bush Hill Park, Middlesex, have a group apart from the rest in its distinctive staging. On the left the deep red of *Renanthera* overhangs the soft pinks of

SWEET PEAS.

These are scarcely so numerous as usual, but the quality of the exhibits is, we imagine, superior to anything seen at previous spring shows.

Not the least important stand is that of Messrs. S. Bide and Sons, Farnham. Backed by black velvet, artistically decorated with *Smilax*, *Cocos weddelliana* and *Maidenhair Ferns*, the vases of Sweet Peas, elevated at varying heights, show up to perfection. The unfortunate position prevents a full lighting effect, but this, however, is no fault of the exhibitors. A few of the most telling varieties on view are *R. F. Felton* (mauve), *White Queen*, *Constance Champion* (a very fine new salmon), *Edward Cowdy* (the new flaming scarlet), *Phyllis Bide* (orange), *Royal Purple*, *Orchid*, *Dick Bide* (rich amaranth), *Mrs. Hugh Wormald* and *Mrs. J. Balmer* (two 1915 novelties), and *Robert Sydenham*.

Messrs. Dobbie and Co., Edinburgh—what visions the name conjures up! Each season we look forward to seeing some firm arising to contest the great Scottish firm for premier position, and each year we find the invincible *Andrew Ireland* come up from *Mark's Tey* with more wonderful flowers than ever. The ordinary person on seeing this great Chelsea Show exhibit will gasp with astonishment. The expert will raise his hat as an acknowledgment. To pick out individual varieties is perhaps unfair to the remainder, but we must refer to *Elfrida Pearson*, *Jean Ireland* (the new *picotee*), *Dobbie's Orange*, *Frilled Pink*, *Royal Purple*, *Blue Picotee*, *New Marquis*, *King Manoel*, *Duchess of Portland*, *Mrs. Cuthbertson*, *Princess Mary*, *Dobbie's Scarlet* and *Illuminator*. One particularly fine feature is the collection of plants that fill the background. These are a veritable eye-opener; indeed, one comes away with the idea that Messrs. Dobbie and Co. are beyond the reach of mere mortals.

Messrs. Alex. Dickson and Sons, Newtownards, now that they are fully established in their branch at *Mark's Tey*, can be independent of German submarine threats, and their exhibit at Chelsea is entirely made up with flowers culled from Essex. Flanked on either side by *Tulips*, the Sweet Peas—the first the firm has ever brought to Chelsea—were by no means eclipsed. Splendidly set up in vases, one is able to admire the beauties of *King Manoel*, *Hawthorn Gladys* (a fine salmon pink), *Royal Purple*, *Orchid* (a really fine light mauve), *Robert Sydenham*, *President* (the new fiery orange self), *Fiery Cross* (the sensational silver medal variety of 1914), *Mrs. Cuthbertson*, *Dobbie's Cream*, *Sincerity*, *King White* and many others.

Robert Sydenham, Limited, Birmingham, are making an effective little display. *Lady Evelyn Eyre*, *Princess Mary*, *Robert Sydenham*, *Lady Miller*, *Norvic* (the new white), *Nora Unwin* (still able to hold its ground among whites), *Lord Fisher* (an improved *Brunette*) and numerous other well-known varieties were shown.

Mr. J. Stevenson, Wimborne, has a very effective stand near the Chelsea Hospital entrance. One of the most telling varieties is a new vivid orange named *Golden Glory*. *Honour Bright*, which recalls the *Fiery Cross* of last year, is also a fine feature. *Peace* (a pretty soft salmon pink) and *Warrior* (a new maroon) are also among the notables; while among standard varieties one notes *R. F. Felton*, *Thomas Stevenson*, *Scarlet Emperor*, *Sincerity*, *Dorothy*, *Prince George* and *Robert Sydenham*.

SOME OF THE MAGNIFICENT SWEET PEAS SHOWN BY MESSRS. DOBBIE AND CO.

Mr. Harry Dixon, *Spencer Park Nurseries*, *Wandsworth Common*, shows a small miscellaneous group of choice *Orchids*. *Masdevallia*, *Odontoglossum*, *Oncidium*, *Cymbidium* and the other principal genera are represented without special emphasis on one group more than another. From the point of view of the public, it is unfortunate that the plants are not named.

J. Gurney Fowler, Esq., *Brackenhurst, Pembury*, *Tunbridge Wells* (gardener, *Mr. J. Davis*), sends a collection full of interest and novelty. Attention centres in the rich middle group of *Cattleyas* and the side groups of *Lælio-Cattleyas*, but a large number of individual plants call for mention. *Odontoglossum Princess Mary* (a new richly blotched variety) and *Odontioda Coronation Fowler's Variety* are up for certificate. There are several fine plants of the lovely white *Odontoglossum Xanthotes*. *Brasso-Cattleya Veitchii splendens* and *Cattleya Mossiaë Pintadean* are also outstanding. Two large batches of the seldom-seen *Cattleya citrina*, well grown and

Miltonias, while lower down is a good batch of *Dendrobium brymerianum*, with its large, fringed yellow lips. A corresponding arrangement on the right includes the white *Phalaenopsis* with a number of choice *Odontiodas*, with *Stelia*, *Lycaste* and a number of little-known plants at the base. But the main bank is a large batch of *Cattleyas*, with many fine *C. Mossiaë* connecting these two wings. The new *Cattleya Princess Mary* is a charming tender pink, well-formed *Mossiaë*. *Lælio-Cattleyas G. S. Ball* and *tenebrava* give unusual pieces of orange. One expects in the exhibits from this firm a number of out-of-the-way plants, and attention should be given to the little collection, on the right, of blue-shaded *Orchids*. These are *Vanda carulescens*, *Dendrobium Victoria Regina*, *Vanda Charlesworthii* and *Cattleya intermedia carulea*. The large pans of the fragrant *Arpophyllum giganteum*, with its long, erect, rose fingers, should also be noted. The plants are all in good condition, and show unmistakable signs of good cultivation.

ROSES.

Although the beautiful novelty National Emblem is not on view, our national flower is worthily represented by sumptuous displays from the leading growers. It has often been a matter for surprise to us that no amateur has brought a really unique group of Roses to this greatest of all exhibitions. We can only recall one instance, when Lord Rothschild put up a splendid collection of Moss Roses grown in pots. Surely there are wealthy amateurs who could make a display of Roses on the same worthy scale as those who make the Orchid their hobby, and although the intrinsic value might not be so great, the honour of producing a really worthy group of Roses that calls forth equally as much cultural skill would be worth the attempt. We trust this hint thrown out to readers of *THE GARDEN* may induce some to make an attempt next year. What a delightful feature would be a good collection of the exquisite Rose species; or even a large collection of the beautiful ramblers, now so very numerous!

Messrs. William Paul and Son of Waltham Cross have certainly a most wonderful group, and it contains many choice varieties of the firm's own raising. One of the most striking novelties in the whole exhibition is Paul's Scarlet Climber. It gives us the impression of a Climbing Charlotte Klemm, and all who know that brilliant bedding Rose will realise what a fine thing Messrs. Paul have raised. The semi-double flowers of Scarlet Climber are fully $3\frac{1}{2}$ inches in diameter, and the petals are very large. The blooms are produced in nice large clusters from the base of the plant to the summit, and one can readily imagine the gorgeous effect of such a climber in the garden. Its value as a decorative plant for the conservatory is seen from the numerous

ORCHIDS TASTEFULLY ARRANGED BY MESSRS. J. CYPHER AND SONS.

specimens on view, and we feel sure this Rose will be grown by the thousand in the near future. Unlike Roses of the Carmine Pillar type, its blooms are so very persistent that they remain on the plants some two or three weeks, a desirable attribute derived from its hybrid origin with *Rosa wichuraiana*. Other fine ramblers in this group are White Tausendschön (effectively placed near Scarlet Climber), Blush Rambler, Excelsa (a Rose that seems to have quite eclipsed the old Crimson Rambler), American Pillar and Lady Godiva. There are some well-flowered standards and numerous dwarf plants, among which we

noted Mrs. Charles Hunter (very fine), Ophelia, Margaret, Sunburst, Lady Hillingdon, Marquise de Sinety, J. L. Mock, Mrs. T. Hillas, Willowmere, Mrs. T. Delacourt, Candeur Lyonnaise and Mme. Jules Crette. The last two are seedlings of Frau Karl Druschki. The first named is a grand flower, almost pure white as shown. Candeur Lyonnaise will probably supersede Frau Karl Druschki. Its flowers are much fuller, and as shown it is very fine.

Messrs. Cutbush and Son, Highgate, have their usual fine group of Polyantha Roses, and they certainly are expert cultivators of these delightful little plants. Fine weepers of Dorothy Perkins and Tausendschön, together with splendid pillars of Excelsa, relieve the group considerably, and numerous standards of Polyanthas are gracefully interspersed. Huge conical mounds of Jessie, Louise Walter, Ellen Poulsen, Mrs. Cutbush, Orleans, Yvonne Rabier, Jeanne d'Arc and Georges Elger are shown, while in the centre there are numbers of the brilliant Erna Teschendorff. Interspersed throughout the group are plants of Louise Walter (Baby Tausendschön), the whole producing a charming effect.

Mr. Charles Turner of Slough is showing some fine weeping standards of Dorothy Perkins, White Dorothy, Ethel, Flame, Coronation, Farquhar, Tausendschön, Excelsa, Hiawatha and Lady Gay; and standards of many of the popular large-flowered Roses, such as Lady Ashtown, Mme. J. Gravereaux, Hugh Dickson, Florence Pemberton, Frau Karl Druschki and J. B. Clark. These are set off by well-flowered dwarf plants of Polyanthas and some of the well-known Hybrid Perpetual and Hybrid Tea sorts, such as Mrs. Sharman Crawford, Captain Hayward, La France, Mrs. Aaron Ward, Mme. Edouard Herriot, Mrs. W. Christie Miller, Lady Hillingdon and others.

Messrs. Piper and Co. of Bayswater have put up a bank of Polyanthas, mostly in large baskets. In this group we noticed a very pretty double white named J. Bourgeois, a sort likely to prove extremely useful, as a pot plant especially. Phyllis, Jeanne d'Arc, Schneewittchen, Georges Elger, E. Teschendorff, Mrs. W. H. Cutbush and K. Zeimet are found in large masses, the whole effectively backed by well-flowered ramblers.

MESSRS. WILLIAM PAUL AND SON'S GROUP OF ROSES BEFORE THE LARGE BLOOMS WERE UNITED.

Messrs. Cannell and Son of Swanley are showing pyramidal ramblers, well flowered, among which we noted American Pillar, a variety this firm first exhibited in this country. Excelsa, Veilchenblau, Dorothy Dennison, Lady Gay and Minnehaha are also very fine.

Mr. E. J. Hicks, Twyford, has a grand group, arranged most effectively. Prominent in the group are several plants of the brilliant single Princess Mary and some well-flowered pieces of the beautiful single species, Rosa Moyesii. Mrs. George Norwood shows its value as a forcing Rose, and it possesses a delightful fragrance. Other novelties are Mrs. John Foster (in the way of Lieutenant Chauré), Mrs. George Roupell (orange), and Mme. Edouard Herriot. There are also numerous Polyanthas of the best sorts.

Messrs. Brown of Peterborough, among other things, have put up a nice lot of their new semi-double climber, Miss Rosalie Wrench. It is a pretty shade of pink, and should be useful.

C. Russell, Mme. Edouard Herriot, Molly Sharman Crawford, Countess of Shaftesbury and many others.

Altogether the Rose is very grandly represented, and in our opinion equal to any former show. We miss the fine group of Messrs. Mount and Sons, for hitherto the quality of bloom of this firm has been really splendid. The numerous array of ramblers and Polyanthas in almost every group portray the value of these Roses for decoration, and their place in the up-to-date garden is certainly assured.

A most excellent group is that of Messrs. B. R. Cant and Sons, Colchester. It reminds one of the glorious summer show, so splendid is the quality of the individual flowers. There is an absence of overcrowding, far too evident in many of the displays. The pillars and standards are very fine, consisting of the well-known American Pillar, Excelsa, Lady Godiva, White Dorothy, Minnehaha, &c. Splendid masses of the firm's own novelties are to be seen, such as Hon. Mrs. Grosvenor, Sallie

close together. The ramblers and weepers are not very densely flowered, but they are very elegantly disposed over the groups. Here we find the lovely yellow Banksian, now so rarely seen. Beautiful specimens of Freda, Rayon d'Or, Othello, Sunburst (although white, the flowers are fine), Florence Pemberton, Edward Mawley, Mrs. A. R. Waddell, David Harum, Souv. de G. Prat, A. Colomb, Magnolia, G. Grunerwald and Lady A. Stanley are other good things in this very fine lot.

Messrs. Hobbies, Limited, have also two groups, unfortunately separated, but very tastefully displayed upon arches and in large baskets, together with columns of cut bloom. Polyanthas of their own raising are very interesting, especially Baby Elegance, Meadow Sweet and Dewdrop. Fine masses of Pemberton's White Rambler, Florence Mitten, Tausendschön, Excelsa, Dorothy Perkins, Lady Godiva and Mrs. M. H. Walsh are seen. This last is a grand pure white rambler

that has come to stay. The cut blooms of Ophelia, Lady Pirrie, Sunburst, Souv. de G. Prat, Mme. Edouard Herriot, Lady Hillingdon and Frau Karl Druschki are extremely good.

Mr. George Prince of Longworth is very strong in densely flowered ramblers, among which we noted Chatillon Rambler, a most beautiful novelty of lighter shade than Dorothy Perkins. Standards of Excelsa, Blush Rambler, White Dorothy and Hiawatha are particularly good, while the masses of Jessie, E. Teschendorff, Ellen Poulsen and Phyllis give a beautiful finish to a very pretty lot.

Messrs. Frank Cant and Co., Colchester, have two large groups most tastefully arranged, and they contain a very large selection of superb varieties and of grand quality. Mrs. Charles E. Salmon is a delightful single, and its colour is a very dainty salmon pink. The flowers are of huge size, quite 5 inches across, so that its effectiveness in the garden will be very great. The blooms of Mrs. Foley Hobbs are all of medal quality, and other noteworthy sorts are Lady A. Stanley, Dorothy

Ratcliff (a charming Rose under glass), George Dickson (superb), Mme. Edouard Herriot, Florence Pemberton, Mrs. George Shawyer, Lady Roberts and many of the newer kinds. Br iswick Charm is a very beautiful Rambler.

Some grandly flowered plants of American Pillar come from Messrs. R. J. Barnes and Son of Malvern, who also show good cut blooms of such as Rayon d'Or and Mme. Edouard Herriot.

STOVE AND GREENHOUSE PLANTS.

Like most of the departments in the show, this section has considerably fewer exhibits than in previous years. The large, handsome groups staged by Messrs. James Veitch and Son certainly leave a place which is not filled at the present show. The exhibits staged show excellent quality, and the colours in the subdued light of the large tent show to the greatest advantage.

A PORTION OF MESSRS. SUTTON AND SONS' GROUP OF GREENHOUSE PLANTS RAISED FROM SEEDS.

Messrs. G. and W. Burch of Peterborough have a splendid group, mainly of cut blooms. The quality is excellent. Splendid flowers of Mrs. Foley Hobbs remind one of the summer shows, and there are also grand lots of Molly Sharman Crawford, Lyon Rose, Mme. Edouard Herriot, Sunburst (very rich in colour), Mrs. H. Stevens, Melody (very fine) and Yvonne Vacherot; while these are all backed up by good masses of Sodenia and other ramblers.

The Rev. J. Pemberton is showing his White Rambler. It is certainly a very pure white, but somehow the flowers become soiled in appearance, which somewhat detracts from its beauty. This may be owing to damage in travelling, but it is unquestionably a Rose to be desired.

Among their lovely collection of good things Messrs. H. B. May and Sons of Chingford have ramblers and Polyantha Roses in really well-flowered specimens.

Messrs. Low and Co. of Bush Hill Park have a sumptuous array of good things, especially Mrs.

(a very rich orange colour of lovely elongated form) and Augustus Hartmann (one of the most brilliant of the scarlet orange Roses of recent years, which proves of great value to the exhibitor). Cupid will be a delightful pillar Rose, and one we all shall want. It deservedly obtained the Cory Cup at the Spring Show of the National Rose Society. Autumn Tints is also of exquisite colour. The charming variety Joan is quite unique in its tinting, and partakes in form of one of its parents, Melanie Soupert. St. Helena is grand. The wonderful colour of Mme. Edouard Herriot gives a charm to this lovely display, and our minds are carried to the early June days by the masses of Austrian Copper and Austrian Yellow. Juliet, Richmond, Hugh Dickson and a host of other kinds are also represented by large clusters, while the exquisite single Rambler, Silver Moon, will make everyone desire to have this fine variety upon their pergola.

Messrs. George Paul and Son of Cheshunt have a charmingly arranged group, or rather two groups,

CALCEOLARIAS AND SCHIZANTHUSES SHOWN BY MESSRS. E. WEBB AND SONS.

On entering the Main Tent from the Embankment the visitor is immediately attracted by the splendid display of Messrs. James Carter and Co. of Raynes Park. This includes some of the choicest examples of the well-known strains of Cinerarias, Gloxinias, Calceolarias and Begonias. Several distinct features are introduced in the present display, making a welcome change from the stereotyped exhibits of greenhouse flowers which have been so prominent formerly. Especially noticeable is the collection of annuals grown in pots in order to demonstrate their value for spring flowering. These include some handsome and well-grown specimens of Clarkias Salmon Queen and Brilliant Princess, both in excellent form and colour. Chrysanthemum Morning Star, Thunbergia alata, the brilliant colouring of Alonsoa Warscewiczii, Phacelia campanularia and Dimorphanthea aurantiaca showing to great advantage in conjunction with Nemesis, Thunbergia alata and Nycteria selaginoides, the whole making a magnificent display.

In close proximity to this a most interesting group, including many New Holland Plants, is staged by Messrs. Stuart Low and Co. of Bush Hill Park, Enfield. The centre consists of some well-grown plants of Acacia armata variety pendula, its pale yellow flowers borne in the greatest profusion. Some well-flowered plants of Metrosideros floribunda with its rich crimson flowers stand out prominently in direct contrast, while in conjunction with these, arranged on a table, are some Streptocarpus hybrids of good form and colour, which form excellent plants for greenhouse decoration. Boronia heterophylla is also in evidence, together with Eriostemons in full flower and bud. An interesting

plant in this exhibit is Echium Wildpretii, consisting of a single flowering stem with long linear, silvery leaves, surmounted with spikes of rosy crimson flowers.

A most interesting and noteworthy display of Amaryllis is staged by Messrs. Robert P. Ker and Sons, Grassendale, Liverpool. The exceptional size of the blooms, the beautiful form of the flowers and the brilliancy of the colouring at once give the hall-mark of excellence to this charming display.

A very tastefully arranged exhibit of Lilies of the Valley, surmounted and interspersed with Palms, &c., is staged by Mr. William Iceton, Putney, S.W. The size of the flowers, their clean foliage and general excellence make this

an exceedingly pretty and charming display, and fully demonstrates the decorative value of the flower, which is obtainable throughout the year.

A pleasing group of Richardia Pentlandii is shown at an entrance of the marquee by James Horlick, Esq., West Dean Park, Chichester (gardener, Mr. W. H. Smith).

A very choice and well-grown display of Schizanthus is staged by Messrs. Whitelegg and Page, Chislehurst, which comprises excellent and well-grown specimens of choice form and colour.

Messrs. Wills and Segar, Royal Exotic Nursery, South Kensington, are showing a collection of flowering plants in conjunction with Palms and other foliage plants.

A large and varied exhibit of choice Ferns is staged by Messrs. H. B. May and Sons, Upper Edmonton, hardy Ferns forming a distinct feature. Particularly noticeable are the Royal Fern and its varieties, handsome specimens of Polypodium mundaianum with its delicately crested fronds; also Nephrolepis exaltata Neubertii and Marshallii compacta (both in excellent condition), and the most finely divided variety N. exaltata variety Willmottæ and Polypodium glaucum crispum, being most distinct in colouring. The Climbing Fern, Lygodium scandens, is also prominent. Flowering and foliage plants are also staged in an adjoining group by this firm, and present an effective display.

Messrs. John Peed and Son, West Norwood, have a splendid group of Caladiums, embracing some of the choicest varieties in form and colour. Prominent among these are Mikado, Rio de Janeiro, Silver Queen, Oriflamme, Sir Oswald Moseley and King George V. These handsome specimen plants, lightly staged over a groundwork of suitable green foliage, make a particularly striking display.

Many beautiful hardy Azaleas, chiefly forms of Azalea mollis and Ghent varieties, are splendidly grown and shown by Messrs. R. and G. Cuthbert, Southgate. Of the former, the rich colouring of Brilliant Sunset and Flambeau at once claims the visitor's attention. That charming variety,

PART OF MESSRS J. CARTER AND CO.'S GROUP OF GREENHOUSE ANNUALS.

"HAWLMARK" TULIPS ARRANGED BY MESSRS. ALEX. DICKSON AND SONS.

Anthony Koster, is to be noticed in the fullest beauty; and Nicholas Beet's Comte de Quincy and the pleasing variety Rosy, all blended together in delightful harmony of colouring, make a most attractive display. The new variety, *occidentalis delicatissima*, is of a distinct and pleasing shade, and will doubtless prove a distinct addition to these well-known flowers.

A very sweet perfume is noticed, and, when traced to its source, reveals a group of white-flowered Stock All The Year Round, which is exceptionally well grown by Mr. S. Mortimer, Swiss Nursery, Rowledge, near Farnham.

A group of Clematises attracts the visitor, staged by Mr. L. R. Russell, Sheen Road, Richmond. Prominent varieties are Ville de Lyon, of deep rosy hue; Henryi, a charming white; Mrs. Cholmondeley, pale mauve; Lady Northcliffe, rich purple; Nelly Moser, a distinct variety, the petals having a pale rose centre and deep white margins; President, richest deep purple; and Miss Bateman, pure white.

The attractive exhibit arranged in double pyramid form by Messrs. Edward Webb and Sons, Stourbridge, meets the eye, and shows some well-flowered plants of Cinerarias, Calceolarias, Gloxinias, Amaryllis and other annual and greenhouse plants, all in excellent condition, and for which this well-known firm is famous.

A bank of Palms closely interspersed with some well-grown examples of hybrid Amaryllis in the widest possible range of colouring is staged by Messrs. William Bull and Sons, Chelsea, and is well worthy of attention.

The exhibit of Messrs. Sutton and Sons, Reading, forms a most attractive feature. It is arranged in the form of a complete flower garden, comprising a central circular bed surrounded by four others. The centre bed consists of a beautiful group of *Salpiglossis*, grown in pots, each forming a handsome specimen, of rich and varied hues. *Cineraria stellata* is a leading feature of the surrounding beds, and the delicate shades of pink and blue are most attractive. Gloxinias, Begonias, Calceolarias, *Primula obconica* and other greenhouse flowers are also shown in pleasing conjunction. The exhibit also embraces a comprehensive collection of annuals, including some large-flowered examples of *Phlox Drummondii* in seven distinct shades of colour. Other leading features are Nicotianas, Clarkias, *Schizanthuses*, *Nemesias*, &c.,

all arranged in pleasing harmony with their surroundings.

An attractive group of *Dracæna Victoria*, with its handsome green and golden variegated foliage, is displayed by Mr. L. R. Russell, Sheen Road, Richmond. The plants are extremely well grown, and range from 6 feet specimens in the centre to 30 inches at the margins of group, each plant being a specimen, the whole group being edged with *Tillandsias*. *Caladiums* are also shown by this exhibitor, some of the choicest varieties being Thomas Tomlinson, William Rappart, Rose Lang, Dora Russell, Emperor Alexander III. and Mrs. L. R. Russell.

A grand exhibit of stove and greenhouse Ferns is staged by Messrs. James Hill and Son, Barrowfield Nursery, Lower Edmonton, having some well-grown specimens of Tree Ferns, *Dicksonia squarrosa* and *Cyathea dealbata* as a background. Other leading varieties were *Davallia Veitchii elegantissima*, *Gymnogramma*, *Pelleas*, *Adiantum reniforme*, and the richly tinted fronds of *A. macrophyllum*. An outstanding feature of the

group is the magnificent specimen of *Platycerium grande*, which has two large sterile and three fertile fronds.

TULIPS.

Sir Harry Veitch truly said, at the Council luncheon to members of the Press, that Tulips were one of the great features of the 1915 Show. We have never seen them in greater numbers or in better condition, as a general rule the Great Spring Show is too late or the season is too early. On the present occasion the two coincide.

Messrs. Barr and Sons have two mountains, each made of well-grown and clean blooms. The stiffness is relieved by the introduction of cut-leaved Maples, while the margins of both groups are furnished off with Ferns. Among other Tulips we noted Zulu, a fine, tall, rich purple of a shade quite its own; Mrs. Moon, a tall, yellow "waisted" flower with pointed petals; Illuminator, one of the best of the beautiful *billietiana* type which has red-edged, yellow flowers; The Bishop, the best of the blue purples; Louis XIV., a rich, deep plum purple with an edge of coppery brown, universally acknowledged to be one of the most refined of all varieties; and Glare of the Garden, a dwarf-growing, deep crimson, long-shaped flower, useful for windy places or for front positions in borders.

Messrs. Hogg and Robertson brought over a good representative collection from Ireland, which is staged in large vases of one variety against the western side of the tent. Palms in pots and cut *Asparagus Sprengeri* in the vases toned the brightness of the flowers. We noticed The Fawn, buff or pinky buff, with a paler edge to the petals; *lutea pallida* (Mrs. Keightley), long, pale yellow; Europe, a lovely rosy red Darwin, with an almost white base; Rev. H. Ewbank, mauve, with a lighter tone on the edges; Emerald Gem; Goldfinder, white base, with clear scarlet colouring; and Petrus Hondius, a pinkish cherry (large flower), said to be the brightest of all Tulips in a mass.

Messrs. C. H. Tandevin and Co. staged Tulips for the first time. They only started growing them last autumn, when they settled down at

SOME OF THE BEAUTIFUL AURICULAS AND BORDER CARNATIONS SHOWN BY MR. J. DOUGLAS.

Raby Flower Farm, Willaston, near Chester. Pluto (a hue of dull rose), Clara Butt, Orange King (the best orange red) and Phyllis (a pale lilac) are all good.

Messrs. Walter T. Ware, Limited, have some of their seedlings which created so much interest at the Tulip Exhibition and Conference last week. They are a very striking lot, and deserve special mention as signalling the coming of the seedling, for which we have been so long waiting. Creselda, a pretty pale orange rose with a buff edge; Chamois, a long-shaped rose with a pale pink edge; and Empire, an immense but rather too coarse-looking yellow (award of merit on Tuesday, May 11), are in a most interesting little group.

Messrs. G. Bunyard and Co. of Maidstone arranged a large circular bed with appropriate greenery, the general idea being a centre of Cottage and Darwin varieties with a surround of different kinds of "Parrots." It is a departure from the common, and cannot fail to be noticed. Many of the good old sorts, like Mr. Farncombe Sanders, Clara Butt, Tulipe Noire, Rev. H. Ewbank, Psyche, Mrs. Krelage and Pride of Haarlem, are well shown.

Mr. Alfred Dawkins puts up a small but select little lot in the ordinary way on one of the side tables. He has a pretty vase of Sir Harry, which is one of the best pale pinks among the cottages, also the good old double Blue Flag and the now popular dark brown-maroon Dom Pedro. William Pitt looks very fine; the deep blood red of the middle part of the exterior of the petals, together with the brighter tone of the edge, is most effective. By the way, this variety is excellent for pots.

Messrs. Dobbie and Co. are a Scottish firm, but where would they be in their glorious displays without poor Ould Ireland? Where Moses was when the light went out. The reporter who made our notes simply said another fine bit of work, very much on the lines of the Conference Exhibition group, which we hope to illustrate next week. The individual blooms are large and clean, and the individual vases not too much crowded together. The bright red Isis and the grand yellows W. T. Ware, gesneriana lutea and Ellen Willmott, to place them in order of depth of colour, are distinctly good, although the first-named were on the pale side.

The Cotswold firm of John Jeffries and Son—ever redolent of the Tulip from the days when Tulip shows filled the land—shows what the West Country can turn out. There is a considerable number of unusual varieties, such as Viking (a rich blue purple, second only to The Bishop in its particular shade), Geefs (the pale Burgundy-coloured, straight-petalled Darwin), Gryphus (a very handsome dark purple), Ariadne (a brilliant scarlet) and Jeffries (a very fine ruby red, which, we suppose, must have been named after the old firm).

Messrs. J. Piper and Sons have an uncommon-shaped group next a large bank of Orchids at the Thames end of the tent. It is very deep from back to front. Tall pillars of bloom formed a background for lightly arranged vases. The

whole effect against the light striped canvas reminds us of a kaleidoscope, and it only wanted to be gently shaken to give one the impression of a coloured firework cascade. The rich deep plum purple Bacchus; Vitellina, the pale green toned yellow; the red-edged Golden Crown; the orange cherry La Merveille and the deep-shaded Faust stand out very well.

Messrs. Alexander Dickson and Sons have a large and varied collection, well set up and both well grown and in good condition. To see the huge cases and to note the slowly growing group as vase after vase is given its appointed place would make anyone realise what the staging of such a display means. It is a great effort, and will, we imagine, figure high in the list of awards. Bonfire, a deep rich red with a fiery scarlet edge; Cleo (Sensation), a taking biscuit brown; the old Bouton d'Or, as large as Oranges; Velvet King, deep red-purple; Erguste, the exquisite mauve; Moonlight, the refined, long-

Solomon's Seal in large sprays, and a grey-looking daffodil green grass, Elymus glaucus, are introduced with very pleasing effect. Colour schemes of mauve and pink and other combinations clothe the mountain and hill, while red predominated in the valley. Marconi, large deep purple; Zomerschoom, the ancient; Carnation, the refined Picotee; Edmee, the most brilliant of the roses, with pink edges; Blue Flag and Inglescombe Pink are a few picked out almost at hazard.

Messrs. R. H. Bath, Limited, are one of those firms who affected the mountain, but in their case it has a wider base than the others. Broken Darwin forms are much in evidence, reminding us of their group at the Conference Show. Are these going to come into fashion? Special mention of a new picotee edge on a pale primrose ground must be made—Eva; its rose-coloured edge looks very bright. Bleu Aimable, the lovely, shapely, deep mauve; Nauticus, the giant early rose; Professor F. Darwin, a florist shaped cerise

THE MAGNIFICENT COLLECTION OF VEGETABLES EXHIBITED BY THE HON. VICARY GIBBS.

flowered deep primrose yellow; Melicette, the shapely mauve; and many another staged, but alas! because of space, unnoticed here, compose a fine whole.

Messrs. Sutton and Sons, upon a groundwork of black velvet and taking full advantage of two pillars which intersected their table, have a most pleasing exhibit, well arranged and excellently carried out. The different varieties are all good examples of themselves. Perhaps we may mention the quaint horned Tulip cornuta, Massenet (The Dove), Bacchus, Clio, Leghorn Bonnet (a very favourite late straw yellow) and the never-to-be-surpassed deep rich plum purple and bronze Louis XIV.

Messrs. Waterer, Sons and Crisp varied the usual sugar-loaf mountain type. The whole display is quite first-rate, and as full of good things as an egg is full of meat. In fact, there is an overflow meeting graced by just as nice blooms as were to be seen in the main group.

red Darwin; Viking, Melicette, rectified; Calliope; and the very bright and pretty flamed bizarre Miss Doris Diggle, are but a few of the delectable dishes prepared for our eyes to feast upon.

Messrs. R. Wallace and Co. of Colchester have escaped the Zeppelin bombs, and so have their Tulips and their brains. A more pleasing set-out of Tulips in artistic fashion than the triangular space assigned to them it would be impossible to imagine. It is a bit of hilly country, and each bit of the raised ground is a colour scheme in mauve, rose, red or brown, while the valleys and plains show themselves clothed in white and yellow—a pretty conception, admirably conceived and well carried out. Boadicea, Grenadier and the exquisite Beau Brummel are prominent among the reds. Panorama, Melicette, Marjoletti, Gertrude and many other beauties fill up their allotted spaces and help to give the necessary tones and shades. Encircling all was a band of hardy Ferns.

CARNATIONS.

As usual, these are very prominent, indeed, it is impossible to walk of a Chelsea Show devoid of Carnations.

Mr. A. F. Dutton, ever surpasses himself on this occasion. The baskets are staged both on pedestals and upon the staging itself, and among the host of varieties, each occupying a basket, one observes Baroness de Brien (glorious), the well-known Mikado, Champion, Winsor (very hot), Lady Northcliffe, Lady Fuller (a grand new salmon), Chelsea (the new dark), Sunstar, Mrs. C. F. Raphael, White Perfection, Mrs. A. F. Dutton (very charming with its varying shades of pink), Enchantress Supreme, Triumph and Carola.

Messrs. William Clibbush and Son, Highgate, unlike the usual run of Carnation specialists, arrange a large number of growing plants, mostly Malmaisons, in their group. Among the most notable varieties are Lady Ingestre, Highgate White (a fine new Perpetual Malmaison), Countess Fitzwilliam (a huge crimson), Sabina (a very distinct salmon) and Mrs. L. Mackinnon (a superb scarlet).

Messrs. Allwood Brothers, Bayward's Heath, make a very effective group. The centre is filled by a large triple side mirror surrounded by a superb Palm. At each corner of the mirror is a tall pillar, which arches over and carries a hanging basket of Carnations. The space above the mirror is filled with the gorgeous Mary Allwood, while the corners are filled in with Wivelsfield White. Among the other varieties on view are Salmon Enchantress, Princess Dagmar, Mrs. B. Chenev, and Mrs. C. F. Raphael.

Messrs. Stuart Low and Co., Enfield, can always be depended upon to put up a telling exhibit, and on this occasion they fill some eighteen feet run. Arranged in a charming bowl in the centre is a mass of the well-known Georgeus, while above it is a hanging basket of the same variety. Apart from this centre-piece, one sees superb stands and vases of Salmon King, Baroness de Brien, Princess Dagmar, Enchantress Supreme, Megasta (the giant new Perpetual Malmaison), Yellow Primer and many other varieties.

Mr. C. Engelmann's exhibit consists of a tall pillar of Scarlet Carola, surrounded by smaller pillars of Carola, Enchantress Supreme, Pioneer (a fine rose pink), Variegated Carola, Lady Northcliffe, Bella (a charming luxury) and Sunstar. Altogether, about five hundred dozen blooms are included in the wonderful exhibit.

Messrs. Young and Co., Chesham, make a very pleasing display. Carola fills the centre of the stand, while well-set-up vases and tall stands flank it on either side. Dutchess of Devonshire (crimson), White Enchantress, Triumph, Baroness de Brien, Scarlet Glow, Mikado, Lady Northcliffe (a charming new pink), Lady A. Newell and Winsor are a few of the varieties one comes in passing along. A strikingly fine exhibit of Anterlaminum Nelsae is also a feature.

Messrs. Laxton Brothers, Bedford, have come out as Carnation growers, and they exhibit a very fine seedling named Bedford Belle. This is a very bright salmon pink, reminding one of Lady Fuller, but we should say a better grower. Seven large vases and a tall basket are filled with this one variety, and the effect is decidedly pleasing.

Messrs. William Wells and Co., Merstham, fill a small space with some excellent blooms of Pink Sensation, Yellow Stone, Champion, Mrs. B. Chenev, Enchantress Supreme, and several other well-known varieties. Owing to the curtailment of space, this firm is not able to make a full display, but, needless to state, Anterlaminum Nelsae occupies a strong position.

For the first time, Messrs. C. H. Tadevin and Co., Willaston, Chester, have come to London, and their efforts are not to be despised.

A CORNER OF MESSRS. LAXTON'S GROUP, SHOWING FORCED STRAWBERRIES IN PERFECT CONDITION.

A few of the varieties set up are Mrs. C. F. Raphael, Max Day, Mikado, Fektra, Winsor, Scarlet Glow, Carola and Rose Pink Enchantress.

A change from the Perpetuals are the superb flowers set up by Mr. James Douglas, Great Buckham. Fully thirty vases of border varieties are set up, and here one sees some of the most beautiful tints. Buckham Clive (crimson), Daisy Walker (white, faded pink), Amy Roberts (white), Miss Rose Josephs (terra-cotta), Elizabeth Sealfour (buff), Mrs. E. Douglas (yellow), Mrs. Robert Morton (orange), Rose Mary (red rose) and Mrs. R. Gordon (salmon pink) are a few striking varieties at this collection.

Mr. H. Batters, Chesham, in the limited space allotted him, makes a great display with very choice blooms. Few growers can equal the Chesham man at his best, and on this occasion he shows in splendid style. Although the vases

are perforce somewhat crowded. Such notable varieties as Mrs. C. F. Raphael, R. F. Felton, Carola, Lady Ingestre, White Enchantress, Mary Allwood, Enchantress Supreme, Mikado, &c., are in perfection.

FRUIT AND VEGETABLES.

Considering the importance of our food supply at the present juncture, it is disappointing and so few exhibits of eatables. The exhibit is of superlative excellence, and Mr. E. Beckett, head gardener to the Hon. Vicary Gibbs, Elstree, has admirably surpassed himself. The general kinds—Cabbages, Broccoli, Carrots, Onions, &c.—are there in perfect form; while such forced vegetables as Marrows, Turnips, Cucumbers, Aubergines, Broad Beans, Golden Waxpod Beans, Peas and Cauliflowers illustrate supreme cultural skill. The arrangement also leaves nothing to be desired.

Of the collections of fruit, that from the gardens of the Hon. John Ward, C.V.O., Chesham, Hungerford, reflects the greatest credit on the gardener, Mr. Charles Beckett. At this early season such well-coloured Grapes as the large bunches of Black Hamburgh and Foster's Seedling have rarely been seen. The Melons (Sutton's Scarlet, Emerald and Superlative) are very large and of enticing aroma; while the dish of Cardinal Nectarines and those of Strawberries King George and Royal Sovereign make one wish to break the Tenth Commandment and seriously threaten the Eighth.

Melons in great variety and ripeness are displayed by Messrs. Sutton of Reading. Of the fifteen or more sorts, the bright yellow Universal, King George (scarlet flesh), Emerald Gem, Jubilee (green flesh) and the old favourite Hero of Lockinge predominate. But all are splendid, and this probably unique exhibit will live in the memories of the visitors.

The keeping qualities of many Apples are well illustrated on the stand of Messrs. George Burdett, Maidstone, who show large, well-

coloured and very firm fruits in fifty varieties. Space permits the mention of only a few, and we select Clarke's Seedling (which is said by some to be a better keeper than Bramley's Seedling), Newton Wonder, Ontario, Lady's Finger, Albert, Calville de Fontenay, King of Tomkins' Country, Waggoner, Cox's Orange Pippin and Annie Elizabeth as being representative of this noteworthy exhibit.

No one is likely to overlook the superb collection of pot fruits set up by Messrs. Laxton of Bedford, where they show pots of Laxtonberries, Loganberries and Strawberries bearing ample crops. Such Strawberries as Admiral, King George, Bountiful and The Duke are of splendid appearance. In an outdoor group this firm are showing trained trees, among which a large gridiron Renette du Canada Apple tree in full bloom is delightful.

(Continued on page viii.)

SEASONABLE NOTES ON CHRYSANTHEMUMS.

WATERING now is a matter that must be given very close attention, as the soil in the small pots dries quickly. Some cultivators keep their plants in blocks to prevent the rapid drying of the soil and, further, for convenience in attending to their general requirements. This plan may be adopted where large numbers of plants are grown for market purposes, but it is not a good one in the case of plants for exhibition, as later, when they are spaced out and placed in their large pots, many valuable lower leaves are lost. Keep the plants quite free of each other and carefully examine them three or four times on every fine day, picking out the plants that are at all dry and filling the pots with water.

Feeding.—Thousands of plants become weakly at this season through lack of a stimulant. Other work presses, and perhaps the potting of the Chrysanthemums is put off for a week or more; then the stems near the base unduly harden, contracting the sap-vessels. Such stems never fill out properly afterwards, and I dare say many readers of *THE GARDEN* have noted this fact. Plants that have filled their pots with roots and cannot be repotted forthwith would be much benefited if given a dose of nitrate of soda at the rate of one tea-spoonful dissolved in a gallon of water, applying this an hour after giving clear water. One watering with nitrate of soda is sufficient. Several waterings with ordinary diluted manure water will be beneficial. Soot-water, unless quite clear, must not be given, as it would clog the pores of the soil.

Stopping and Potting Plants.—The cultivator will be busy now attending to the stopping of many varieties. Before pinching off any points, however, closely examine the latter, as if a tiny bud is showing there it will cause a natural break, and the resultant shoots from such breaks bear crown-buds in August, as a rule, about a week earlier than do shoots resulting from a stopping. My reference here to potting is in direct connection with stopping, as it should be done a week before or after the repotting is done.

Persistent Bud Formation.—Some varieties are very troublesome in this respect. When a bud is removed, another forms again when the new shoot is about an inch long. So to be efficacious the stopping is best done when the

new shoot is about an inch long, as it is then an inch of growth; then from the next point a budless shoot is the more likely to grow. At this stage it is very important that the ends of pointed all shoots be kept quite free from green or black flies, as they would quickly cripple them.

The Summer Quarters for the Plants.—It is not always convenient to have all the plants nicely placed in rows running north and south in one position, on account of lack of space. More frequently they have to be arranged at the sides of garden paths. They do well there, as a rule, but cause more labour in giving them proper attention. In the block a common ash-bed can be made; but if the pots are placed on it, earthworms will soon come through the ashes and enter the pots. Place tiles or slates on the ashes, and the pots on the tiles. The latter are porous, the slates not

so, instead of which, however, being rather an awkward arrangement. A few points of bone-meal to six pence, an 8-ounce portion of wood-ashes in a five-bushel and an 8-ounce concentrated artificial manure added according to the special directions given with it, I do not favour the mixing of soot with the compost, as it clogs the pores. The naturally strong growing varieties firmly, and the more weakly growing ones less firmly. Leave ample room for watering and timely top dressings. Use the compost in a medium state of moisture, syringe the plants twice daily for three days, then water the soil. *Arum.*

THE GIANT VIRGINIAN SPEEDWELL.

Among the herbaceous version of the *Veronica* or *Speedwells* there is not a nobler plant than

A BED OF THE GIANT VIRGINIAN SPEEDWELL, *VERONICA VIRGINICA*

so porous, so it is advisable to scatter a very thin layer of fine ashes on the slates; then surplus water will drain away freely. When boards are available, they may be used.

The Final Potting.—This is the heaviest work in connection with the cultivation of the Chrysanthemum. The shifting of the plants to larger pots in their earlier stages does not take up much time, but the final potting does, so that ample time should be allowed for the work to be properly done. Although large pots are used, do not put in more roots than is absolutely necessary, but place them carefully; this is an important point. Thoroughly mix the rough parts of the compost with the fine, and when engaged in the work of potting, regulate the proportion of the parts and further. *Flowers* (continued from the

the giant species shown in the accompanying illustration. As will be seen, the flowers-stems rise to a considerable height, usually about three feet, though under exceptionally good cultivation they may go to nearly five feet. The plants, which usually open during July, are white here in colour, though they vary somewhat, some being quite white and others a good blue. It is a native of North America, and was introduced to this country as long ago as 1811. For filling a large bed, such as the one illustrated, the *Veronica* is an excellent plant, but it also makes a fine group in a mixed border. Some time or other plants, according to the width of the border, should be planted together. It requires a deep dry dog and well manured soil, which should, however, be well drained. *G. H. S.*

NEW PRIMULAS AT THE EDINBURGH BOTANIC GARDENS.

THROUGH the kindness of Professor Bayley Balfour, I had recently the privilege of examining his wonderful collection of Primulas in the Royal Botanic Gardens of Edinburgh. Among them was the new

Primula gracilentia, which has flowered this year for the first time in cultivation. It proves to be a better plant than was at one time anticipated, and may well be received with favour by those who like the section to which it belongs—that of *Muscarioides*. It has deep lilac flowers, which are arranged in the spicate inflorescence with deflexed sessile flowers, which are features

tested. Its future is probably in the direction of pot cultivation. This pleasing Primula was not included in the papers given at the Primula Conference in 1913.

P. brevifolia.—At the Primula Conference of the Royal Horticultural Society in 1913, Professor Bayley Balfour, whose papers formed a contribution of the utmost value to lovers and students of the Primulas, in speaking of the Chinese species, mentioned at that time that not one of the lovely *Amethystina* section was in cultivation. He has soon remedied this deficiency by obtaining *P. brevifolia*, one of this section, which was in bloom at the time of my visit. The section *Amethystina* may be said to be a development of that called *Soldanelloides*, the plants in which have the sessile flowers of the *Muscaroid* section with a slight attempt at pedicels. The section *Amethystina* has the drooping flowers, but longer

It was one of Mr. George Forrest's finds, and comes from the Mekong-Salween Divide in China. S. ARNOTT.

NEW AND RARE PLANTS.

AWARDS OF MERIT.

Daphne arbuscula.—An exquisitely beautiful and rare species from Transylvania, of which, unfortunately, more than one plant bears the name, the much less beautiful *D. Verlotii* occasionally doing duty for the true plant. The latter has a leaf growth intermediate between *D. rupestris* and *D. Cneorum*, the stems terminated by clusters of fragrant, lilac-coloured flowers. As shown the plant was not more than 4 inches high, the miniature bush almost hidden by the clusters of flowers. From Mr. G. Reuthe, Keston, Kent. (See illustration.)

Clematis aphylla.—A species of rare botanical interest rather than of high garden merit, the fragrant, greenish white flowers occurring in the leaf-axils at intervals on dark green, Rush-like stems.

Ceanothus rigidus (vera).—The name "vera" is employed advisedly to distinguish this from a very inferior plant bearing the same specific name and almost universally sold for it. The small, shining leaves are obovate or broadly cuneate and obscurely toothed, the bushy, erect, rigid stem growth being densely furnished with rich purple blue flowers of a very distinct shade. These two were shown by Miss Willmott, Warley Place.

Lælio-Cattleya Anaconda (L.-C. Pall's × *C. dowiana* Rosita).—A very beautiful and distinct hybrid. The sepals and petals are of old gold colouring; lip deep crimson. A cultural commendation was also awarded. From Baron Bruno Schröder, The Dell, Egham.

Lælio-Cattleya Fascinator Mossiæ var. *Imogene* (L.-C. *Fascinator* alba × *C. Mossiæ reinckiana*).—The sepals and petals are pure white and of good substance; lip crimson. From Messrs. Flory and Black, Slough.

Tulip Marconi (Darwin).—The colour is deep purple plum, a pronounced white base dominating the interior of the flower. Exhibited by Messrs. Waterer, Sons and Crisp, Bagshot and Twyford.

Tulip Mirvana (Cottage).—A mingling of rose and bronze in a very showy flower. The base of the flower internally is greenish and contrasts well with the other colour.

Tulip Winner (Cottage).—Of rose and white colour; very handsome.

Tulip Empire (Cottage).—A rich golden yellow self in a flower of splendid proportions. These three were exhibited by Messrs. Walter T. Ware and Co., Bath.

The whole of the above-named novelties were exhibited before the committees of the Royal Horticultural Society on May 11, when the awards were made.

DAPHNE ARBUSCULA, A DWARF SPECIES WITH FRAGRANT, LILAC-COLOURED FLOWERS.

of the better-known species of the section. The flower-stem is prettily clad with small hairs, and the stalked leaves are oblong in form. The individual blooms have a fringed effect, from the presence of a short tail on each petal. So far, *P. gracilentia* has not been tried outdoors, but it is likely that it will require protection from winter wet—a protection most of the Primulas of the section appear to need.

P. florida.—This I had the opportunity of seeing in bloom for the first time in cultivation. It is, Professor Balfour says, allied to *P. incisa* of the *Soldanelloid* section. The flowers, which are short-stalked, have a purple blue corolla and a calyx covered with farina. The blade of the leaves is ovate, on a long stalk, and is covered beneath with white farina. *P. florida* is a remarkably pretty plant, but its adaptabilities as an outdoor plant in this country are not yet properly

pedicels. *P. brevifolia* is a lovely plant, one, indeed, which gives one a feeling approaching ecstasy as we look upon it when in flower. Imagine a plant with short, pretty leaves with a horny margin, and so beautiful in their formation and appearance as to be really delightful in themselves. From this rises slender, yet sturdy stems, bearing trusses of from six to twelve drooping purple blue flowers of the most exquisite texture and shape. The form of the flowers reminds one of those of the *Satin Flower* (*Sisyrinchium grandiflorum*), but of a more beautiful colour, and of exquisite texture and substance. These are on longish pedicels, and give one the impression he is looking at the glorified flowers of a *Soldanella*. Should *P. brevifolia* prove hardy enough to stand our seasons, we may look forward to the advent of one of the most exquisite plants in a wonderfully beautiful genus to our gardens.

SEASONABLE NOTES ON VEGETABLES.

THE present drought is having its effect upon the various kitchen garden crops, preventing the quick and regular germination of seeds and checking the progress of other crops.

In sowing seeds such as Turnips, Lettuce, Radish and all the Brassica tribe, it is a good plan to thoroughly soak the soil before sowing, as this hastens germination and accelerates the growth of the seedlings in their early stages. In the case of seeds to be sown in drills, first draw the drill, then water it with a rosed water-pot, wait half an hour, and then sow the seeds, covering them at once in the usual way. In the case of seed-beds, thoroughly soak the soil when preparing it for the seeds. Do this overnight, finish off the beds, and sow the seeds next morning. Shade the beds, either with mats or green boughs, until the tiny plants are showing through the soil, when the shading material should be removed to strengthen the growth of the seedlings.

Hoeing and Mulching.—Among all growing crops the hoe should be kept moving. Stirring the surface of the soil does so much to conserve the moisture in the ground that this detail should not be neglected, apart from its value in keeping down weeds. The mulching of various crops, such as Peas, Beans and Cauliflowers, should not be neglected as long as the dry weather lasts. If so, the foundation for mildew might be laid in the Peas, black fly among Broad Beans, and a check to growth in the Cauliflower crop. Half-decayed stable manure is the best material. A good substitute is a compost of decayed vegetable refuse, old potting soil and wood-ashes, with an occasional handful of quicklime added as mixing proceeds. Spread this compost around the plants 2 inches thick, when it will not only conserve the moisture in the soil, but also improve the soil for future growth.

Asparagus.—Now is the time to assist the growth of the plants—especially those in newly made beds—with liquid manure. After a thorough soaking, apply a mulch of half-decayed horse-manure. It is not yet too late to sow seeds in small pots in a cold frame to provide plants for putting out next year. This is probably the quickest way to establish a bed. Thin the seedlings to one plant in a pot, and plunge the pots in ashes at the foot of a west or north wall, where they will require less attention as regards watering than when in the open.

Broad Beans.—Make the last sowing of these, pinch out the points of those plants well in flower, and syringe with an insecticide those that are infested with black fly. Where the pods are swelling, thoroughly soak the roots with liquid manure.

Cauliflowers.—Put out the plants as fast as they are ready, taking those which are small rather than allowing the plants to become too large, as these suffer so much more from a check to growth in lifting than when moved in a small state. Those not planted with a trowel should be puddled and carefully dibbled in with fine soil about the roots. I prefer, however, to plant with a trowel; the roots are so much better spread and covered with fine soil. Allow plenty of space, well water, and mulch afterwards.

Sow seeds of Early Giant and Mammoth for future supplies. Dust the soil with soot before the plants appear.

Celery should be planted as fast as the seedlings are ready. Much harm may be done to the future progress of the plants by neglect in getting them into the trenches. The growing of double rows is economy of space, and with care succeeds; but where possible I favour the single-row plan. A free water supply after planting is essential. A steady, uninterrupted growth from the start is the best way to avoid pithy leaves in the future.

Lettuce.—The supplies of all kinds should be kept up by fortnightly sowings in rows, where it may be more convenient to thin out the plants, allowing those remaining to mature in the rows, than to plant all afresh from seed-beds. To grow succulent Lettuce during the summer, much moisture is required. Apart from frequent soakings at the roots, it is wise to sprinkle the plants overhead nightly, as these cool conditions encourage freedom of growth.

Radishes should be daily available. To obtain them small and tender, weekly sowings should be made of the various forms of the French Breakfast type. Shading until the seedlings appear and daily moistening afterwards are the chief points to ensure success.

Onions and Leeks recently planted should be daily syringed during dry weather to encourage freedom of growth. Dust the plants occasionally with soot, even if there is no sign of mildew on them. The soot encourages growth.

Runner Beans put out recently will require attention in seeing that the plants are made secure to the supports. Do not overcrowd the growths, but thin out laterals where too many are inclined to grow.

Swanmore, Hants.

E. MOLYNEUX.

APPLES AT SWANMORE PARK, HANTS.

IT is now about twenty-five years since a new orchard of six acres at Swanmore was devoted to the culture of Apples, and was planted principally with bush trees of what were considered the best varieties at that time. It has been my privilege and pleasure to see these annually for some years, and so impressed was I this season with the promising condition of the whole of the trees that I am induced to send a few notes anent them. There are few men who take a keener interest in or know Apples better than my friend Mr. E. Molyneux, and his name in connection with this branch of fruit culture alone is known far and wide.

I am bound to confess that when I paid my first visit to Swanmore some years ago (it might have been I was expecting too much), I was a little disappointed with the appearance and growth of the large majority of the trees, and I think, if I remember rightly, expressed myself to that effect; but now I am as much pleased and astonished at their healthy appearance. Practically every variety of tree on May 1 was studded with trusses of bloom just bursting, and considering this orchard was very heavily cropped last year with fruit of the finest quality, it is all the more remarkable.

The secret of such quick improvement is no doubt due, to a great extent, to two causes. One is thoroughly trenching between the trees, and working in plenty of good farmyard manure and other suitable material, thus giving the roots a free run, which undoubtedly is most essential in this particular position, as both the top soil and sub-soil are of a very heavy and retentive nature. The second is cleansing the trees from moss and lichen. This extraneous vegetation proves troublesome, due largely to the condition of the soil and locality, no doubt; but from whatever cause, the wood was badly infested. At the time of my visit not a particle of live injurious growth could be seen, and, indeed, there was some difficulty in finding a small portion which had been killed.

About ten days prior to my visit the whole of the trees had been thoroughly sprayed with stone lime wash. Nothing could have done its work more effectually without fear of doing the slightest damage. It is a cheap and safe remedy, within the reach of all, and one I hope to adopt in the future. This, of course, will apply to all fruit trees. Even when in full flower, Mr. Molyneux assures me, no harm is done if it is used at the proper strength. The proportions recommended are a pound of fresh lime to a gallon of water, and this should be strained and then sprayed on with a syringe or suitable machine.

Upwards of eighty varieties are grown here, but only sufficient of the large majority for comparison. Those favoured most are, naturally, varieties which do best in that locality and find a ready sale. I think if Mr. Molyneux was pressed to name his favourite, he would without much hesitation say Bramley's Seedling. Though I do not think it has behaved quite satisfactorily as to its keeping during the past season, which, I think, was pretty general, this is planted in large numbers, both as standards and in bush form, and nothing could be more promising. Other favourite kitchen varieties are Lord Grosvenor, Norfolk Beauty (highly thought of), Grenadier, Mère du Ménage, Peasgood's Non-such, Warner's King and Gascoigne's Scarlet. Among the favourite dessert sorts are Cox's Orange Pippin (exceedingly well grown), Lady Sudeley, Worcester Pearmain, James Grieve, Ben's Red and Allington Pippin. Several new and little-known varieties are on trial, such as Arthur Turner, Rev. W. Wilks, W. Crump, Crawley Beauty, The Houblon, Paroquet, Crimson Bramley, Sir John Thornycroft, Ontario, Early Victoria and many others.

Of special interest in the orchard are two small trees of Mank's Codlin, each about seven feet in height, on their own roots, which have been planted between twenty and thirty years. Some good bushes of Blenheim Orange, grafted six years ago, were full of flower. This variety has the reputation of not fruiting early; but to my knowledge there are many types of this Apple. The best only should be grown.

Swanmore is much exposed to wind, and provision was made at the time by planting a hedge of *Thuya gigantea*. This is now about fifteen feet in height, two feet in width, and perfectly ridged, having been regularly kept cut. The stems are as thick as one's thigh, and, planted 3 feet apart, one can easily imagine what a fine screen this makes. The owner, Mr. W. H. Myers, must, I am sure, feel highly satisfied with such a fruitful spot on his fine estate, and Mr. Molyneux is to be congratulated on such an achievement.

Elstree.

E. BECKETT.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Cucumbers.—Feed liberally with manure those plants which are carrying full crops of fruit, and add small surface-dressings of loam and decayed horse-manure when roots appear on the surface. Remove all surplus growth regularly, and lay in promising shoots to continue the supply of fruits. It is not a good practice to keep the old plants fruiting too long, as the quality of the fruits deteriorates as a consequence. Therefore raise another batch of plants to replace the old ones when these are showing signs of exhaustion.

Late Strawberries in Pots.—Plants growing on shelves under glass must be well supplied with water at the roots. It will be of considerable benefit to top-dress them with a mixture of soil and manure. They should, if possible, be grown in a house by themselves, where they can be shaded during the hottest part of the day. During very bright weather they must be sprayed with rain-water two or three times a day, and the atmosphere should be kept moist by frequently damping down the bare surfaces in the house.

Autumn-Fruiting Strawberries.—It is possible to obtain a second crop of fruits from old forced plants by potting on some of the plants into 7-inch pots. Select some of the healthiest and remove all the old leaves. As a safeguard against red spider, the foliage must be dipped in an insecticide. The ball of roots ought to be carefully shaken out before potting. A compost of loam, manure from an old spent Mushroom-bed and brick rubble will be suitable. Partly plunge the pots in ashes in a sheltered position outdoors, and carefully water the plants till the pots are filled with roots. Syringe them vigorously both morning and afternoon, and to keep them free from red spider and mildew they must be syringed occasionally with a mixture of soft soap and sulphur.

Plants Under Glass.

Begonia Gloire de Lorraine.—Pot the plants on into larger pots as they become ready. The earliest-struck plants will require 7-inch pots in which to flower. Another batch of cuttings may be put in for flowering in smaller pots. These late-struck plants are very useful for table decoration.

Hydrangea Hortensis.—The plants will now be developing their flowers, and should be liberally fed with manures. The blue varieties must be watered with the preparation "Azure," or the colour of the flowers will be disappointing.

Aspidistras.—It is sometimes necessary to divide these, potting up the most suitable portions. They ought not to be overpotted, as this would cause them to lose their colour. After potting, place them in a warm, moist house where they will get plenty of light.

The Flower Garden.

May-Flowering Tulips.—The bulbs which are to be removed from beds which are to be occupied with summer-flowering plants must be carefully lifted and replanted in a piece of well-prepared ground. These Tulips are invaluable for indoor decorations, and a good batch should be grown specially for cutting. Nowhere are these beautiful Tulips seen to better advantage than when grown in grass, but the ground must be specially prepared for this purpose.

Summer Bedding.—The lateness of the spring bedding plants will have a tendency this season to delay the putting out of the summer-flowering plants. Therefore, when the time for bedding out arrives, it will be necessary to get the work finished with the least possible delay. Much may be done to enhance this work by having everything ready to hand. The furnishing of the mixed border may be proceeded with at once. Such subjects as Calceolarias, Dahlias, Arctotis, Asters, Verbenas, Salpiglossis and nearly all kinds of annuals may be planted now.

Japanese Irises.—Those who have a garden naturally suited to the culture of these beautiful Irises are to be envied, as probably Iris Kämpferi

is the most popular and beautiful of all the Irises. They are without doubt more at home when grown on the banks of streams or pools, and if it is intended to plant them, it must be seen to that the soil is quite suitable for their requirements. They enjoy a rich rooting medium, with plenty of rich, well-decomposed manure. Imported plants may now be procured and planted.

The Hardy Fruit Garden.

Pears.—These are promising a very heavy crop. Should there be a continual spell of dry weather, trees on walls must be watered. In districts where the Pear leaf-blisters are common, it is wise to anticipate attacks by spraying the trees with some reliable remedy at regular intervals.

Mulching.—The rainfall for the month of April was much below the average, and this, combined with drying winds, considerably dried the surface soil. This is a reminder of the immense value of mulching early those trees which have their roots near the surface. A special effort should be made this season to mulch as many trees as possible, for, with the shortage of labour, the watering of fruit trees outdoors will probably have to be neglected.

The Kitchen Garden.

Potatoes.—The early planted Potatoes will now be growing freely, and attention must be paid to earthing them up. At the same time the hoe should be worked freely between the rows. Should frost be imminent, a light covering of dry litter will be necessary to protect them.

Leeks.—The main batch of these valuable vegetables may now be planted out. For ordinary purposes the plants can be put in holes about a foot deep. The ground must, however, be well manured and deeply dug. Plant them about a foot apart, and put only sufficient soil in the hole to cover the roots.

Beet.—The earliest sowings of Turnip-rooted Beet will now be ready for thinning. The main sowings of this crop may be made now. Sow in shallow drills about fifteen inches apart. Thin the seedlings, as soon as they are large enough to handle, to 9 inches apart. Other crops which will now be in need of thinning are Parsnips and Turnips. This important work must not be neglected, or the crops will suffer.

E. HARRISS.

(Head-gardener to Lady Wantage.)
Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Vegetable Marrows.—The main crop should now be planted out with the protection of hand-lights if available; but, failing this, a few branches of evergreens will do all that is required. To succeed well, the ground should be properly prepared beforehand, but excellent Marrows may be had from plants growing on rubbish-heaps and other such places if accommodation is very limited. Hot-beds where the crops are over are ideal places on which to plant Marrows, especially if the frames can be allowed to remain until the plants get well started into growth.

Celery.—It is now time the earliest crop was planted out. If trenches were prepared and manured as advised previously, they will be in good condition to receive the plants. Lift the plants carefully with as much soil adhering as possible and, after planting, give a good watering to settle the soil around them.

Autumn-Sown Onions.—A number of these will perhaps be showing flowers, which should instantly be removed. To encourage a free growth, both liquid manure and artificial fertilisers must be washed in to the roots by watering, unless the weather is showery. The hoe should be used freely whenever the surface is again dry.

Radishes.—Sowings ought to be made at not greater intervals than ten days or a fortnight to keep up a continuous supply of nice, small, tender Radishes. They should not be sown too thickly. French Breakfast is the general favourite.

The Flower Garden.

Tender Plants.—The more tender subjects, such as Begonias, Ageratums, Lobelias and Perillas, should be left until most of the general bedding is nearing completion, so that they will be much safer left in their frames for a few days yet, where they can be conveniently protected by replacing the lights if frost threatens.

Canterbury Bells.—Plants to flower next year may be had by sowing seed now. These indispensable plants have few equals where an early summer display is required.

Sweet Williams should likewise be sown at this date to produce plants for flowering next season.

Rock Garden.—Many plants in this garden are at their best and full of interest. Where the subjects are named—and this should always be done—the labelling ought to be gone over while the various plants are in flower, as they are then more readily identified. Small metal labels are the most inconspicuous and best adapted for this garden; but if labels are an objection, small numbered discs can be used, a key to which can be made.

The Hardy Fruit Garden.

Gooseberries.—The young green fruits being always in demand for cooking purposes, pulling should commence as soon as the berries are the size of Peas. This thinning not only helps the fruit which remains to swell to a larger size, but permits the berries developing a finer flavour. It is also essential for the well-being of the bushes that a fairly severe thinning should take place at this season. The new growth on young bushes must be regulated somewhat, with a view to the formation of shapely bushes.

Raspberries.—As established plantations of this fruit have a tendency to produce more young canes than are required for the succeeding season, a judicious thinning out ought to take place; this will help to concentrate more vigour and freedom of growth in the canes which are to be left. On light or sandy soils a mulching with litter or manure is necessary if success is to be had, as Raspberries resent anything in the nature of dry soil.

Fruit Under Glass.

Early Melons.—The early batches are now ripening their fruit, and should have an abundance of air when the weather is fine. A small amount of air ought to be left on during the night-time as well. The advantage of having separate pits or houses for the different batches will be readily seen, as cracked fruits are generally the outcome of having to bring on successional crops where one crop may be maturing its ripe fruits, and where free ventilation should be given.

Plants Under Glass.

Gloxinias.—The early plants now commencing to flower should be removed to a house where they can have slightly drier treatment. They will not object to even an ordinary greenhouse if the temperature is never allowed to drop below 50°. Feeding with manures must almost cease, except for an occasional application, which should be given in a weak state.

Boronia megastigma.—As this small, fragrant flowering plant passes out of bloom it ought to be pruned slightly by cutting the growths back to about a third of their length. Plants requiring potting should be dealt with, using a mixture largely consisting of peat and silver sand. The treatment given to Azalea indica will suit this plant.

Azalea mollis, after having flowered indoors, ought to be plunged in ashes or soil outdoors in the shelter of a hedge enclosure or wall, but should not be shaded in any way from the sun's rays. Some of the plants will be helped by a top-dressing of peat, to which some easily assimilated fertiliser has been added. Close attention is required in regard to watering, and during very bright weather a spraying with clear water will be of great help.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine,
Bart.)
Castlemilk Gardens, Lockerbie, N.B.

PYRETHRUMS AND DELPHINIUMS.

DURING late May, June and the early days of July the herbaceous border owes not a little of its beauty to the modern varieties of the florist's Pyrethrum and Delphinium, or Perennial Larkspur as some delight to call the latter. Although the garden at this season is more interesting than at any other period of the year, the plants under notice stand out from all others, the exquisite colours and stately form of the flowers attracting the attention of all. In appearance the Pyrethrums and Delphiniums are totally dissimilar, yet they have one point in common, viz., that with proper care and treatment after flowering they can be induced to give us a second and bountiful display of flowers in the autumn without serious detriment to the plants themselves.

The value of these flowers in the garden during summer and autumn cannot well be over-stated. Since some of our hardy plant specialists took them in hand and commenced crossing and selecting the best obtainable, some very beautiful varieties have been raised, and it is now possible to obtain sorts as varied in habit and general contour as they are in colour. In the Pyrethrums we have both single and double forms, and they are exceedingly popular, though I must confess to a partiality for those with single blossoms, the beautiful glowing crimson-scarlet James Kelway being an ideal flower of this section. Apart from their use in the herbaceous border, I think these modern Pyrethrums might well be grown in large lawn beds, one variety massed in a bed. I have seen this attempted on one or two occasions, and although the work was only done in a half-hearted manner, the effect was excellent. As already stated, there are now so many beautiful varieties to select from that quite a good colour-scheme of beds might be worked out on the lines laid down by Miss Jekyll in her book, "Colour in the Flower Garden." Nor must we overlook the value of Pyrethrums as cut flowers. Their slender, graceful stems are ideal for arranging in vases and large bowls, and they last quite a long time in water. This is where they score over the more stately Delphiniums, which so soon drop their exquisite spurred flowers when cut.

The Delphiniums, however, are equally useful, or even more so, in the garden. It is difficult to imagine what our herbaceous borders would be like without the sentinel-like groups of these stately plants, the colour of whose blossoms runs the whole gamut of the many shades of blue. There is, of course, a white Delphinium, but only once have I seen really good white spikes of it, the usual result being flowers of a dirty creamy white that is far from pleasing. At Kew the Delphinium is used for massing in some of the large lawn beds, and the effect is exceptionally pretty, especially when a background of some dark-foliaged trees is secured. In a Yorkshire nursery, a few years ago, I saw a long, broad pathway bordered on each side with Delphiniums and Pyrethrums, the last named being grouped in large masses of one colour in front of the Delphiniums, and the effect was decidedly good. At the outset mention was made of the fact that both Pyrethrums and Delphiniums can be induced to flower again in the autumn, and the work neces-

sary to bring about this desirable end is not very difficult or irksome. Before seed has had an opportunity of forming, they must be cut down quite close to the ground, leaving the natural basal foliage of the plants intact. After lightly stirring the soil around the plants, place a 2-inch-thick layer of manure around them. If this work is carried out immediately after the first flowering, practically all the Pyrethrums, and many of the Delphiniums, will give us their beautiful and pleasing flowers again in September.

B. B.

THE AMARYLLIS AFTER FLOWERING.

MANY growers fail miserably with this fine bulbous plant after they have flowered it once. The reason is not far to seek, as a rule, for in most cases, immediately the blooms fade, the pots are placed under the stage or in some out-of-the-way corner, and little further attention is given the plants until the time comes round for them to flower again. Then, of course, disappointment is almost certain, and wonder is expressed at these expensive bulbs failing after doing so well the first year. In almost every case the fault lies with the grower, for under proper treatment these plants will flower every spring. I have grown them for many years with very satisfactory results, and the following is my method.

As a rule, the plants while in flower have a lower temperature than is required while they are making their growth. Immediately, therefore, the flowers fade, the plants are moved into a house with a temperature ranging between 65° and 70°. Here they make strong, healthy growth, and, when necessary, gentle feeding with liquid manure is administered at this stage. After flowering, too, is the best time for repotting, if this is necessary. I say "if this is necessary," for it is seldom that the Amaryllis requires a shift. I have grown fine bulbs for four or five years in 5-inch pots with only an annual top-dressing of rich soil, and judicious feeding with liquid stimulants while making their growth. It is a mistake to use large pots. The largest bulbs have ample room in the 7-inch size, while very good bulbs can be accommodated in 6-inch pots. When no repotting is necessary, remove a little of the surface soil and make up with fresh rich compost, and then, as directed, place in a temperature of 65° to 70°.

Careful watering and a daily sprinkling overhead with tepid water are very beneficial while they are making their growth. After full growth has been attained, which is usually about the middle of June with plants that flower in February and March, the plants are removed to the open stage of a greenhouse and placed in as sunny a position as possible. I continue to water regularly, and also give twice weekly liquid made by stirring a tablespoonful of Ichthemic Guano into a gallon of water. This is continued until the foliage begins to change colour, when all stimulants are entirely stopped and water gradually diminished. It is wrong, however, to keep the soil dust-dry, for by doing so the roots perish; but if a little water is given occasionally, the whole remains fresh and ready to start into full vigour when the flower-spikes begin to push up.

After the foliage becomes yellow, the pots may be put under the stage, but some method should be adopted for preventing drip falling on the bulbs or soil. Treated in this way, a grand harvest of brilliant blossoms will reward the grower for the little trouble entailed.

Preston House Gardens, Linlithgow. C. BLAIR.

SOME FLOWERING SHRUBS OF AUSTRALIA.

IT is a singular fact that many of the most beautiful blossoms of Australia are destitute of petals, possessing anthers only, which take their place in abundant tufts or brushes. The Blue Gum (*Eucalyptus globulus*) is one of the best known plants of this kind, being cultivated all over the world for the value of its essential oil as a disinfectant. But it rarely flowers in this country, except in our mildest districts, for it does not usually produce bloom before it is seven years old, and a severe winter is likely to be fatal to it. But in South Devon we have a small tree which flowered profusely in its fifth year, and this early maturity was obtained by means of checking the sap. The strong wire used to fix the plant to a stout stake during its fourth season in the open ground cut into the bark as the girth of the stem increased, and thus ringed the bark, with the effect of a crop of early blossoms.

Eucalyptus citriodora is a variety of which the leaves rival those of the *Aloysia* in refreshing scent, and *Eucalyptus ficifolia* (the Red Gum) blossoms in its third year from seed, both its foliage and the scarlet tufts of inflorescence being decidedly handsome; while there are many *Eucalypti* which attain a great height in Australia as forest trees.

But the Wattles (*Acacias*), which are so largely grown on the Riviera and of which the golden sprays of blossom are so popular in London during the early spring, are pre-eminently Australian flowers; in fact, the Silver Wattle (*Acacia dealbata*) has now obtained the title of "the flower of Australia," just as the Rose is the flower of England and the Shamrock is typical of Ireland. Of the many varieties of Australian *Acacias*, there are only a few which are not too tall for general purposes in Britain, for they are not perfectly hardy in our climate, although they require but slight protection in winter and do not do well in a close, damp atmosphere. In fact, they should be grown as much as possible in the open air in a compost of peat, loam and sand; no manure should be added to it, as this is specially injurious to their roots. A temperature from 40° to 50° from October until the end of April will suit them, with as much air as practicable, and they should stand out of doors for the rest of the year. They usually flower in our winter or the early spring, for this is, of course, the summer-time at the Antipodes.

One of the best for an ordinary greenhouse is *A. Drummondii*, a small shrub of neat habit, which is covered in March with yellow, bottle-brush-shaped blossoms, even when only in a young state. *A. lophantha* is decidedly handsome with a mass of pale primrose yellow flowers. This plant is of very quick growth from seed, and is useful as a specimen plant among lower flowers in a flower-bed.

A. baileyana (the Cootamundra Wattle) has beautiful foliage, silvery in tint, and *A. discolor*

(the Sunshine Wattle) contrasts well with it, the leaves being dark in colour. The Golden Wattle (*Acacia cochlearis*, syn. *pycnantha*) produces handsome leaves of greater size than the rest, and sprays of globular blossoms in deep yellow; and *A. riceana* is very distinct, with long tassels of similar flowers in pale yellow.

Another group of Australian shrubs are the Callistemons, or Crimson Bottle-brushes, remarkably handsome plants bearing large carmine flowers without petals, to which the golden anthers give a brilliant effect. Quite small specimens of *C. speciosus* are covered with blossom and are very decorative, while the plant is so nearly hardy that it should be in the open air almost all the year round, except when buds are formed, when a little protection in a sunny greenhouse will bring them to perfection.

All these plants prefer a peaty compost, and they need abundant water while in growth. They may be grown from seed, but this should be sown as soon as it is received from Australia, as it appears to quickly lose its vitality. Cuttings of Callistemon, choosing ripened growths of last year, can be grown under a bell-glass in peat, sand and charcoal dust. These will produce their flowers at an earlier stage than plants grown from seed.

I. L. RICHMOND.

ORIENTAL POPPIES.

It is quite apparent that these old-world Poppies are again coming into favour in our gardens. This is undoubtedly due to the introduction of new varieties of the most delicate and beautiful shades imaginable. The variety Jennie Mawson, with large, handsome, salmon pink flowers and a purple blotch at the base of the petals, must be counted one of the most beautiful border plants in cultivation. Lady Roscoe is an attractive variety with orange terra-cotta flowers, while other varieties worthy of special note are Princess Ena, orange, flushed pink; Silver Queen, lovely silvery white, with a faint blush hue; and Carminatum, deep carmine. Their chief flowering season is from May to July, but nearly all of them flower again in September and October. It is not generally known that these gorgeous Poppies may be naturalised in groups in open meadows or orchards.

C. Q.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

THE GREENHOUSE.

HYACINTHS NOT THRIVING (*Courtenay*).—We find the Hyacinths have been severely checked owing to damage done to the roots by the bulb mite. The bulbs themselves appear to be perfectly sound and healthy in every way, and doubtless the mites were present in the soil or pots used. Care should be taken that old potting soil is not used again, and that the pots are

thoroughly cleansed or disinfected by scrubbing with carbolic soft soap or boiling water when pests of this kind are about.

PELARGONIUMS FOR INSPECTION (*Crane's-bill*).—All the young plants attacked by the disease from which your Pelargoniums are suffering should be destroyed, so as to check the spread of the disease. They have probably not been sufficiently ventilated during their growth, and have perhaps been in too moist an atmosphere, which has laid them open to the attack of Botrytis, a fungus which was possibly in the leaf-mould used.

FLOWERING PLANTS FOR FRAMES (*A. Constan Reader*).—Your further letter puts the matter in an entirely new light, and enables us to deal with the question at once. The depths given will enable you to grow and flower to perfection the Star section of Cinerarias, Balsams, single and double flowered Fuchsias as pyramidal specimens from plants raised from cuttings in the spring, herbaceous Calceolarias, Schizanthuses, Cockscombs and other plants. If you require plants for indoor decoration, in all probability Cinerarias, Fuchsias and tuberous Begonias would be found most serviceable. The last named could be started in boxes from tubers or raised in heat from January-sown seed, though the deeper frames would require temporary staging to bring the plants near the glass. These would flower till quite late in the summer. For the early autumn you might grow a selection of decorative Chrysanthemums in a reserve border, and lift and transplant in the frame before frost arrives. These would be most useful for cutting. For winter work one section could be devoted to Sweet Violets, but the frame would require filling up with a bed of soil to within a few inches of the glass. The plants could be grown in the open till September. Such frames in the winter would be ideal for growing Daffodils, Tulips (especially Darwins) and other bulbous plants for flowering in the early spring; hence may be turned to account throughout the year.

ROCK GARDEN.

PROPAGATING ONOSMA TAURICA (*Vectis*).—There is only one way for the gardener, viz., cuttings, and we believe we have frequently given it in the past, though, perhaps, not very recently. But there is only one type of cutting which is of the least service, and that is that secured with a "heel" intact. In our issue for January 23, page 42, in an article on "The Propagation of Plants," the *Onosma* was cited as an example. Take any fresh young bits of 2 inches to 4 inches long, strip them from the parent stem by a downward pull, and—keeping the knife in the pocket meanwhile—insert them without further ado. A hand-light in a cool, shaded place is the best; the plant abhors artificial heat. Use very sandy soil, an inch of pure sand at the surface of the cutting pots, and, given the right cutting, with intelligent treatment, every cutting will root within a month. Take care not to bury the heart of the cutting when inserting it.

MISCELLANEOUS.

PREVENTION OF FLIES (*F. Huli*).—Gnats (or mosquitoes) are the only troublesome flies likely to come from tubs of water, and these may be prevented from doing harm by keeping a very thin film of oil on the surface of the water. House-flies breed in rubbish and manure heaps, and these should be kept as far away from the house as possible. Spraying with poisonous substances would probably check the decay of the manure and render it harmful to plants, but the least harmful thing would be an occasional watering of the heap with a solution of one part of formalin in 100 to 200 parts of water.

INSECTS FOR IDENTIFICATION (*J. G.*).—The insects sent are weevils of the genus *Otiorynchus*. The grubs feed on the roots of Cyclamen, Pelargoniums and the like, and do considerable damage to pot plants in greenhouses. The best time to deal with them is now, while the weevils are in their perfect state and feeding on the foliage. If the plants are shaken over a newspaper after dark, the weevils will fall on to the paper, and may be collected and destroyed. They will not fly away, as their wing-cases are soldered together along the back. They hide in the soil during the day. Vines and other fruits are liable to attack.

VARIOUS QUESTIONS (*Ribble*).—The Bordeaux mixture you intend to use will be about right, though there is probably a little more lime in it than is actually necessary, the usual proportions being 6lb. of copper sulphate, 4lb. of quicklime and 40 gallons of water. The importance of dissolving the copper sulphate and making the milk of lime in separate wooden or earthen vessels must be recognised, the mixing and the making up to the exact quantity with water being done afterwards. The syringe will not be suitable, however; it must be applied as a very fine, mist-like spray, so that every part of the plant is reached and covered. There are syringes on the market which make a much finer spray than yours would do, and give a mist rather than drops of appreciable size. Arabis is often called White Rock Cress. It would perhaps be best to set aside a few plants from which to propagate your Strawberries, choosing those which have fruited well in the past. Check the runner after it has formed the first plant, and either root it in a pot or in the soil about the plant, putting it out into its permanent position as soon as well rooted. The plants may be put into nursery beds as you suggest if the ground is not available when they are ready.

NAMES OF PLANTS.—*G. B. Bassil*.—The Snowy Mespilus (*Amelanchier canadensis*).—*Rhodo*.—1, *Rhododendron catawbiense*, var.; 2 and 3, forms of *Rhododendron caucasicum*.—*A. Surrey Beginner*.—*Gazania* splendens.

Assistant Superintendent of Glasgow Parks.

Mr. James Rourke, of the Botanic Gardens, Glasgow, who was recommended by the Parks Committee of the City of Glasgow for appointment as assistant superintendent of the parks, was unanimously appointed by the Town Council at their meeting on May 13.

United Horticultural Benefit and Provident Society.

The monthly meeting of this society was held at the Royal Horticultural Society's Hall on Monday, May 10, Mr. Arthur Bedford in the chair. One new member was elected. Seven members were allowed to withdraw double their amount of interest, amounting to £26 6s. 6d. One member who had been lapsed for forty-one years withdrew his lapsed account, viz., £1 15s. 9d. The sum of £9 17s. 9d. was passed for payment to the nominee of a deceased member. Two deceased members' widows were assisted from the Distress Fund. The sick pay for the month on the ordinary side amounted to £80 16s. 3d., on the State Section £19 9s., and maternity claims to £19 10s.

Advisory Officer for Forestry for Scotland.

Dr. A. W. Borthwick, Lecturer on Forestry at the University of Edinburgh, has been appointed by the Board of Agriculture for Scotland to be their Advisory Officer for Forestry. Dr. Borthwick, who thus occupies the position held by the late Mr. John Nisbet, has had a distinguished career in his studies and in the various appointments he has held. He was Gold Medallist in Mathematics at Madras College, St. Andrews, where he was educated. At the St. Andrews University he graduated as B.Sc., and afterwards as D.Sc. On his decision to devote himself to forestry he went to Munich, where he was for three years. In 1899, on his return to Scotland, he was appointed Assistant to the Professor of Botany and Lecturer on Plant Physiology. In 1908 Dr. Borthwick was appointed Lecturer on Forest Botany to the University, and since that time he has obtained several similar high positions. He is an active member of several scientific societies, and has written many contributions on forestry. Dr. Borthwick's new appointment will be received with satisfaction by all interested in present-day forestry.

Awards to Horticultural Washes.

At the meeting of the Royal Horticultural Society on the 11th inst., the following awards in connection with the trials of horticultural washes at the Society's Gardens at Wisley were made: Highly commended.—Liquid Gishurst Compound, sent by Price's Patent Candle Company, Battersea; Jeyes' Winter Wash, sent by Jeyes' Sanitary Company, Limited, 64, Cannon Street, E.C.; Morlar Winter Wash, sent by Messrs. S. P. Charges and Co., St. Helens, Lancs; Voss' Winter Wash (caustic soda, 1lb. to 10 gallons), sent by Messrs. Walter Voss and Co., Limited, Carlton Works, Millwall, E.C. Commended.—Cooper's Winter Wash (Vr), sent by Messrs. W. Cooper and Nephews, Chemical Works, Berkhamsted; Woburn Bordeaux Mixture and Woburn Winter Wash, sent by Messrs. Walter Voss and Co., Limited, Carlton Works, Millwall, E.C.; Evans' Winter Spray, sent by Mr. R. E. Evans, Stratford-on-Avon; Standard Lime (Sulphur Solution), sent by Messrs. Walter Voss and Co., Carlton Works, Millwall, E.C.; and Winter Wash and Soluble Paraffin, sent by the Acme Chemical Company, Limited, Vale Road East, Tonbridge, Kent.

THE GARDEN.

No. 2271.—VOL. LXXIX.

MAY 29, 1915.

NOTES OF THE WEEK.

The Shetland Pony at the Chelsea Show.—Those who visited the Chelsea Show last week will be interested to learn that the little pony, Café Caramel, led around by Viscount Dalrymple, collected during the three days £125 1s. This amount is to be equally divided between Lady Lansdowne's Fund for Officers' Families and the Royal Horticultural Society's War Relief Fund. We understand that the sum taken at the gates for admission to the show was about one-half of that paid last year. Considering the first day was exceedingly wet, the result is, we think, satisfactory.

The Royal Horticultural Society's War Relief Fund.—At a recent meeting of the Council it was announced that Her Majesty Queen Alexandra has consented to become a patron of the War Horticultural Relief Fund. At the same meeting the Council appointed a Relief Fund Committee, consisting of the following members: Field-Marshal Lord Grenfell, Sir Harry Veitch, Mr. Gurney Fowler, Colonel Lockwood, Mr. Arthur Sutton, Mr. R. Hooper Pearson, Mr. F. Keeble and the Rev. W. Wilks.

Sowing Late Annuals.—Any bare spots that exist in the borders or other parts of the flower garden should be sown with annuals of some description. Although they will be later than those from ordinary sowings, they will give some flowers in the late autumn which will be valuable for garden decoration or for cutting.

The Butterfly Viola.—The beautiful Viola Papilio is one of the most decorative plants, either for the rock garden or the border, and at the present time it is a mass of blue flowers, the petals of which resemble the wings of a butterfly. It commences to flower early in the year, and is one of the last to remain with us. There is also a beautiful white variety which is equally as floriferous. Both come freely from seed.

The Purple-Flowered Broom.—As the majority of Brooms have flowers that are white or yellow, or intermediate between the two, those of Cytisus purpureus give us a distinct and welcome change. A shrub of dwarf, semi-prostrate habit, its slender and graceful branches are at the present time studded with bright pinkish purple flowers. On the front row of the shrubbery or in the bolder parts of the rock garden it shows off to

good advantage. It is readily raised from seeds or cuttings. C. purpureus is a native of the European Alps, and was introduced to this country in 1792.

Major Cautley, D.S.O., Killed in Action.—Sweet Pea lovers will learn with deep regret of the death of this gallant officer, who was recently killed in action while serving with the British Expeditionary Force. He was a most

the attention of visitors. As the bush is of vigorous habit, this Lilac is an ideal one for the garden, while the blossoms, in a cut state, are excellent for decorating the dwelling-house.

The Spanish Squill.—Like our native Bluebell, which has so delighted numerous visitors to Kew this spring, the Spanish species must be massed if its full beauty is to be enjoyed. Solitary spikes, or even little colonies of a dozen or so, beautiful as they are, give no suggestion of the effect produced when the nodding bells of blue flowers are in goodly company. Although blue is the normal colour, Scilla hispanica is often a variable plant and produces flowers paler or deeper in colour than the type. Flowering a little later in the season than the common species, it is also valuable for prolonging the Bluebell season.

Dividing Heucheras.—Often is it said that owners of gardens cannot get this decorative genus to produce many flowers. This applies chiefly to the well-known and favourite H. sanguinea. When such is the case, the plants should be lifted as soon as the flowering is over and pulled into small pieces, for, if clumps of it are allowed to remain, the flowers become fewer and the plants altogether unsatisfactory. This operation should be done during the first spell of showery weather. In dividing the plant, reject pieces with woody stems, such as those found in the middle of the old clumps. The divisions should be planted about a foot apart, either in beds or the front row of the herbaceous borders, where they are intended to flower. If the weather is dry, a good watering should be given occasionally. If treated in the way mentioned, a good display will be obtained from plants that have been a partial or complete failure.

New Zealand Spinach.—Those who experience difficulty in securing ordinary Spinach during the late summer and autumn months should make a small sowing of New Zealand Spinach at once. This is a quick-growing and rapidly spreading plant, and a single row will spread at least 2 feet each way; hence it must have plenty of room. It will thrive in almost any soil, and give a good supply of leaves during the summer.

A BEAUTIFUL GROUPING OF THE SPANISH SQUILL
(SCILLA HISPANICA).

lovable man and a great Sweet Pea enthusiast. It was in September last that he was awarded the D.S.O.

A Beautiful Lilac.—We do not remember seeing that glorious Lilac Souvenir de Louis Späth in better condition than it is this year. The large panicles of deep rosy red flowers are now opening in profusion and never fail to attract

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

A Rare Primula.—Miss Amy Cameron, Trinity, Duns, sends us a photograph of *Primula tosaensis* which she saw flowering in Dr. Macwatt's garden at Duns. The plant is quite new to us, and, so far as we know, has never been illustrated before. The photograph shows well the character of this newly introduced *Primula*. The flowers are a very pretty magenta pink colour. It belongs to the Section *Reinii*, and comes from Sikoku, Japan.

Perpetual-Flowering Carnations.—I am always interested in Mr. R. P. Brotherston's valuable notes on these popular plants, and not least in those appearing on page 234, issue May 15. But I only intend to refer to the paragraph dealing with "Old Plants to Flower Next Winter." Owing to a severe and long illness, I have been prevented from potting on some rooted cuttings as they ought to be potted, so I am having my old plants cut back as suggested by Mr. Brotherston. This course I had decided on before his notes appeared in *THE GARDEN* in a previous issue to that of May 15. His intention, however, gives one encouragement to go ahead with the cutting back. There is plenty of space for top-dressings and feeding in due course, and the plants are very healthy. All being well, I hope to have, in due time, more blooms, though on an average smaller, than I obtained from the young plants. Judicious syringing in hot weather will, I feel sure, prove very beneficial to the young shoots.—G. G.

How to Flower *Wulfenia carinthiaca*.—This plant is proverbially obstinate in the matter of flowering. I have a plant on my rockery in full flower now with seven fine heads and others coming; it made a sickly attempt to flower last autumn, but conditions were too much for it. This particular plant, grown from seed (Thompson and Morgan's), was put into its present quarters in December, 1913. It grows on a bank of very rough and clayey soil with an admixture of chalk, with a top layer of grit and leaf-mould to a depth of about nine inches. It is in full sun from April to August, and after that gets afternoon sun only. It has had one or two applications of weak liquid manure during the spring. Other plants of it on lighter soil have done little. It evidently likes a rather stiff and retentive subsoil, like *Primula denticulata*, which flourishes well in the same position. This part of my rockery was most unscientifically prepared, and was only meant at first for surface-rooting plants, yet a number of other things do very well there—from which I gather that quick drainage may be overdone sometimes.—L. H. EVANS, *Goodnestone, Canterbury*.

Propagating Azaleas from Cuttings.—A fact not fully recognised is that Indian Azaleas can be readily propagated by means of cuttings. They

are now so generally increased by grafting that very few cuttings are struck. An exception must, however, be made in the case of the small-flowered variety *Hexe*, which is mostly struck from cuttings. In days gone by, when many Azaleas were propagated in this country, increase by means of cuttings was very generally followed. The best cuttings are formed of the current season's shoots taken when they are in a half-ripened condition—that is, just before they become woody. The pots prepared for their reception should be quite clean and effectually drained to within a couple of inches of the top. The remaining space must be filled with a mixture of peat and sand, passed through a sieve with a quarter of an inch mesh, and pressed down very firmly. Some propagators prefer to put a

word "great" or its equivalent. In my own case, we paid one penny for each queen wasp killed till as late as Whitsuntide each year, and one year I paid £9 to workmen and their families. Within a radius of a little more than a mile from the gardens, we destroyed 200 nests at sixpence per nest. The same summer I was driven out of a Peach-house by the hordes of wasps (the only time I remember them attacking me direct in such circumstances). The Grapes and wall fruits were eaten wholesale. The cost of nets was great, and through them the wasps ate their way. This was, of course, the worst year; but in that district—the South—the pest caused nearly half as much damage, taking the average year by year. In North Lancashire I experienced trouble with the wasps to nearly the same extent. In Warwickshire they were as bad. A fairly wide experience. It is freely admitted that wasps destroy many insects and do some good in this way; but, as the Editor truly says in his footnote, they do much more harm. In town gardens the ravages are not nearly as great as in the country districts. Now, a word as to the way to destroy nests. We find the nests in the daytime by following the wasps. When one has disappeared from view at a certain point, we go there and wait for the next one to come, thus by stages tracking them home. The nests are marked by sticks bearing a large piece of white paper. At eight o'clock in the evening the work of destruction begins; this is simple. We make rolls of rags as large as one's finger and soak them in turpentine, as many rolls as there are nests to destroy. All those nests having but one opening are easily dealt with. The roll of rag is pushed far down the hole and a spadeful of soil placed firmly on. The wasps never survive if air is excluded. The queen wasps are bred in the latest-formed nests, nearly always near running water.—AVON.

Large Vegetables.—As the "housekeeping daughter" I had to cater for a large tableful for many years in days gone by, but (doubtless owing to woman's lack of logic) I fail to see why twenty persons at a table should be obliged to eat large vegetables while two may enjoy small ones.

Only think what an uninviting wreck a large Cauliflower becomes after the first one or two persons have been served! Is it not much nicer to have several small Cauliflowers, which can be cut neatly and served fairly for all, not to mention that small Cauliflowers, Cabbages and Onions are more certain to be thoroughly cooked than large ones? And why need a large household be supposed to prefer large Beans? In my experience it is usually large, not small, vegetables that are apt to be "strong and stringy," or else too watery and flavourless, though I quite agree with Mr. G. Andrews that vegetables have made very rapid strides in quality during the last twenty years. Is not Mr. Beckett, too, a wee bit illogical ("A. La T." does not wish to waste

PRIMULA TOSAENSIS, A RARE SPECIES FROM JAPAN. THE FLOWERS ARE PALE MAGENTA.

layer of clean silver sand on the top, but that old practice is by others discontinued, on the ground that it is difficult to ascertain the condition of the soil below as regards moisture. The cuttings must be dibbled in securely, and a thorough watering through a fine rose will serve to settle everything in its place. When finished, the pots should be placed in a close propagating-case or covered with a bell-glass in gentle heat, where they will soon root.—H. P.

Wasps and Fruit.—Your correspondent E. Robinson, page 230, issue May 15, in writing on this subject, speaks of the "little harm wasps do us." Well, if he had seen one quarter of the harm wasps have done fruit-growers in certain country districts that I have, he would use the

vegetables; *au contraire*, as I read her protest), and does he not contradict himself in two sentences? First, he says "those with large families are thankful for improved (*i.e.*, larger) vegetables"; then adds "judges and best exhibitors never favour mere size, quality being the first and most important consideration," with which conclusion I most heartily agree.—ANNE AMATEUR.

Lewisia Howellii in Scotland.—Moraine treatment appears to suit the *Lewisias* very well in the South-West of Scotland, and *L. Howellii* is one of the best for the purpose. It has stood the winter in several gardens in this district when given moraine treatment. In some cases it has been covered with a sheet of glass, even when in the moraine, but, by way of experiment, I subjected a good plant of this *Lewisia*, which flowered last year, to a trial by leaving it without glass overhead. The result has been quite satisfactory, although the winter was one of a severe nature for plants which do not like much wet above. This plant is now looking very well indeed. It is on a moraine slightly sloping almost due south, and composed largely of whinstone chips and old lime rubbish. I saw a good plant of *L. leeana* in a South of Scotland garden the other day; it had been covered by glass, but I think it stands wet even better than *L. Howellii*.—S. ARNOTT, *Maxwelltown, Dumfries*.

Hardy Ferns for Shady Green-houses.—One may often see, particularly in towns, small green-houses so situated that they scarcely, if ever, get a ray of sunshine. Frequently, too, there is no provision for heating them, so that any plants it is attempted to grow therein must be able to withstand a certain amount of frost. For such structures the choice of plants that can be grown there is very limited, and must be practically restricted to foliage subjects. In such places there is nothing that will give a greater amount of pleasure (if as much) as a collection of hardy Ferns, of which small specimens established in 3-inch or 4-inch pots can be obtained at a cheap rate. If purchased at once, they will in most cases be ready to shift into larger pots, say, 4½ inches to 5 inches in diameter. A suitable compost for most of them may be made up of two-thirds loam to one-third leaf-mould or peat, and a good sprinkling of silver sand. When the roots have taken possession of the new soil and the plants are growing freely, they may be watered abundantly; but while much less water will be needed in the winter, at no time must they be allowed to get very dry. The list of species and varieties suitable for such a purpose is a long one, but beginners may well purchase a mixed collection and make additions thereto according to fancy.—H. P.

FORTHCOMING EVENT.

June 8.—Royal Horticultural Society's Fortnightly Exhibition, Vincent Square, Westminster, 1 to 6 p.m.

THE TULIP EXHIBITION AND CONFERENCE.

BY THE REV. JOSEPH JACOB.

THEIR HISTORY AND OBJECTS.

THE genesis of the large assemblage of Tulips gathered together at Vincent Square on May 14 was a suggestion proffered to the Royal Horticultural Society that they should undertake the preparation of a list of Tulip synonyms. The seed fell into good ground, and trials at Wisley, the publication with accurate descriptions of a list of all the best varieties, a new garden classification, and a selection of some of the best varieties in the several groups, all became part of the work which ultimately

selecting the best blooms and then cutting, labelling and, finally, packing them was successfully accomplished. Thanks to these and the representative flowers contributed by the exhibiting firms, a decidedly comprehensive collection was formed. How many varieties of one kind or another were in the Hall it is quite impossible to say. They were like the grains of sand on the seashore in multitude. In only one of the largest of the colour groups among the Darwins, that labelled scarlet vermilion, of which *Isis* is taken as the type, I counted no fewer than sixty to seventy varieties.

The exhibition may be described as being divided into two parts, which might be variously described. Mrs. Jarley, on the lines of her celebrated division of China (and, I presume, any other country), would have said into the show "proper" and the show "improper." Not a

PART OF THE BEAUTIFULLY ARRANGED GROUP OF TULIPS SHOWN BY MESSRS. DOBBIE AT THE TULIP EXHIBITION ON THE 14TH INST. (See page 269.)

the Royal Horticultural Society set themselves to do.

The Dutch Bulb Growers' Association was asked to co-operate, which they willingly did. Eight members came over last year and worked with their English comrades at Wisley. The war has prevented them taking the same active part in the deliberations this spring, but all that is done here is to be submitted to Haarlem. One very great loss is that of the index collection of Darwin and Dutch Tulips that in normal times would have been sent over from Holland for this exhibition. It is a disaster of the first magnitude, as it has been found impossible to get together any adequate substitute. The only thing possible was to use the collections at Wisley Gardens as far as they went and bring cut blooms from there. Thanks to Mr. Titchmarsh, the trials officer, and his assistants, this was done. The work of

very bad one, if I may put a little meaning into her parrot jargon, and say that the "improper" part of the show was the encircling band of beautiful trade exhibits, which in one sense were foreign to the business propositions before the committee, viz., the final placing of the individual varieties in their proper classes, the final selection of a few of the best in each division, and a general revision of the descriptions of the blooms. The labour involved was very great. The chairman did tell us how many miles he had walked in the preliminary operations of grading and placing the flowers on the staging on the day before the committee were to set to work. At the appointed time, nine, on the Thursday morning, the final revision began, and, before it was over, the floor of the Hall must have been a hundredth part of an inch thinner. Oh, the tramping and the looking! Tired feet and eyes! Just once in a

TULIP BOWMONT OR CORDELIA RECTIFIED. A BEAUTIFUL VARIETY SHOWN BY MESSRS. R. H. BATE. (See text.)

moment of leisure I did wonder if "D.V." or its equivalent "L.C." was on the agenda. "Parson gave out a meeting on Thursday at twelve, D.V. What does D.V. mean?" The friend said promptly, "Dinner in the vestry." Lunch in the Council Chamber was there all right, and very welcome it was. Whatever value attaches to our work in future years, those who took part in it had a strenuous time, both at Vincent Square and at Wisley. They will, I feel sure, approve of my publicly acknowledging the way in which the Royal Horticultural Society looked after the inner man. The meal-times were such pleasant oases of rest in the midst of our labours.

But to go back to the twofold division of exhibits. Another very proper one would be that into "useful" and "ornamental." On the centre staging of the great Hall were rows of Tulips divided up into Darwins, Cottage, Breeders and Broken (striped), and these, again, subdivided into colour divisions. It was upon this sorting out that the main attack of the committee was concentrated. As one of the units who took part in it, I can vouch it was a "teaser," and, like Aaron's rod, it seemed to swallow up all our other activities. But it was at last brought to a successful conclusion, so that visitors to the show were enabled to see for themselves how far our sense of colour had led us to a satisfactory end. There were a great many during the after-

amateur and trade exhibits. They made a beautiful setting round the more utilitarian colour groups on the central staging, where usefulness and not arrangement was the primary consideration. They made the ornamental part, and right well they did it. Let me enumerate each one and add a few words of comment or description.

First must come the gold medal group of Messrs. Barr and Sons, a most extensive and important-looking collection that filled the whole of the west end of the exhibition hall. Numbers, diversity and good culture, aided by good arrangement, gained for it its award. Messrs. Barr seem likely to do the "hat trick" for gold medals this season. Two in one week at Vincent Square, and Chelsea following on the next Tuesday! Before these lines are in print we will know the result.

Canon Fowler, who was awarded a standard silver cup, put up some superbly grown blooms—large, spotless and beautifully fresh. There were none better, if there were any as good. Here there was no attempt at artistic arrangement. The varieties were placed in tiered lines with plenty of space between them, and only about five or six blooms in a vase. I certainly thought that one got a better idea of each individual kind in this style of grouping than in any other.

Novelty was the keynote of Mr. Walter T. Ware's most interesting exhibit, for which the

noon of the Friday, including Miss Willmott, Mr. J. T. Bennett-Poë, Mr. H. J. Elwes, Mr. Hugh Dickson from Belfast, and the famous veteran, Mr. J. G. Baker, whose interest in the Inglescombe garden novelties, no less than in a certain box of species from Colesborne, opened and displayed before a few choice spirits after Mr. A. D. Hall's lecture, seemed to reveal the old hunter, roused by the distant sound of hound and horn. The Tulip already appeals to a wide circle of friends. I think the display at Vincent Square on the 13th and 14th inst. will do something to extend it. Tulips, Tulips everywhere, all Tulips. Not another flower present. His Magnificence for once dined, as it were, at a table apart, as Queen Rosa did a few weeks past. Any sense of monotony was amply relieved by the circle of

unusual award of a Lindley silver medal was given. I believe I am right in saying that it denotes meritorious cultivation and patient work on behalf of the recipient. With two or three exceptions the whole of the varieties were new. Nearly every one merited a detailed description, but I cannot, however, give that in these notes, as they are intended to be more an account of the exhibition as a whole and the special objects for which it was held. The illustration on page 269 shows two of the best and most refined and beautiful. A huge, overlarge yellow Empire gained an award on May 11, while Burgundy, which was to my mind the most distinct of all that were before the committee, was passed over. It is a long flower of the Cottage class, somewhat pointed and of a rich, bright-looking purple, quite a self. Lena, which accompanies it, is a charming rosy mauve with edges of a paler tone, not unlike Salaman, which, when at the top of its form, is to me almost the most exquisite of all Tulips. The raiser whispered in my ear in a way that I feel I may pass on, that this was one of his very special favourites. Of all in this group, the two in the illustration were the ones that appealed most to me. As in the case of the exhibit of Canon Fowler, there was plenty of space between the vases, and the number in each was limited. One saw them very well in consequence.

Messrs. Hogg and Robertson had an unmistakably fine collection. The individual blooms were clean and well grown, and I believe some good judges expected it to receive a higher award than a silver-gilt Flora medal. It had, however, a weak end. As a friend remarked, it looked like a runner who had to fall out just before the tape was reached. It was a great pity.

The large collection of Messrs. R. H. Bath I take to be in a sense prophetic, inasmuch as broken Darwins or Rembrandts were specially prominent. The time may come when these parti-coloured blooms will once again be the fashion. It looks as if this firm intends to be "there" when it does. Cordelia rectified is an excellent type of a good Rembrandt. I regret more than I can express in words the way we are going to get into of naming these "breaks." This was labelled Bowmont. Will every other stock of Cordelia rectified receive the same name? All well and good if it were so. But suppose, as is infinitely more likely, every person in whose garden Cordelia breaks gives that break a name of his own, there will be as many synonyms as there have been namers, except, once in a blue moon, the same one is hit upon by two or more people. To me the practice is against common sense and the plain teaching of history. But then, people are not always sensible, and history is not always listened to.

I associate the name of Wallace with various things—Lilies, Coronation Cups, Japanese Iris, Colchester, &c. Had the groups in the Hall been unnamed, I would have known which belonged to this firm, from its arrangement being a "colour scheme." It contained many valuable suggestions in the very pretty gradation of shade and tone as one colour ran into another, brown, pink, mauve, yellow and crimson. The flowers, however, were too young to do themselves justice, and the whole of the surface was too flat for my liking.

A second Lindley medal went to Mr. A. D. Hall for a small collection of the English florist type. This represents the last word in Tulips, according to the Royal National Tulip Society;

but the flowers need care and protection when they are in bloom, otherwise their dainty colouring is very apt to be spoilt by the weather. Mr. Hall is known all the world over as a great soil expert. His Tulips reap the benefit of his vast knowledge.

Messrs. Waterer, Sons and Crisp had an extensive display, for which they gained a silver-gilt Banksian medal. It was too much of a medley to be really effective. The outline of the whole was decidedly novel—two flat, broad ends and a raised tiered portion in the centre, like a camel's back. I am very glad to see this new-born energy for Tulips on the part of the old firm, and from the keen way in which I saw Mr. B. Crisp examining everything at the exhibition, I fancy it is his advent that has brought it about. I wish him every success.

Mr. Christopher Bourne's collection was good, and had not the standard of the day been a very high one, as befitted an all-Tulip exhibition, it would doubtless have been awarded something higher than a silver medal. The group had no prominent outstanding feature, although the flowers were clean and fresh, and there was a considerable sprinkling of choice varieties.

As far as attractiveness went, nothing equalled the beautiful display of Messrs. Dobbie and Co. I have seen Sweet Peas, Roses, Carnations, Daffodils, Dahlias and Orchids figuring in a one-flower group, but none of them has ever made a more pleasing show than the Tulips did upon this occasion. The illustration on page 267 will help readers to imagine what it was like. The black velvet background and the white covering of the staging was a bold but highly successful venture. The Palms were introduced just where they were wanted. The variety of water-holders allowed the blooms to be displayed in several ways, and the artistic feeling of the arranger enabled the different factors to be combined in an exceptionally delightful whole. The number of varieties was not large compared, say, to those of their neighbours, Messrs. Hogg and Robertson, but the blooms were fresh and clean, and had that peculiar, tender tone which slight shading under glass invariably imparts. Whoever thought this all out, I congratulate most heartily.

SOME CURIOUS INSECTIVOROUS PLANTS.

THE SARRACENIAS.

THESE are interesting Pitcher Plants which are well worth consideration by those who possess a greenhouse where a minimum temperature of 45° Fahr. can be maintained during the winter months. Some of them, especially the handsome *S. purpurea*, are often grown outside in a sheltered bog or a damp spot in the rock garden. Others, no doubt, would also thrive more or less in similar positions, but where it is practised care must be taken to prevent the roots becoming exposed through the summer months. A layer of living sphagnum moss should be placed around the base of each plant, as moisture is an important factor in the successful cultivation of Sarracenias. Although much alike in shape and habit, there is considerable variety among the species, while the hybridist has further enriched the genus with several striking plants.

A few of the best would include *Sarracenia flava*, *S. rubra*, *S. Drummondii*, *S. Chelsonii*, *S. Courtii*, *S. tolliana*, *S. wrigleyana*, *S. psittacina*, *S. Stevensii* and *S. exoniensis*. To grow really fine specimens a greenhouse is necessary. A porch or corridor at the south end of a range of houses would be an ideal spot for them, providing they were tolerably near the roof glass. For the last few months the plants have been resting, and the soil has been kept just moist.

Repotting.—When growth commences, the repotting must be taken in hand, an operation which should be performed annually. Fairly deep pans prove the most suitable receptacles, and they ought to be provided with plenty of drainage, for although Sarracenias need a large quantity of water, nothing approaching stagnation can be permitted. The rooting medium consists of fibrous peat and live sphagnum moss in equal parts, to which may be added a liberal sprinkling of rough sand or finely crushed potsherds. The plants must be potted firmly, and the crowns and rhizomes should be on a level with the surface of the soil, and not buried in any way. When the repotting is completed, give a thorough watering and keep them moist until growth becomes active. At this stage an abundance of water is necessary, and to attain this end each pan may be placed in a saucerful of water. Full sunlight must be given, and a light spraying overhead three or four times a day will be most beneficial.

It has been said that Sarracenias like their roots in water and their leaves in full sunshine, and there is a lot of truth in that remark. With the approach of autumn the moisture, both at the root and in the atmosphere, can be diminished, but the plants must never become really dry.

In addition to the Sarracenias, the following insectivorous subjects could be grown in the same structure: *Dionæa muscipula* (Venus' Fly-trap), *Darlingtonia californica*, the rare *Heliophora nutans*, *Cephalotus follicularis*, *Pinguicula caudata*, and several of the pretty Sundews, such as *Drosera dichotoma*, *D. capensis* and *D. binata*. W. B.

LARGE-FLOWERED ROSES FOR ARCHES & PILLARS.

ALTHOUGH I have not a word to say in depreciation of the so-called "Rambler Roses," I find in moving among the Rose-loving public that there is a desire for more of the large-flowered varieties to clothe arches and pillars.

One may have these large-flowered Roses against walls, but these are frequently very limited in extent and often already covered with *Wistaria*, *Clematis* and other climbers.

Fortunately, there is a great variety of Roses available that yield large blooms almost continually throughout the summer. Although they do not furnish the gorgeous and lavish display of bloom at one given time as the "ramblers" do, yet in a great measure they are more useful, giving us beautiful Roses for our vases and table decorations. I would put in a strong plea for the pillar Roses, and would like to see more of them in gardens. In many positions they are more effective than standards, as they are clothed with bloom from base to summit and have no ugly stem to

TULIPS LENA LIGHT, AND BURGUNDY, TWO INTERESTING FLOWERS AT THE LONDON SHOW. (See previous page.)

display. Again, one may have quite a number of really fine exhibition Roses so growing, because the natural vigour of the varieties seems to call for some such mode of training. I allude more especially to Roses such as Avoca, Hugh Dickson, J. B. Clark and Mrs. Stewart Clark, varieties that are impossible in beds with ordinary bush Roses, as they speedily usurp more than their share of space.

Before giving the list of varieties which I can recommend for arches and pillars, I would like to say that mistakes are often made in the first pruning of these Roses. As a rule, it is desirable to prune back the ordinary climbing Rose to 2 feet, in order that it may well furnish itself with growths from the base; but there are a few kinds, such as Climbing Mrs. W. J. Grant, which resent this treatment, and if pruned will often refuse to run afterwards. I have marked with an asterisk such varieties which, in my opinion, should be retained almost full length the first year and have a very moderate pruning for the next two or three years; then, when the plants send up the fine, strong growths which they will do, the old wood may be gradually cut away. I have arranged the varieties into two groups, those first named being more fitted for tall pillars or arches; the second group would be best as pillars, or used to furnish the lower part of an arch which a Rambler Rose has left almost bare. In both cases good deep holes should be prepared. A depth of 3 feet and the same in width is none too much for future needs, and if some basic slag, say, about half a pound, is worked in the lower soil with the manure, and a handful of bone-flour scattered on the soil above the roots and slightly covered, there will be good healthy growth from the first.

Varieties for Arches or Tall Pillars.—Climbing Captain Christy, Climbing Caroline Tesout, Climbing Mrs. W. J. Grant, *Climbing Lady Ash-town, *Climbing Frau Karl Druschki, Climbing Kaiserin Augusta Victoria, Dr. Van Fleet, Francois Crousse, Gerbe Rose, Mme. Bérard, Morletti, Johannisfeuer, *Lady Waterlow, Mme. Alfred Carrière, *Mme. Hector Leuillot, Miss Helyett, M. Desir, Neervelt, Noella Nabonnand, Reine Marie Henriette, Rêve d'Or, Reine Olga de Wurtemberg, Conrad F. Meyer, Nova Zembla, Souvenir de Mme. Joseph Metral and Souvenir de L. Viennet.

Varieties for Moderate Pillars.—*Gustave Regis, Grüss an Teplitz, *Lina Schmidt-Michel, *Florence H. Veitch, *Mrs. Stewart Clark, *Mrs. Cornwallis West, Gloire des Rosomanes, *Climbing Richmond, *Climbing Liberty, *Hugh Dickson, *J. B. Clark, Zephyrine Drouhin, *Juliet, *Climbing White Cochet, *Ards Rambler, *Ards Rover, *Avoca, *Effective, *Johanna Sebus, Longworth Rambler, *Billiard et Barre, Sarah Bernhardt, Bardou Job, *George Dickson, *King George V. and *Coronation (Hybrid Perpetual). DANECROFT.

SPRING FLOWERS AT STRATTON PARK.

THERE are few greater joys on earth to the true lover of plant life than to visit a properly planned and well-tended garden during a sunny day of May. At that time Nature has settled into her kindest mood, and the fresh and ever-varying tints of green provided by the trees that should form a boundary to every good English garden create a wonderful and highly appropriate setting for the more vivid colours of the less stately, but none the less beautiful,

ANEMONE RUPICOLA SHOWN BY MESSRS. BEES, LIMITED, AT THE CHELSEA SHOW LAST WEEK. (See page 273.)

flowers. Thus it was with considerable pleasure we visited, through the kindness of Lord and Lady Northbrook, their charming gardens at Stratton Park at a time when the gorgeous May-flowering Tulips were providing a wonderful riot of colour, a riot subdued and kept in bounds by the soft blue of Aubrietia or Forget-me-not.

The gardens at West Stratton owe not a little of their beauty and fascination to the energy and enthusiasm of Lady Northbrook. At the east end of the house, which nestles in a sort of hollow at the foot of a rather steep hillside, is a delightful formal garden enclosed with closely clipped Yew hedges and intersected by pathways of beautifully weathered York paving. At each corner where the pathways meet are some very

finely sculptured Italian stone vases, and in a prominent central position we find a beautiful old Italian well-head.

This garden was planned and designed by Lady Northbrook some eight or nine years ago, and it speaks volumes for the good taste displayed when we say that in appearance it might have been there for half a century. All traces of newness, if ever there were any, have departed, and the garden is now a restful retreat in which one may sit and contemplate the beautiful colours of flowers and the wonderful forms of the plants that bear them. All the central flower-beds in this garden have a well-proportioned border of turf, and just now are filled with mixed

May-flowering Tulips, principally of red and pink shades, carpeted with Forget-me-not Royal Blue. In the interstices of the flagged pathways a number of plants find a happy home. Campanula muralis or portenschlagiana, Viola gracilis, Red Valerian (near the well-head), Maiden Pinks and Aubrietias are found thriving amazingly, yet the mistake of too thick planting that one often finds had been wisely and consistently avoided. We were pleased to find that seeds of Leptosiphon hybridus had been sown between the flagstones. It is a gem among annuals, and loves the sun.

On the north side of the east end garden, but separated from it by a broad pathway and belts of turf, is a dry retaining wall of some 7 feet or 8 feet high, with a border about three feet wide nestling at the foot. At the top of the wall Rose Dorothy Perkins has been planted and trained along on rustic poles to form a sort of informal hedge, the beauty of which in July can be easily imagined. The wall itself, which is made of sandstone, was constructed with a good batter and large interstices, so that it now provides a suitable home for a brilliant array of plants—Aubrietias, Alys-sum saxatile, Erinus alpinus, dwarf Lavender and Rosemary, Red Valerian, Campanula muralis or portenschlagiana, Mulleins (near the top), Nepeta Mussinii, Iberis sempervirens, Woolly Thyme and Cheiranthus Allionii were a few of many kinds that had transformed this wall into

an object of great beauty and interest. In the border at the foot of the wall, which faces due south, we were rather surprised to find Hart's-tongue Ferns flourishing in company with Tulips, Forget-me-nots, Polyanthes and other hardy plants. Evidently these Ferns do not mind exposure to full sun so much as is generally supposed. At the west end of this wall some new and well-designed stone steps that lead to the pleasure grounds form one side of a curious little nook, the north and west banks of which are retained with enormous pudding-stones. Apparently nothing is known of the history of these, but some of them must weigh several tons.

Leaving the more formal parts of the garden, and mounting the stone steps already referred to,

one finds a very charming effect on either side of the steps leading from the drawing-room door. Some years ago Lady Northbrook conceived the happy idea of planting the purple-leaved Plum (*Prunus Pissardii*) in the borders there, and at the present time the ground beneath is a veritable cloud of deep sky blue, created by lusty Forget-me-nots. Later on, when the blue is finished, pink *Begonia semperflorens* will take up the colour scheme. And here let it be said that one of the greatest charms of the gardens at Stratton Park

Erigerons, Campanulas, *Verbena venosa*, Veronicas and *Nepeta Mussinii* all play important parts later on. Near by is the Rose garden, the beds of which are mainly filled with those grand varieties *Grüss an Teplitz* and *Caroline Testout*. Round about the Roses there are long beds edged with full-grown Lavender, and planted with blue Delphiniums and weeping standards of Rose Dorothy Perkins. Turning a cleverly concealed corner, one is brought face to face with a winding vista of blue and purple. This is skilfully formed

of natural depression, is a charming little rock garden, filled with a good collection of rare and beautiful plants that for the most part seem perfectly at home. At the summit of the rocks such shrubs as *Cytisus præcox*, purple-leaved Japanese Maples, Azaleas and some particularly fine specimens of *Euphorbia Wulfenii* have been planted to form a screen, and in the rocks below one finds *Ramondias*, *Gentianas verna* and *acaulis*, *Phloxes Vivid* and *amœna*, such *Saxifrages* as *ligulata* and *cochlearis*, *Erinus alpinus* and many

CAMPANULA PORTENSCHLAGIANA, VIOLA GRACILIS AND OTHER DWARF PLANTS GROWING BETWEEN YORK PAVING AT STRATTON PARK.

is the surprises that are always in store for the visitor. At every turn one comes to some charming and totally unexpected feature. Unusual colour combinations or bold examples of grouping have been adopted by Lady Northbrook with considerable forethought and skill. Thus, near to the purple-leaved Plums we find Crimson Rambler Roses trained over rustic poles.

Passing along the pathway in a north-westerly direction, and through bold arches of clipped Yews, we come to the blue and mauve garden, in which

by some fine young trees of the purple-leaved Plum, carpeted with blue Forget-me-nots. The effect is most soothing, particularly on a hot, sunny day. About halfway along this pathway, and on the right, is a short pergola leading to a garden seat; this provides a support for ornamental Vines such as *Vitis Coignetiae* and *V. Thunbergii*. Along each side of the pergola the beds are planted with Madonna and other Lilies, so that the effect later on should be very charming. At the end of the vista, and nestling in a sort

other gems too numerous to mention in detail. In close association with the rock garden, and yet effectively screened from it, is the Italian pergola, a lofty structure that has for its object a thatched summer-house. This pergola forms a support now for *Ceanothuses Gloire de Versailles* and *veitchianus*, while at the opposite end to the summer-house, and on a stone dais, is the beautiful and perfectly weathered old Italian well-head. Advancing still further north, one comes to the wild garden, which is the latest result of Lady

Northbrook's activity and interest. What used to be at one time a tangle of undergrowth to magnificent Beeches, Sequoias and other trees has been cleared away, and the open spaces thus formed planted with many kinds of flowers that are suitable for wild or semi-wild spots. Snake's-head Fritillaries, purple and white Honesty, Funkias, Anemone blanda, Polygonums, Mulleins, Cowslips, Bluebells, Gentiana asclepiadea and Yellow Loosestrife in bold masses are a few of the many. One pleasing effect, in a more open

NEW PLANTS AT THE CHELSEA SHOW.

FIRST CLASS CERTIFICATES.

Odontioda Colmaniae (Odontioda Bradshawiae × Odontoglossum hybrid).—A small three year old plant of this gloriously coloured hybrid was shown, a four-flowered raceme representing the plant. It is a lovely thing, done in scarlet and gold, the body colour, scarlet, coming from O.

of fine proportions. From Messrs. Stuart Low and Co., Enfield.

Laelio-Cattleya Transylvania Leonora Enid.—Sepals and petals ruby crimson, with velvet crimson lip. A very beautiful novelty. From J. Gurney Fowler, Esq., Tunbridge Wells.

AWARDS OF MERIT.

Odontoglossum Aglaon Orchidhurst Variety.—The plant carried a bold spike with thirteen fully expanded flowers. The latter are unusually

A CORNER OF THE ITALIAN PERGOLA AT STRATTON PARK, WITH OLD WELL-HEAD ON THE LEFT.

spot than most, was created by American or coloured Cowslips and the white-flowered native Saxifraga granulata. Both were growing in the grass, and seedlings were present in their hundreds. Already this wild garden, bounded on the north and east sides by fine avenues of Beeches and Limes, trees that seem to thrive in the chalk that forms the bulk of the soil on which these interesting gardens are situated, is full of charm and beauty.

Bradshawiae. This is reticulated with gold, which colour also characterises the tips of the petals. From Sir Jeremiah Colman, Bart., Gatton Park, Reigate.

Laelio-Cattleya Sybil Low's Variety (L.-C. dominiana × C. Mendelii).—The sepals and petals of this handsome hybrid are of pinky tone, with deeper-coloured veins, the front lobe of the lip rich crimson, with side blotches of bright yellow. A strikingly beautiful form

large and acutely pointed. The white ground is heavily blotched with crimson. It is very handsome and distinct. From Messrs. Armstrong and Brown, Tunbridge Wells.

Odontoglossum Princess Mary.—This is a large blush-white flower blotched with claret-red. From J. Gurney Fowler, Esq., Tunbridge Wells.

Disa Blackii (D. grandiflora × D. Luna).—The finest hybrid Disa yet raised, and quite

intermediate between the parents. The dorsal sepal is carmine, the lower ones pink. The lip is crimson.

Cattleya Tityus Rex (C. Enid × C. Octave Doin).—A charming hybrid with rosy red sepals and petals and ruby-coloured lip, which are in striking contrast to the golden-blotched sides.

Odontioda lambeauiana Nellie (Odontioda Cochlioda noetzliana × Odontoglossum lambeauianum).—This is of reddish scarlet colour, with rich orange lip distinctly margined with violet. A shapely flower of remarkable substance with well-imbricated petals. These three novelties were from Messrs. Flory and Black, Slough.

Lælio-Cattleya Helius.—The sepals and petals are of apricot yellow tone, the front lobe of the lip coloured a rich magenta. From Messrs. McBean, Cooksbridge.

Lælio-Cattleya Gold Star (L.-C. Ariel × C. Mendelii).—A moderately large flower, having cream yellow bordered sepals and petals, the lower half of the front lobe of the lip crimson, with rich golden yellow throat. Shown by Messrs. Sander and Sons, St. Albans.

Odontoglossum crispum Queen of the Belgians. The plant bore a solitary flower, which, heavily blotched with chocolate and crimson, is veined and margined white. It is a strikingly beautiful variety. From Messrs. Charlesworth and Co., Hayward's Heath.

Miltonia hyeana F. M. Ogilvie, from F. M. Ogilvie, Esq., also received recognition, but we could not locate the plant.

Tulip Comedy (Darwin).—Rosy scarlet, white base.

Tulip Bloodstone (Cottage).—Crimson maroon, with dark centre. A very striking variety.

Tulip Satin Gown (Cottage).—Of silky rose hue.

Tulip Inglescombe White (Cottage).—A very pure and good flower. These four were shown by Messrs. Walter T. Ware and Co., Bath.

Rose Paul's Scarlet Climber.—The most brilliant thing in Roses we have yet seen, in a plant of perfect habit. Examples of it forming a group were 7 feet or 8 feet high, the growths wreathed in flowers of the richest scarlet and about three inches across. Quite self-coloured to the base, it is said the variety retains its colour for a long time. We know of nothing like it in brilliant colouring or profuse flowering. From Messrs. W. Paul and Son, Waltham Cross.

Rose Dewdrop.—A group of this pretty Polyantha kind was shown. The flowers are clear rose colour, good in form and abundantly produced. The examples shown were less than two feet high. From Messrs. Hobbies and Co., Dereham.

Anemone rupicola.—A new Chinese species, and without doubt the finest new hardy plant at the show. The flowers are of great substance, pure white, with outer sepals coloured rosy lilac. As large as the white Japanese kind of September, the flowers are much superior looking, and chaste withal. About a foot high, lifted, we were informed, from the open, the new-comer presents a sturdiness of habit and vigour, as well as profuse flowering, which will be welcome. It is both a novelty and an acquisition. Admirably shown by Bees, Limited, Liverpool. See illustration on page 270.

Pyrus Malus Sargentii.—A white-flowered form as beautiful as it is distinct. From Messrs. Paul and Son, Cheshunt.

Lewisia columbiana.—Several of the Lewisias, while possessing distinctive habits of growth, approximate to each other in colour. This is one of them, though a very charming plant, notwithstanding. The fleshy, nearly spatulate leaves are 3 inches long and plain, the flower-buds buff-coloured, the expanded flowers having a like coloured margin and a centre of rosy scarlet. Six inches or eight inches long, the much-branched inflorescence is crowded with bud and blossom. From Miss Willmott, Warley Place.

Senecio multibracteatus Clare Lodge Variety. A perennial kind of bushy habit and about two and a-half feet high. The flower-heads are rich rosy colour, and approximate to a single Pyrethrum in form. Shown by Mr. R. C. Notcutt, Woodbridge, on behalf of Mr. E. Novell.

Carnation Bookham Clove.—A handsome, glossy crimson maroon self of excellent form with slightly incurving petals. Its fragrance and fine constitution are among its many attributes.

Carnation Daisy Walker.—A white-ground fancy with scarlet markings. The ground colour is singularly pure and good, the markings well defined. These two were shown by Mr. J. Douglas, Great Bookham.

Viola septentrionalis.—A very pretty white-flowered species of large size, much lined with violet colour at the base of the flowers. The rather frail stems are 6 inches or 8 inches long. Shown by Miss Leonard, St. Ippolyts, Hitchin.

THE YELLOW ROCK GARDEN VIOLAS.

UNTIL a few seasons ago the number of yellow Violas suited for rock gardens was very limited, and the few forms in cultivation were notable either for their brilliance or their garden value. Among the best of them were the yellow form of the alpine Pansy (*Viola calcarata*), known as *flava*; the scarce, large-blossomed *V. altaica*, which is difficult to secure; and the various forms of *V. lutea*, some of which are very effective in colour. Indeed, on the introduction of the deep violet *V. gracilis*, we largely utilised some of the best forms of *V. lutea* for contrasting with masses of *V. gracilis* on the rock garden slopes. A few other yellow mountain Violas were also occasionally met with, yet in such small quantities or giving such poor effects as to make them unworthy of notice for big plantings. With *V. lutea* and its forms, the one difficulty was summer drought; consequently for this reason they were not ideal subjects. Their colour, freedom and perfume pointed the way for new and better things.

I should like to note some of the more recent advances in yellow mountain Violas, with the idea of bringing more of their golden beauty into many gardens. Now, the chief requirements in a rock garden Viola are a strong resistive power to winter rigour, and this hardiness the newer Violas have in full; a neat-growing, floriferous habit (this is

most essential); and the *gracilis* powers of drought resistance, which are secured by the shoots from underground. Now, if to these are added beauty of colour and refined blossoms, the Violas are then a power to reckon with, for there are no rock garden subjects to surpass them for direct attractive beauty.

New yellows have perhaps been a little slower in coming than novelties in blues and purples, yet in almost all cases they have risen to notice and popularity at once. Good yellows of the *gracilis* type are indeed valuable for rock garden work. Masses of soft yellow or gold are a glory to behold, especially when contrasted with the wealth of blues, lavenders, purples, violets, &c., of the *Aubrietias* and the deeper-hued Violas. Some very useful forms are in commerce. Two of the most popular are *Marjorie* and *Golden Fleece*, both very tiny forms, very floriferous and dainty in formation. *Marjorie* is pale primrose, with a few tiny pencillings at the centre; and *Golden Fleece* is its counterpart in a deeper shade of yellow.

The variety *lutea* must come somewhere near these, but I have not seen it. *Golden Wave* is larger, with rich colour, very erect stems and a haunting fragrance. *V. gracilis aurea* is on the lines of *Golden Fleece*, a little more rounded in formation and practically rayless. It is indeed a most exquisite plant. A very pretty and fragrant variety is *Golden Drift*, which is now being grown on by a well-known firm preparatory to its being placed in commerce. It is neat, and of distinct beauty for drift planting. *Moonlight*, a beautiful soft yellow, should have a distinct appeal to flower-lovers. Here, again, the blossoms are rather small, very pleasing in appearance and very floriferous. *Golden Gondolier* differs from all of the foregoing. It has larger flowers and broader foliage, and combines with its lovely colouring and wonderful freedom a very neat, close habit. This we tried extensively previous to its departure into trade circles, and found it an invaluable subject for big drifts of colour.

The foregoing are all either in commerce or in rapid preparation for the same, yet there are a few others which will follow them and prove worthy of the fine race of plants to which they belong. A few especially notable forms may be briefly described. Very beautiful is *Princess Charming*, a small-flowered mine of delight, very floriferous, of a beautiful soft, clear colour, and very pleasing in shape. Much deeper than *Princess Charming* is that ideal of a golden rock Viola, *April Morn*. It is very like *V. gracilis aurea* in form and foliage, but is far deeper in colour, and may be looked upon as a coming plant. Next to it in value as a deep yellow is *Golden Glory*, a bright, pleasing flower of considerable merit and very attractive.

In a wonderful soft creamy yellow shade are two sterling novelties, *Fairy* and *Enchantement*. These are delightful forms, very distinct from any that have preceded them, and are doubtless destined for popular favour. In freedom, colour and form they are superb. Lastly, I note *Les Torrent*, a dainty, floriferous form that promises to make an invaluable drift plant. The freedom, the beauty of the soft and deeper shadings of yellow, and the character of the light winged flowers make this variety a charming subject fully worthy of inclusion in the ranks of the select rock garden Violas.

Clacton-on-Sea.

P. S. HAYWARD.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Cherries in Pots.—The trees from which all the fruits have been gathered must not be neglected. The roots will still be in need of plenty of water, and stimulants should be regularly afforded. The trees may now be removed outdoors and placed in a sunny position, plunging the pots up to the rims in ashes. If they are infested with red spider or aphid, a thorough washing with an insecticide should be given them, and, in order to keep the foliage clean, it must be well drenched with water from the garden hose every evening all through the summer.

Peaches and Nectarines in Pots.—When all the fruits have been gathered from the earliest trees, they may be given the same treatment as advised above for Cherries. Later trees which are carrying full crops of fruit must receive close attention to watering, as, should the roots be allowed to suffer, it is bound to reflect on the quality of the fruit. When the fruits commence their second swelling, the roots should receive a top-dressing of loam and manure. The final thinning of the fruits on the latest trees must be done as soon as they have stoned. This should be governed more or less according to the size and vigour of the trees, but in no case must they be overtaxed, or the fruits will be poor in quality.

Plants Under Glass.

Carnations.—The old plants which have been flowering all through the winter and spring will have to be removed to make room for the young stock. Good flowers may still be obtained from these old plants if they are plunged outdoors in a sheltered position and given plenty of water. When the earliest-struck plants are sufficiently well rooted, lose no time in potting them into their flowering pots.

Euphorbia jacquiniæflora.—Pot on rooted plants and keep them moving in a warm, moist house. Later on, cooler conditions may be given them. A batch of cuttings rooted now will make most useful plants for flowering in small pots. Much care is necessary in propagating Euphorbias at this time of the year. If the old plants have been growing in a high temperature, they should be placed in a cool house for a few days before taking off the cuttings.

Mignonette.—A sowing may be made now to obtain plants for flowering in the autumn. The seeds can be sown in the flowering pots and thinned out when the young plants are large enough. They should be grown in a cold frame.

Calanthes.—As growth advances, the plants may be watered more liberally, and this can be increased as the pots become filled with roots. Encourage a growing atmosphere by frequently damping between the plants, and syringe twice daily with rain-water.

Calceolarias.—Seed may be sown to produce an early batch of plants. Sow in pans in a light, finely sifted soil. The seed will germinate in a cold frame. Cover the pans with a sheet of glass and shade them till the seedlings are through the soil.

The Flower Garden.

Flowering Shrubs.—Forsythias, Ribes, Chimonanthus and various other early flowering shrubs which flower on the previous year's growth may be cut hard back after flowering.

Summer Bedding.—A start should be made with the planting of summer-flowering subjects as soon as possible after the spring kinds are over. Most of the beds will require a little manure, but this must be well seasoned. In the event of the soil being very dry, it should be well soaked with water from the garden hose. It is a good plan to requisition all hands from other departments of the garden to expedite the work of bedding out.

The Rock Garden.—When the spring flowers are over, there will be many blanks in the rock garden. In some cases these may be made good by planting or sowing annuals. Many annuals are quite suitable for planting on the rocks, and if a little fresh soil is added, these will thrive during the greater part of the summer.

The Hardy Fruit Garden.

Coverings on Fruit Trees.—Where glass copings are used to protect fruit trees, they should be so fixed that they may be easily removed when the danger of frost is passed, so that the trees can have the full benefit of rain. All coverings on fruit trees may safely be removed now.

Grafted Trees.—The clay must be moved from the grafts and the ties loosened when it can be seen that the scions are growing freely. The graft should again be supported with a fresh piece of tying material. All new growths below the graft must be cut off.

The Kitchen Garden.

Late Peas.—During the next fortnight all late Peas ought to be planted. The ground for this crop should be well prepared by deep cultivation and thorough manuring. Sow thinly in shallow trenches. Autocrat, Rearguard and The Gladstone are all reliable varieties to grow for late work.

Cauliflowers.—The earliest plants are now growing freely. In the event of a continued spell of dry weather, plenty of water must be afforded them. Liquid manure from the farmyard will put vigour into the plants. Use the hoe freely between them, and draw the soil around the stems for support in the event of strong winds.

French Beans.—Seeds must be sown at regular intervals to keep up a supply of this excellent vegetable. A deeply tilled soil with plenty of manure is necessary for this crop. Canadian Wonder and The Belfast are both reliable varieties to grow.

Radishes.—Make frequent sowings of Radishes in a shady position and give abundance of water.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Digging.—There will be a few plots which have only just become vacant through spring vegetables having become exhausted, such as Spinach, Broccoli and other crops. As the ground is cleared it can be dug in preparation for planting out and sowing other crops in their rotation.

Onions.—To keep the Onion fly in check, the young plants should be occasionally dusted with soot to stimulate their growth over the present critical period, when they are likely to be attacked. Afterwards there is not so much danger of them being injured.

Spinach.—If a succession is to be kept up during the warm summer months, Spinach will be found less liable to run so quickly to seed if sown in a shady border or on the north side of a wall. To further help in the production of good Spinach, the ground should be deeply dug and well manured. If the weather is dry, a good soaking with water will greatly assist the plants.

Asparagus.—Weeds are usually most troublesome on Asparagus-beds, and should be pulled by hand to prevent injury to the growing crowns. Unless the beds are exceptionally vigorous and well established, cutting ought not to continue too long, or there is a danger of weakening the plants. If liquid manure is available and the weather at all moist, now is a good time to apply it, when the plants are in full growth.

Potatoes.—The hoe must be used between the rows to keep down weeds, and earthing-up should be carried out as the growths appear above the soil.

Plants Under Glass.

Fuchsias.—Young plants must have their tops pinched out occasionally to encourage bushy growth and the desired shape. For ordinary purposes the pyramid shape seems the most natural, and displays the blooms to advantage. Fuchsias succeed best in a shaded glass house, but do not like too dense a covering, which causes the growth to become weak and not to produce many flowers. Feeding should be done fairly frequently, remembering that a change of diet will induce better growth than by adhering to one form of food.

Chrysanthemums.—The final potting must now be proceeded with. Both bush and single-stemmed plants should be completed within the next fortnight. When potting, do not fill the pots as in potting, most other plants, but leave sufficient space to allow several liberal top-dressings to be applied. As the plants are potted, they ought to be stood closely together until such time as they can have attention paid to the final staking and tying to the wires. If it is noticed that some of the plants are likely to starve a little before they can be potted, some weak soot-water can be given to keep the foliage a healthy colour. Let the potting compost be fairly rough and contain plenty of porous materials, especially if the district is a wet one.

Zonal Pelargoniums for winter flowering should soon be moved into their final pots, so that they may become well established before August and September, when they are usually housed. To get the best results, with freedom of flowering, they must not be overpotted, otherwise there is a tendency to make too much foliage at the expense of flowers.

Cœlogyne cristata.—Most gardens contain a few plants of this Orchid. The present is a good time for top-dressing them, just as the young roots are pushing out. Some of the oldest bulbs should be removed to make room for the young growths. As this Orchid resents disturbance at the roots, it is not advisable to repot often, so long as it can be kept in a healthy growing condition by top-dressing.

The Flower Garden.

Bedding Out.—Most plants can now be safely put in their flowering quarters. It is wise, however, to leave all the very tender subjects until last. Should the soil be very dry, it will be necessary to apply water as soon as the plants are in their places. Avoid unduly splashing the foliage with soil, but see that a sufficient quantity of water is given to thoroughly settle the earth around the plants.

Dahlias which have been thoroughly hardened off may now be planted out too, and in their case it is best to first drive in the stakes which are to support them later on and then plant; this prevents any injury to the roots or tubers.

Roses.—The young growths on Roses must be occasionally examined for maggot, which is easily seen by its habit of rolling itself up in the leaves. These should all be squeezed between the finger and thumb. Some varieties are much improved by a certain amount of disbudding; but where a continued display of Roses is the object, this is not usually necessary. As soon as any green fly makes its appearance, spraying with Quassia or a similar insecticide is necessary.

The Hardy Fruit Garden.

Stone Fruits, such as Plums, Apricots and Peaches, if set well, will require severe thinning before they become too large or commence to stone. Usually a certain amount of dropping occurs, especially among Plums, if the soil is deficient in lime, so that it is safer to keep this in view and not thin too severely at first.

Peaches and Nectarines.—Disbudding should still receive attention, making sure that the shoots are sufficiently reduced to retain a uniform spread of branches. If this is properly attended to, it will not be necessary to use a knife for pruning during the winter, a practice which has much to condemn it.

Fruit Under Glass.

Early Peaches and Nectarines.—As the fruits are now approaching maturity, they must be assisted to get all the light possible by adjusting them carefully just clear of the leaves and wires by the aid of wooden labels or short pieces of wood. The operation requires great care, but by this method much finer colour is developed in the fruit.

Successional Peach-Houses.—The trees ought to be regularly syringed during the early morning and in the middle of the afternoon, and fairly humid conditions maintained during fine weather. Water will be required at fairly frequent intervals, and opportunity should be taken to apply stimulants with it.

JOHN JEFFREY.
(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

SPRING SHOW AT CHELSEA.

HERBACEOUS AND BULBOUS PLANTS.

THE following was unavoidably held over from our last issue:

Messrs. Wallace and Co., Colchester, had a superb collection, making a special feature, as in former years, of the choicest Lilies. Of these, the lovely *L. regale* (white with yellow throat), *L. Brownii*, *L. excelsum*, *L. japonicum colchesterense*, *L. Hansonii*, *L. Martagon album*, *L. M. dalmaticum*, with many forms of *L. umbellatum*, made both sumptuous beauty and variety. Early *Gladioli*, *Eremurus robustus albus*, *Habranthus pratensis*, *Calochorti*, *Ixias*, the newer *Astilbes*, with *Funkias*, *Brodiaea coccinea*, *Globe-flowers*, *Bamboos*, *Verbasiums* and such also created beauty and interest.

Messrs. Jackman and Son, Woking, had a considerable exhibit of *Delphiniums* in variety with such of the newer *Astilbes* as *Ceres* and *gloriosa* (both high-coloured sorts), *Lavatera Olbia*, early *Gladioli*, *Liliums* of sorts, *Tree Lupines*, *Columbines*, *Irises*, *Wahlenbergia vincaeflora* (very rich blue) and other good plants. *Cytisus Dallimorei*, *Euphorbia Characias* and *Gaillardia E. T. Anderton* (a self yellow) were among other showy and good things.

Mr. Amos Perry, Enfield, Middlesex, had a superb hardy plant exhibit in the middle of the large tent, and his display of hybrid *Irises* was very fine. Too numerous to give in detail, they were worthy of special study, some of them, as, for example, the *Regelio-cyclus* hybrids and their near allies, being very beautiful. *Chrysanthemum Leucanthemum flore pleno* is a white-flowered novelty of importance, approximating in effect to a white *Anemone*-formed *Pyrethrum*. *Primula viridis* was very good. *Euphorbia Wulfenii*, *E. Characias* and *E. pilosa major* were a set of these interesting plants too good to be overlooked. *Viola oregana* (in crimson and cream) was a gem fitted for any alpine garden. *Dianthus Atkinsonii* was very brilliant, while *Primula sikkimensis*, *P. Rufa*, *Trillium*, *Dodecatheon* and much more contributed to a highly interesting group. *Tree Pæonies* in a group alone were very fine, and of these *Queen Elizabeth*, *Comtesse de Tudor* (deep salmon), *Souvenir de Ducher* (purple), *Onyx* (pale pink) and *Souvenir de Corwellieri* (rich rose) were some of the best. In a further group in the open Mr. Perry showed a representative set of hardy Ferns.

Messrs. Bunyard and Co., Maidstone, had a fine display of *Flag Irises*, *Tree Pæonies* in variety, a great showing of *Pentstemon Scouleri*, with *Phlox Laphamii*, *Geum Heldreichii splendens*, *Eremuri*, *Thalictrum dipterocarpum* and other plants. *Iris pallida Lohengrin* (of rosy lilac tone) was a plant of great beauty in the group, and is one of the finest of its set.

Mrs. Lloyd Edwards, Bryn Oerog, near Llangollen, showed a fine lot of *Mossy Saxifrages*, of which *Lady Northcliffe* (white), *Red Knight*, *Diana* (very large white), *Jewel*, *Rose Beauty* and *Divinity* (pink) were some of the more distinct.

Messrs. Wallace and Co., Colchester, had a superb table of *Flag Irises*. The *Dove* (mauve), *Blue Boy*, *Walhallia* (light mauve), *The Bride* (white), *Etta* (lemon), *Mars* (purple), with such as *susiana*, *tingitana* and a few of the *Primula* section, made a very fine display.

Mr. G. W. Miller, Wisbech, had a group of *Delphiniums*, *Verbasiums*, *Globe-flowers*, *Geums*, *Pyrethrums* and other flowers in season.

Messrs. G. and A. Clark, Limited, Dover, had an effective group of *Globe-flowers*, *Pyrethrums*, *Astilbes*, *Geums*, *Poppies*, *Flag Irises*, *Mossy Saxifrages*, *Euphorbia Wulfenii*, *Camassias* and other flowers. The grouping was very well done.

Messrs. Phillips and Taylor, Bracknell, had an excellent grouping of *Trilliums*, *Auriculas*, *Daphne Cneorum*, *Saxifraga cordifolia purpurea*, *Primula pulverulenta*, *Trollius* and water plants. *Lithospermum prostratum* was very good.

Messrs. Barr and Sons, Covent Garden, had a great show of *Irises* and other choice hardy flowers that merited close inspection. *Iris Pavonia* ("Peacock Iris" so-called, though more correctly *Moræa glaucopsis*) was very charming. *Cypripedium pubescens* was a show in itself. *Dodecatheons*, early *Gladioli*, *Double Poet's Narcissus*, *Flag Iris*, *Androsace Chumbyi*, *Brilliant*, *Gentians*, *Trilliums*, *Ramondia pyrenaica* and *Ranunculus amplexicaulis* were all in bold array and excellently staged. *Iris susiana* was very finely displayed.

winnock (dark brown with red edge) and *Moseley Perfection* (yellow) were a few of the outstanding varieties. More typical of the *Viola* or *Tufted Pansy* were *Kitty Bell*, *William Robb*, *Modesty*, *gracilis* and several *cornuta* varieties.

TULIPS.

The group of May-flowering Tulips shown by Robert Sydenham, Limited, Tenby Street, Birmingham, was inadvertently omitted from our report of these flowers in our last issue. The exhibit comprised some thirty varieties, including the best of the standard sorts, the whole being displayed so as to show them off to the best advantage.

ALPINES IN TENTS.

Mr. James Box, Lindfield Nurseries, Hayward's Heath, showed a fine table of alpenes, the chief of which were *Lewisia Tweedyi*, *L. Howellii*, *L. Cotyledon*, *L. oppositifolia* and *Anemone sulphurea* (very fine). *Onosma taurica*, *Silene Hookeri*, *Sedum pilosum*, *Trollius Orange Globe*, with alpine *Phloxes*, *Cytisus*, *Acers* and other shrubs, were included in a good exhibit.

THE BEAUTIFUL GROUP OF DELPHINIUMS IN POTS SHOWN BY MESSRS. BLACKMORE AND LANGDON AT THE CHELSEA SHOW.

Mertensia Pulmonaria was very beautiful, and *Listera ovata* is one of the most charming.

Messrs. Lilley, Guernsey, had one of the most graceful exhibits in the show, a group replete with beauty and great charm. *Ixia*, *Ranunculus*, early *Gladioli*, *Spanish Iris* and their new "Dutch" rivals, the *Peacock Iris* (*Moræa glaucopsis*) and the *Mourning Iris* were all here in excellent form. A very conspicuous subject was *Tritonia Prince of Orange*, also very beautiful.

Messrs. Blackmore and Langdon had a group wholly of *Delphiniums*, and the many varieties were well staged. *Walter T. Ware*, of the deepest purple with white eye; *Queen Wilhelmina*, pale mauve; and Mrs. A. J. Watson, mauve, were some of the finest varieties in a really striking exhibit. No group in the show compared with it, and those of our readers who take pleasure in these fine perennials—and who does not?—found here much to admire.

Messrs. John Forbes and Co., Hawick, had a capital exhibit of *Pansies* and *Violas*, of which Mrs. Alsop (deep mauve), *Miss Dove* (chocolate), *James Wilson* (purple with white edge), *Loch-*

Mr. Vernon T. Hill, Langford, near Bristol, showed *Primula japonica* in variety very finely, *Androsace Chumbyi*, *Asperula suberosa*, together with *Aubrietia Fire King* (very bright and good), alpine *Phloxes*, *Erodium corsicum*, *Mossy Saxifrages* and much more in variety. Flowering and other shrubs were pleasingly associated.

HORTICULTURAL SUNDRIES.

The sundries, which are now an important feature of the Chelsea Show, were principally arranged along the Avenue and in an adjoining tent. The exhibits were considerably fewer in number than on previous occasions.

On entering the East Gate, a striking exhibit of stonework, consisting of balustrading, complete with flower vases, garden seats and ornaments, and a paved garden court, decorated with suitable flowering plants, was arranged by Messrs. Pulham and Son, 71, Newman Street, Oxford Street, W. This must have appealed to those who are contemplating alterations to existing gardens or making new ones.

The Dryad Cane and Metal Works, Nicholas Street, Leicester, had a garden house, constructed of a strong Pine framework and roller Bamboo drop sides, and a stout canvas roof.

Patent extension ladders and barrows, suitable for all kinds of garden requirements, were shown by Mr. H. C. Slingsby, Old Street, E.C.

Mr. Arthur Roberts, Leyfield Road, West Derby, Liverpool, showed some useful examples of heating apparatus, including low-pressure boilers in various sizes and some patent ventilating gear.

Mr. Percy F. Bunyard, 57, Kidderminster Road, Croydon, had a comprehensive display of Bunyard's Improved Fumigating Compound in connection with special horticultural sundries adapted for use in the garden and greenhouse. A special feature was the "Incanto" acetylene lamp for garden use.

The Acme Patent Imperishable Labels, with bright letters on a black ground, were shown by Mr. John Pinches, Crown Buildings, Camberwell, who also displayed Rose boxes with patent raiser and hinges, which are most suitable for exhibition purposes. Wire trainers for Roses in the form of umbrella standards, together with patent "Radiate" flower stands, comprised one of the most useful and portable inventions for the exhibitor. Small bottle sprayers were also a feature of this stand.

Mr. Joseph Singleton, 28, Hall Road, Fullwood, near Preston, showed various patterns of the "Muspray," for fixing to water-cans, &c.

The Gripper Manufacturing Company, Howard Road, Leicester, showed some useful articles in the form of a garden walking-stick gripper and foot-scraper.

Portable garden frames and glass houses suitable for the cultivation of either special or general classes of plants were shown by Messrs. James Crispin and Sons, Nelson Street, Bristol, who also had suitable boilers and heating apparatus to use in conjunction.

Messrs. Crookshanks and Macself, 9, Cromwell House, Fulwood Place, Holborn, W.C., had a useful exhibit of spraying machines in various sizes, adaptable for both garden and conservatory work, together with bowls and vases of Bilton ware.

Teakwood chairs, tables and garden furniture of artistic design were shown by Castle's Ship-breaking Company, Limited, Millwall, S.W. These are made from the timber of old men-of-war, and can be adapted for either indoor or outdoor use.

A unique exhibit of old-world garden stone ornaments, in the form of stone pillars for pergolas and paving for garden paths and courts, together with some most ornamental designs of stone lanterns, pigeon-houses and dovecots, were arranged in an artistic manner by Mr. Herbert Jones, Horsecombe Quarries, Combedown, Bath.

The Acme Ladder Company, Summerley Works, Earlsfield, had a useful series of ladders, folding steps and garden barrows.

A variety of syringes and spraying machines, of sizes suitable for various requirements, both indoors and in the open garden, in the most approved and up-to-date patterns, were shown by the United Brassfounders and Engineers, Limited, Holloway Head, Birmingham.

Messrs. G. W. Purser and Co., 92, Hatton Garden, E.C., had a stand consisting principally of spraying apparatus, syringes, hose sprinklers, &c.

Messrs. Drew, Clark and Co., Lea Bridge Road, Leyton, E., had examples of the Diamond patent telescopic and other ladders.

A miniature lawn, showing the use and value of Key fertilisers, was displayed by Mr. A. Key of Norwich.

The Four Oaks Spraying Machine Company, Sutton Coldfield, Birmingham, had a stand showing a selection of spraying machines, pumps for garden use, syringes, sprinklers, &c.

Messrs. Hughes, Bolckow and Co., Dover Street, W., and Battleship Wharf, Blyth, showed a large and varied display of "Battleship" teakwood garden furniture. This included a choice selection of garden chairs, seats, plain and folding tables, in ornamental design; also garden arches suitable for climbers of all descriptions.

Messrs. Thomas Crowther and Son, North End Road, Fulham, showed old garden ornaments, sundials, seats, and figures in marble, lead and stonework.

Folding span garden lights and frames, filled with growing plants to illustrate the value of the system for forcing early vegetables and flowers and for the protection of the more tender plants, were shown in use by the Folding Span Light Company, Slough.

The Leyton Timber Company, Limited, Trundleys Road, New Cross, had an exhibit of summer-houses in rustic work, and garden seats and furniture generally.

Messrs. Pearce and Co., 644, Holloway Road, N., had examples of their productions in the form of greenhouses, rustic summer-houses, and boilers suitable for all types of glass houses.

Messrs. Skinner, Board and Co., Exmoor Street, Bedminster, Bristol, showed an excellent example of their wire tension glass houses, together with the new travelling plant frames and protectors constructed on similar principles. Boilers and heating apparatus were also a speciality of this display.

Messrs. Maggs and Co., Bristol, showed teakwood garden seats, together with folding chairs and tents.

IN THE SUNDRIES TENT.

Fame's Fertiliser, Ichthemic Guano and other fertilisers for which this firm is noted were to be seen and their uses explained at Messrs. Prentice Brothers' stand in the Sundries Tent.

Insecticides, including the famous Gishurst Compound and other well-known remedies, were the leading feature of Messrs. Price's Patent Candle Company, Limited, Belmont Works, Battersea.

Messrs. Walter Voss and Co., Limited, Glengall Road, Millwall, E., showed a selection of sprayers and syringes in conjunction with their noted "Carlton Brand" insecticides and fertilisers.

Horse lawn boots, for use while mowing, rolling, &c., were shown by Messrs. H. Pattison and Co., Greyhound Lane, Streatham, who also had specimens of their patent turf renovators, sprinklers, hose-reels, brooms and weeding appliances.

Messrs. E. A. White and Co., Limited, Paddock Wood, Kent, showed patterns of the Abol syringe with all the latest improvements, in conjunction with Abol fertilisers, insecticides, sprayers and other sundries.

Insecticides, including Cyllene and other compounds, also fertilisers and syringes, were staged by Jeyes' Sanitary Compound Company, Limited, Cannon Street, E.C.

Wakeley's Patent Hop Manure for the garden, which is certainly the best substitute for stable manure, being cleaner in use and quicker in action, was shown on a stand in the tent, and those who find a difficulty in securing a regular supply should write direct to Messrs. Wakeley Brothers and Co., Limited, Honduras Wharf, Bankside, S.E.

Messrs. William Cooper and Nephews, Berkhamsted, had a well-arranged stand, showing weed-killers, insecticides and spraying pumps.

Models of glass houses fitted with lath blind were staged by Messrs. J. Weeks and Co., 72 Victoria Street, S.W., who also had a model of their original Duplex boiler, together with the latest designs adapted to use at any level. The flow is taken off the centre of the boiler, which is arranged to stand at a dead level, enabling the entire system to be worked on the return if required.

The Boundary Chemical Company, Cranmer Street, Liverpool, had a display of their well-known brands of weed-killers, lawn sand, sprayers, syringes and patent cord netting.

Samples of fibrous yellow loam of excellent quality and texture were shown by Mr. A. B. Johnston, New Park, Cranleigh, Surrey.

Improved watering-cans of the well-known "Haws" pattern were arranged in a selection of sizes by Mr. J. Haws, 227, Lower Clapton Road, London, N.E.

Mr. S. W. McLeod Braggins, 6, Tudor Road, Kingston Hill, Kingston-on-Thames, had a selection of landscape garden and other plans.

Some interesting plans and designs of work carried out by Messrs. R. W. Wallace and Co., Kilnfield Nurseries, Colchester, were arranged on their stand, together with proposed schemes for planting.

Messrs. Milner, Son and White, 7, Victoria Street, S.W., also showed various garden plans and designs.

Some well-arranged garden plans and photographs of rock gardens designed by Messrs. Pulham and Sons, Newman Street, Oxford Street, W., were displayed in the tent.

Garden plans were arranged by Messrs. Kent and Brydon, Victoria Road, Darlington.

Plans and designs for gardens were also shown by Mr. William Innes Stuckey, 46, Dyne Road, Brondesbury, N.W.

Messrs. Waterer, Sons and Crisp, Limited, The Arcade, Liverpool Street, and Bagshot, Surrey, had a special selection of garden plans.

CALLA GLORY OF HILLEGOM.

So many novelties reach this country from Holland that the average garden-lover can hardly keep pace with them. Some, however, are of such sterling value that they are deserving of the widest culture. Such a one is the new yellow Calla (or Arum) Glory of Hillegom. In the way of growth it is the grandest yellow Calla in existence, being robust, strong and free. The leaves are large, flecked with silver, and the large flowers, borne upon stout stems, carry a wonderfully pleasing shade of soft yellow, one of the clearest and prettiest yellows it is possible to conceive. At the base of the blossom is a crimson blotch. The flowers are lasting, and I can imagine no more charming companion to *C. elliotiana* than the present subject, *C. Glory of Hillegom*. A good future is assured this plant, and I would heartily commend it to the notice of growers.

P. S. HAYWARD.

THE GARDEN.

No. 2272.—VOL. LXXIX.

JUNE 5, 1915.

NOTES OF THE WEEK.

A New Kew Hand List.—We have just received a copy of the second edition of the "Kew Hand List of Tender Monocotyledons." This has been brought up to date, and is neatly bound in green cloth covers. The contents are arranged alphabetically, so that it is an easy matter to find any genus or species required. This arrangement is much better than the grouping of genera together under their respective Natural Orders. The Hand List can be obtained from the Royal Gardens, Kew, price 1s. 6d. net.

The Snowdrop Anemone.—The pure white flowers of *Anemone sylvestris* are to our gardens in spring what the well-known Japanese kinds are in the autumn. Although its flowers are not so large as those of the many forms of *A. japonica*, they are produced in abundance, and are very effective. We have an attractive mass of it intermixed with the double-flowered *Lychnis diurna*, while at the back of it is a large mass of the rich dark blue *Symphytum peregrinum*. Growing on the edge of a shrubbery, the three make a very charming picture.

Roses and Pinks.—Both Roses and Pinks are such favourites in our gardens that it is surprising we do not more often find them in association. One would not, of course, advocate planting the Pinks between the Rose bushes, but where a permanent edging is needed to either beds or borders, few plants answer the purpose better. Even when not in flower the glaucous foliage of the common sorts of garden Pinks is pleasing, and it is not difficult to keep the plants within bounds. The accompanying

illustration represents Pinks used as an edging to a border of light-coloured Roses, such as *Mme. Abel Chatenay*, *Mme. Leon Pain* and *Pharisæer*, though they would answer equally well for those of darker hues.

Lady Gardeners at Kew.—We understand that owing to the difficulty in obtaining men, a number of lady gardeners are now being employed in the Royal Gardens, Kew. For a period prior to 1903 a few members of the fair sex were admitted as gardeners, but for some reason the practice was discontinued.

Trial of Winter-Flowering Begonias.—We are asked by the authorities at Wisley to publish

the following notice. We must, however, leave it to those who wish to send plants to ascertain whether they send them first and obtain the "necessary forms of entry" afterwards, or *vice versa*: "A trial of winter-flowering Begonias will be held at Wisley during the coming winter. Three plants of each variety should be sent immediately, addressed The Director, Royal Horticultural Society's Gardens, Wisley, Ripley, Surrey (station, Horsley, London and South Western Railway), from whom the necessary forms of entry may be obtained."

A Beautiful Yellow Tulip.—During the last few weeks we have derived considerable pleasure from a colony of the Cottage Tulip *Bouton d'Or*.

spring, and a bed of it at Kew a few weeks ago was a novel sight with the leafless branches terminated with clusters of white flowers. The showy part of each flower consists of a bundle of pure white stamens, about an inch in length, closely packed together, and each flower-head consists of from twelve to twenty of these flowers, the whole somewhat resembling a Bottle-brush. The effect of the whole is very refined and pleasing. It is a comparatively new introduction that will become a popular garden plant when better known. It is a free-growing, bushy shrub that will probably reach a height of 8 feet when mature, though the largest we have seen is only about half that size. *Fothergilla major* is a native of the Southern United States.

The First Roses of Summer.

It may be interesting to record that the first Roses opened in our garden in Essex on Whit Monday, the 24th ult. These were two blooms of the common Pink Monthly or China. On the following day several flowers of *Gloire de Dijon* were fully expanded, and on the 26th ult. the Hybrid *Rugosa Conrad F. Meyer* opened its first bloom. All the plants are growing against a wall with a southern exposure. The last named, though only planted two years ago last February, is now 9 feet high, and promises to reach the roof in the course of another year or two. Its large, silvery pink blossoms are very fragrant.

A Scarlet-Flowered Bulbous Plant.

Although by no means a novelty, *Habranthus pratensis* is one of those uncommon bulbous plants that are very seldom met with outside botanical collec-

tions. At the present time it is looking very bright, growing in a warm border in the Cambridge Botanic Garden. In such a position, and under conditions suitable for the *Belladonna Lily*, it will be found to thrive, and its bright scarlet flowers are conspicuous from a long distance. It is now included in the genus *Hippeastrum*, but is best known under its old name. It was introduced into this country from Chili in 1840, and a beautiful coloured plate of it was issued with *THE GARDEN* for December, 1878. Mr. Davison of Westwick House Gardens, Norfolk, is one of the most successful cultivators of this plant that we know.

Fothergilla major.—This is one of the most uncommon-looking hardy shrubs that flower in

PINKS AS AN EDGING TO A BORDER OF ROSES.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Amaryllis at the Chelsea Show.—We notice that in your excellent report of the Chelsea Show you have given us credit for Messrs. Bull's exhibit of Amaryllis, and in drawing your attention to the error we wish to give credit to whom credit is due.—ROBERT P. KER AND SONS. [We regret that a slip on the part of one of our reporters credited Messrs. Ker with the group of Amaryllis or Hippeastrums shown by Messrs. Bull.—ED.]

New Zealand Spinach.—In "Notes of the Week," issue May 29, the cultivation of this Spinach is recommended, and rightly so. Thirty years ago I saw it cultivated for the first time, and as it was my duty to serve the vegetables

stamens, while the lower one acts as a platform on which insects may alight to enter the flower. It is a native of Western and Southern Europe, extending from Flanders over France to Spain and Italy. Another member of this genus is *L. squamaria*, a native of this country. This is also worthy of attention. It is usually found on the roots of Hazel, but it will succeed on other tree roots. These plants are closely allied to the Broom-rape (*Orobanche*), and were at one time included in that genus. They are readily raised from seeds, which should be sown near the roots of the host plant.—F. G. PRESTON.

The Cultivation of *Lupinus polyphyllus*.—May I be allowed to answer the criticisms of Mr. E. T. Ellis, which appear on page 243, issue May 22. I admit that I over-estimated the length of the roots, but they were certainly 1½ feet to 2 feet long. I discovered the length

better than those moved in the spring do the early drought.—GARDEN STEWARD.

About Apple Blossoms and Other Things. In early childhood I once horrified my elders by expressing a fervent hope that I might never "have to go to Heaven." Dr. Isaac Watts was chiefly to blame for this heterodox remark. The "never-withering flowers" of the hymn associated with a certain Dresden china shepherdess and I did not want to exchange my Buttercups and Daisies for flowers like hers. As for music and white raiment, I frankly hated both as two great trials of my life, in the forms of "practising" and the white pinafores and stockings we little girls wore in Mid-Victorian times—they told such terrible tales of trespasses among coals and jam. "Time cannot wither thee, nor custom stale Thine infinite variety." So said Cleopatra's lover. But methinks it is in part their fugitiveness

which makes flowers so dear a joy. This is one reason why I dislike "bedding" in a private garden. It so soon becomes tiresome and uninteresting. I can even imagine the Rev. J. Jacob might possibly tire of Tulips and Daffodils if they lasted continually (though what he does when their time is over I cannot think, unless, to be Irish, he hibernates all the summer). It is the short stay of the Apple blossoms this year which has given rise to these reflections. Never since first I saw Apple blossom do I remember it so profuse and lovely, nor so short-lived. Being "Cockney, born within sound of Bow Bells," I never saw country sights until, just after the Franco-Prussian War, we moved a little way out of London, and my mother—true to the instinct of her French refugee forbears—immediately planted some fruit trees. Even at this distance of time I recall my breathless delight when first I saw the fruit blossoms, and how, later in the year, I attempted my first painting from Nature—a Louise Bonne of Jersey Pear, whose rich colour caught my fancy. It is still my favourite Pear. *A propos* of Apple blossoms, I do wish Mr. Bunyard and others would tell me which Apples have the

most beautiful flowers. I know Lane's Prince Albert, Bismarck, and the old French Codlin have pretty suffused pink flowers. Mr. Bunyard specifies Lord Derby and Golden Spire in one of his catalogues; but what I want are the names of other Apples which have first-class fruit as well as lovely blossom, to plant in some of the still vacant spaces in my new orchard next autumn.—ANNE AMATEUR.

Golden-Flowered Richardias.—The much-admired group of *Richardia Pentlandii* exhibited at the recent Chelsea Show by Sir James Horlick, West Dean Park, Chichester, served to recall the time when the first golden-flowered species created quite a sensation in the horticultural world. This was on May 19, 1890, when a single plant of *R. elliottiana* was shown at a meeting of the Royal Horticultural Society, and a first-class certificate was awarded it. For the introduction of *R. elliottiana* we are indebted to Captain

LATHRÆA CLANDESTINA, AN INTERESTING PARASITE, GROWING ON THE ROOTS OF A POPLAR IN CAMBRIDGE BOTANIC GARDEN.

to the kitchen that year, which was hot and dry late in the summer-time, I found the New Zealand variety extremely useful. Where naturally dry soils obtain, this Spinach succeeds though the summer variety fails. I find it a good plan to lay down a few Pea-sticks on both sides of the row for the branches to trail over.—AVON.

An Interesting Parasite.—Although a parasite, *Lathræa clandestina* claims attention for its attractiveness as well as from an interesting and curious point of view. It is well worth a place in our gardens or woodlands, particularly in a moist and partially shady position. It grows on the roots of Poplar and Willow, but chiefly on the former, where it will form large masses, which are at first in the form of whitish scales, later producing erect flowers with a purple corolla 1½ inches to 2 inches high, and at the present time they are most conspicuous. The structure is interesting, as the upper lip forms a cowl over the

by digging them up to transplant them in their permanent quarters. "Saved" should be "sowed," as I had to buy fresh seed each year, because my seedlings never developed more than a few weak leaves before dying away until dressed with the soil containing bacteria. I can quite believe that *Lupinus* always remains small near Sheffield, having spent a good many years trying to make plants grow on a hillside not many miles from that town. My present locality is one of the Eastern Counties, the soil very light gravel, the rainfall one of the lowest in England, the summer of last year exceptionally dry, so that the roots would strike downwards more than usual. The seeds were sown in a frame in early spring, then pricked out in a nursery bed, and finally transplanted in the autumn, as I have learned from sad experience that, with such a soil and climate, spring planting is fatal, and that plants moved in the autumn generally stand the winter

Elliott of Farnborough, Hampshire, who had a few seeds from South Africa given him. Only one germinated, but when it flowered it proved to be so distinct and beautiful in its colouring as to be admired by everyone. Fortunately, the plant in question produced seeds which proved to be true to the parent, so that by the summer of 1892 a fair stock was obtained, which on June 17 of that year was sold by Messrs. Protheroe and Morris. The highest price realised for a single plant was 17 guineas, and the lowest 14s., these last being very small. Since then, owing to the readiness with which it can be raised from seeds and from importations of bulbs that have taken place, *R. elliottiana* has now become common, and can be obtained at quite a cheap rate. Apart from the golden colour of its blossoms, a notable feature of *R. elliottiana* is the translucent blotches on the leaves, while the stalks are also mottled.

The second golden-flowered species to make its appearance was *R. Pentlandii*, which was shown in June, 1892, and awarded a first-class certificate by the Royal Horticultural Society. In this species the leaves are larger and thicker than those of *R. elliottiana*, while they are of a very deep green colour. The flowers, too, have a pronounced but for the most part small blotch of crimson at the base. Though the leaves of *R. Pentlandii* are quite green in the typical kind, I have among imported tubers occasionally met with a specimen which, agreeing in all other particulars with *R. Pentlandii*, had leaves sparingly spotted. The species just named was first introduced from South Africa by Mr. R. Wyte, Pentland House, Lee. During the Boer War a considerable number of these *Richardias* made their way into this country. While the common Arum Lily is a native of Cape Colony, these golden forms occur further north, where warmer conditions prevail. While the specific name of *Pentlandii* occurs in the "Kew Hand List" and also in the *Botanical Magazine*, in the "List of Plants Certificated by the Royal Horticultural Society" it is referred to as *R. angustiloba*.

Though such a magnificent group as that shown at Chelsea proves that the culture of these *Richardias* is fully understood, yet it was not always so. A good deal of confusion at first prevailed, owing to the fact that these golden-flowered species were first referred to as yellow counterparts of the Arum Lily, whereas they differ markedly therefrom. The tubers of *R. elliottiana* and *R. Pentlandii* are flattened like those of a *Caladium*, and they both pass the winter in a state of absolute rest. The tubers should be potted in the early months of the year, according to the time at which they are needed to flower, in a fairly rich compost suiting them well. If they are placed in the temperature of an intermediate house, growth will be rapid, both below and above the ground. When the pots are well furnished with roots, an occasional stimulant will be useful. Apart from seeds, which afford a ready means of increase, the tubers produce offsets freely. After flowering, the plants should be encouraged to make good growth, and as the season advances be gradually hardened off. They may for a time be kept almost, if not quite, dry.—H. P.

FORTHCOMING EVENT.

June 8.—Royal Horticultural Society's Fortnightly Meeting and Exhibition, Vincent Square, Westminster, 1 p.m. to 6 p.m.

TULIP NOTES.

BY THE REV. JOSEPH JACOB.

The Coming of the "Self" into Fashion as a Garden Plant.—I remember reading in one of the books that were so eagerly consumed at the outbreak of the war, by way of explaining how it came about that we in England were so ignorant of the German ideal of world conquest, that it took a book a hundred years to cross the North Sea. It has taken a much longer period for the self-coloured Tulip to be appreciated as it undoubtedly should be. It was only after being in our gardens for nearly three hundred and fifty years in its broken or striped form that garden-lovers became aware that the despised late-flowering self colours had very great latent possibilities as plants of high decorative value. They were exceptionally bright, and they flowered at a time of the year when colour was wanted. When the first book *wholly* given up to Tulips was published in 1654 ("Le Floriste François"), the most highly esteemed varieties were the Marquelines or Marquetrines, which had four or five shades or colours in their markings—"C'est cette sorte de Tulipe qui emporte le prix sur les autres."

I suppose Summer Beauty (syn. Striped Beauty) gives us as good an idea as any of the sort of thing that pleased the early seventeenth century Tulip fanciers. Chameleon would be another, and the little-known Kaleidoscope a third that might be instanced. In 1854 it was still stripes, but the many-coloured coat had become more subdued in tone and its ornamentation must be arranged in a particular way. Thanks to such men as Gibbons of Chellaston, Slater of Manchester, and, later still, Hardy of Warrington, Hepworth of Wakefield and Ashmole of Middleton, the present type of pure bases, symmetrical markings, correct shapes and solid colours was practically established. As examples we have Sir Joseph Paxton, Annie Macgregor and Talisman. It was less perfect varieties of a similar type that alone were denizens of our gardens sixty years ago. "Look, my dear," said an old lady to her daughter who was going round my garden a few days before this was written, on coming to a bed full of these striped kinds, "Look, Kathleen, these are the Tulips that we had in my young days." There was no sign of regret at seeing them dethroned. As her eyes wandered on to some selfs in the next bed, she simply said, "I like these so much the best." The old lady, in her obvious penchant for the one-coloured blooms, was but expressing the feelings of nine out of every ten people. At the present moment selfs are in the ascendant. This great change in fashion has thrown overboard all the old divisions, or perhaps I should rather say has caused them to fall into disuse, and the terms "flamed" and "feathered," "bybloemen" and "bizarre" are very little better understood than Marquetrine or Agate of the middle of the seventeenth century. We have a more or less confused mass of varieties filling the modern catalogue which badly need authoritative classification. The present state of things is very mystifying. I sincerely hope that the scheme of the joint committee of the Royal Horticultural Society and the Dutch Bulb Growers' Association will be accepted by all traders, British and Dutch, and that as soon as it is published everyone will do their best to make it known.

Mr. A. D. Hall's Lecture.—Mr. Hall's lecture on the afternoon of the last day of the Conference was intended to serve as an introduction and send off to this new scheme. The fact that so little is known about the parentage of garden Tulips and that the work of breaking up what are obviously hybrid forms into their original species has never as yet been accomplished—Mr. W. R. Dykes of Iris fame is just setting about it, but it will be a long, long way to the end—it is impossible to frame any strictly scientific system of grouping. The one about to be put forward is based on *garden convenience*, and historical and scientific considerations are almost entirely left out of count. "It aims at bringing together those Tulips which have a similar habit and which can be harmoniously associated in the garden." The oldest division that we find in English flower books was that which classed Tulips as early, mid-season and late bloomers. As we have but few midseason varieties, the proposed classification leaves out that section and boldly divides all varieties into early and late flowerers as its main groups.

Those which in ordinary seasons are in full flower before the end of April are classed as *early flowerers* or *earlies*. They are generally of a dwarf habit, and for the most part are self-coloured. The subsections here are two—single and double.

The proposed name for the second main division is *May-flowerers*, and they are described as garden varieties, mostly of a tall and robust habit, which usually flower after May 1. Here the difficulty begins, because, take any principle of useful division that one can think of, the dividing line is exceedingly difficult to draw. There are such numerous gradations both of shape and markings that a wide borderland has to be somewhat arbitrarily divided. The main subsections are (a) Cottage, (b) Breeder, (c) Broken, (d) Parrot, and (e) Species. The last one includes all the true species, which, as Mr. Hall says, have not been "messed about," not necessarily those with Latin names like *retroflexa*, *elegans* and *gesneriana* *spatulata*, which are now known to be but garden hybrids.

Taking the above subsections in order, the *Cottage* is a large amorphous group of self-coloured, generally long-shaped flowers of various tones and shades of yellow, red, mauve, or purple. We may have true cups, like *Bouton d'Or*; long blooms, like *Mrs. Moon*; some with graceful recurving petals, like *elegans* or *retroflexa*; others egg-shaped, like *Fairy Queen*; and so on *ad infinitum*.

The *Breeders* are subdivided into (a) Dutch, (b) English and (c) Darwins. As a group they may be described as self-coloured flowers, opening after the manner of a cup with rounded petals, and as a rule strong and vigorous growers. This characteristic is particularly noticeable in the Darwins, and this, together with their being all white ground varieties, constitutes the salient feature of the section. (All Tulips have either white or yellow grounds, which can be seen by an examination of the base or bottom of a flower, or by peeling off the inner or outer skin of a petal, which then discloses a middle layer which is either yellow or white and of the same colour as is to be seen in the base.) Dutch Breeders are longer and more egg-shaped than the Darwins. English Breeders are more cup-shaped and not so long, and are further distinguished by the *pure* colour of their bases.

Broken Tulips are similarly divided into Dutch, English and Rembrandts, which is the name now given to broken Darwins. To a considerable extent they follow the lines of the Breeder divisions.

Parrots are Tulips with lacinated petals. Up to the present they have all had yellow grounds. There is, however, no reason why there should not be white grounds in the group, as I think it

to reduce the huge mass of Tulips, many so much alike that none but an expert could separate them, and then only after a very careful comparison, to something like manageable numbers, to the relief both of the overburdened trader and the doubtful purchaser. Each suffers from the plethora of names (varieties?).

I hope the gardening public will make use of the Royal Horticultural Society's booklet as

one must see to it that some of the oldest wood is cut away annually, and this can best be done in the summer, just after the first crop of bloom.

Tea Roses such as White Maman Cochet and Marie van Houtte, which also were left unpruned against walls, have buds swelling rapidly, and the liquid manure just given should make them yield fine quality flowers. It goes without saying that Roses allowed to carry large quantities of

buds must be correspondingly fed, and now is the time to do it.

Thinning Shoots.—I would urge upon amateurs the need for a thorough thinning of weakly shoots from the centres of the plants. If retained, they make a fine retreat for insect foes, and when one is spraying they hinder the more effectual carrying out of the work.

Feeding.—One must not forget that the very wet winter has consequently deprived our Roses of much of the soil nourishment in the shape of potash, &c.; so that it will be necessary to replace this shortage by timely dressings of a good all-round stimulant, such as Clay's Fertilizer, Wakeley's Hop Manure or Ichthemic Guano.

Keeping Down Weeds.—I do not recall a worse season for weeds, and with shortage of labour it is as much as one can do to keep them down. Timely hoeing is the best remedy, and for amateurs this should not be an onerous task; but where one has acres to go over, it becomes a most strenuous occupation. Happily, by planting 600 to 800 plants a yard apart in long rows, one can use a pony hoe to much advantage. I would strongly advise amateurs to obtain a Buco Cultivator. It is a grand tool, and allows one to walk backwards and loosen

the soil, so that treading on the ground after it is loosened is avoided. The Canterbury Hoe is also excellent for prodding up rather stiff soil; and another hoe I came across last year, called the "Andyho," is a great labour saver. One side is pointed arrow shape; the other, wedge shape; and, being made of best steel, it gets over the work admirably. I believe in a good loose surface, so that air, warmth and water may enter freely. Mulchings of manure before June are a positive nuisance.

Mildew.—Where mildew has been troublesome in past seasons, I would advise a liberal dressing of green sulphur to the soil. This, together with careful spraying with Seride No. 2, will enable anyone to keep fungoid and insect pests in check. For the ordinary Rose grub the thumb and finger is the safest remedy, and the plants need going over every day, and even twice a day, if we would free them from this terror.

Rose Species.—The lovely little Scotch Roses will soon be opening, and there are also many beautiful gems among the various species which I would make a claim for, where space permits. I have a walk containing some three hundred different varieties of ramblers and what I term "uncommon" Roses, and it is a real delight to watch the daily opening of the different kinds. Here I have planted the old Apothecaries Rose and many of the dear old Gallicas and Hybrid Chinese that so delighted our grandparents. DANECROFT.

SOME OF THE POLYANTHUSES IN THE GARDENS AT WOODSIDE.

is now generally recognised that any variety may sport into a Parrot form. Within the last three or four years Messrs. Barr and Sons have listed such a one in their byblœmen with lacinated petals—Sensation.

The *Species* I have already referred to. Some of those usually placed under this heading in catalogues may in time be found to be hybrids. Like Haworth's species Daffodils, when tested by the process of seedling raising they may be found wanting.

The Conference Show.—A cut-and-dried scheme like the above would lose more than half its value unless every Tulip was placed in its proper subdivision, and grouped in those subdivisions according to its colour. This was, as I said last week, one of the reasons for gathering together such a large collection at Vincent Square. In the case of the Cottages and the Darwins, the long and difficult process of selection and combination has been carried out very fully. It will be a guide as to the different varieties that may be grown together without any clashing of colour, and in this way it will be of great utility to gardeners. To make things still plainer, a typical flower has been selected in each colour group, so that there may be no doubt as to what is the colour meant. About four of the best varieties in each have been singled out for detailed description. In this way I hope a start has been made

soon as it is published. I am sure it will prove an immense boon to all if it only comes into general use.

PROSPECTS OF THE ROSE SEASON.

I CANNOT recall a more promising season for Roses than the present. The glorious sunshine of last summer ripened the wood so effectually that we are now reaping the result in fine, healthy growths. I also consider it a very early season, especially for the Teas and Hybrid Teas. The Rose species are, if anything, a few days later. Last year Rosa Hugonis was out well on May 15; this year it did not open until May 20. The first to open with me this year was Rosa sericea pteracantha on May 19.

In my part of Essex we have had little or no spring frosts to check growth, so that Roses such as Irish Elegance, which I never prune, are covered with delightful, healthy buds. Some of the Pernetiana Roses, such as Mme. Edouard Herriot, Lyon Rose and Mme. Ruau, which I purposely left unpruned, are carrying splendid buds. I feel sure, given a good spring, this class of Rose may be left practically unpruned. Of course,

SEASONABLE NOTES ON AURICULAS.

THE bulk of the repotting should be done in May; but where it was not possible to complete the work, no time should be lost, and the end of June ought to see the repotting finished. Exception, of course, must

be made with those plants that are being used for seed purposes; but directly this is gathered, they may be repotted. All seed-bearing specimens must be kept well supplied with water, or the seed will be poor in quality and slow in germinating.

Suitable Positions for the Auricula.—The hot, dry months of the year are always trying for Auriculas and, in fact, most of the Primula family, and whenever possible a cool, shady spot should be chosen. As a general rule, there are a few frames that are not required at this period of the year, and if these are arranged on the north side of a high wall or building, an excellent position can be provided. A sprinkling of fine ashes on the bottom will help to keep the plants cool and prevent them from becoming dry so frequently.

General Remarks.—All those plants that were repotted early in May will now be rooting well, and, as root action increases, water may be afforded more liberally; but until this stage is reached, moderation with the water-pot must be the rule, and only sufficient water should be given to prevent the foliage from flagging. A few of the lower leaves will perhaps turn yellow, and these should be picked off when they will readily part from the stem. In a previous article reference was made to the flower-stalks; at this season they will begin to wither up, and may be removed directly they will easily leave their base. At this point decay occasionally commences, especially among the show varieties, if the watering is done carelessly. A little powdered charcoal or lime will stop it if applied in the early stages. When arranging the Auriculas in the frames, the alpines should be placed in one batch and the shows in another, as this method enables the grower to ventilate to suit each kind. Throughout the summer and early autumn plenty of fresh air is necessary, and the lights can be removed on all favourable occasions. The show varieties are more or less covered with a white meal or farina, therefore it is not advisable to expose the plants to heavy rains; but with alpines it is different, as light showers are more beneficial than otherwise. The collection ought to be gone over at intervals and each plant examined. It can then be ascertained if any plants are too wet or not thriving from some other cause.

Cleanliness.—It has been stated before that this is a most important point in the cultivation of Auriculas, and it is often overlooked by the beginner, except when his plants are flowering. Whenever green fly is noticed, the frames must be vaporized at once, and care should be taken that all the woolly aphid is destroyed

around the collars of the plants. One year I was troubled with a caterpillar similar to that found on the Cabbage tribe, and several plants were badly disfigured before this destructive pest was discovered. It is usually found on the under sides of the leaves, and may be picked off if only a few are present; but, personally, I give the frames a light fumigating, then none is missed.

Suggested Additions.—It is not always possible for amateurs to visit shows or trade collections, therefore this short list of names may be helpful to some: Alpines.—Admiration, Dazzle, Ettrick, Majestic, Prince of Tyre, Phyllis Douglas, Miss Berkeley, Blue Bell, Teviotdale and Golden Dustman. Show.—Daffodil, Harrison Weir, Mikado, Acme, Heather Bell, Marmion, Prince Charming and Mrs. Henwood. T. W. B.

THE TREATMENT OF GENTIANA ACAULIS.

THIS delightful Gentian is rather variable in its behaviour, for in some gardens it flourishes, while in others it fails to thrive. As it is particularly successful here, my method of culture may be of interest. It delights in full sunshine and a moist, loamy soil, and if it can be given a position that is free from excessive moisture in the winter and yet can be kept moist at the roots in the

as soon as it is dry enough, to give it a good treading. A top-dressing after flowering is always followed by good results, and at this season of the year a layer of granite chips placed around the plants will do much to preserve moisture at the roots. Transplanting may be carried out successfully immediately after flowering or early in September, but the former time is preferable. Satisfactory results are obtained by dividing the roots at either period; but the practice of reducing the plants to single crowns does not find favour, as better results are obtained by planting fair-sized specimens.

Gloucester.

J. GARDNER

GARDENS OF TO-DAY.

WOODSIDE, CHENIES, BUCKS.

ALTHOUGH the gardens at Woodside, the country residence of Adeline Duchess of Bedford, are not of a very extensive character, it would be difficult to find a more pleasing and interesting spot during the spring months. Situated at the foot of a rather steep slope, with the river Chess running through the whole length of the grounds, the best possible use of the space has been made.

AURICULA GOLDEN QUEEN AND MYOSOTIS ROYAL BLUE, A DELIGHTFUL COLOUR COMBINATION IN ADELINE DUCHESS OF BEDFORD'S GARDENS.

summer, there will be little difficulty in growing it well. Light, sandy soil is unsuitable, but good loam with a little leaf-soil and mortar rubble added suits it admirably. Plant very firmly and give water at the roots in dry weather, also damp the plants overhead after hot days. Under these conditions it makes healthy growth and produces numerous flower-heads. If the ground becomes loosened by frost in the winter, it is advisable,

What most of all surprises the visitor is the beautiful effect which has been obtained in a comparatively short period. It was only in 1912 that Mr. J. Dickson, the head-gardener, undertook the work of forming the banks of the river into long stretches of rock garden, yet at the present time they are clothed with such a profusion of flowers that one might be reasonably pardoned for thinking that they have been in

existence for ten or fifteen years. In designing this rocky bank, Mr. Dickson very wisely devised a grass pathway between the upper portion and that next to the water, so that a border of about four feet in width runs along by the river's margin. Naturally, this provides splendid scope for growing

erect flowers being produced freely on sturdy, tufted plants. The colour is particularly good, and this plant should have a brilliant future in store for it.

Close by is a rock and water garden constructed as recently as 1913, yet it is now covered with a

will be obtained. Daffodils are naturalised by the thousand in the grass, and we were very pleased to notice a number of plants of *Fritillaria Meleagris*, with their curiously chequered, nodding flowers.

The whole of these gardens owe not a little of their charm to the great personal interest taken by Adeline Duchess of Bedford, who has an intimate knowledge of all flowers, and especially alpine and hardy herbaceous plants.

A PORTION OF THE ROCK AND WATER GARDEN CONSTRUCTED DURING 1913.

moisture-loving plants, such as Japanese Irises, *Lythrum*s, *Primulas* and many kinds of *Day Lilies*, the latter appearing to thrive either in dry or moist situations, although doubtless the best effects are obtained where the soil is cool and damp. On the upper portion of the bank, limestone boulders of many sizes have been cleverly arranged to form pockets and cavities for numerous choice rock plants. We do not ever remember seeing *Saxifrage*s, especially those of the *Encrusted* section, doing better than they are here, large tufts, some of them 18 inches or more in diameter, showing excellent promise of a rich floral display a little later.

At the time of our visit the charming *Arabis aubrietoides* was flowering profusely, large tufts, 2 feet or more in diameter, being studded with the rose pink flowers. We were also particularly interested in a very fine group of *Auricula Golden Queen* grouped behind a little collection of *Myosotis Royal Blue*, a *Forget-me-not* which abounds by the thousand in these gardens, and which, we believe, originated here. The combination of the pale yellow flowers of the *Auricula* with the brilliant blue of the *Forget-me-not* was particularly good. Such *Aubrietias* as *Mrs. Lloyd Edwards*, *Lavender*, *The Gem*, *Fire King*, *Bridesmaid* (with flowers of the palest rose) and *Dr. Mules* were making vivid shades of colour; while *Daphne Cneorum*, *Viola gracilis* and *V. Chenies Blue* all added interest and beauty to this feature of the grounds. The last-named *Viola*, which was raised by Mr. Dickson, is one of the richest blues we have seen, the large, bold,

very choice and pleasing collection of well-grown plants, seedling *Saxifrage*s raised at *Chenies* abounding everywhere. Mr. Dickson has for many years devoted his abilities to the raising of choice plants, and we do not ever remember seeing a better collection of *Polyanthuses* than he has. They are really a wonderful lot, some of the deep orange yellow shades being quite unique.

In obtaining these colours, the vigour of the plants, length of flower-stem and size of bloom have been retained. Another very pleasing section of these spring flowers is that of dark colours with silver lacing to the petals. Some of these are almost claret colour, others bright red, and others, again, nearly black, with almost every imaginable shade between, the dainty silver margin giving a very refined finish to the flower.

In the greenhouses we were particularly interested in a remarkably fine strain of *Primula obconica*. We have never seen flowers of deeper and richer colour than these, those of carmine hue being of exceptional merit. One most interesting plant in full flower Mr. Dickson claims to be a cross between *Primula obconica* and *P. malacoides*. Certainly the flowers have the appearance of being midway between the two, the petals being lacinated similar to those of *P. malacoides*, but the size of the flowers and the sturdiness of stem more approach those of *P. obconica*. It is an exceedingly pretty plant, and has been named *Market Pink*.

The wilder parts of the grounds have not yet been fully developed, though sufficient has been done to indicate that some very beautiful effects

and old mortar added, form a suitable soil mixture. As with all plants, thorough drainage is necessary. The bulbs ought to be arranged equidistant round the sides of the pots, with one in the centre, and covered with not less than an inch of soil.

A cold frame with a coal-ash bottom is the best place to stand the pots containing the bulbs, and watering must be done carefully until the long green leaves appear. As the days get cold and short, the plants may be taken to a greenhouse where the temperature ranges from 45° to 50° Fahr. Hard forcing with a higher temperature is one of the most prolific sources of failure in the cultivation of the *Freesia*. Frequent fumigations with nicotine to keep down green fly are most essential, as this ubiquitous pest has a partiality for the tender leaves. Owing to their slender foliage and flower-stems, *Freessias* need supports of some kind, and I know of nothing better than twigs from an old Birch broom, or Allwood's Patent Wire Support, an ingenious coil of wire that can be easily and quickly fixed to one central stake. Where flowers are required for cutting, a large number of bulbs may be grown in boxes, but these ought not to be less than 3 inches deep. The bulbs may be placed 2 inches apart.

In addition to the ordinary *Freesia refracta* and its variety *alba*, there are the beautiful golden yellow hybrid known as *F. Chapmanii* and the purple and mauve *Tubergen* hybrids, all of which are worthy of a place in every conservatory in the country.

FREESIAS FOR CHRISTMAS.

ALTHOUGH the festive season is still a long way off, there is no time to lose if flowers of the fragrant *Freesia* are to be available then. It is strange that the *Freesia*, which is a universal favourite, is so seldom grown in large quantities. The bulbs are cheap and the cultivation simple, while the flowers are much more highly prized than the earliest *Daffodils* and *Hyacinths*. There is no better time for potting *Freesia* bulbs than the end of June or early July, and for early flowers only the largest and most solid should be selected. Pots 5 inches or 6 inches in diameter are the most useful, these taking respectively six and ten large-sized bulbs. Rather light, turfy loam, flaky leaf-soil and old, dried cow manure, with a dash of coarse sand

SEASONABLE NOTES ON CHRYSANTHEMUMS.

THE heavy rains of May have been very beneficial to these plants, washing the foliage cleaner than any hand syringing would, and also freeing the tender shoots from green fly. Since these rains came, the young shoots, resultant from stopping by hand or natural breaks caused by the formation of buds, have made splendid progress, and this should be maintained by careful watering and syringing when the weather is suitable.

Plants in Rows.—When arranged in rows, the pots containing the tallest plants should be quite 2 feet apart. If grown for exhibition purposes and three branches are allowed for each plant, counting in the space occupied by the leaves on those branches, there will not be much open space left for air to pass through. The dwarf-growing plants may be placed 18 inches apart, not nearer; and if there is ample room, I would allow 2 feet in their case also.

Staking.—In every instance when engaged in putting the tall stakes to the plants, insert them on the north side. If already inserted when the plants are being arranged in the rows, it is a very

easy matter to turn the pot round so that the stake will be on the north side. This is, at first thought, a very unimportant item in the general management; but the stake used, often thicker than the stem of the plant, would permanently shade the latter from the sun's rays, a really important matter, especially in cool summers and when there is not an average amount of sunshine.

Side Stakes.—To each plant grown for the production of three or four blooms, a like number of stakes are used by many cultivators; but in the case of amateurs in town and suburban districts, stakes are not easily procured, except Bamboo canes, which are expensive, but desirable where money is not an object. Only in dealing with plants growing more than 4 feet 6 inches high should more stakes than the central one be used. The majority of the dwarf varieties possess strong, sturdy shoots which are very short-jointed when well grown. The side branches of these may be looped with broad strands of raffia to the central or only stake used. Do not tie nearer than 6 inches to the top of the shoot; then there will not be much danger of loss from breakages.

Plants for Lifting.—Early, medium early and late varieties may be planted in prepared ground for lifting and potting in due course. The early flowering ones will be nicely established in the

borders, but the late flowering varieties, of which I may name that grand white Mme. R. Oberthur and others desired for December and Christmas supplies of blossom, and propagated in March, will now be in good condition. Sturdiness and a bushy growth are two desirable features, and, to obtain them, rather severe cutting back must be the rule, especially in the case of Mme. R. Oberthur. This variety assumes a straggling habit if not cut low down in its early stages. When plants are lifted from the open borders to be placed in pots, it is desirable that they possess plenty of small or fibrous roots as close to the main stem as can be secured. To this end the cultivator must mix with the ordinary border soil some good loam, leaf-soil, rotted manure and road grit, if the latter is obtainable. A bushel of this mixture will be sufficient for nine plants. It must not be scattered broadcast, but locally, in the rows marked for the plants. Place stakes early for the support of the plants, as if they once fall apart the branches will not be easily rearranged.

Old Plants in Borders.—These are retained in many gardens undisturbed for a number of years, and bear, as a rule, many but rather small flowers, which are useful for border embellishment and in a cut state for vases. At the present time the clumps can be much improved by thinning out the weakly shoots, watering in dry weather and feeding liberally afterwards. . . . AVON.

THE ROCK-GARDEN BANK AT WOODSIDE. THIS WAS MADE AS RECENTLY AS 1912.

ROSE-GROWING IN TOWN GARDENS.

THE town gardener is now at his busiest time, and it is difficult for him to keep pace with the work entailed by his Roses alone. The remainder of the garden may be calling for attention, and there are doubtless many other additional demands upon his time (especially if he has become a Special Constable), but the Roses will brook no delay. If the work is systematised, much may be done at odd moments. Perhaps half an hour can be spared before breakfast; but if this is devoted only to a haphazard overlooking of the trees, it is not likely to be of much benefit, whereas if the beds are divided into sections and each of these is examined in turn, the result will be a decided lessening of the maggot and aphid tribes. Ruined foliage is always unsightly, and no pains should be spared to catch the insects before they have had an opportunity of doing much damage.

Almost as important as pruning is the removal of the superfluous "eyes" and shoots. As far as possible these should be taken out in their earliest stages with the point of a knife, but it is sometimes difficult at that time to discern all that need removing or to judge which are best left. Weak shoots in proximity to stronger ones should always be taken out, and it is, of course, unwise to allow several growths to come close together. Vigorous plants throw three growths from many of their "eyes," and of these the centre one only should be retained, though, since the others will remain almost dormant for a while and an accident may happen, it is not advisable to hurry the removal of the other two.

In the process indicated the chief thing to bear in mind is the future shape of the tree, and if the grower will picture to himself the effect of a few weeks of active growth upon the "eyes," he will have little difficulty in knowing which he can best do without. Shoots which are growing inwards towards the centre of the plant can be dispensed with far better than those which are pointing the opposite way.

There are also a number of growths which, for one reason or another, "go blind"—that is, they produce no buds. These should be cut out as soon as the fault is detected, and this will help to concentrate the energy of the plant upon those which will produce flowers. This limitation of the number of shoots goes a long way towards correcting errors in pruning, and if carried out judiciously it adds materially to the quality of the blooms, besides lessening the labour of keeping the trees clean, for the weak shoots which are removed are those which would be most infested by aphid and fungus.

Very vigorous Roses which have not been pruned hard should now be examined to see if they are breaking freely from the lower "eyes" as well as the topmost ones. Some kinds will do so naturally; others, like Frau Karl Druschki, need a certain amount of coaxing. Bending the shoots over and tying them to a stake in the ground will usually have the effect of starting the lower growths going; and in the case of semi-climbers, such as Hugh Dickson or J. B. Clark, this should always be done. After they have been tied down for a week or two, these growths can be released if it is desired to have them in an upright position.

P. L. GODDARD.

THE TREE HEATHS.

ALTHOUGH the title of Tree Heath is applied indiscriminately to a number of the more vigorous kinds, it is perhaps only strictly applicable to one species, *Erica arborea*, and even in this case the plant forms a large bush rather than a tree, the thick, woody branches probably accounting for the prefix. As, however, the tall-growing kinds form a group quite distinct from other hardy sorts typified by the common Heather and the Cornish Heath, they may well be taken together, especially as all respond to the same treatment.

They are natives of Southern Europe, and are not above reproach as regards hardiness, though there are many parts of the country where they thrive excellently, and even in colder places frosts severe enough to injure them severely are only experienced now and then. Moreover, it is always possible on the approach of frost to scatter dry leaves about the lower parts of the plants and intermix a few dry Aster tops or a little Bracken with the branches, which will prove a great protection. As is the case with other ericaceous plants, they give the best results when planted in light loam free from lime, or in peaty soil. When soil is made up for Heaths, it is a mistake to introduce a lot of peat; rather allow the bulk of the material to be sweet, sandy loam and fork a little peat into the upper part. Propagation is easily effected during July and August by means of short cuttings of young shoots dibbled into pots of sandy peat and placed in a close frame until rooted. For the first two years of their lives it is advisable to remove the points of the shoots occasionally, to induce a bushy habit. In after-life no regular pruning is needed.

The Tree Heaths may be put to a variety of uses, but they are seen to the best advantage when arranged in groups of considerable size, preferably beneath a scattering of mature Scots Pines, the golden trunks of which harmonise well with the undergrowth. Then, by a judicious mingling of groups of various kinds, the area may be made to present an irregular surface, some sorts being several feet taller than others, thus exhibiting the flowers to better advantage than would be the case were the same area planted with one sort. When naturally undulating ground can be planted, the effect is even more pleasing, the undulations accounting for different height levels among the heads of the bushes. The following species fall naturally into the group under notice:

***Erica arborea*.**—One of the commonest Heaths of the Mediterranean region, and interesting from the fact that it is chiefly from the large, woody nodules which are formed on its roots that the popular Briar-root pipes are made; not from the roots of a Rose, as some people imagine. In its native habitat it attains a height of 18 feet or 20 feet, but is usually below 10 feet high in this country, though an example nearly eighteen feet high existed a year or two ago in the gardens of Tresco Abbey. The leaves are dark green and the flowers white. The latter commence to open in February, and are at their best between March and May. During that period the leaves are almost hidden by the flowers, which, in addition to being very attractive, are delightfully fragrant. A variety called *alpina* is of more plumose habit, with somewhat brighter leaves. It is rather hardier than the type.

E. australis is a loose-habited bush from Spain and Portugal. It usually grows from 4 feet to 6 feet high, with a few branches clothed from base to summit with secondary shoots, which blossom freely from March to May. The flowers are larger than those of the other Tree Heaths, and are bright red in colour. Curiously, although other kinds thicken up quickly by repeatedly pruning the young branches, this one never appears to form a dense bush. It is not a disadvantage for it makes a change among other kinds.

E. lusitanica is often called *E. codonodes*, especially in the South-West, while it is also known as the Portuguese Heath. It is a native of Spain and Portugal, and is a common plant in gardens in the South of England, where it is found as a bush 4 feet to 10 feet high, with elegant, plumose branches clothed with bright green leaves. The flowers usually commence opening in November or December, and are at their best during February and March, but often last until May. They are longer than those of *E. arborea*, and are scentless. A pretty effect is produced by the mixture of unopen buds and expanded flowers, the former being pink and the latter white. Good-sized branches are excellent for cutting for house decoration.

E. mediterranea is a common and fairly hardy species which may be met with between 4 feet and 12 feet in height, the latter proportions rarely being attained in this country. Its branches freely and covers a considerable area of ground. The pinkish or reddish purple flowers are borne from March to May. There are several varieties, such as *alba*, with white flowers; *nana*, of dwarf habit; and *hibernica*, a glaucous-leaved form which is found wild in Ireland. The low-growing hybrid between this species and the alpine *E. carnea* has the longest flowering period of all hardy shrubs, for it may be found in bloom from October to May, and for four months it is in full blossom.

E. scoparia, a tall, upright-growing kind from Southern Europe, is distinct, but of no horticultural value, for its flowers are not showy. It is possible that some of the root nodules used for pipes may come from this species.

E. stricta is a pink-flowered species growing from 3 feet to 5 feet high. It is of stiff, upright habit, and blooms during July and August. As far north as Derbyshire it can be grown at an altitude of 1,100 feet.

E. Veitchii is a free-flowering hybrid between *E. arborea* and *E. lusitanica*. The flowers are white and the plant intermediate between the parents. It has been found useful for growing in tubs and pots for greenhouse decoration in the winter.

D.

TREATMENT OF SHRUBS AFTER FORCING.

AFTER flowering, Lilacs should be pruned into shape, and planted out as soon as possible. If allowed to remain a season without being forced, good plants will be available the second year. If any seed-pods of *Azalea indica* remain on forced plants, these should be removed with as little delay as possible. All necessary potting may be done now, and the plants placed in a temperature of 66°. Keep the syringe frequently at work among them in order to keep thrip in check. Deciduous Azaleas which were potted previous to forcing will not require potting now, but should be encouraged to make fresh growth, and may eventually be plunged in ashes in the open.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Late Vines.—As soon as the bunches have set, no time should be lost in removing the surplus bunches. Carefully tie down the shoots to the trellis and remove all superfluous growth. Commence thinning the berries as soon as possible, as they swell very quickly at this time of the year. Thin first those varieties which set their berries thickly. The borders should now be in need of a thorough soaking with diluted liquid manure. To encourage roots to the surface of the border, an occasional light sprinkling with Le Fruitier or some other suitable fertiliser may be given. Use artificial heat as sparingly as possible, and damp the bare surfaces in the house frequently during hot weather.

The Orchard-House.—Fruit trees growing in pots must be frequently examined at this time of the year to see if they need water, as any neglect in this important matter will have a detrimental effect on the quality of the fruits. Plenty of stimulants may now be safely given, as the pots will be full of roots. The fruits can be finally thinned when the stoning stage has passed. If fruits of good quality are desired, the trees must not be overcropped. Stop all lateral growths at the fourth or fifth leaf, and remove others freely where the trees are becoming too dense. Syringe the foliage vigorously twice daily, and, to keep the trees free from aphids, fumigate occasionally with a nicotine compound.

Plants Under Glass.

Bouvardias.—If very large plants are desired, they should now be planted out on a well-prepared border. Put the plants out about eighteen inches apart, and if the weather is hot at the time of planting, shade them during the hottest part of the day. During the earlier stages of growth the shoots must be pinched to encourage a bushy habit. Plants in pots should be plunged in ashes in cold frames.

Climbing Roses.—Timely attention to the thinning of the young growths will save much time later on, as the young shoots quickly grow into an entangled mass. Give the plants plenty of stimulants, and, if not already done, mulch the roots with manure.

Caladiums.—Give plenty of stimulants to plants which are well rooted, or they will quickly lose their decorative value. Some of the large-leaved kinds must be supported by neat stakes. Do not expose them to the sun during the hottest part of the day, as the leaves are liable to scorch.

Primulas.—The earliest plants may now be placed in cold frames, plunging the pots in ashes. Recently potted plants will need very careful watering till they have again become well rooted.

Cannas.—These may be repotted if necessary. The Canna is a gross-feeding subject, and requires very liberal treatment as to soil. When well rooted, plenty of stimulants are necessary to develop the flowers perfectly.

The Flower Garden.

Roses.—Where time permits, it is a considerable benefit to the plants to remove the weak, useless shoots. In the event of a dry summer, the beds should be mulched with some suitable material. Syringe the plants at least once a week with an insecticide to keep down aphids and mildew.

Herbaceous Borders.—Pay timely attention to the staking of the plants and thin severely those which are too thick, for the true character of many of the species may be spoilt if they are overcrowded with growth.

Watering.—Most of the strong-growing herbaceous plants need abundance of water; therefore, in the event of a continued spell of drought, watering must be attended to. A sprinkling of soot between the plants prior to watering will be of great benefit. The hoe should be freely used between the plants. Recently planted trees and shrubs must be watered if necessary.

The Rock Garden.—In very dry weather the plants ought to be liberally soaked with water. In some cases it will be found that the roots have become exposed by constant watering. In this case a little fresh soil should be added. The

growth of many of the strong-growing plants must be restricted, or they will injure those of less vigour.

The Hardy Fruit Garden.

Morello Cherries.—It is very important that Cherry trees should be kept free from aphids, as this pest does a great deal of damage, not only to the young growth, but also to the fruits. Regular spraying with an insecticide is the best way to deal with it. This work should be done late in the afternoon. The trees ought also to be well washed with the garden hose. The young growth must now be finally thinned or stopped.

Sweet Cherries.—Netting must be fixed over the trees to protect the fruits from birds, which often commence their attacks before the fruits are ripe. Stop all the surplus growth and lay in the leaders. Give the trees plenty of water at the roots.

The Kitchen Garden.

Chicory.—Seeds of this valuable winter salad may be sown now. Sow in drills about a foot apart. Should the ground be dry, water the drills before sowing the seeds. When the young plants are large enough, thin them to 9 inches apart.

Ridge Cucumbers.—These may now be planted out. They can either be planted on mounds of soil on a hot-bed, or a ridge of soil may be placed along the hot-bed, planting them about three feet apart. Encourage free growth by sprinkling the plants twice daily during hot weather.

Climbing French Beans.—These will be found of great value where large supplies of vegetables are in constant demand. The seeds may be sown in rows and grown much in the same manner as Scarlet Runners.

Onions.—Those which were planted from boxes or pots must be liberally supplied with water, and during fine, dry weather the hoe should be kept going between the plants. Autumn-sown Onions must be fed liberally with manures, so that the crop may be fit for use as early as possible.

Lettuce.—Make frequent small sowings of Lettuce and prick out the young plants when large enough. Afford them plenty of water and hoe frequently between the rows.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

Fruit Under Glass.

Early Vinery.—As the Grapes are now colouring nicely, less moisture in the atmosphere must exist and the ventilators be used more freely. Air should be allowed a free circulation from both top and bottom ventilators during the night-time as well. The variety Madresfield Court is very subject to cracking some of its best berries at this period, and one of the best recognised cures is to discontinue the pinching or stopping of all laterals until the fruit is ripe.

Successional Vines.—The thinning of Grapes having now been completed, the borders, especially indoor ones, will require occasional supplies of water. This should always be accompanied by liquid obtained from either cow or sheep manure. Failing this, some rich manure, such as guano, should be mixed with the water. If liquid or manure from a stable is used, care ought to be taken to leave the top ventilators open slightly to allow the ammonia fumes to escape and so avoid injuring the foliage.

The Hardy Fruit Garden.

Strawberries.—Should very dry weather prevail while the fruit is swelling, water must be given if large fruit in quantity is desired. Where portable frames and lights are available, with their aid the ripening of a few fruits can be hastened by a few days if necessary.

Orchard Trees.—The hoe should be used freely, not so much to keep down weeds, but to try to conserve as much of the moisture in the soil as possible. Grafted trees ought to be examined occasionally to see that the wrappings and ties are intact and not exposed to the air.

The Kitchen Garden.

Cauliflower.—More seedlings will be ready for planting, and these ought to be set out at a slightly greater distance apart than the early crop. After planting, dust around with soot to check slugs.

Peas.—This popular vegetable succeeds best during a warm and moist season; but if the ground was well prepared beforehand, the crop is not so likely to be affected by the weather conditions. Mildew is often troublesome, and spreads at an alarming rate. If possible, this crop should be grown in different parts of the garden for this reason. During very dry weather, when time can be spared, watering is of great assistance in adding to the length and productiveness of the crop.

French Beans.—Seed sown now will keep up the supply during August and well into September. As soon as the plants appear above the ground, dust with soot or gritty sand to keep away slugs.

Winter Greens and Savoys.—Another sowing might still be made to supply plants for filling up ground which will have been cleared of Potatoes or perhaps Strawberries by the first or second week in August.

Jerusalem Artichokes can be earthed up in a similar way to Potatoes. As growth proceeds, hoeing will not be needed much longer to keep down weeds, as the foliage is sufficient to smother all other vegetation growing underneath.

The Flower Garden.

Bedding Out being a very large undertaking in some establishments, routine and other important work has to remain untouched until this is completed. If most of the other operations were got well in hand previous to the bedding out, the task of catching up will not be so great. The advantage will be here seen of using a number of more hardy plants, which can be put out earlier in the season, and so avoiding a rush at this time.

Spring Bedding Plants will still be flowering freely, and cannot be disturbed yet. Especially is this the case where Darwin and May-flowering Tulips form part of the scheme. These must first be allowed to partially mature their young bulbs before being lifted temporarily, and this will not be for a few days yet. Alyssum, Aubrietia and other plants which will be required again in the autumn should be cut over and carefully laid in a vacant spot.

Clematises.—These climbing plants require occasional attention to keep them tidy, as they grow very quickly at this season, and, if not attended to in time, are apt to grow into an entangled mass, which it is almost impossible to tie up and regulate later on, besides giving the plants a bundled up and unnatural appearance.

Reserve Garden.—Where accommodation will permit, a surplus from the bedding out plants can be grown apart from the flower garden. This, in the case of such plants as Geraniums, would prevent stripping the plants which are flowering during August and September, when propagation-time arrives again. Varieties of Pentstemons which are scarce could also be planted here and given an occasional topping to produce a larger number of growths for cuttings.

Plants Under Glass.

Tree Carnations.—The final potting must soon be completed for plants which are expected to commence flowering in October, a time when a good supply of blooms is usually in great demand and when outdoor flowers for cutting get scarce and of poor quality. For most growers' purposes 6-inch and 7-inch pots are the general sizes used for the final potting; but for very late-struck plants 5-inch and 5½-inch pots will be large enough. The compost should contain plenty of crushed brick and charcoal, clean leaf-soil and fine oyster-shell. This latter ingredient is much better than the lime rubble so often advocated for these plants. The loam used must contain a large proportion of fibre. Silver sand, soot and some Carnation manure should also be included. Where the roots have matted around the crocks, it is best not to disturb them at all. Fly and thrip usually make their appearance at this season, so an occasional fumigation must be given.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish expert advice.

The Editor welcomes photographs, articles and notes, but he will not be responsible for their safe return. All reasonable care, however, will be taken, and where stamps are enclosed, he will endeavour to return non-accepted contributions.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

The Editor will not be responsible for the return of artistic or literary contributions which he may not be able to use, and the receipt of a proof must not be taken as evidence that an article is accepted. Publication in THE GARDEN will alone be recognised as acceptance.

Offices: 20, Tavistock Street, Covent Garden, W.C.

ANSWERS
TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR of THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

PLANTING FORCED DAFFODILS IN GRASS (R. F. C.).

—If convenient, it would be best to plant the bulbs at once, though they will do quite well planted in October. If they were forced very hard, we would prefer planting them, for one year at least, in a bed in the kitchen garden before putting them in the grass.

PLANTING COLCHICUMS (E. S.).—These plants will soon be maturing their growth, and if you can obtain them, you might plant without further delay. Usually the bulbs are not available until July or later, though an early application for them might assist you. Keep the bulbs 3 inches or 4 inches under the soil when planting.

WATER GARDEN (Mrs. M.).—If tubs of moderate size would do, ordinary paraffin casks, cut in halves, might supply the want. These would have to be fired to rid them of the oil, and might also be lightly charred externally for the same purpose before applying a coating of pitch or tar as a preservative. If larger receptacles are required, probably a brewer near you could let you have all you wanted. The only way to make a rock garden pool water-tight is with cement and ballast. First fix the size of the pool, and beyond this a 6-inch bottom of cement concrete and 4-inch thick sides. If the concrete is gauged up to four and one, i.e., four parts clean gravel to one part cement, that will be strong enough. When the side walls and bottom are moderately dry, all inner surfaces should be coated with sand and cement at two and one strength, which, if properly done, will hold water quite well. An overflow hole should be arranged, as it is necessary occasionally to overflow it for cleansing and changing the water. The pond may be of any size or form, though one of bath-like form at sides and bottom is that most easily rendered water-tight. The depth will be in proportion to the plants you wish to grow, though not less than 2 feet of water is advised.

IRIS GERMANICA FAILING (M. M. K. C.).—From the statement of your letter alone we should conclude that the excessively heavy nature of the clay soil and the winter flooding are the chief causes of the failure, though the "brown" to which you refer may be either the outcome of a fungoid attack or the collapse of the sectional portion to which it is attached. In all the circumstances, it would have been better had you sent a clump for our inspection. These plants succeed best in light loamy, gravelly and sandy soils, and in such grow and flourish in almost any position. Flooding and much winter wet in heavy soils is abhorrent to them. A contributory cause of failure is deep planting, particularly of the rhizomes, and if these are buried 2 inches, the flooding would in all probability cause the new growth to decay. Try them in a much lighter bed of sandy soil raised above that they now occupy, replanting them at once in single pieces—not in clumps—and employing only the healthy bits. Is the soil free of wireworm? No insect pest of the garden is more destructive to the Iris than this.

For the shady border the above applies with equal force, the failure of the plants here also indicating uncongenial soil conditions. Other good plants for shade would be Ferns, Bluebells, Madonna and other Lilies, and Daffodils. The best time to deal with the mixed Irises is when they are in flower. At no other time could they be properly "rogued."

TREES AND SHRUBS.

SHRUB FOR NAMING (K. A. K.).—The flowering shoot you send is that of the Mexican Orange, *Choisya ternata*. This is an evergreen shrub that attains a height of 15 feet, or sometimes even more. Though hardy in the London district, it sometimes gets injured by comparatively light frosts during the early spring. For that reason it ought to be given a rather sheltered, though open position. It appreciates rather light, well-drained, but at the same time well-enriched soil, and may be planted either at the middle of October or during March.

SELF-CLINGING CLIMBER (Climber).—There are very few self-clinging hardy climbers, and none with fragrant flowers. The best self-clinging flowering climber is *Hydrangea petiolaris*, and probably the best of all fragrant-flowered climbers for your purpose is *Wistaria chinensis*. This must, however, be nailed to its support. If the main branches are secured in position, it is possible to do with very little nailing, for the side branches can be cut back each year to form spur-like growths. Flowers are usually produced more freely from stunted, spur-like growths than from very rampant branches. We do not know a plant under the name of Cinnamon Vine. If you can obtain a specimen, we shall be pleased to undertake its identification and advise you regarding it.

THE GREENHOUSE.

CHRYSANTHEMUM SECTIONS AND TREATMENT (C. G. A.).—Of the list you send, the following varieties are Japanese: Mrs. Greenfield, Leigh Park Rival, Niveus, White Australie, Mafeking Hero, Souvenir de Petite Amie and Mrs. J. Dunn. Major Bonaffon is an incurved variety. (2) "Chrysanthemums for Garden and Greenhouse," by D. B. Crane; published at 2s. 6d. by W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, E.C. (3) Yes; you have not done wrong. Allow the plants to grow on from this point, and do not stop them again.

ADVICE ON ORCHIDS (L. G. W.).—The reason of your non-success in flowering the *Dendrobiums* referred to is probably owing to the fact that they were not encouraged to grow freely after the last flowering season, and also that the growths were insufficiently ripened. The different species of *Dendrobium* referred to by you bloom naturally in the winter and spring. When the blooms are past, the plants may be repotted, or top-dressed as they require it. At all events, we advise you to repot yours at once. In the first place, the Ferns that you speak of as growing in the pots should be pulled out, as every living bit of Fern draws nourishment that should go to the Orchids. As so much success has attended your single specimen in a basket, would it not be as well to treat them all in this way? The baskets selected for the purpose should be comparatively small and shallow, and be drained by means of two or three large pieces of broken crocks. A suitable compost for *Dendrobiums* may be made up of three parts of fibrous peat or *Osmunda* fibre and one-third chopped sphagnum moss, with a few small nodules of charcoal mixed therewith. This must be worked firmly around the roots so as to hold the plant firmly in position, care being taken not to bury the eyes at the base of the stems too deeply, otherwise they will damp off. If pots instead of baskets are used, much the same procedure must be followed, except that the pots should be half filled with broken crocks. When potted, the plants must be kept in a fairly warm, moist atmosphere in order to encourage growth. At the time, if the roots are active, a liberal quantity of water will be required, with an occasional syringing in hot weather. When growing, the plants need to be partially shaded from the sun's rays. As growth is completed, say, by the time summer quarters where they can have more air and sunshine. This will lead to a thorough ripening of the pseudo-bulbs, so necessary to their successful flowering. At that stage the soil will only need to be kept slightly moist. Before the winter the plants may be taken back into the warmer structure, taking great care not to overwater them. As the buds show, more moisture can be given, for the blossoms then develop rapidly. *Vanda kimballiana* will do well except that it does not need to be ripened off at any time. It flowers in the autumn. *Vanda cerulea* may have been rare where your brother obtained his *Dendrobiums*, but it is very common in cultivation, and can be purchased cheaply in this country.

FRUIT GARDEN.

GOOSEBERRIES FOR INSPECTION (I. R.).—The Gooseberries appear to be attacked by the fungus *Botrytis cinerea*, which is producing the disease called die-back. All the diseased parts should be cut away and burned, and the bushes sprayed with Bordeaux mixture as soon as the fruit has been gathered.

GOOSEBERRIES FAILING TO SWELL (J. J. E.).—There are many failures with Gooseberries this year, and in most cases it is due to frost, especially in low-lying situations, where the "air drainage" is bad. Sparrows have also been the cause of loss of crop; they have eaten the tips of the flowers just as they were setting.

MISCELLANEOUS.

HOW TO ERADICATE CELANDINE (Mrs. C.).—The best way to eradicate the Lesser Celandine (*Ranunculus Ficaria*) from ground is to fork it up and carefully pick out the tuber-like roots. This will doubtless be necessary over two or three years, for seedlings are bound to appear from time to time. Some good can be done by continually hoeing it down as soon as the leaves appear above the ground, but such work must be persisted in for some considerable time. It is possible that Mr. L. R. Russell, nurseryman, Sheen Road, Richmond, Surrey, could supply the double-flowered Blackthorn.

STIGMA OF A FLOWER (E. H. W.).—The length of time the stigma of a flower remains receptive varies very much according to the species (or even the variety), the temperature, and whether it has been pollinated or not. If an Apple stigma is receptive for 2 days (generally about two or three days in fine weather) and it rains continuously, there is still a chance of the flower being fertilised. The damage done by rain is mainly to the pollen, and if the air about the stamens were dry enough, some pollen might be shed, and that already shed would tend to be distributed by the battering of the rain drops. In the case of the Apple, the probability of fruit being produced would again depend upon whether the variety was a self-fertile or a self-sterile one.

NAMES OF PLANTS.—*Alpha*.—*Luzula sylvatica*.—*Mrs. W.*—*Claytonia alsinoides*.—*W. H. S.*—1, *Lithospermum prostratum*; 2, *Acer palmatum atropurpureum*; 3, *Thuja dolabrata variegata*; 4, *Cupressus obtusangula*; 5, *C. lawsoniana*; 6, *C. nootkatensis*; 7, *Alnus glutinosus*; 8, *Begonia metallica*; 9, *Sedum Sieboldi*.—*Cornish Gardener*.—*Rhamnus cathartica*.—*E. B.*—*Billbergia nutans*; this is a Bromeliaceous flower, sepals reddish, petals yellowish green, both with a blue margin.—*T. C. C.*—1, *Viburnum lantana*; 2, *Pyrus Aria*; 3, *Viburnum Tinus*; 4, *Pyrus Malus* variety.—*B. Cummings*.—The plant is *Fuchsia procumbens*. It is a native of New Zealand and has magenta crimson berries later in the year. It is most likely birds that pull up your Houseleeks, in their search for snails.

SOCIETIES.

BRIGHTON, HOVE AND SUSSEX HORTICULTURAL SOCIETY.

"THE WONDERS OF FERNLAND."

On Thursday, the 20th ult., at the Assembly Room, Oddfellows' Hall, Brighton, a very interesting lecture under the above title and illustrated by a large number of lantern slides was delivered by the well-known authority on British Ferns, Mr. Charles T. Drury, V.M.H., F.L.S., to an appreciative audience.

The first and main wonder was, in the opinion of the lecturer, that while Nature in Great Britain, with only a few native species, some forty odd, had far and away eclipsed the multitude of exotic Ferns in the diversity and beauty of the plants which she had, so to speak, invented, it was only a comparative few among plant-lovers who profited by these gifts or, indeed, knew that they existed. It was, therefore, his object to demonstrate to those present by actual photographs of a selected few of these varieties how much they lost by ignoring the opportunity they afforded for both garden and home decoration. For more than half a century a coterie of British Fern-lovers had devoted their attention to the particular study of our wild Ferns, which are so plentiful in our Western Counties, it having been found that among these multitudes of the common types there existed, scattered here and there and usually solitary, individual plants which exhibited very striking differences from their companions of the same species. Some of these being discovered and cultivated, it was next found that the offspring raised from their spores usually inherited their peculiarities, but often in different degrees, so that these peculiarities could be enhanced and a beautiful plant thus increased in attractiveness. In this way in time more and more enthusiasts joined the cult, until at the present time the known fine varieties run into hundreds, and in many cases eclipse all exotics in diversity of type, there being no parallels. Over exotics, too, these Ferns, being natives, and therefore hardy, possess the advantage of the easiest possible culture under quite even conditions. The lecturer then proceeded by means of some excellent lantern slides to demonstrate the life-history of Ferns generally and the variations in such life-history that had been shown to exist, as well as that of their individual sports, and then showed a number of the most beautiful types, some found wild as shown and others improved by selection, these constituting a series of wonders well meriting the name. In the course of the lecture, the lecturer indicated that although to-day had but little value, it must not be forgotten that it is to the Ferns and their allies of the far distant Coal Age that we practically owe all our present prosperity, for all our coal is simply and solely the residue of immense forests of these plants, which, deeply buried as they now may be, grew in their day on the earth's surface, just as do the existing Fern paradises of the Antipodes or the lesser ones of our Devonian and other similar terry valleys and glens of both Great Britain and Ireland. The lecturer, as the hon. secretary of the British Pteridological Society and editor of the *British Fern Gazette*, then distributed some copies of that publication, and invited those present to become members as evidence that his words had gone home. A hearty vote of thanks was accorded the lecturer.

HORTICULTURAL TRADES' ASSOCIATION.

M. VILMORIN (of MM. Vilmorin et Cie, Paris) was the principal guest at the dinner of the Horticultural Trades' Association, held at the Hotel Windsor, on Tuesday, May 18. Mr. William Cuthbertson (Messrs. Dobbie and Co., Edinburgh) presided over a large company.

In his opening speech, the chairman said the association had sent out forms asking for particulars about the horticultural trade of the country. About half of the number replied, but, as Mr. Courtney Fowler said, the figures could not be taken as very authoritative, but in coming to their conclusions they thought they were justified in doubling the figures received. The returns showed that the area cultivated amounted to over 26,000 acres, which, doubled, gave, roughly, 50,000 acres. The area under glass was 20,000,000 square feet—doubled, 40,000,000. The number of employes doubled for the whole trade was 30,000 men; boys, 5,400; women, 3,350; girls, 1,500; giving over 40,000 employes in the whole trade of Great Britain. The wages, doubled, were nearly £2,000,000 per annum, and the capital involved was something between £8,000,000 and £9,000,000.

Mr. N. N. Sherwood proposed the health of M. Vilmorin. He said they had with them that night one of the most delightful men he had ever met in his life. The name of Vilmorin stood very, very high in the horticultural world of France. M. Vilmorin had for some months past represented the French War Minister in regard to the supplies for the troops, and that showed what the Minister for War thought of his wonderful capacity.

M. Vilmorin, in reply, said he was not prepared to speak that evening, and he must be excused if he had not had time to have a Blue Book printed. (Laughter.) He was, however, very glad to be present. The letter sent him indicating the lines on which he might speak did not reach him until that morning. He was afraid it must have been kept back by the Censor. That was awkward, because he expected money in the same letter. Turning to the state of affairs in France, M. Vilmorin said the horticultural trade had been greatly hindered by the war. It had seriously affected the exportation of flowers and food, and even the Jersey trade had been greatly affected.

Mr. Stuart Low gave the toast of "Belgium." He said the world owed a great debt to that brave little country, for, had it not been for Belgium, God alone knew where many of them would be at the present moment. (Cheers.) When no one else was ready, those brave fellows—not a military nation—stopped the invader. They had taught all a lesson they would not forget—(cheers)—and others would be very careful in again handling the hedgehog. (Laughter and cheers.) Belgium was a nation of horticulturists and the home of some of the most enthusiastic gardeners. It was up to England to see that right was done to them.

M. Verbonen replied. He said Belgium was certainly a little country—it had always been called La Petite

Belgique. The people there never believed they would have been plunged into war, especially with Germany, as they were supposed to be protected by Germany. "Of course," he said, "we could have allowed Germany to go through, but very likely we would have remained the slaves of Germany ever afterwards. For what little Belgium has done, I for my part am very proud of it. We thank England very much for all she has done. England has done magnificently. Belgians thank England for all her kind hospitality to them when they have been deprived of their homes by the cruel foe." (Cheers.)

Councillor Wallace (Colchester) proposed "The Horticultural Trades' Association." Since the war commenced, he said, they had passed through very anxious times, but they would not forget what France and Belgium had been through, and they could not be too thankful for the narrow strip of sea which divided us from the foe; nor were they likely to forget that it was entirely due to little Belgium's first step that the onrush of the enemy was stopped at the onset. (Cheers.) Their hearts were stirred by the distress which had been caused, and it was the duty of all to assist in relieving the distress. As to their own trade, they had had a fair season, far better than they could possibly have anticipated, and that bore wonderful testimony to the vitality of the trade to-day. The extraordinary rallying power of the trade was shown in the great exhibition at Chelsea.

Mr. Charles Pearson, the secretary, responded. He said he had always been a strong believer in the power of organisation. In the old days the motto—a very bad one—was "Everyone for himself and the devil take the hindmost." They had outlived that, and the people generally were beginning to see that it was not a bad thing to be altruistic.

Sir Harry Veitch proposed "The Chairman," to whom, he said, they owed so much, and he paid a glowing tribute to M. Vilmorin and his family. He alluded to the fund being raised on behalf of the sufferers in Belgium, and invited them all to contribute out of their abundance, not only financially, but with stock. They must not forget Poland and Serbia. In the latter country whole orchards had been destroyed.

The chairman, in reply, heartily thanked Sir Harry. He agreed with the Prime Minister's reply to the Archbishop that the Scriptural advice, "Let not the sun go down on your wrath," did not apply. He hoped that before another year the war clouds would have rolled away. (Cheers.)

WATFORD HORTICULTURAL SOCIETY.

The usual monthly meeting was held on Tuesday, the 11th ult., at the Lime Tree Hotel, when Mr. E. S. Theobald presided over a good attendance of members. The room presented an exceedingly bright and gay appearance with a fine collection of May-flowering and Darwin Tulips exhibited by C. H. Waterlow, Esq. (gardener, Mr. W. R. Phillips). The collection, which was admired by every-

body, was awarded a first-class certificate. The lecture was given by Mr. W. W. Phillips on "Tulips." He dealt with his subject in a masterly style, and gave many valuable hints upon the cultivation and selection of suitable bulbs for pot and bowl culture, as well as for bedding purposes. At the close of the meeting the chairman distributed the following awards in the monthly competition: For a vase of Tulips, six blooms, first-class certificates were given to C. H. Waterlow, Esq. (gardener, Mr. W. R. Phillips), Mr. S. Bird (gardener, Mr. E. Blinco) and Mr. G. B. Dodwell (gardener, Mr. G. Middleton); and a second-class certificate to Mr. F. J. McLees. For two spring Cabbage, second-class certificates were awarded to Mr. W. E. Catesby, J.P. (gardener, Mr. W. Webb) and Mr. W. Buckingam.

THE EDITOR'S TABLE.

A Beautiful Flowering Shrub from Lancashire.—Mr. F. A. Fenner, Holker Hall Gardens, Cark-in-Cartmel, Lancashire, sends a beautiful flowering branch of *Pieris formosa*. This is a native of the Himalaya, and is generally regarded as hardy only in the warm South-Western or Western Counties. The white flowers, which are produced in large clusters at the tips of the shoots, resemble in appearance those of Lily of the Valley, the glossy green foliage, which persists throughout the winter, making a charming foil for the blossoms. This is, we think, the most beautiful member of the genus, and we congratulate Mr. Fenner on growing and flowering it so well. He writes: "I am sending a flowering spray of *Pieris formosa*. There are three trees here which I think are good specimens. The height of the two largest is 19 feet 6 inches, the smaller one 18 feet. They are a delightful picture just now with their large clusters of white flowers and the red colouring of the young growths. I should be pleased to know where the largest specimens are growing in this country."

*** The Yearly Subscription to THE GARDEN is: Inland, 6s. 6d.; Foreign, 8s. 9d.

TREE STRAWBERRY, OR STRAWBERRY-RASPBERRY.

This is one of the most unique, and at the same time the largest and most beautiful berry of any kind that has yet appeared before the public. It comes to us from Japan, and is one of the Raspberry family, though in many respects it resembles a Strawberry growing on a bush two feet high. The plant is entirely hardy in any location, and a most profuse yielder, ripening an enormous crop of fruit in July and August, and more or less all the time up to November. The berries are globular, slightly oblong in form, monstrous in size, a rich, glossy, ruby-red colour. Makes a most lovely preserve and jelly. 1/3 each; 3 for 2/6; 6 for 4/6; 12 for 7/6. Now best time to plant, fruit this season.

GLORIOUS NEW BEDDING HYBRID PENTSTEMONS.

For grand display in border, plant some of my new hybrid Pentstemons, which are now rich in variety of colour, in size almost equal to Gloxinias, and have superbly splashed and mottled throats; they are quite hardy, and bloom the whole season right up to severe frost. I have grown an extra large stock of very fine bushy plants. 6, 1/6; 12, 2/9; 25, 5/-; 50, 9/-; 100, 17/6.

THE REAL OLD-FASHIONED TRUE SPICE-SCENTED CARNATION.

Crimson Clove (deep rich glowing crimson). These are very hardy, and do well anywhere, especially in smoky town gardens, where the less robust varieties refuse to grow. These are strong plants that will be a mass of bloom this season, and warranted the true old spice-scented variety. 6 for 2/-; 12 for 3/6; 25 for 6/6.

EXTRACT FROM THE "DAILY MAIL."

In a wet season, tuberous rooted begonias make a better display than any other kind of bedding plants, as the more moisture they get the more freely do they bloom. This characteristic is so valuable in a climate like ours, that it should ensure their being used much more than they are.

A VERY SPECIAL LINE FOR BEDDING.

In Brilliant Scarlet or Mixed Shades, as desired, 2/- per dozen; 25 for 3/9; 50 for 7/-; 100 for 13/6. Very fine plants.

ALL PACKED FREE AND POSTAGE OR CARRIAGE PAID.

Mrs. GARDNER, F.R.H.S., PRIORY HOUSE, STROUD.

Photo. Merrett Bros., Stroud.]

TREE STRAWBERRY OR STRAWBERRY-RASPBERRY.

GIGANTIC ERECT-FLOWERING (GOLD MEDAL STRAIN) BEDDING BEGONIAS

The fashionable plant of the day, and richly does it deserve its honours, for, in addition to very handsome foliage, it bears a never-ending profusion of the most ravishingly beautiful flowers the whole summer, and then, with the coming of the cold weather, very obligingly takes a nap until spring, asking no further care through the winter than to be packed in oil away from frost. They will flourish in the cottage window, the smallest home-made greenhouse, or the most costly conservatory, and more important still, they are equally at home out-doors, and flower right into November.

ALL COLOURS MIXED.

Nothing can exceed the brilliancy and richness of their flowers. From the time the first blossoms appear until all growth is stopped by frost, they are never out of bloom. 2, 2/6; 50, 9/-; 100 for 16/-. All grand plants for immediate bedding out.

WARE'S DAHLIAS & BEGONIAS

Over 100 Gold and Silver Gilt Medals
awarded (Highest Honours).

Our Summer Catalogue, giving a concise list of
all varieties for Bedding and Greenhouse culture of
Begonias, Dahlias, Geraniums, Cannas, and Annuals,
now ready, which may be had post free upon
application.

THE GARDEN.

No. 2273.—VOL. LXXIX.

JUNE 12, 1915.

NOTES OF THE WEEK.

Blackbirds Eating Fruits of Sea Buckthorn.

A few days ago we were interested in watching two blackbirds eating the semi-dried fruits of the Sea Buckthorn (*Hippophaë rhamnoides*), and evidently enjoying them. We do not remember seeing birds eating these fruits before. Mr. W. J. Bean, in his recently published work on trees and shrubs, states that "However pressed by hunger, birds will not eat the berries, which are filled with an intensely acid, yellowish juice." It is possible that as they reach a semi-dried state the berries lose their objectionable acidity. It would be interesting to know if any of our readers have noticed birds eating them.

A Pleasing Viola Combination.

During the last few weeks, visitors to Kew have been much interested in the large beds of Violas situated in front of the Palm House. In several of these the varieties Maggie Mott and White Swan have been used with excellent effect. The first named has flowers of a pleasing mauve-blue shade, and this has harmonised splendidly with the white. The plants are old ones, saved from last autumn, and have been used in the proportion of about two blue to one white.

Red Cross Rose Show in London.

All rosarians should make a point of visiting the Cannon Street Hotel, London, E.C., on Thursday, June 24, the day set apart for the City of London Rose Society's Show. Instead of abandoning their show this year, as so many societies have done, the committee decided to hold it as usual, but to devote the proceeds to the British Red Cross. Visitors will, therefore, be enabled to see an exhibit of beautiful Roses and at the same time contribute to a highly praiseworthy cause. The show opens at 1 p.m. and closes at 7 p.m.

A Beautiful Hardy Iris.—The illustration on this page represents a colony of *Iris pallida* *dalmatica*, one of the most beautiful of the so-called Flag Irises, and one that, fortunately, is not at all difficult to grow. In habit it is not unlike *I. germanica*, though more than a casual inspection will reveal several differences. The foliage is much broader, somewhat dwarfer and very glaucous. The flower-stems, too, are more branched, and the spathes are silvery white. The

blossoms are a pleasing shade of lilac blue, and continue in good condition longer than those of *I. germanica*. It will thrive in any ordinarily good garden soil that is well drained.

Mr. Frank Reader and the Horticultural Press.—A pleasing little function was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Tuesday last, when Mr. Frank Reader, Chief Cashier of the Royal Horticultural

watch-chain had attached to it a suitably engraved pendant, and this and the brooch were accompanied by a letter bearing the signatures of all who had subscribed to the testimonial.

The Judas Tree.—This little-known, low-growing tree, *Cercis Siliquastrum*, has been very beautiful during the past fortnight, its myriads of Pea-shaped flowers forming billows of rose mauve, relieved here and there by the clusters of newly opened, pale green reniform leaves. It is quite hardy in this country, but does not always flower freely, though where quite at home a fair quantity of blossom is produced each year. The colour of the flowers varies in intensity on different trees, the brightest that we have seen being in Mr. E. A. Bowles' garden at Waltham Cross. It is a native of the Mediterranean region.

A Curious Honeysuckle.—Although it is seldom met with in private gardens, the Honeysuckle known as *Lonicera hispida* has been grown in botanic gardens for some years. A native of Central Asia and Siberia, it was introduced to this country about 100 years ago. It forms a spreading bush 4 feet or more in height, its long, slender branches bearing their leaves in pairs. These are ovate-lanceolate in shape, very hairy, and dark green in colour. The flowers are large, resembling in shape and size those of the *Diervilla* or *Weigela*. They are borne in pairs, and open at the present time. Each pair of blossoms has a large, hooded, leaf-like twin sepal, pale green in colour, which harmonises well with the primrose yellow of the flowers. Although not borne in profusion, these are certainly beautiful, and the shrub is one that might well find a place in those gardens where unusual kinds are appreciated.

The Scarlet and Black Poppy.—A brilliant bit of colouring may be seen at Kew just now, at the end of the Temperate House, where that gorgeous

Poppy, *Papaver commutatum* or *P. umbrosum*, has been sown broadcast in the open spaces between various kinds of shrubs. Here the Poppies create a waving mass of scarlet and black, the intensity of which is increased when lit up by brilliant sunshine. The black is created by a large blotch situated at the base of each crimson-scarlet petal, both on the interior and exterior. In habit and general character this Poppy is not unlike the Shirley Poppy, now so well known in gardens.

A COLONY OF *IRIS PALLIDA DALMATICA*, A HARDY PLANT WITH BEAUTIFUL PALE BLUE FLOWERS.

Society, was presented with a gold watch-chain and pendant, with a gold brooch for Mrs. Reader, by members of the horticultural Press. It will be remembered that Mr. Reader recently completed his twenty-fifth year with the society, and it was thought that a fitting occasion had arisen to present him with something useful and lasting as an appreciation of the kindness and courtesy that he has invariably extended to members of the Press during that period. The

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

A Noble Tree Heath.—I herewith enclose a photograph of Erica arborea growing at the bottom of the rock garden at Wayford Manor. I think it is a fine specimen. It has been planted about eight years. I am standing beside it to show its size.—E. B. GIBLIN, *The Gardens, Wayford Manor, Crewkerne, Somerset.*

Lilac Souvenir de Louis Spath.—I was glad to see you draw attention to this Lilac on page 265, issue of May 29. For garden decoration it is the most beautiful of all the fifty varieties I grow here. Three bushes of this variety cannot have fewer than 2,000 panicles each, and, flowering as they do simultaneously, they provide a lovely patch of colour, emphasised so much when they happen to have an evergreen background.—E. MOLYNEUX, *Swanmore, Hants.*

The Tulip in Bygone Days.—Now that the Tulip is one of our most admired flowers, and one which gives us more colour and pleasure at this time of the year than almost anything else (personally, I consider it far more beautiful, lasting and satisfying than any Rose), it is interesting to remember what was thought of it by old writers. Thomas Fuller, a writer who lived in the middle of the seventeenth century, about which date Tulips seem to have been introduced into England, speaks of the flower as "a well complexioned stink, an ill favour wrapt up in pleasant odours" (Did he mean colours?); while, later still, Joubert, in his "Thoughts," calls it "A flower without a soul." Perhaps this is so, and I understand what he means; but we could ill dispense with its varied colours, while there is no flower so decorative when cut, so easy to arrange, or more lasting in water.—A. LA T.

Limelight Flowers.—A recent article with this title in the *Times* arrested my attention. On reading it I found the writer referred particularly to the sickly, jaundiced, yellow-pink shades so much in vogue during the last few years. I own I was at first beguiled by their brilliance and novelty (for I do not recall any wild flowers of this hue), but after a couple of seasons I banished them from my borders, finding they quarrelled with nearly all their neighbours—the dear old pink, rose and crimson inhabitants of long standing. So I only retained a few very fragrant Roses with rich red foliage behind a line of silver grey-foliaged sweet white Pinks, interspersed with delicate lavender and mauve English Irises and the many shaded Shirley Poppies, which never jar with one another. Nevertheless, "limelight flowers" look very well for table decoration, and may well be grown in some place set apart for the purpose. But in the garden I find them almost, if not quite, as bad as that horrid Geranium West Brighton Gem. The only place I have ever found that tolerable is West Brighton, where, along the side of the green Hove lawns, against the eternal hedges of Euonymus and with the spacious background of sea and sky, West Brighton Gem suits the gay gowns and glaring artificiality of the surroundings.—ANNE AMATEUR.

Roses and Pinks.—I was very pleased to see the note and illustration on page 277 of last week's issue. For some years I have grown Pinks as edgings to Rose beds and borders and at all seasons find the association a most happy one. The Pinks are the small white ones, and in a few instances the old laced varieties.—NEMO.

Early Flowering of Liliun giganteum.—This not at all common Lily is a very handsome plant. We had one in bloom on May 25 which was only started three years ago. The parent of the present bulb bloomed and, of course, died in 1912. I grew on four of the offsets, giving one of these, when a year old, to a friend. Our own three plants have all had the same treatment, but only one has flowered this year. They are grown in 8-inch pots in a cool greenhouse. The flower-spike is about eight feet high and carries eleven blooms. I have frequently been told that

A NOBLE TREE HEATH GROWING IN THE GARDENS AT WAYFORD MANOR, CREWKERNE, SOMERSET.

five years have to elapse before this Lily blooms, and would be glad if other readers would give their experiences with it.—C. BLAIR, *Preston House Gardens, Linlithgow.*

Sun Roses.—There are no better plants than the many pretty varieties of Helianthemum for hot, sunny banks in light soil, where their near relatives the Rock Roses flourish, and where Phlomis, Lavender, Santolina, Stachys and Catmint are also at their best and happiest. But the weak point of the pretty little Sun Roses is that they so soon grow into wide, straggling carpets, so that after two years the patches become quite unsightly and have to be renewed. It does not seem to be generally known that this can be corrected, and the life of the plants in good shape prolonged for several years, by cutting them hard back when the best of the bloom is over. They then grow away again almost at once, and by the late

summer are well-furnished leafy tufts with quantity of close-at-home blooming shoots for next year. I cannot say how long the process may be repeated, but have had some tufts cut back for quite seven years, that as yet show no sign of being worn out. The same treatment can be applied to the beautiful yellow-flowered Helianthemum formosum, often called Cistus formosus. It is perhaps in horticulture assumed to be a Cistus because of the much larger flower and larger growth generally, and is probably, botanically, a link between Cistus and Helianthemum, in company with its congeners H. halimifolium and H. algarvense and others of less garden merit; but it is a useful guide to remember that no true Cistus has yellow flowers.—G. JEKYLL.

Large versus Small Vegetables.—"Ann Amateur" seems very sore on this point, and cannot help thinking, in the issue for May 29, page 266, that her letter is suggestive of picking other people's ideas to pieces rather than the main object, though I have from time to time been very interested in her notes. Let me explain that I have had a good deal of experience in both growing and selling for market, and Cauliflowers must be a good size—average 6 inches—and clean to make a good price. Small ones will not sell if larger can be had. Carrots and Onions are preferred small on account of retailers having to sell them in small quantities. French and Runner Beans are of no use unless young, but all other vegetables sell better on the larger scale, which proves that small vegetables are only needed on the very daintiest of tables. I have to send Broad Beans in for my people when quite young; but as they want only one lot, this proves that they are not considered a luxury. There are two meanings in the words "small vegetables"—one is young vegetables grown well and quickly and eaten before they get any flavour; the other, vegetables grown by careless people who plant them and afterwards allow them to take their chance. Being long in growth and never very luxuriant, they will always be both strong and stringy. Give the same varieties a good garden and care, with the idea of obtaining exhibition vegetables, and if used just when they reach perfection I would defy anyone to call them strong or stringy. Surely in the case of the beautiful New Intermediate

Carrots there is no disgrace in two good Carrots being quartered before being cooked to make a dish of eight nice pieces. "A. La T.'s" letter, I considered, with Mr. Beckett, was suggestive of nothing but waste, and surely in this great crisis of our national history we should do all possible to put our little likes and dislikes on one side and grow as many and as large vegetables as possible, so that if we do not want them all ourselves we can help others.—G. ANDREWS, *Tilmanstone.*

Sparrows in the Garden.—I have read with interest the letters by "O. N. E. Another" and "Bird Lover" published in recent issues of THE GARDEN, and I feel I must state my whole-hearted agreement up to the present with the latter writer. We suffer so much from sparrows here that I speak feelingly. "O. N. E. Another's" toleration and kindness is all very well and, indeed, most

admirable, so long as the sparrows play the game—that is to say, provided he gets sparrows which are thoughtful and grateful to him for what he does. Our experiences here are somewhat different. We are fond of birds, and sparrows are never maltreated in any way save one, viz., the torment of being prevented, as far as possible, from getting at certain choicer morsels. But we find they do not repay our kindness. They begin with the Crocuses in the early spring, and then attack young plants and seeds just nicely coming up. We have to keep them off as well as we can with netting, black cotton, Pea-sticks and wire netting. Gooseberry bushes have to be protected every season. You cannot put young Lettuce plants out in the spring without cotton; and a clergyman friend who lives in Sheffield and whose calling does not permit him to utter, well, words which perhaps were better not said, is getting quite despairing about ever growing grass from seed on the bare patches of his lawn, for the sparrows, despite his efforts, contrive to fetch off the seed. I do not hold with the view that sparrows do these and other equally wicked things to get water and moisture. I think they do it because they like good things. Has “O. N. E. Another” ever found sparrows taking their dust baths in a bed just sown with choice Godetia or other seeds, and the seeds and soil thrown all over the place? This is what we suffer from unless we take steps. No, no; “O. N. E. Another” knows his garden and his sparrows, and we know ours. For my own part I never trust them, and I advise other readers to at once take strenuous steps to prevent sparrows getting at their crops.—E. T. ELLIS, *Weetwood, Ecclesall, Sheffield.*

The Oak: Some Historical Notes.—“Caledonia’s” note on the Evergreen Oak, page 242 issue May 22, is rather inadequate. This tree has probably the remotest history of any cultivated ornamental tree, as it was used in forming groves for the Divine worship of classic ages in the Mediterranean regions. The Hebrew word “Alah,” mentioned in Scripture, is considered by most authorities to refer to the Holm or Evergreen Oak, though applied to other Quercuses. Its introduction to England is usually referred to the end of the sixteenth century, but there is little doubt that it was lost to England by the destruction of the monasteries at the Reformation, and then reintroduced from the South of Europe. It is commoner in the South of England than further North, and is a usual feature of old pleasure grounds. It has been neglected in recent times by planters, as it is somewhat difficult to establish. Nurserymen thus usually offer it in pots. Once established it is a free and rapid grower, given a good loam and well-drained site, without too much exposure. Like all the Oaks, it stands lopping and cutting well, though not regular clipping for any length of time. It is usually seen as a broad, spreading tree, sometimes with a head 100 feet across, and an isolated old specimen is very striking with its very dark foliage and dense, regular growth. Among other trees it attains a more upright habit, though always with a rounded contour, and divides into several stems at a few feet above the ground. It will attain a height of 60 feet. There is one approximately that height at Cobham Hall, Gravesend, with a magnificent expanse of limbs. Close to it and surpassing it in height is a fine specimen of the Willow Oak (*Quercus Phellos*), a species much less planted than it should be. With its light, graceful foliage

and open habit, the Willow Oak contrasts with all other species of Oak, and is of comparatively rapid growth. Both *Quercus Phellos* and *Q. Ilex* at Cobham Hall are about a hundred and twenty years old. There is no tree with the same number of species and varieties as the Oak. Even the literature relating to it is very extensive. Many of its species are little known, and notes regarding little-known specimens would be welcome. One of the most pictorial of trees is the silver variegated form of *Quercus Cerris* (the Turkey Oak). The best specimens I have seen were in Messrs. Fisher, Son and Sibray’s nursery, Handsworth, Sheffield. It is little known. The Scarlet Oak is now planted very frequently. There is an avenue of it at Cumberland Lodge, Windsor Great Park, but only recently planted. The possible size of the English Oak is a debatable question. Most authorities give 100 feet as its maximum height, but 180 feet have been given by some as attained by the Oak. The Evergreen Oak fruits even more freely than the English Oak, and, given proper protection, it is best to sow the Acorns where they are to develop, without transplanting. As a shelter or screen tree for game coverts and many similar purposes, *Quercus Ilex* deserves more extended use.—HURSTCOT.

TULIP NOTES.

BY THE REV. JOSEPH JACOB.

New Varieties.—The displays of a series of his own home-raised seedlings by Mr. Walter T. Ware, both at the Conference Show and at Chelsea, is an event of importance to all Tulip-lovers. Hitherto—at any rate I may say until last year, when Messrs. E. H. Krelage and Son produced at one of our May exhibitions at the Hall visible proof in the appearance of Siren that the grass has not been growing under their feet—the appearances of seedlings have been few and far between. Messrs. R. Wallace and Co. of Colchester have put on the market a small and very striking series, which includes Grenadier, Beau Brummell, and Boadicea, which is extremely like a great favourite of mine, the true pointed petalled Hammer Hales. Mr. A. D. Hall has raised some remarkable English florists’ varieties, of which Miss Willmott (a rose), whose breaking is being looked forward to with the liveliest expectations, is a flower of the very highest quality. Others, which were to be seen on his stand of Breeders at Chelsea, include Helen (rose), Athos (bybloemen), Gleam (bizarre) and Enid Christie (rose). I have seen some fine midseason seedlings in a very old garden behind one of the houses on the right-hand side of Kleine Houtweg as one goes from the town of Haarlem to the famous “wood,” a few of the best of which have already come to England, and are being “grown on.” I have also seen a fair stretch of young plants just entering upon the flowering period of their lives in the Zwanenburg Gardens in the famous Tulip city, one of which, a pure white Darwin, will deserve a *fête* day and a Queen to do it honour, when its turn comes to be exposed to public view. Should such an event come to pass, may my old bachelor friend who presides over the fortunes of those gardens be rewarded, as was Cornelius van Baerle, with something more than a money prize. Here is a nice name, “*Tulipa alba Rosa Tubergeniensis*”!

If, however, of late years we have had to look to sports for our novelties, everyone who

knows the flower will readily acknowledge that when Prince of Austria sported and became De Wet, it gave us a variety of outstanding merit, and one for which I confidently predict a great future. So, too, when Pink Beauty gave us the marvellous White Beauty; and others still—Cullinan, President Cleveland, President Taft and Safrano—we were not left quite without novelties, but there were by no means many. It could not be otherwise if we think for a moment of the difference between “sporting” and seed. The very thought of seedlings is like “Who said rats?” We are all expectancy. In next May I fancy the scent will be very hot. We had a foretaste this year with Lena, Burgundy, Empire, Imperial, Inglescombe White, Bloodstone, Satin Gown, Winner, Inglescombe Mauve, Brockweir, Creselda, Comedy and Mirvana. Out of this baker’s dozen Empire, Inglescombe White, Bloodstone, Satin Gown, Winner, Comedy and Mirvana have been given awards in 1915, and have been already described on pages 260 and 273 of *THE GARDEN*. There has been considerable discussion as to the relative merits of the seedlings. My own opinion of them was different on the Thursday of Chelsea to what it was on the Tuesday, mainly with regard to Brockweir. Between times the blooms had grown and developed colour, and I was then able to understand why Mr. E. M. Crosfield had picked this as the one to be named after his house. I find I did not make a colour description on the spot, but the impression left upon my mind is one of an almost Darwin-shaped bloom with colouring something between Orange Beauty and the less-known Konigskroon. Another variety which had changed for the better was Inglescombe Mauve. One saw why Inglescombe is part of the name. Let me say that this name is not attached to “any Dick, Tom or Harry” of a flower. It is an attractive, long-shaped bloom of a mauve on the blue or lavender side. Against these gains must be set the falling down from its high pinnacle of Inglescombe White. A good tall-growing white Cottage is one of the “wants” of tulipdom. We have Dora and Didieri alba, but the first is too short and the second too small; while if Inglescombe White is the third “old maid,” she is too shapeless. A last word about Comedy, which is a most beautiful rose colour without the least trace of blue in its composition. It bore a striking resemblance to Hall’s Miss Willmott, but of the two it was the brighter shade, although the colour did not have such a solid all over look. I will always think of it in my own mind as the flower of the flock at Chelsea; and readers, please remember that, as the preacher said of the fatted calf that the father had kept for “years and years, and years,” it was no ordinary flock that bore the brand of “W. T. W.” at Chelsea.

Good Old Stagers.—Amid the many old and sometimes long-lost friends which one has met at the trials at Wisley and elsewhere during the month of May, 1915, it would be strange if there were none that impressed themselves upon one in a way they had not done before. For example, I never have thought more of gesneriana spathulata, Picotee, Clara Butt, Farncombe Sanders or Faust than I do now. Without divulging any details of what is still *sub judice* with regard to the selected varieties in the different colour classes, it will be a surprise to many to find how the committee at Wisley again and again had to rely on the old favourites when it came to a definite selection.

YELLOW-FLOWERED EVER-GREEN RHODODENDRONS.

THE most remarkable feature of this interesting subject is that while there is an abundance of hardy yellow-flowered deciduous hybrid Azaleas or Rhododendrons, we do not yet possess in gardens a hardy, large-flowered evergreen Rhododendron with rich yellow flowers. Enthusiasts of this lovely and

the bushy plants are no great height, but ultimately they are said to reach from 5 feet to 6 feet. The leaves are obovate, dark green, $1\frac{1}{2}$ inches to 3 inches long, and about an inch broad. Flowers yellow, with darker yellow green spots, about two inches in diameter, borne in terminal clusters of four to six or seven flowers. These open during April. Though the plants are quite hardy, this early flowering character makes it very desirable that they should be grown in a position sheltered from the early morning sun. Seeds of this species ripen freely in this country. Unfortunately,

free-flowering qualities. It forms a shapely bush some 5 feet to 7 feet or more in height, with dark glossy green leaves, greyish white beneath. The bell-shaped blossoms are 2 inches to $2\frac{1}{2}$ inches across, borne in loose terminal clusters of five to nine sulphur yellow flowers. A splendid Rhododendron for the outdoor garden in the South and West, *R. campylocarpum* is rather tender, and at Kew will only thrive outside in sheltered positions.

***R. flavidum*.**—This is a dainty species with pale yellow flowers, growing to 2 feet in height. It is a Chinese species, and, under the name of *R. primulinum*, plants raised from seeds collected by Mr. Wilson and exhibited by Messrs. James Veitch and Sons, Limited, were given an award of merit by the Royal Horticultural Society. A good subject for sheltered nooks in the rock garden, *R. flavidum* has evergreen leaves three-quarters of an inch to an inch long, ovate-oblong, dark green above, paler beneath. The flowers are produced during April, three to five in a cluster at the ends of the shoots, each one being about an inch across. The plants flower when only a few inches high.

***R. lutescens*.**—This species was first introduced from China by the French missionary Abbé David, and later by Mr. E. H. Wilson. It is an evergreen bush with lanceolate leaves and yellow flowers, not unlike those of *R. ambiguum*. The flowers, however, are borne singly or in pairs in the axils of the leaves towards the ends of the shoots and also terminal, whereas in *R. ambiguum* they are all terminal. *R. lutescens*, unfortunately, starts into growth early, and is thus very liable to damage by spring frosts. The flowering season is April.

***R. Nuttallii*.**—This is really a tender species, but it has such large, creamy white flowers that one is tempted to name it as a possible species to cross with a hardy kind in the endeavour to get a large-flowered rich yellow hybrid. As can be readily seen by the illustration, there is ample substance in the flowers. They measure 5 inches to 6 inches across, and may very well be likened to a large Lily flower. A native of Bhotan, *R. Nuttallii* grows at about five thousand feet elevation, and was first introduced in 1859.

***R. ochroleucum*.**—This is a hybrid with creamy white flowers. The illustration on page 291 shows it to be a good free-flowering plant, and possibly a step on the road to a good yellow.

***R. sulphureum*.**—Here we have the best yellow evergreen Rhododendron in commerce to date. It was raised at Comely Bank, Edinburgh, about 1894. The parents are said to be *R. caucasicum* × *R. arboreum album*. The general character of the plant suggests *R. ochroleucum* as one of the parents. *R. sulphureum* forms a rather low-growing, compact bush, opening its sulphur yellow flowers towards the end of April.

***R. Smithii aureum*.**—This is a low-growing, spreading bush of compact habit. A hybrid between an evergreen Rhododendron and a yellow Azalea, *R. Smithii aureum* was raised some years ago by Mr. Smith, the then owner of a nursery at Norbiton, near Kingston-on-Thames. At first sight the plant resembles *R. Broughtonii aureum*, but is distinguished by the leaves being glaucous beneath, and the flowers are of a lighter yellow shade.

***R. triflorum*.**—Another species not perfectly hardy from Sikkim. It has pale yellow flowers, which might prove of use in the hands of the hybridist.

A. O.

A FLOWERING SHOOT OF RHODODENDRON NUTTALLII. THE BLOOMS ARE VERY LARGE.

showy genus often comment upon and regret this failing. Considering, for instance, the many beautiful hybrids which have been obtained from *Rhododendron arboreum*, it should be possible, with the skill and care of the hybridist, to make some advance in the direction indicated. In addition to the older species with flowers of a yellow shade of colour, there are several yellow-flowered species among the many new Rhododendrons of recent introduction from China. Perhaps with the help of these the hybridist will in course of time be able to evolve a good evergreen sort with rich yellow flowers.

So far the two most useful evergreen Rhododendrons of this colour are *R. Broughtonii aureum* and *R. Smithii aureum*. These are hybrids obtained by crossing an evergreen Rhododendron and a deciduous yellow-flowered Azalea. They were formerly known as Azaleodendrons, but since the fusion of Rhododendrons and Azaleas into one genus, this name has disappeared. Under glass there are several hybrid Javanese Rhododendrons with delightfully rich yellow blooms and evergreen foliage, but their tender character debars their use in the endeavour to obtain a hardy yellow-flowered variety.

***Rhododendron ambiguum*.**—This is an evergreen Chinese species introduced by Mr. E. H. Wilson. Judged by the number of times it has been collected by him, this must be a fairly common species. At present, though flowering freely,

confusion exists between this species and *R. concinnum*. Botanically they are closely allied, but the true *R. concinnum* has purple flowers.

***R. Anthopogon*.**—An alpine species from the Himalayas and Northern Asia, this is a very hardy plant, being found at an altitude of 9,000 feet to 16,000 feet in Nepal and Kashmir. Growing to about two feet in height, it has oval leaves 1 inch to $1\frac{1}{2}$ inches long, green above, scaly beneath. The small, bell-shaped flowers are borne in terminal clusters during April. The flowers are sulphur yellow. First introduced to British gardens in 1820, *R. Anthopogon* is an interesting species for the rock garden.

***R. Broughtonii aureum*.**—As previously mentioned, this is an Azaleodendron hybrid obtained by crossing an evergreen Rhododendron and a yellow Azalea. It was raised in the village of Broughton in Peeblesshire; hence the name. It forms a low-growing evergreen bush 2 feet to 3 feet in height; leaves dark bronze green above, pale green beneath, up to 6 inches long, and about one and a-half inches wide. The average number of flowers in a truss is about ten. These are $2\frac{1}{2}$ inches across, primrose yellow in colour, freely spotted reddish brown.

***R. campylocarpum*.**—A native of Sikkim, growing at an elevation of 12,000 feet, this is our best yellow-flowered evergreen Rhododendron. A plant growing outside at Kew was last year very beautiful and emphasised its

TREE PÆONIES.

THESE are among the most beautiful subjects from Japan that adorn our gardens. The flowers exhibit a great variety of colours, and their large blooms are invariably much admired.

The plants are seen to advantage when planted in the forefront of shrubberies, but they are sometimes grown in the ordinary herbaceous borders or in beds by themselves. It is important, however, to give them positions sheltered from the cold, biting winds, or they will not succeed, and the young foliage is liable to injury from spring frosts.

Tree Pæonies are not particularly fastidious as to soil, but that of a fairly loamy nature and well drained suits them admirably. A fairly rich rooting medium is desirable, and they derive much benefit from a top-dressing of well-rotted farmyard manure in the early summer, as this not only helps to feed the plants, but checks evaporation. Any suckers that grow from the rootstocks should be removed as they appear.

Late spring is a good time to plant out specimens from pots, provided they have been suitably hardened, and the plants will soon become established.

Tree Pæonies are often grown for conservatory decoration in the early spring, a time when their handsome blooms are invariably appreciated. It is necessary to allow the plants plenty of root room, and they derive benefit from weak doses of liquid manure. During the summer months the pots may be plunged outside in a bed of ashes.

Propagation is carried out by grafting in the summer. A non-flowering shoot is worked on a vigorous root of the herbaceous species. A union is readily formed if the plants are kept close in a frame, and the soil should be brought above the union to secure good results. It is a simple matter to obtain plants on their own roots by layering.

J. GARDNER

SOME EARLY ROSES.

WHAT a real delight it is to have some Roses in bloom during the month of May! Our first to flower was *Rosa sericea pteracantha*. This opened on May 19. It is a very interesting Rose, apart from its pretty white flowers, for these are studded all the way up the growths among the marvellous large spines. These latter are a most curious feature, and give to this variety a unique appearance, especially when the young growths are seen with the sun shining through, for then the spines are a vivid scarlet colour. As a flowering shrub *R. sericea pteracantha* could not fail to be a source of pleasure to those interested in such plants.

The next to open was *R. Hugonis* on May 20, and *R. Malyii* the following day. The former is a delightful yellow, flowering intensely right to the ground and giving a wonderful effect upon the lawn, and it lasts over several days. This species is a few days earlier than *R. xanthina*, which on May 29 was just opening. It is known as *R. Ecæ*, or the yellow Abyssinian Rose, and is supposed to be very scarce. It is a good strong grower, making a bush 3 feet to 4 feet high with me. Its beautiful elongated buds are most charming.

R. altaica was also in bloom at the same time as *R. Hugonis*. It is an old favourite, coming earlier than others of the *R. spinosissima* tribe. What a glorious picture is a big bush of *R. altaica*! I consider it one of the loveliest of single Roses. Another delightful gem is *R. Malyii*, allied to the alpina or Boursault Roses. Its soft rose pink blooms, so sweetly fragrant, give a lovely bit of colour when blended with the varieties previously named.

I would suggest planting *R. Hugonis*, *R. altaica*, *R. Malyii* and *R. sericea pteracantha* in one group, the latter in the centre, and they would form a most interesting feature if carefully grouped in front of dark conifers or Hollies. There are other beautiful species coming along which I hope to name later. I think we miss much in the matter of grouping these beautiful species, and certainly could make them far more interesting by planting together those that bloom at the same time.

DANECROFT.

INFORMAL AND WILD GARDENING.

BY JAMES HUDSON, V.M.H.

[The following is a lecture given by Mr Hudson before the members of the Royal Horticultural

and upkeep. This is perhaps not so much the case in our own country as in France and Italy, especially the latter. The most formal of these gardens might almost be kept in order by a machine, no room being left for the true art of gardening. The formal or the geometrical garden has a tendency to make those who look after it quite formal too. In such gardens every plant must be in its exact position to an inch, and every one must correspond with or stand in strict relation to another.

Again, in the formal garden there is generally too much repetition. This may produce a gorgeous blaze of colour, but it is not in the best sense effective. Where there is too much repetition, there must necessarily also be waste of material. When the system of bedding out was at its height, the glass houses through the spring months were crowded to excess with bedding plants, to the injury and weakening of the permanent plants therein. A vast amount of labour was spent over this work, labour that might have been employed in far more profitable ways; and labour is a serious item in these days. The sooner, then, that "carpet bedding and ribbon borders" are consigned to the limbo of obscurity, the better will it be, both for those who look after them and from the point of waste of material. It should be possible to arrange any flower garden in such a way as to have not more than two beds, at the very most, of any one

RHODODENDRON OCHROLEUCUM, A HYBRID WITH CREAMY WHITE FLOWERS.

Society and published in the Society's Journal for April last. We are indebted to the Council and to Mr. Hudson for permission to reproduce it.—ED.]

I DO not wish in any way to condemn formal or set gardening, but I think we still see too much of it. Formal gardens, no doubt, have their place in the wide field of horticulture, but they soon cease to charm.

Many of the garden designs of the seventeenth, eighteenth and nineteenth centuries appear set and formal. The most prominent feature in them generally is the elaborate architecture, frequently most costly, both in design

kind of plant, for variety is infinitely better than repetition. In one direction there has been an improvement of late years in the arranging of what I would describe as "picture beds," i.e., beds that are relieved by taller plants in the centre or at the back, in which way the formality is considerably lessened. These beds, when arranged with good taste as to colour, are undoubtedly effective.

A system has grown up of late years, especially in public parks, of frequently renewing the plants. Plants are put out into the beds which cannot in any sense be termed suitable for general

purposes. The beds or borders, as the case may be, look remarkably well for a time, and as soon as the plants begin to fade they are lifted and another lot put out in their place. Thus a wonderful display may be kept up, but it is not done in what I might term a fair way, as contrasted with those gardens which have not the accommodation or the resources to provide the second lot of material. Not in one private garden in a thousand is there accommodation for bringing forward a sufficient supply of plants to treat the bedding in this way, nor do I think it ought to be encouraged. I have noticed in some of our well-known public gardens what a crowding there is of material to produce the desired effect just for the time being. It is well known that these supplies of plants are brought forward in houses and pits built for that purpose alone. In private

4. It affords greater space for greater variety.

1. As to Economy.—This is attained in two ways. First, there need not be the waste of material—I mean the waste of having an excess of one kind of plant. In an informal garden there will be scope for variety rather than too much of one thing. The larger the garden, the greater should be the variety as a matter of course. Secondly, a better result will ensue from the same amount of labour, and in consequence the cultivation can be maintained at a higher standard.

2. As to Its Accomplishment.—It will be found to be an easier matter to manage an informal than a formal garden, for in an informal garden every opportunity will be, or should be, taken to find the most suitable position for any plants you may have, and no hard-and-fast rule will

is afforded for those that are being grown to develop in the best possible manner.

Waste of Material.—This occurs in various ways, one of which is that of planting or grouping too many shrubs or plants together *en masse*, which cannot help but produce a formal effect as the plants grow. Another way is the overcrowding of them at planting-time to produce what is called immediate effect. These, as they grow, crowd each other, and in the end are often all spoilt or made most unsightly by leggy, straggly growth. On the other hand, in an informal garden more reliance can be placed upon individual shrubs, trees or plants, and each plant may have given it the opportunity of ultimate development. In the planting of shrubs it is customary to allow for only narrow margins of turf and then the gravel walk or road. It is far better to keep the

shrubs well set back or to increase the width of the turf. The effect produced by a broad margin of turf adds greatly to the general appearance. It is an all too common practice to plant too many shrubs as an undergrowth to trees, thus impoverishing the trees, and notably so if the position be at all dry. In such situations I would rather use the common British Ferns than anything else, and plant Daffodils among them for spring flowering, and Colchiums or Crocus speciosus for the autumn. Wherever there are numbers of timber trees that have been too thickly planted—or should I not say, that were not thinned out when they should have been—there, if it be possible, encourage a carpeting of grass, with, say, Daffodils and Snowdrops. The boles of large trees should never be hidden, for they are distinctly ornamental at all seasons of the year. The familiar quotation of “Woodman spare that tree” is often applicable to the

INFORMAL GROUPING OF SHRUBS IN THE REV. W. WILKS' GARDEN AT SHIRLEY, SURREY.

gardens, therefore, it is next to impossible to compete with such cases as these. I well remember, when I was a young man, being told not to give too much heed to the cultivation of bedding plants which occupied the houses and pits to an excessive degree, and that advice was not lost. Nowadays, I am pleased to see more attention is being given to such plants as Antirrhinums and Pentstemons, to name only two instances of almost or quite hardy plants. These and the Viola will no doubt play a more important part in the future than they have done as yet.

It may be asked what do I mean by “Informal Gardening,” and what are its advantages? It has several points in its favour, as I hope to show.

1. It is more economical.
2. It is more easily accomplished.
3. It is more attractive the year through, at least to all real garden lovers and enthusiasts.

be made that certain plants must be put in certain places. Again, an informal garden may begin in quite a small way and be extended according to the tastes of the owner, or according to the suitability of the situation and soil for certain plants, as found out by experience.

3. As to Attractiveness.—If not at any one particular time so showy, an informal garden that is well planted and in good condition will be found more attractive the year round. More attention can be centred upon individual plants, and each of these can be made to display itself to the best advantage.

4. As to Greater Variety.—This almost speaks for itself as being a feature of such a garden. It should also be one of the great essentials of every well-managed garden; and as regards space, this also should be apparent, for by dispensing with the number of any given plant, more room

formal style of garden. If a tree be ever so beautiful it has to succumb to the inevitable, if it be so unfortunate as to stand in the way of a formal design. This occurs frequently when a new house is being erected. But why not alter the position of the site somewhat and spare the tree? Before it became the fashion to enclose the house on all sides with formal and kept gardens and shrubs, it was the custom to let one side at least abut upon a park-like open space—lesser or greater as the case might be. This method is excellent, as it adds rusticity to the view, with cattle grazing, in all probability, in the immediate foreground. Many views of country houses have been taken where this arrangement prevails; and where the grounds slope away from the building an opportunity is offered for most picturesque planting and grouping.

(To be continued.)

THE WISTARIAS AND THEIR CULTIVATION.

AT this season there are few plants in the outdoor garden that attract more attention than the Wistarias. Their long, pendulous racemes of soft blue or white flowers are always highly appreciated, and it would be

are to be found in this country, one of the oldest that I know clothing Mr. Arthur Turner's residence at Slough. This has huge branches that extend for a long distance, and a few years ago precautions had been taken to prevent wet entering cavities that had been caused by decay.

Soil.—Although not very particular as to soil, there is no doubt the Wistarias give the best results when grown in good, though rather light

Apple are formed; hence it is desirable to encourage the production of these as much as possible. For that reason summer pruning, *i.e.*, early July, is usually adopted. At that time the lateral or side shoots are cut back to within three or four buds of their base, much in the same way that one would spur in a Grape Vine during the winter; then in early autumn, say, towards the end of September, any lateral shoots that have been

WISTARIA MULTIJUGA GROWING IN A LAWN BED. THE STEMS ARE SUPPORTED WITH IRON PIPING.

difficult to mention climbers better adapted for pergolas or verandahs. Plants dwarfed by severe pruning are largely used for tubs or earthenware bowls, and these have their value for standing beside formal Lily pools, in cool conservatories, or even the hall of the dwelling-house. By nature a vigorous climber, the Wistaria does not appear to resent this dwarfing process; hence we may safely regard it as one of the most useful of all our hardy plants of shrubby character. Some very fine gnarled specimens of *Wistaria chinensis*

loam that is well drained. Very rich soil is not essential, though if on the poor side it would be advantageous to add some well-decayed manure in the lower spit before planting. The actual planting may be done either at the end of October or early in March, though specimens in pots could be put out at almost any season.

Pruning.—This is an important item in the successful cultivation of these beautiful climbers. The blossoms are produced on short, stunted spurs, much in the same way that those of the

made since the first pruning ought also to be cut back. Of course, where growths are needed for the extension of the plant, they must be left untouched, merely shortening them back somewhat at the autumn pruning.

The Best to Grow.—There are two species well worthy of extended cultivation, *viz.*, *W. chinensis* and *W. multijuga*. The first named is much the most prevalent of the two, and is the one usually seen growing on pergolas, verandahs, and sometimes on trellis. It is a native of China,

and its porcelain blue flowers are too well known to need description. Of far greater beauty is *W. multijuga*, owing to the length of the racemes. These sometimes attain a length of 3 feet, occasionally even more, and as they are produced in great profusion, a well-grown plant makes a beautiful picture during June. The type has blue flowers of much the same shade as *W. chinensis*, but there are several varieties, the best being that with white blossoms. The illustration on page 293 represents several plants of this variety grown as bushes in a large lawn bed.

A. B. ESSEX.

SAXIFRAGA MARGINATA.

SAXIFRAGA MARGINATA appears to be one of the best tempered of the *Kabschia* section, growing readily in a limy compost liberally mixed with

SEASONABLE NOTES ON VEGETABLES.

French Beans.—Support those growing in frames by a single stake. Keep the roots well watered and the foliage syringed, especially during hot and dry weather, to ward off attacks of red spider. Pick the Beans as fast as they are ready, so as to induce more to form upon the plants, and thus avoid a strain upon them, as is the case when seed-forming is allowed. Sow successional rows in the open of such varieties as *Canadian Wonder*.

Broccoli.—Plants for the main crop should be put out without delay, allowing plenty of room between them, as when growth is of a sturdy, well-matured character, the plants are less liable to suffer from frost. Should the weather be dry at planting-time, make holes with the dibber,

clear water. When growth is well advanced, apply liquid manure freely.

Ridge Cucumbers.—The earliest-raised plants in pots should be put out on slightly raised ridges of long manure, leaves and old potting soil. Sow for succession on the site where the plants are to grow, and to all plants in growth apply water freely, with a sprinkling overhead every evening.

Onions, on the whole, are looking well. Keep the soil stirred between the rows and occasionally dust with soot, wood-ashes or artificial manure, preferably during showery weather. The main crop, sown in the open in March, should now be thinned if extra large bulbs are required, although where a crop of serviceable Onions only is needed, it is not necessary to thin at all, or very little. It is surprising how the plants bulb, even when apparently crowded. Those put out singly and intended for exhibition must be well supplied with liquid manure and be nightly syringed, as they should be encouraged to make as much growth as possible during the next three months if they are to weigh 3lb. each. Less than this weight they are not considered satisfactory.

Peas.—Sow seed of late varieties of the Gladstone type in well-watered drills. Earth up early, and mulch each side of the row with manure to conserve moisture in the soil, assist growth and prevent an attack of mildew. Too many persons defer the mulching until they see the mildew on the haulm; it is then too late to remedy. Stake early, so that the haulm can have support for its tendrils. Water frequently rows in all stages of growth, as Peas are moisture-loving subjects, and quickly resent the lack of it by a relaxation of growth.

Turnips.—Make full sowings of the best varieties in shallow drills well soaked before sowing the seed. Cover lightly with soil and finally with short grass, which is a good remedy against Turnip fly and conserves the moisture in the soil, hastening germination of the seed. Keep the hoe moving among recently sown plots, occasionally dusting freely with soot or wood-ashes, which not only checks attacks of fly, but gives a deep

colour to the leaves, improving growth and imparting succulence to the roots.

Potatoes.—The growth of the haulm is irregular this season, even where the tubers were duly sprouted before planting. Such plants that are lagging behind should have a sprinkling of nitrate of soda or sulphate of ammonia to bring the growth to a level with that of the more promising plants. No time should be lost in earthing up all late-planted batches, first thinning out surplus weak growths where they promise to be overcrowded. Four shoots are ample for any tuber; indeed, fewer are better.

Cabbage.—This crop has been exceptionally good this season. So many of the newer varieties have "turned in" early, especially Harbinger, which is one of the most reliable of the early sorts. When cutting, do not cut too low, as a second crop will quickly come on and be most acceptable later.

Swanmore.

E. MOLYNEUX

SAXIFRAGA MARGINATA, AN EARLY FLOWERING SPECIES WITH WHITE BLOSSOMS.

grit, and exposed to the fullest sunshine. The small button-like rosettes are brilliantly silvery in dry weather, and these in early March throw up 3-inch stems bearing clusters of large, pure white flowers of great beauty. The accompanying illustration indicates how dainty a colony of these rosettes appears in the early spring, and how shapely and solid in texture the individual flowers are. The plant is readily propagated by division, which is best done soon after flowering, say, in April or May, and if shaded for a week or so from hot sun and occasionally syringed, should the weather be dry, the divided pieces rapidly make themselves at home in their new conditions and in a comparatively short time join up to form a pleasing hummock. Top-dressing with grit and humus at least twice a year is very beneficial, but care should be taken to do this on a dry day, so that the foliage is not soiled.

R. A. MALBY.

fill them with water, and plant afterwards, again watering them. It is better to induce the plants to start into growth at once, even at the expense of more labour, than to allow them to linger for days in the drought before root action can take place. The same remarks apply to all the Brassica tribe planted at this time.

Cucumbers in houses and frames need daily attention to thinning and shortening new growths. Take out the point at every second leaf, and remove entirely shoots that have borne fruit. This will make room for new shoots, and thus keep up a succession of fruiting growths. Occasionally remove old leaves to admit more light to the plants. As an extra stimulant to fruiting plants, remove an inch or so of the surface soil and replace with fresh loam and half-decayed horse-manure in equal parts, first sprinkling over the border a handful of soot or some concentrated manure, afterwards giving the whole a good soaking with

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Early Muscat Vines.—The foliage of Muscat Vines is very liable to scorch, especially after a spell of dull weather. This may be avoided by covering the glass with a light shading, such as fish-netting or a little limewash. To assist the berries to colour perfectly, the foliage must be drawn aside a little to admit plenty of light. The roots should have an abundance of water and stimulants till the berries are ripe.

Early Peaches.—When all the fruits have been gathered from the permanent trees, the borders must be given a thorough soaking with water. If red spider and thrip are present on the trees, the latter should be syringed with an insecticide late in the afternoon. A daily wash with the hose-pipe will also assist in dealing with these pests. The ventilators must now be kept open day and night.

Midseason Peaches.—When the fruits are approaching the ripening stage, the borders should not be watered if this can be avoided, as the flavour of the fruits would suffer. See that the fruits are well exposed to the light, and, to avoid scorching, place a double thickness of fish-netting over the glass. During the ripening stage admit plenty of air and keep the atmosphere of the house dry.

Plants Under Glass.

Gardenias.—When the old plants have passed out of flower, the most suitable may be transferred to larger pots. A rich soil is necessary, and some stimulants should be given during the growing season. Plenty of heat and moisture is essential to their well-being. Where there is convenience for planting them out, this method of culture should be adopted, as the flowers are then larger and much more numerous. After the flowering is over, the plants must be cut well back.

Annuals.—The conservatory and greenhouse may be considerably brightened at little expense by the use of annuals grown in pots. The following are suitable kinds: Browallias, Lobelia tenuior, Petunias, Asters, Godetias, Statice, Ten-week Stocks, annual Larkspurs and Phlox Drummondii.

Violets.—During hot, dry weather it will be necessary to spray the plants every evening. Light dustings with soot will help to keep the plants clean, and also act as a stimulant. Work the hoe freely between the plants to promote healthy growth, and remove all runners that appear.

The Flower Garden.

Climbing Plants.—Constant attention must be paid to the thinning and regulating of climbing plants growing on walls and pergolas, as they grow very quickly at this time of the year. Those which are infested with aphids should be syringed with an insecticide. The strong young growths from the base of climbing Roses must be preserved, as these will be required for next season's flowering.

Carnations.—Attend to the staking of the plants, or they may become damaged by wind and rain. The perpetual kinds will require regular attention in tying. Green Bamboo tips will be found the most suitable stakes for the perpetuals, but for border Carnations there is nothing better than wire supports. Seedling Dianthus of the Heddergii type may be planted among Carnations for a succession of flowers after the Carnations have finished blooming.

Sweet Peas.—The earliest plants are now showing their flower-buds, and must be given plenty of stimulants. Hoe between the rows, especially after heavy rains. If not already done, place a mulch of well-seasoned manure over the roots.

The Hardy Fruit Garden.

Raspberries and Loganberries.—Attention must now be given to the young growths which are springing from the base of the plants. Those on Raspberries may be thinned to about six to each stool. The growths on Loganberries should be secured to stakes, or they will be damaged.

Autumn-fruiting Raspberries must be severely thinned, or the crop will suffer in quality.

Summer Pruning.—The summer pruning or pinching of trained trees is a matter of great importance, and must not be neglected. Young trees especially should be well looked after in this matter. Select carefully those shoots which are needed for extension, and in the case of wall trees secure them in their positions on the walls.

The Kitchen Garden.

Asparagus.—Cutting must be discontinued about the middle of the month. Attention should then be devoted to the growth of the plants. During showery weather artificial manure may be scattered over the beds. Should, however, the weather set in dry, a watering with diluted farm-yard manure will be beneficial. The stronger growths may be supported with stakes or wires to prevent damage by winds.

Mushrooms.—A shed on the north side of a wall, or, better still, a cellar, is the most suitable place for the growing of Mushrooms during the summer months. To make the most use of the space, oval beds are best. Prepare the materials under cover, and be sure that the manure is not too hot before spawning the beds.

Parsley.—Make a good sowing of Parsley in the open for the winter supply. The ground should be rich and deeply dug. A narrow border is convenient for growing winter Parsley, because lights may easily be fixed over it during very hard frosts.

Celery.—Take advantage of showery weather to plant Celery. Should a long spell of drought set in, water the plants frequently. Keep a sharp look-out for the Celery fly. Frequent dustings with soot when the foliage is damp will help to keep the plants free from this pest.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

Plants Under Glass.

Gloire de Lorraine Begonias which are expected to become large specimens by next winter must not be allowed to become potbound, or no amount of after-treatment will make them grow to the size of plants receiving timely attention. Fumigations should be frequent and regular to prevent attacks from mite and other insect pests.

Primulas.—Plants of the sinensis and stellata types will be ready for potting into $\frac{3}{4}$ -inch pots. Use a fairly light compost rich in leaf-soil and coarse silver sand. Now that the bedding plants have been cleared from the frames, a number can be used for growing Primulas and similar plants, taking care that the glass is first shaded to protect them from bright sunshine.

Bouvardias can now be either potted on or planted out in frames. If the latter method is adopted, they do not require so much attention to watering. The advantage gained by planting in frames is that they are easily fumigated, as these plants very rarely escape an attack from green fly.

Malmaison Carnations.—When flowers are required the entire year round—and this is possible by correct treatment if suitable varieties are grown—layering must now be commenced. Two year old plants are most suitable, as they are more economical in frame space. The growths layered should not be too large nor the incision made too long. After layering is done, keep the frames closed and fairly moist by spraying early in the afternoon; but care should be taken that this is not overdone, or rust may develop.

Heating.—If the season is normal, very little artificial heat will be required for the next few weeks. The fires are best kept burning, so that in the event of a sudden drop in the temperature, which generally happens when rain is likely, they may be stirred up at once to generate heat quickly.

The Flower Garden.

Annuals which were sown in the open where they are to flower must now be thinned. Most

kinds should be thinned sufficiently to allow each individual plant to expand to its full size, so that the natural habit and character of each may be displayed.

The Herbaceous Border.—Some of the early flowering subjects are already over, and the dead blooms ought to be removed. In some cases the plants should be partly cut over to allow greater room for others to develop. Further staking will be needed for Phloxes, Asters, Lychnis and many other plants. In staking the plants, try to conceal the ties and stakes, and allow the plants to have a natural appearance. The borders should be frequently stirred with the Dutch hoe.

Chrysanthemums.—Permanent stakes must now be put to each plant, the length depending on the varieties. Some of the very dwarf bedding kinds do not require this attention. Tarrad twine is best, but it should not be used too fine nor tied too tightly, or breakages will occur.

Roses.—Frequent inspection is necessary to remove any suckers which may appear; these are best removed by twisting or pulling them off entire. If merely cut back, they very quickly form other buds and reappear.

Sweet Peas will soon be flowering, and should be frequently tied and disbudded. The ground must be hoed often to retain all possible moisture, as this is better than having to resort to watering, which may, however, be necessary later when the plants become larger and require more moisture and food.

The Kitchen Garden.

Onions.—The plants which were sown under glass early in the year are now growing freely, and should be treated liberally if big bulbs are expected. Even if the ground was well manured in advance, additional stimulants must be applied during growth. If there is not much rain, it will be necessary to water in the manures.

Runner Beans.—These should not be allowed to get too long before being staked. Fairly tall stakes are necessary, but when these cannot be obtained it is quite possible to get good crops from the plants if they are occasionally pinched; this causes them to assume much the habit of Dwarf French Beans. When grown in this fashion less space should, of course, be allowed between the rows.

Tomatoes.—For plants which are to fruit during late autumn or early winter, seed must be sown now, choosing a free-setting variety. At this season it is much better to germinate the seed without the aid of artificial heat.

The Hardy Fruit Garden.

Strawberries.—If very dry conditions prevail, birds will devour the fruit long before it is ripe, so that it becomes necessary to net the plants early. Stout stakes should be placed at intervals of from 12 feet to 20 feet, and either wire or strong twine strained between them. By supporting the nets in this manner, much time is saved in the fruit gathering season, and the length of life of the nets is also increased.

Thinning Fruits.—With such a disastrous frost as came at the middle of May, when many outdoor fruit trees and bushes were in full bloom, I am afraid much thinning will not be necessary this year; still, it sometimes happens that trees growing quite near affected ones are bearing heavy crops. Apples, having now nicely set, ought to be gone over and the small and badly clustered fruits thinned. Where certain trees are known to drop their fruit badly, a timely watering will sometimes prevent this.

Fruit Under Glass.

Peaches and Nectarines.—As the fruits in the early houses approach maturity, there is a danger of injury by the sun on very bright days. To prevent this, shading should be sprayed on the roof of the glass house where they are growing, just sufficient to break the strong rays of the sun. As the fruits ripen they ought to be examined daily and all ripe fruit carefully pulled. Extreme care is necessary in the handling of ripe Peaches and Nectarines, owing to them being so easily marked and disfigured.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine.)

Castlemilk Gardens, Lockerbie, N.B.

THE FRAGRANCE OF SPRING.

AFTER an exceptionally wet and gloomy winter, full of anxiety for all, and of sorrow for many an English home, we have all looked forward with even greater longing than in other years for the renewing of the joys of Nature which we call spring.

Spring was late in coming, but it has now come in the fulness of its beauty, bringing joy with its vivid yet tender verdure to our sense of sight, with the songs of its birds to our sense of hearing, with the delicate fragrance of leaf and flower to our sense of smell. The poet who wrote the Song of Solomon felt this awakening of Nature: "For lo: the winter is past, the rain is over and gone. The flowers appear on the earth, the time of the singing of birds is come, and the voice of the turtle is heard in our land. The fig tree putteth forth her green figs, and the vines with the tender grape give a good smell."

This last, this "good smell," is by no means the least of the pleasures of the garden in spring-time; in fact, all the year through I doubt if any sensation is more delightful than that given by the first whiff of Sweet Briar which greets us generally on some soft south windy day in early April. This, also, was later this year than usual in coming, and April was well advanced before we had the pleasure of inhaling that refreshing smell of Sweet Briar. When, at the end of April, the warm burst of sunshine came, it brought with it many delicious scents, which blended in the garden in a wholly delightful way.

One sunny day as I walked round the garden with a friend from London, she expressed more pleasure at the fragrance than even at the beauty of that spring day. From a border of double Arabis overshadowed by a Cherry tree in full blossom the scent of Almond was diffused through the air around, and mingled with the elusive yet pungent aroma of quantities of Muscari Heavenly Blue. Further on, the sweetest of all the Narcissi, well called *Narcissus odoratus rugulosus*, exhaled its perfume under a hedge of Sweet Briar, the deep golden flowers of this Jonquil looking wonderfully well against a background of the tender green of the Sweet Briar. The garden just then was full of Daffodils of all sorts. Most of this family have a more or less pleasant smell, from the old Daffa-down-dilly to the Pheasant's-eye *Narcissus*; but some classes are more fragrant than others. Nearly all the Leedsii are very sweet; so are the Poeticus, such as Virgil, Homer and Epic; but none, I think, has so strong a scent as the old Pheasant's-eye, *Narcissus recurvus*, and the double Gardenia-flowered *Narcissus*. These, however, do not bloom till May.

Big borders and window-boxes filled with Wallflowers of brilliant hues scent the air round and under the windows with their Almond-like fragrance. Here, too, are bushes of the aromatic Rosemary, this spring unusually full of unobtrusive lavender grey blooms. Violets, large and small, pour forth their delicate and always welcome scent from quite unexpected nooks and corners. They love to shelter under a hedge, or even wall, and if they can find some stones to push their roots under, they appear quite happy. There is a good deal of similarity between the scent of the Wallflower and that of the Violet. Both belong to Kerner's third group of flower smells,

which he calls "benzaloid," or aromatic; both have the specially delightful attribute of being able to diffuse their fragrance into the surrounding air; and both, unfortunately, lose that fragrance very quickly when picked and put into water. In this respect the double Violets are superior to the single, but they do not thrive well outdoors in this part of the world, and require the protection of a frame.

A bed of Hyacinths, though not very artistic to look at, is very pleasant to smell. Some of the Tulips—especially, I think, the pale yellows—have quite a sweet scent. The double Tulip called Yellow Rose is certainly fragrant, as is *Tulipa sylvestris*, which may sometimes be induced to naturalise itself in meadow or woodland.

One of the sweetest of yellow flowers is *Primula Auricula*, the Dusty Miller, a delightful little plant for a rather moist place, well wedged with stones, on the rockery. Its powdery stems and leaves of a soft green, edged with silver, are a beautiful setting for the deep yellow blossoms. *Primula sikkimensis*, also a lover of moist spots, has pale yellow flowers with lemon fragrance.

Another rockery plant with really exquisite scent is *Daphne Cneorum*, the Garland Flower. It is a tiny evergreen shrub of prostrate habit, with neat little heads of bright rose-coloured flowers collected in clusters like small Bouvardias. The trailing stems should be kept close to the earth with small stones, and it may be propagated by layers or cuttings. It enjoys a soil of peat and leaf-mould, and on our rockery it is associated with the white *Trilliums*, which flower about the same time.

Those who know M. Henri Correvon's delightful book of "Alpine Flora," illustrated with coloured reproductions of M. Philippe Robert's faithful yet decorative water-colour studies, may recall the illustration of this plant, and also M. Correvon's graceful poem on this little *Daphne*. In Mr. E. W. Clayforth's clever English edition of the book it is given in French, but for those who may not know it I copy the verses of a translation of it that has been given me:

"Raised high to Heaven where Jura's white rocks tower

The smooth-leaved *Daphne* with its cross like flower

Hallows with fragrance all the mountain air.

Along the hills' wild crest, by night and day

The flowers incarnate sing love's roundelay

Lonely yet wise, the Sun's gay gifts they share.

Raised high above the world's harsh noise and cries

They spread their pink flowers 'neath the clearest skies

Happy to flood the air with incense rare."

With the advent of May come the sweet Lilies of the Valley, also fond of peat and leaf-mould, followed by the many scented flowering shrubs—the Hawthorns, Laburnums and, most fragrant of all, the Lilacs. Perhaps there is no other scent which has to the same degree as the Lilac the power of awakening slumbering thoughts and recalling old memories. Walt Whitman tells of this attribute of the Lilac in the first of his "Memories of President Lincoln," called "When Lilacs last in the dooryard bloom'd":

"When Lilacs last in the dooryard bloom'd
And the great star early droop'd in the western
sky in the night

I mourned, and yet shall mourn with ever-returning spring.

Ever-returning spring, trinity sure to me you bring

Lilac blooming perennial and drooping star 'in the west,

And thought of him I love."

The poet goes on to give a charming description of the Lilac bush: "tall growing with heart shaped leaves of rich green, with many a pointed blossom rising delicate, with the perfume strong I love, with every leaf a miracle," and a little further on he writes: "Yet the Lilac with masterful odour holds me." There are many beautiful varieties of Lilac. Among the best are Marie Legraye, single white, very free in flowering; Mme. Lemoine and Mme. Abel Chatenay, double white, with big blooms which last well; Beranger, single lilac; President Grévy, double, of a bluish lavender; and, most striking of all, Souvenir de Louis Späth, with great spiral clusters of dark vinous purple bloom. A big bush of this variety in our garden, when in bloom in mid-May, always attracts admiration. It lasts in perfection longer than most of the Lilacs.

Before the end of May some of the Rose species are in bloom. *Rosa alpina* and *R. a. pendulina*, with attractive, bright single blooms of magenta crimson, a better colour than the type, have a distinctly resinous and refreshing scent, and the little double Scotch Roses and the Rugosas are very fragrant, while the leaves of *Rosa pomifera* are almost as fragrant as the Sweet Briars. But with the mention of Roses I feel I am trespassing on the domain of summer.

We have seen something of what spring may bring to us in the garden, and when we are planting let us not forget that fragrance is a flower's most gracious and endearing charm.

If we leave the garden and wander into wood and meadow on a mild May day, we shall still have our senses satisfied with lovely odours and delicate scents. The wild Hyacinths or Bluebells which carpet our woods with Ruskin's "dust of sapphire" have a very pleasant honey smell, and nothing is more refreshing than the fragrance of a meadow sprinkled over with Cowslips; in fact, when an English spring really comes with its soft showers and genial sunshine, the "very fields breathe sweet," and the earth itself gives forth a goodly smell.

WHITE LADY.

ANSWERS TO CORRESPONDENTS.

FLOWER GARDEN.

LILY OF THE VALLEY UNDER TREES (*K. Marshall*).—In Nature this is frequently found in woodland places, and in the garden, too, enjoys not a little shade. That of Fir trees, however, in conjunction with the poor condition of the soil usually existing, is about the worst conceivable, and we are not surprised at the poor results obtained. The plant really delights in rich, moist loam, and some of the finest we have ever seen were grown in this in a Thames-side garden, which in winter was occasionally flooded. Here at flower-time the plants were 15 inches high, the giant sprays and foliage demonstrating that their every need was amply supplied. If you can imitate the above conditions, you need have no fear of failure. The thin shade of Apple trees near by is good; the cold, impenetrable shade of house or wall that to avoid. With rich soil and root moisture constantly assured to the plants, shade may be dispensed with. In the circumstances, you had better leave them alone till September is nearly gone; then dig them up, sort out the biggest crowns, and plant singly a few inches apart. If you make a bed of them in this way, you will have plenty of good spikes in a season or two. It is a mistake to plant these things in mat-like clumps. Planted as suggested, the bed with annual mulchings may remain good for many years.

DAFFODILS IN GRASS BANK (P. J. W.).—We imagine the fault to be with the bank itself, and concerns either its too acute angle or the dryness or poverty of the soil. A large number of Daffodils prefer cool, moist loams, and, given these, are happy almost anywhere, whether in sun or partial shade. In drier soils on level ground the soil requires enriching, and, even so, the greater luxuriance the plant assumes in cooler rooting mediums is not reached. If, therefore, the soil of the bank is naturally dry, or rendered so by excessive drainage or the presence of tree roots, the poor growth of which you complain is easily accounted for. The remedy in such a case is not easy, since moisture—a difficult thing to apply in the circumstances—is the thing most needed from October to May, when root and top growth are being made. Daffodils are deep rooting, and ordinary surface mulchings are of little avail. Liquid manure during the period named might assist materially if possible of application in the circumstances. Basic slag would be of little avail unless dug in. It is also somewhat slow in action. Two sprinklings of sulphate of ammonia—one in November and the other in February or March—might stimulate growth considerably if applied at the rate of an ounce to 2 square yards.

TREES AND SHRUBS.

AZALEA AMENA NOT FLOWERING (M. J.).—The direct cause of the non-flowering is poorness of growth, which may be brought about by unsuitable soil or spring and summer drought, or both. This species delights in a constantly cool root-run, and does not require excessive moisture. A better growth probably would have resulted had the plants been in a bed wholly made up of peat, leaf-mould and sand, ordinary garden soil being little to their liking. In the above mixture and a sunny position, with fair supplies of root moisture during spring and summer, there should be little difficulty in securing a good flowering. Firm planting is also necessary. The Gentian might well be divided and replanted every third year, avoiding a position of much dryness; and if the soil is of a heavy nature, the sandstone of your district, finely pulverised, might with advantage be freely incorporated with it. September and October are the best months for planting, and, apart from firmness, it is important to insert the units right up to the base of the leaves.

RHODODENDRON FOR IDENTIFICATION (Macclesfield).—The specimen sent for identification is *Rhododendron forsterianum*, a tender hybrid raised by crossing two Himalayan species. It gives the most satisfactory results when grown in a quite cold greenhouse or frame which can be well ventilated at all times. During the summer and early autumn the lights can be removed, or, if that is not possible, the plant can be plunged in ashes outdoors in a position where it will obtain a little shade from very hot sun. It should be given a compost of sandy peat, which must be made quite firm about the roots. Repotting is not required very often. When well rooted, cow-manure water can be given once a week with advantage during the growing season. At other times a little cow-manure water can be given every three or four weeks. Keep the plant well syringed, taking care to get the water beneath the leaves, so that insect pests may be kept away. The only time when the house will not require free ventilation is during severe frost or cold east or north winds. A moist atmosphere with moist stages and paths is essential, especially during the spring, summer and autumn. Artificial heat is only necessary to maintain a temperature of 35°. Cuttings may be rooted by inserting them in sandy peat during June or July in a close, shaded frame.

THE GREENHOUSE.

CULTURE OF STREPTOCARPI (Enquirer).—The plants will do best on the shady side of a span-roofed house. They should be freely watered during the growing season and kept moderately dry in the winter. They may be fed in the summer, when the pots are well furnished with roots, either with liquid manure or one of the many plant foods of a chemical nature now so much used. Suitable liquid manure may be made of sheep or cow manure in which a bag of soot has been allowed to steep. This must be well stirred up, and then allowed to settle till quite clear. Care must be taken not to use it when too strong. About once a fortnight will be sufficient to apply the manure. Second-year plants may be had in bloom by May, and by employing successive batches a display may be kept up till the autumn. If the earlier flowers are kept picked off, the display will, of course, be greater when all are allowed to expand. Seedlings of one year that have flowered throughout the summer months may in the autumn be kept somewhat drier than before, and during the winter only enough water should be given to keep the soil slightly moist. An extreme minimum temperature of 45°, rising 10° to 15°, will suit them well. Then about the middle of February or early in March the plants should be repotted, using a compost made up of two-thirds loam to one-third leaf-mould and a good sprinkling of silver sand. For this first potting some of them at least may not need pots larger than, even if as large as, those they have been grown in before. In a rising temperature they will, however, grow freely, and the more advanced will soon be ready for a shift. Good plants may be flowered in from 4½-inch to 5-inch pots, but, of course, the size must be regulated by the vigour of the specimen. *Streptocarpus* are, as a rule, raised from seed sown early in the year

and placed in a temperature of 60° to 70°. From the minute character of the seeds and the delicate nature of the young plants, they need considerable care during their earlier stages. When large enough to handle, they must be pricked off, then potted singly into small pots, and finally—for the first season put into pots from 4 inches to 4½ inches in diameter—they will flower freely in the summer and early autumn. You give us no indication of the condition of your plants, otherwise we might have given more particular rather than general advice, but hope our answer will convey all that you want to know.

FRUIT GARDEN.

MELONS DISEASED (Melon).—Cut out all the affected parts and wash the cut ends of the stems with a rose red solution of potassium permanganate.

PEAR SHOOTS FOR INSPECTION (E. F. S. M.).—Your Pear Louise Bonne of Jersey appears to be attacked by the Pear scab fungus, *Fusicladium (Venturia) pyrinum*. It would be well to spray it with Bordeaux mixture, of half the strength used for spraying Potatoes, as soon as possible, and at intervals of three or four weeks on two other occasions.

PEACH LEAF-BLISTER (Glastonbury).—The Peach is attacked by the Peach leaf-blister fungus, which is usually perennial in the shoots. Therefore all shoots affected should be removed; they are useless, as they never produce good fruit. The tree should also be sprayed with ammoniacal copper carbonate. Protection from cold winds and frosts, which predispose the trees to attack, should also be afforded, and spraying with Bordeaux mixture before the buds burst seems likely to be of considerable value as a preventive of attack.

VINES COLLAPSING AND BLEEDING AFTER BREAKING INTO GROWTH (J. McD.).—We are very sorry for the unfortunate accident to your Vines and the worry it is causing you. The first thing to do will be to try to stop the bleeding. While this is going on we fear it is impossible for the Vines to break into strong growth again. The most likely way to stop it will be by scaring the bleeding parts with a hot iron, and then, while the parts are dry, apply the preparation used in mending punctures in bicycle tyres. Cover this over with oilskin, and bind the whole down tightly with strong tape. It is now too late for grafting on the old wood, but, as you suggest, you may inarch young shoots from your young Vines on shoots of the injured Vines. They may or may not help you; at any rate, it can do no harm. The thing to aim at is to stop the bleeding, and then the Vines will break if there are plenty of well-conditioned roots in the border. The way to inarch young shoots is to cut away a thin piece, about three inches long, from the side of each shoot, and then bring the two cut faces together and bind them down firmly. You will have to stand the young Vines on something solid, because, if they are disturbed, the roots will easily break off.

KITCHEN GARDEN.

ASPARAGUS GROWING WEAKLY (Constant Reader).—The best thing you can do to improve the strength of the grass in your Asparagus-bed is to cease cutting any more of it this year. This will give the plants a longer season of rest and a longer time to form stronger root crowns for next year's crop. Should the remainder of the summer prove at all dry, give your bed occasional waterings of manure-water up to the end of August. You will find that this treatment will improve the quality of your Asparagus next year. The following is a safe and simple system to adopt in cutting Asparagus. Try it next year. Cut all the grass that grows as soon as it is large enough to be useful, including the large, medium and small (even the small is useful) from the time (in April) when it commences to grow until June 16, when cutting must cease altogether. The plants will have time after this to form new root crowns for the following year's crop.

NEGLECTED ASPARAGUS-BEDS (Humble).—Seeing that your grass is weak, you will do well not to cut any of it this season. Let all that comes up grow to maturity, cutting the grass down to within 4 inches of the ground when it is ripe and yellow in the autumn. By doing this you will find that the grass will be stronger next year. If there are any large, bare patches in the beds without roots, dig them up and place two or three seeds in each patch at once. Water the bed once a fortnight in dry weather with liquid manure until the end of August. As soon as the ripe grass has been cut in the autumn and the beds cleared of weeds, dress them over with a covering of well-rotted manure 3 inches deep. The rains during the winter will wash the goodness of the manure to the roots of the plants and help to strengthen them greatly. At the end of March rake off the dry manure on the surface of the beds into the paths between, digging it in. At the same time cover over the beds to the depth of 2 inches with the finest of the soil from the dry paths. Press this soil down and rake over neatly; then scatter over the beds a dressing of ordinary salt or nitrate of soda at the rate of a good handful to the square yard. When cutting-time arrives in the spring, cut all the grass, large and small, when ready, as it comes up, and cease cutting altogether on June 16. All that comes up after that must be allowed to grow, and be encouraged by watering as above. Keep the beds clear of weeds at all times.

MISCELLANEOUS.

THE "GHOST" FLY IN GREENHOUSES (A. K.).—Fumigation with hydrocyanic acid is the best method of getting rid of the "ghost" fly or white fly (*Aleyrodes vaporariorum*), but in many greenhouses it is impossible to adopt this method of destroying the pest. Failing this, fumigation with one or other of the approved fumigants should be carried out, and as some of the larvae will not be killed and all the eggs will escape, the fumigation must be repeated twice more at intervals of a few days.

NAMES OF PLANTS.—M. T.—*Streptosolen Jamesonii*.—*Philippine*.—A, *Spiraea arguta*; B, *Cotoneaster Simonsii*.—*Nemo*.—*Prunus Padus*, the Bird Cherry.—*Mrs. Douglas Pass.*—*Le Murville*, orange scarlet; *Bronze Queen*, bronze.—*Boris*.—1, *Ulmus montanus*; 2, *Populus canescens*; 3, *Cedrus Deodara*.—*W. Y.*—1, Probably *Crinum* species; 2, *Adiantum formosum*; 3, *Sedum Sieboldi*; 4, *Chlorophytum elatum*; 5, probably *Hamanthus* species; 6, *Passiflora cærulea*; 7, *Melissa officinalis* variegata.—*Mrs. E. I., Edgaston*.—1, *Ranunculus aconitifolius* flore pleno; 2, *Alyssum montanum*; 3, *Globularia cordifolia*. As a rule *Sempervivum* may be left alone after planting. But in order to get larger rosettes, all, or nearly all, of the smaller side ones may be removed. Enough, however, should be left to take the place of all that flower, as these die after flowering.—*T. Lee*.—1, *Silene maritima*; 2, *Dianthus cæsius* variety; 3, *Heuchera sanguinea* hybrida; 4, *Saxifraga hypnoides*; 5, *S. muscoides* variety; 6, *Scilla hispanica*.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

The fortnightly meeting on June 8 was one of the most comprehensive held this year. Herbaceous plants were in great numbers and of high excellence, such things as Irises, Pæonies and the sumptuous beauty of the Oriental Poppy predominating. Carnations, as usual, were good; Sweet Peas, Columbines and Snapdragons in perfection. Orchids were not numerous shown, though several good groups and novelties were on view.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), and Messrs. C. T. Druery, J. Green, R. C. Notcutt, F. W. Harvey, W. J. Bean, G. Reuthe, W. Howe, C. R. Fielder, R. W. Wallace, E. A. Bowles, J. Jennings, J. F. McLeod, R. Hooper Pearson, C. Dixon, J. Dickson, H. J. Jones, A. Turner, J. T. Bennett-Poë, W. P. Thomson, E. H. Jenkins and J. W. Barr.

Messrs. Barr and Sons, Covent Garden, displayed Flag Irises, Poppies and Lupines very finely, the first named in the greater numbers. Of these, some of the more distinct were *I. pallida dalmatica*, *Princess Beatrice* (a fine blue), *Alcazar* (mauve and purple), *Victorine* (violet, splashed white), *Mrs. H. Darwin* (nearly all white), *Queen of May* (rosy mauve), *Caterina* (one of the best of the *pallida* set), *Her Majesty* (reddish lilac) and *Isolene* (the most distinct in reddish falls and rose and white tinted standards). The old *jacquiniana*, in velvety crimson and brown, was also very fine.

Messrs. Allwood Brothers, Hayward's Heath, staged some very good Carnations, of which *Mandarin* (yellow fancy), *Mary Allwood*, *Wivelsfield White*, *Terrific*, *Benora* (white-ground fancy), *Queen Alexandra* (pink), *Lady Meyer* (pale pink) and *Marmion* were among the finer things.

Messrs. Stuart Low and Co., Enfield, showed a fine strain of *Streptocarpus* in many shades of colour, also hard-wooded Heaths and New Holland Plants in variety. *Primula decussata* (rose pink heads) and *Boronia heterophylla* were very beautiful. Messrs. Low also staged a capital lot of Carnations, showing these flowers to advantage on a double table end. *Venus*, *Cleopatra*, *Minerva*, *Diana* and *Mars* of the Perpetual Malmesdon class were very fine, with *Gorgeous*, *Mary Allwood*, *Geoffrey Henslow*, *Mrs. Mackay Edgar* and *Sunstar* of the Perpetual-flowering class. A very handsome lot.

Messrs. Dobbie and Co., Edinburgh, occupied the whole of the western end of the hall with a table of long-spurred Columbines (*Aquilegias*), Sweet Peas and Snapdragons, the latter constituting a superb centre-piece to the whole. Sown in August last, it is doubtful if anything so fine in these flowers has ever before been staged, the cultural skill displayed demonstrating what is possible with so everyday a flower. *Moonlight* (in bronze and gold), *Primrose King*, *Blush Queen*, *Fiery Belt*, *Nelrose* (the so-called Perpetual), *Tom Thumb White*, *Bonfire*, *Amber Queen*, *Maize Queen* and *Golden Morn*—these were a few of the more important in a most imposing group. Sweet Peas, too, were delightful; *Dobbie's Orange*, *Miss Burnie* (fine white), *Inspector* (orange), *Alfred Watkins* (pale blue), *New Marquis*, *Dobbie's Cream* and *Lavender George* *Herbert* were among the most important of these.

Messrs. Thomson and Charman showed herbaceous plants, having a fine central group of *Geum* *Mrs. J. Bradshaw*. *Pæonia lutea* splendens and *Pentstemon heterophyllus* were well shown. *Dianthus sub-acaulis* among alpinas was very pleasing.

Mr. J. Box, Lindfield, Hayward's Heath, had a glorious bank of single and double *Pyrethrums*, of which *Alfred*, *J. N. Twerdy*, *Queen Mary* (pink), *Aphrodite* (white) and *Melton* (crimson) among singles, and *Hamlet* (pink) and *J. Kelway* (crimson) were the best. *Pæonia albiflora*, *P. lobata* *Sunbeam* and *Iris Caterina* were all well staged.

Messrs. Young and Co., Cheltenham, had a nice group of Carnations, of which Cecilia, Carola, Mary Allwood and others were in excellent condition.

Mr. L. R. Russell, Richmond, showed a table of shrubs and evergreens, of which *Plagianthus Lyallii* (a rare white-flowered shrub), *Carpenteria californica*, *Tricuspidaria lanceolata*, *Erythrina Crista-galli* and *Leptospermum Chapmanii* were notable examples.

The Misses Hopkins, Shepperton-on-Thames, showed many seasonable hardy flowers—Geums, Lupines, *Primula sikkimensis*, *P. bulleyana* and others.

Messrs. J. Cheal and Sons, Crawley, contributed *Hydrangeas*, *Ozothamnus thyrsoides*, *Rhododendrons* and others in a showy group of shrubs.

Mr. Charles Turner, Slough, showed standard grown examples of *Bougainvillea glabra* somewhat lacking in colour.

Mr. Clarence Elliott, Stevenage, showed alpines in pots, some of them very charming. Of these latter, *Asperula Gussonii*, *Dianthus woodfordensis*, *Erodium corsicum*, *Campanula Miss Willmott*, *Anthemis Biebersteinii*, with *Sedums* and *Saxifrages*, were very beautiful.

Mr. G. Reuthe, Keston, Kent, showed a variety of hardy plants, alpine, bulb, herbaceous and shrub. *Irises*, *Heucheras*, *Rhododendrons* and *Eremuri* were all in effective groups.

Messrs. G. and A. Clark, Dover, displayed a variety of *Pyrethrums*, *Eremuri*, *Gaillardias* and other good hardy flowers.

Mr. H. Burnett, Guernsey, showed admirable vases of Carnations, the best being *Triumph* (crimson), *Marmion* (very fine), *White Chief*, *Washington* (deep pink), *Carola*, *Mandarin*, and *Mrs. W. B. Clode*, which is highly fragrant. *Enchantress Supreme* was very fine.

Mr. Elisha Hicks, Twyford, displayed an admirable lot of *Roses*, of which *Austrian Copper*, *Princess Mary*, *Irish Elegance*, *Old Gold* and *Beauté de Lyon* were among the best. The new *Chinese Rosa Moyesii* was also shown.

Messrs. Carter Page and Co. exhibited *Dahlias* in several sections, also many *Violas* in variety.

Mr. George Prince, Oxford, had some lovely vases of *Roses*, *Louis Barbier* (rose and apricot) being most charming. *Blush Rambler*, *Harrisonii*, *Austrian Copper* and *Maréchal Niel* were equally handsome and good.

Messrs. T. S. Ware, Limited, Feltham, showed *Pyrethrums*, *Poppies*, *Irises*, and an excellent vase of *Betonica grandiflora superba*.

Messrs. George Bunyard and Co., Maidstone, had a particularly good grouping of *Pyrethrums*, *Oriental Poppies*, *Pæonies* and *Irises* of several sections. *Pæonia The Bride*, virtually a good *P. albiflora grandiflora*, was very handsome. *Iris Rembrandt* (one of the new Dutch *Irises*), *Prosper*, *Langier* and *Jacquinianna* were all very finely shown.

Messrs. H. B. May and Sons, Edmonton, exhibited a table of standard grown *Fuchsias* and Ivy-leaved *Pelargoniums*, with groupings of *Verbenas*, *Hydrangeas*, *Crassula rosea* and other things beneath. *Gardenia radicans* was also on view in many well-flowered examples.

The Hon. Vicary Gibbs, Aldenham (gardener, Mr. E. Beckett), sent an admirable lot of *Streptocarpus* in blue, white, rose, violet and other shades, representative of an excellent strain. A rather comprehensive collection of herbs was staged by the same exhibitor.

Messrs. Waterer, Sons and Crisp, The Arcade, Liverpool Street, put up a long bank of hardy flowers, with a small piece of rockwork forming the centre. At one end, *Pyrethrums*, both single and double forms, were lightly grouped, these leading to *Lupines*, among which were some good pink shades as well as some soft blues. At the other end, *Oriental Poppies* and *Irises* formed a feature, the latter especially being excellent. In the rockwork we noticed *Lewisia oppositifolia*, *Dianthus alpinus albus* and *D. Coed-y-coch*, the latter having large, bright cerise flowers.

Messrs. R. Wallace and Co. of Colchester had a long table filled with a wonderful collection of *Flag Irises*, these including many beautiful sorts, such as *pallida dalmatica*, *Albert Victor*, *Edouard Michel*, *Ossian*, *Rhein Mixe* (white standards and purple falls), *Ma Mie* (a beautiful mixture of pale blue and white), together with several very promising seedlings that were not named.

The small group from Messrs. Whitelegg and Page, Chislehurst, was composed of well-grown examples of *Heucheras*, *Geums*, *Mimulus*, *Saxifraga pyramidalis* and *Dianthus neglectus*.

Messrs. J. Piper and Sons, Bayswater, had a table of alpine and rock garden plants, all well grown and flowered. A fine plant of *Genista sagittalis*, with numerous yellow blossoms, called for special mention.

Messrs. W. and J. Brown, Peterborough, had a small group, which contained some good spikes of *Eremurus robustus* and the large-flowered single, deep pink *Rose Mrs. Rosalie Winch*.

Sweet Peas from Messrs. Bide and Sons of Farnham occupied a whole table length, the flowers being clean, fresh and well staged. Such sorts as *Edward Cowdy* (deep rich orange scarlet), *Orchid* (pale blue) and *Fripled Pink* (a double, highly frilled flower) called for special mention.

Messrs. Cutbush and Son, Highgate, had a miscellaneous group, comprising *Carnations*, *Pyrethrums*, *Irises*, and some exceptionally good *Hydrangeas* with a quantity of a new Ivy-leaved *Pelargonium* named *Radiance*. This has flowers of bright cerise scarlet.

Mr. J. C. Allgrove, Langley, Slough, had a small but interesting group of hardy flowers, many of them rare. *Convolvulus Cneorum*, *Pentstemon glaber roseus*, *Saxifraga Dr. Ramsey*, a fine plant of *S. lanfoscana superba*, *Dianthus neglectus* and *Primula Veitchii* were a few among many of interest.

Seedling *Primulas* of the pulverulenta section were shown by Mr. A. Milner, Totley Hall, Sheffield. These

were exceptionally well grown, and embraced some very good shades of scarlet and orange.

Violas and *Eremuri*, in quantity and excellent quality, came from Messrs. Artindale and Sons of Sheffield. The *Violas* included about 125 varieties, among which were several new ones, notably *Admiral Beattie*, a magnificent violet blue. The *Eremuri* were superb, and reflected the greatest credit on those responsible for their cultivation.

Gloxinias and *Streptocarpus* were shown in quantity by Messrs. J. Peed and Sons of West Norwood. Needless to say, the quality of the *Gloxinias* was excellent, though the plants did not carry quite so many flowers as usual. The *Streptocarpus* were also a very good strain.

Mr. G. W. Miller of Wisbech had a rather dense group of hardy flowers, all of excellent quality. These included *Pyrethrums*, *Oriental* and *Iceland Poppies*, *Heucheras*, the fine *Pæonia lutea L'Esperance* and *Antirrhinum Nelrose*.

The collection of *Roses* from Messrs. George Paul and Son, Cheshunt, was a most interesting one, a great many of the old Scotch *Roses* being included. At each end sprays of choice hardy shrubs were arranged, notably *Viburnum tomentosum plicatum*, *Deutzia discolor grandiflora* and the beautiful pale blue *Abutilon vitifolium*.

Messrs. James Kelway and Son, Langport, Somerset, had a magnificent group of *Pæonies*, *Delphiniums* and *Pyrethrums*, for which they are famed the world over. The single and double *Pæonies* were exceptionally good, but too numerous to mention in detail. *Delphinium Huish Beauty* is a wonderful violet and indigo colour, and *Prince Andrew* a paler combination of bright blue and indigo.

Mr. Amos Perry, Hardy Plant Farm, Enfield, surpassed himself with a wonderful collection of *Irises* and *Oriental Poppies*. Among the former we specially noticed *I. sibirica Perry's Blue*, vivid blue and beautifully netted; while among the *Poppies* were such magnificent sorts as *Iris Perry* (small orange salmon), *Lady Moore* (a larger flower of the same colour) and *Perry's White* (a large white flower with dark blotches at the base).

Sweet Peas were splendidly shown by Messrs. Alex. Dickson and Sons, Hawtmark, Belfast. The flowers were all large, good and clean, such varieties as *Lilian* (soft glowing pink), *Wedgwood* (blue), *Orchid* (soft blue), *Fiery Cross* (bright scarlet), *The President* (rich orange scarlet) and *Constance Hinton* (white) being a few among many very good ones.

ORCHID COMMITTEE.

Present: J. G. Fowler, Esq. (chairman), and Messrs. J. O'Brien, Gurney Wilson, W. Bolton, S. W. Flory, Arthur Dye, W. P. Bound, H. G. Alexander, J. Cypher, J. Charlesworth, T. Armstrong, Walter Cobb, Pantia Ralli, Stuart H. Low, R. Thwaites, F. Sander, R. A. Rolfe, Sir Jeremiah Colman, and Sir H. J. Veitch.

Messrs. J. and A. McBean had a small group of well-grown plants, several fine *Odontiodas* making a bright splash of colour. *Odontioda Lutetia*, with a very large inflorescence, was particularly noticeable.

Messrs. Hassall and Co., Southgate, N., staged some good *Cattleyas*, the plant of *C. Mossie Wagneri* with a large white flower calling for special mention.

Messrs. Charlesworth and Co., Hayward's Heath, had a beautiful lot of *Miltonias* and *Odontoglossums*, the plants being exceptionally well grown and freely flowered. *M. Charlesworthii*, with its large crimson-blotched flowers, attracted considerable attention.

Odontoglossums and *Odontiodas* in considerable variety came from William Thompson, Esq., Walton Grange, Stone, Staffs (gardener, Mr. J. Howes). These were a magnificent lot, and reflected great credit on owner and gardener.

Messrs. Sander and Sons, St. Albans, had a small group composed mainly of *Cattleyas*, with a few *Lycastes* and *Odontiodas*, all being in good condition.

The group from Messrs. J. Cypher and Sons, Cheltenham, was very bright and good, *Odontoglossums*, *Miltonias*, *Cattleyas*, *Odontiodas* and several other kinds being well displayed.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, had a small group of well-grown *Cattleyas*, some very fine forms being among them.

Cattleya Mossie and *C. M. Wagneri*, with a number of white-flowered seedlings, came from Mr. R. G. Thwaites, Streatham Hill. Several good *Odontoglossums* were also included in this interesting little group.

DUMFRIES AND DISTRICT HORTICULTURAL SOCIETY.

THE prolongation of the war has caused some modification of the show arrangements of this society, which originally comprised a two days' show on August 27 and 28. It has now been resolved to limit the show to August 27, and to hold, on August 28, a sale of vegetables, flowers and fruit for various war funds, including that for the supply of vegetables to the Fleet, a scheme which the society has supported in a practical way since its inception.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE ordinary monthly meeting of this association was held in the Hall, 5, St. Andrew Square, Edinburgh, on the evening of June 1. There was a good attendance. Castle Gardens, president of the association. The paper of the evening, which was written by Miss Frances D. Ash, Liverpool, was read in her unavoidable absence by the secretary, Mr. A. D. Richardson. The subject was "Edges and Edging Plants for Herbaceous Borders." Miss Pollard gave an admirable paper, discussing the important subject in an interesting, practical and suggestive manner. She strenuously advocated the use of irregular

stone edgings for these borders, and gave useful details regarding suitable plants for covering these. She pointed out the capital effect produced by the use of such subjects as *Aubrietias*, *Hypericums*, *Campanulas*, *Alyssums* and the many other dwarf trailing plants which look so well associated with herbaceous borders. Referring to the paths, Miss Pollard spoke strongly in favour of flat stones with dwarf plants in the joints as advisable in preference to those of gravel or grass, the harmony between these and the herbaceous borders being evident. Miss Pollard was heartily thanked for her excellent paper.

Mr. J. W. Scarlett, Sweethope, Inveresk, sent a number of excellent vegetables for exhibition; and from Messrs. Dobbie and Co. came examples of their magnificent varieties of *Antirrhinums*. An interesting exhibit was one of new *Myosotises*, from Mr. Baillie, Eden Gardens, Liberton.

The Fream Memorial Prize.—The Board of Agriculture and Fisheries have awarded a Fream Memorial Prize, of the value of £7 4s. 7d., to Mr. John Wilson, New Road, Mauchline, Ayrshire, a student of the West of Scotland Agricultural College, Glasgow, who took first place in this year's examination for the National Diploma in Agriculture.

Pelargoniums for Winter Flowering.—Cuttings that were rooted in March to provide a display during the dull days of autumn will now be ready for a shift into their flowering pots, which need not be more than 6 inches in diameter. Assuming that they were pinched some time ago, they may be potted and placed at once into cold frames where they will be exposed to the full glare of the sun. Like all other pot plants, they must be carefully watered at the outset, and beyond keeping the flowers pinched off as they appear until August and an occasional watering with weak liquid manure, they may be trusted to look after themselves. By the end of September they should be taken indoors to take the place of the summer occupants of the greenhouse.

The Birmingham Flower Show Cancelled.—The committee of the Birmingham Horticultural Society have very regretfully announced that they have no other course to take but to abandon the flower show which was to have been held in Handsworth Park on July 16 and 17. It is not from any faint heart that the committee make this announcement, but solely because the contractors for the marquees have intimated that no tents will be available in the Midlands for flower shows this season, owing to the requirements of the military authorities. There are many horticultural societies in the district who will be unable to perform their usual functions this year, and at the invitation of the Birmingham Horticultural Society a number of representatives met at the Y.M.C.A. to consider in what way they can make the best use of their organisations during the present crisis. It will be remembered that the united societies last November promoted a successful Patriotic Flower Show, when a substantial sum was handed over to the National Fund. At the meeting on May 31 it was decided to promote a great jumble sale for the provision of funds for securing extra comforts for the wounded soldiers and sailors in the hospitals of Birmingham and district. It is proposed that the sale be held in July, and it is hoped that not only the twenty horticultural societies in the district will take an active part, but also other associations and workers, and thus secure a collection and sale of miscellaneous goods on a scale never before attempted. Mr. William G. Carradine, 36, Hamstead Road, the secretary of the Birmingham Horticultural Society, will gladly send information to all interested in the scheme.

THE GARDEN.

No. 2274.—VOL. LXXIX.

JUNE 19, 1915.

NOTES OF THE WEEK.

An Effective Flower-Bed.—In our garden we have a large bed filled with the beautiful *Aquilegia* hybrids, intermixed with varieties of Spanish Iris. The delicate shades of the Columbines give a very graceful appearance to the bright colours of the Irises. Both of these flowers are so useful for decorating the garden, as well as for cutting, that it seems almost impossible to have too many, particularly as both can be grown with little trouble or expense.

Removing Dead Flowers from Lilacs.—To get the best results from garden varieties of the common Lilac, *Syringa vulgaris*, it is necessary to remove the flower-heads as soon as the blossoms have withered. This enables the bush to concentrate all its energy in forming plump buds for next year's floral display, and also gives the whole a tidy appearance. Few shrubs look more miserable than a Lilac surmounted by rusty looking, dead flower-heads. In addition to removing these, some of the thin, weak wood may also be cut away, to the general benefit of the plant.

Rock Roses for Sandy Soil.

For rocky, sandy banks there are no better flowering shrubs than the *Cistus* or Rock Roses. As will be seen in the accompanying illustration, which represents a bush of *Cistus crispus*, they produce flowers in abundance, usually during the latter part of May, June and well into July. The plant illustrated has flowers of purplish red colour, each nearly two inches in diameter. It attains a height of about two feet, and is hardy except during very severe winters. *Cistus Loretii* grows taller, and has large white flowers with a crimson blotch at the base of each petal. Another beautiful Rock Rose is *C. corbariensis*, which makes a compact, low-growing shrub that during June is covered with white flowers of medium size. *C. purpureus* is a lively species, 3 feet to 4 feet high, with glowing purple flowers, each petal with a crimson blotch at its base. Unfortunately, it is none too hardy.

Iris Maori King.—Among the dwarf Irises suitable for the border or rock garden it would be difficult to find one more beautiful than Maori King. This belongs to the variegata section,

having dwarf tufts of bright green, sword-like foliage, whence the 15 inch high flower-stems emanate. Each carries several blossoms, the standards of which are buttercup yellow. The bold falls are definitely edged with this rich yellow, each bearing at its broadest or outermost part a large patch of dull crimson. As this flows towards the centre of the flower it resolves itself into beautiful crimson-purple venation.

The Moccasin Flower in Dry Soil.—It is generally assumed that the beautiful Moccasin Flower of North America, *Cypripedium spectabile*, needs a cool, moist bed of peat in which to thrive. A plant now flowering in the rock garden at Kew proves that, other conditions being satisfactory,

quite hardy. It makes a rather straggling shrub about five feet high, the slender, semi-pendulous branches of which during early June are clothed with the exceedingly pretty, funnel-shaped flowers. These are pale greenish primrose in colour, with dainty green venation, and cut sprays are most pleasing. The stems are armed with hard, woody spines, and the leaves, which are small and narrow, are of a decidedly glaucous tint. A native of New Mexico and Arizona, it was first sent to this country in 1886. In common with other members of the genus, it will thrive in comparatively poor and well-drained soil.

Seedling Forms of *Cytisus Dallimorei*.—An interesting series of seedlings from this hybrid

Broom were flowering well during the early days of June in a bed near the Rambler Rose Garden at Kew. The hybrid is the result of crossing *Cytisus scoparius andreanus* with *C. albus*, the latter being the pollen parent. Among the seedlings are several bearing flowers with the familiar white, rosy pink and crimson markings of *C. Dallimorei*, one being an improvement on the type. In other cases one colour dominates certain parts of the flower to a greater extent than in the type; some plants have cream-coloured flowers like those of *C. præcox*, but without the objectionable odour of the flowers of that plant; others have yellow flowers rather smaller than those of *C. scoparius*; others, again, are almost identical with *C. albus*; and still others show a considerable variation in habit, with flowers as above. So far as

A FREE-FLOWERING ROCK ROSE: *CISTUS CRISPUS*.

permanent root moisture is not essential. The plant in question is situated on the uppermost ledge of rock, where it is quite happy in a small opening between plants of *Rhododendron ferrugineum*. Mr. Irving, who is in charge of the rock garden, tells us that the plant was put in its present position by mistake three years ago, and has thrived ever since.

An Interesting Hardy Shrub.—Although the common Chinese Box Thorn, *Lycium chinense*, which is found wild in many parts of Great Britain, is a well-known shrub, one seldom meets with Fremont's Box Thorn, *Lycium pallidum*. Yet it is the best of the genus, and has proved to be

can be seen at present, the form with cream-coloured flowers is the most likely one to prove useful in gardens, for, lacking the objectionable odour of *C. præcox*, it ought to replace that plant.

Watering Fruit Trees.—It is important that wall trees which are swelling their fruits should receive an abundant supply of water at the roots, as any lack of moisture at this stage may cause many of the fruits to drop. The soil at the foot of south and west walls soon becomes dry, and under these conditions red spider and other pests are almost sure to make their appearance. Give a good soaking of soft water before the border becomes too dry.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Home-Made Ointments, Soap and Perfumes.

Would it be possible in your valuable paper to give a short article upon the ancient feminine occupations in the still-room, more particularly touching the use of herbs, simple ointments made from the same, soap, toilet articles and cordials; also hints as to how to go about setting up a simple still and working the same? Many a woman who owns a garden would be delighted to revive, for pleasure or profit, many old home-made articles. This practice would largely increase herb-growing and gardening.—M. H. [We have endeavoured to obtain information on the points raised by our correspondent, but cannot secure any definite details. Even "Anne Amateur," with her store of knowledge, states that there are many difficulties in the way of satisfactorily producing ointments, soap and cordials. If any reader can assist "M. H.," we shall be glad to publish particulars.—ED.]

Coronilla glauca as a Hardy Plant.—

The accompanying illustration represents a plant of *Coronilla glauca* growing in the garden of Mr. C. Wakely, Horticultural Instructor to the Essex County Council, at Chelmsford. We are indebted to him for the following particulars of this beautiful yellow-flowered, sub-shrubby plant; which, during Whit-week, we saw growing and flowering freely in quite a number of cottage gardens in Essex, where the cottagers, so far as we could gather, had no idea of its name. "The *Coronilla* in question was planted in a border of gravelly soil nearly four years ago. It has been uninjured by frost during the four winters, and has always flowered well. It is quite 2 feet in height, and rather more in diameter. The aspect is south-east. In the County Gardens I have a larger plant doing well in a peaty soil, and yet another in heavy loam."

CORONILLA GLAUCA GROWING AND FLOWERING OUTDOORS AT CHELMSFORD.

The New Division of the Leedsii Daffodil Classes and a Suggestion.—I was glad to see, in the Rev. Joseph Jacob's remarks in your issue of May 15, that the older and smaller-flowered varieties are to be separated from the newer Giant varieties, I presume like the *Barrii*, as A and B respectively. I wish to point out, however, that among the Giants there are several at present classed as *Leedsii* which, I think, more properly belong to the *Incomparabilis* Division (2B), and I suggest that those who are framing the new classified list of names had better bring the subject up at an early date, as I consider we want some improvements. For instance, I will name two of Messrs. Pearson's raising—Norah Pearson and the Hon. Mrs. J. L. Franklin; and there are others which I consider belong more properly to Division 2B than to Division 4. I will quote from the Official List. The distinguishing character at present reads: "Cup or crown white, cream or pale citron, sometimes tinged with pink or apricot." But the two varieties I have named, in my opinion, have cups not of a citron, but of a decided yellow very nearly as deep in shade as a typical 2B flower, Lady Margaret Boscawen. Lord Kitchener, White Queen, Lowdham Beauty

and Maggie May are typical examples of the Giant *Leedsii*, as each fades to a fairly good white soon after opening. I shall be glad if my remarks lead to some further correspondence, as I consider the moment opportune.—R. MORTON, Woodside Park, London, N.

Notable Magnolias in Westmorland and Southern Scotland.—When recently driving in a motor-car between the head of Ullswater and Penrith—surely one of the loveliest regions in Great Britain—I saw, growing in front of a Westmorland farmhouse, one of the very finest specimens of *Magnolia soulangeana* I have ever beheld. It seemed to be about thirteen feet in height, and was completely festooned with its large and fragrant flowers. The nearest approximation to it I have seen this season was a plant in Logan Gardens, Wigtownshire, of M. Lennei, whose flowers are considerably larger than those of *M. soulangeana*, though it is not so floriferous. *M. conspicua* and *M. stellata*, the latter of which is the most exquisite of all this richly ornamental and intensely fragrant family, also succeed admir-

ably in the gardens at Logan House. *M. Watsonii*, a grandly endowed native of Japan, is at present greatly adorning the centre of the garden at Kirkmaiden Manse with its refined and fragrant flowers. This, along with *M. macrophylla* and other varieties, was presented to me by that consummate horticulturist, Sir Harry J. Veitch, nearly twenty years ago. It is greatly admired and prized by my gifted successor, the Rev. James MacMorland, B.D. I have not yet planted any *Magnolias* in the garden at Kirk House, Kirkmaiden, where I have for the most part confined my attention to the adequate culture of Roses, Oriental Lilies, Violas, Lilacs, *Antirrhinums* and Sweet-Peas; but I cannot doubt that such highly attractive and not too exacting varieties as *M. Watsonii* and *M. stellata* would prove successful there.—DAVID R. WILLIAMSON.

Early Roses.—I live 200 miles north of your Essex correspondent and in a cold district. On a south wall Gloire de Dijon opened its first bloom

on May 20; Reine Olga de Wurtemberg, May 24; Bouquet d'Or, May 26; Ards Rover, June 4; Ards Rambler, June 7; and Lady Waterlow, Climbing Caroline Testout, Noella Nabonnand and Paul Transon were out in the last week in May. On June 8 my children counted 140 flowers fully out (besides which a good many had been gathered) on ten trees. These were all planted in the spring of 1912, and some of them are now over twelve feet high. They are growing in about a foot of soil, with very solid clay beneath them.—WALTER DE H. BIRCH, Walton-le-Dale, Lancashire.

The Plum and Anemone Rust.—Some time ago, in answer to a correspondent in THE GARDEN, you said that Plum rust, *Puccinia Pruni*, had the ascidium stage, or was believed to have, on the garden Anemone. Having a few trees suffering from the rust, I decided to watch for the ascidium on the Anemone, and, curiously enough, found it, but only on the Anemones nearest the Plum trees. There is a drive separating the orchard from the Anemones. The Plums furthest from the Anemones do not have the rust. Some of the spots are, however, not developing ascidium spores, but a coloured mass more compact, and apparently only one very small spore on the end of the hypha. Am I right in coming to the conclusion that it is a species of *Tuberculina*, which Massee says are parasitic on ascidia? I can find no description of the genus in any book I have. There was some correspondence on *Antirrhinum* disease in THE GARDEN a few weeks back. It may interest Mr. Cuthbertson to know that *Septoria Antirrhini* has appeared on a three year old plant here, but only on the growth from last year's wood. This year's young growth is strong and clean. I have bought no seed these eight years. There are no neighbours' gardens for a few hundred yards, so I think in my case the spores must have come a considerable distance on the wind.—JOHN STALEY, Hayling Island, Hants. [The connection between the ascidium on Anemone and the Plum rust was discovered in Russia and confirmed by F. T. Brooks in this country. It is probable that if Anemones were removed from the garden, Plum rust would disappear too. The other fungus is probably *Darluca filum*, a parasite on species of ascidium. The proper name of the fungus on the Anemones is *Puccinia Pruni spinosa*.—ED.]

Undesirable Plants.—It has been interesting to see the opinions of your correspondents on this subject. In a few cases it would appear that a plant may be a weed in one garden and a welcome inmate in another, though probably all are agreed as to a few, such as Winter Heliotrope, Goutweed and *Campanula rapunculoides*. These are my own special objects of dread, the *Campanula* being the worst of all, as it will suddenly appear in new places without any apparent reason. *Cerastium*, which figures in the black list of one of your correspondents, is no trouble with me; but one plant that I think has not been named would be prized for its beautiful bloom, were it not for its troublesome persistence and unconquerable invasion. This is *Ornithogalum nutans*, whose handsome spikes of white and grey-green

blooms of satin-like texture are so good and long lasting as room flowers in water. A patch of Goutweed, if not harbouring among the roots of neighbouring bushes, I could undertake to get rid of, though perhaps not in one season; but the Ornithogalum, when once established, I have found to be quite ineradicable. Even if all flowers are removed to prevent seeding and if, as one thinks, every bulb of a patch is dug up and the soil passed three or four times through one's fingers, it will appear again in the same place, the patch always spreading. I have even, when there was a clump of about nine inches in diameter, dug it up with a barrow-load of the surrounding soil, only to find it growing again the next year. I have sometimes thought it possible that tiny broken pieces of the white underground leaf-stem may grow into bulbs. In any case, in gardens where it is troublesome, where it is continually persecuted and yet always comes again, the way to deal with its persistent vitality and constant increase is a baffling problem.—G. JEKYLL.

The Cutting of Flowers.—I divide gardeners into two great classes—(1) those who like to cut flowers, and (2) those who do not like to cut flowers. If the first class are let entirely loose in a garden full of flowers, by the evening possibly all the flowers will have been cut; but if the other class of people own the garden, they will never cut or allow flowers to be cut if they can help it, and the flowers will die on the plants. I think perhaps a word or two of advice is needed for both parties. As we all know, "a garden is a place for flowers," so those who do not like cutting them say, "Why cut them and let the garden look bare?" Quite so. I agree that if a garden devoid of flowers is to be the result, it is a pity generally to cut them. But in the first class of gardeners (those who like cutting flowers) there are people whose minds are endowed with a good deal of common sense, and whose powers of observation and reasoning may be even greater than those gardeners of the other class. They say: "If we cut flowers, a bare garden does not result, and if it did, we would still do the same thing. For flowers are generous beings. If you cut all the flowers of plants such as Lupines, Pyrethrums, Inulas and many more, in a day or two you will have another crop. But what we do is to cut flowers fairly generously, leaving some on to adorn the garden and keep it gay; but we never hesitate to cut and give away large bunches during the season when the garden is bursting with flowers, for with one or two exceptions the more we cut the more we get." Is not this reasoning sound? Of course, the flowers themselves last longer if they remain on the plants, but not nearly so many are obtained or such a long succession as if they were cut.—E. T. ELLIS, *Weetwood, Ecclesall, Sheffield.*

FORTHCOMING EVENTS.

- June 22.—Royal Horticultural Society's Exhibition of Flowers, Plants, &c., 1 p.m. to 6 p.m. Admission 2s. 6d. Fourteenth Masters Memorial Lecture at 3 p.m. by Dr. E. J. Russell, D.Sc., on "Recent Investigations on the Production of Plant Food in the Soil." Royal Horticultural Hall, Vincent Square, Westminster.
- June 23.—Croydon Horticultural Society's Show.
- June 24.—City of London Rose Society's Show, Cannon Street Hotel, London, E.C., 1 p.m. to 7 p.m. Proceeds in aid of British Red Cross

LIFTING AND STORING DAFFODILS AND TULIPS.

BY THE REV. JOSEPH JACOB.

"TO every thing there is a season, and a time to every purpose under the heaven." What more appropriate motto or quotation could be put over a garden entrance than these words of the author of that famous book of common sense, Ecclesiastes? The doing of this operation or that at just the right moment makes all the difference in the world in so many things connected with horticulture. Sometimes Nature's times and seasons are of very limited duration, sometimes it is otherwise.

Lifting Daffodils.—Among the otherwisely may be put down the lifting of Tulips and, in a more restricted sense, the lifting of Daffodils. If I

allowed to be formed and the bulb is *then* lifted and dried off, the plant is considerably weakened, and shorter growth and smaller flowers will be the result next spring. If the number to be lifted is very great, it is much the wisest plan to begin too soon rather than leave it until too late, when new roots are in full growth. If at getting-up time the foliage is still more or less green, it makes practically no difference whether it is at once cut off 2 inches or 3 inches above the bulbs or whether they are dried off with it on. But in the latter case they must be spread out *very* thinly, to allow the drying process to go on. The foliage of some varieties is almost evergreen. Maximus and some of the Poetaz section are examples. We now take these up with the others, but leave them as much as possible until the end, and find that this treatment works very well.

Lifting Tulips.—Tulip bulbs are unlike those of Daffodils, as there is in all cases, as far as I

OLEARIA INSIGNIS SHOWN BY MR. R. C. NOTCUTT IN LONDON LAST WEEK. (See page 306.)

were asked to be precise and state a time limit when all Daffodils should be lifted, I would say between June 15 and July 15. But latitude and longitude, soil and season, variety and situation, are all determining factors which generally show their influence in the state of the foliage. When it begins to turn yellow and to lie flat and limp upon the ground, the signal for us to think about taking them up has been given, and after a week's delay, to make sure the ripening process has been carried far enough, lifting should be begun. In the majority of cases there is a distinct period before any new roots are made, but with the Poet section there is probably none. Lift a Homer or a Horace when you will, roots of all ages are sure to be seen. Hence it is a safe rule to begin with the Poets, because if there is any pause in their emission, it seems to be just when the decay of the foliage is rapidly being accomplished. If in ordinary varieties new roots are

know, a distinct period during which the new mature bulb is naturally without roots. I am unable to say the precise time when in a surrounding of damp soil they will be emitted, for only a somewhat elaborate experiment would tell us this, and we never seem to have time to make it. Without this I would say the last week in August. This makes, however, little or no difference to the subject under discussion, for in all private gardens, where at the most it is thousands and not acres that have to be dealt with, the whole lot of bulbs should be easily got up before July is over, even if for some exceptional cause the ideal time limit, which is the same for Tulips as for Daffodils, has been exceeded, viz., mid-June to mid-July. There is a double test to be employed to be sure the right moment has come—first, the obvious one of the foliage, which must be *very* yellow and limp, or quite dried up and shrivelled; and, secondly, that of the bulbs,

which must be just beginning to brown over. The only way to be sure about this latter fact is to lift two or three. I mention it because sometimes the foliage, having been attacked by a fungus which is usually spoken of as "fire," prematurely decays, and anyone with no experience to guide him might think lifting could safely be begun earlier than it ought. On the other hand, if bulbs are left too long in the ground after they are ripe, it is invariably found that the outer skins, which then will have become quite brown, will be very tender, and as likely as not they will be

until they are partly dry, more particularly in wet seasons and in the case of Daffodils. After a time they may be put closer together, but they require constant watching to see that the drying is going on satisfactorily.

Tulips should not be left out on the beds or exposed to the weather, but should at once be put in boxes or trays. In the case of Daffodils, they may be left out of doors, if guarded from the hot sun, for a week or ten days with no detrimental results; in fact, considerable experience suggests that there may be an actual benefit in it. It is

A BEAUTIFUL AMERICAN RHODODENDRON.

RHODODENDRON VASEYI is a very beautiful and distinct species. It belongs to the deciduous group of the genus, and is included among the several kinds which are often referred to under the generic name of Azalea. It is found wild in the mountains of Carolina, but differs considerably from the other American species in the shape of its flowers, the corolla being less distinctly tubular, with petals of more uniform shape. The blossoms are also less fragrant than those of other species. It escaped notice for many years after the other American kinds had been introduced to this country, and is said to have been originally brought to notice by Mr. G. R. Vasey in 1878, its first appearance in this country being about 1891. In its native country it exceeds 12 feet in height; here it grows very slowly after it has attained a height of 3 feet or 4 feet. There is every reason to believe, however, that it will grow as large as the ordinary Ghent Azalea, while it forms a shapely bush with little attention to pruning. The flowers are borne in small, terminal heads in early May, each blossom being from 1½ inches to 1¾ inches across. They may be of a clear pink colour, or white shaded with pink. From the age of three or four years flowers are borne with great freedom, and a glance at the accompanying illustration will give an excellent idea of its beauty when planted in a group. The photograph is of a bed in the Azalea Garden at Kew. Although this species does not appear to have been used by the hybridist, it is likely that it might be used with advantage for crossing both with the American and Asiatic kinds.

W. D.

ALYSSUM SPINOSUM.

THIS attractive plant is quite unlike the other members of this useful genus of plants as represented by the well-known *A. saxatile*. It forms a sub-shrubby, densely branched bush up to a foot or more in height, covered with hoary foliage composed of small leaves. During the late spring and early summer months the flowers, varying in colour from white to pink, are very freely produced. At all times of the year this plant, owing to its almost evergreen character, is very effective, and an ideal subject for massing in a prominent position such as that shown in the illustration on the next page. *A. spinosum* grows well in almost any loamy soil which is thoroughly well drained. It produces seed freely, and self-sown seedlings may be found in abundance round about old plants. These will produce flowers the following spring, and in a few years make quite a dense carpet. The plants shown in the illustration are three years old from seed. It is a native of Southern France and Spain.

W. I.

RHODODENDRON VASEYI, A LITTLE-KNOWN SPECIES FROM CAROLINA.

ruptured, so that they soon fall off and we get nothing but those rather uncanny-looking dead-white bulbs which all Tulip growers know so well. This peeling should be avoided, because not only is the naked bulb more prone to shrivel when it is minus its top-coat, but it is much more tender with no natural protection, and so more liable to be damaged in transit. As May-flowering Tulips are now more and more being used in bedding arrangements, they have frequently to be lifted before their natural time. In this case they must be carefully got up without damaging the roots or the foliage, and either laid in by the heels or spread out (leaves, roots and all) thinly under a north wall out of the reach of the sun. In this latter case they will suffer slightly, but I am assured that if another year the flowers are only to be used for cutting, it makes very little practical difference. I saw an instance of this in operation this year at Maer Hall, Staffordshire, where the head-gardener told me it was his annual practice. The idea was new to me, but as it worked I pass it on.

Storing Daffodils and Tulips.—An airy shed or room is essential when a quantity have to be dealt with. The bulbs, too, must not be piled up on top of one another to any depth. Three or four deep is quite sufficient, at any rate

said a few "difficult" varieties should invariably be got up a little *prematurely* and left on the beds for ten days to ripen. I have tried it, but not extensively enough to pronounce any verdict. Where a quantity have to be stored, shallow wooden trays with legs, the wrong way up, are very good. They can be made of any convenient size, provided the upright legs are long enough to allow a free passage of air when the trays are piled up on one another. The final cleaning must not be attempted too soon, for, if the roots are not easily removable, in the case of Daffodils the base of the bulb is apt to come away when they are being taken off, or with Tulips the brown skin may be ruptured.

Summary.—Enough has been said to show the general practices underlying lifting and storing. It only remains for everyone to cut his coat according to his cloth. Bulbs should not be taken up until their foliage has withered. When this has happened, they must not be left too long in the ground, in case new roots should be formed, the loss of which will weaken them for another season. Store in a dry, airy place out of the reach of direct sunlight. See that they are not heaped up too thickly. Turn them every now and again, especially if they have been put away damp. Try to preserve the brown skins.

INFORMAL AND WILD GARDENING.

BY JAMES HUDSON, V.M.H.

(Continued from page 292.)

The Formal Pruning of Shrubs.—I ought to draw attention to this most stupid system, though it is practised more, I think, in public parks and gardens than in private places. There is an old saying that there is "a time for doing everything under the sun," meaning that there is a right and a wrong time. With shrub pruning the late summer and autumn appear to be considered right. Then it is that this "tidying up" is proceeded with. Then it is that flowering shrubs are oftentimes denuded of shoots and branches which would otherwise add beauty to the coming season. Then it is that one often sees the Flowering-Currant (*Ribes sanguineum*) carefully pruned into the correct shape; also *Forsythia suspensa* and *F. viridissima*, to say nothing of the Lilac or of *Jasminum nudiflorum*. Nothing is, I think, more beautiful in March or early April than the *Forsythias* when treated informally. If pruning is needed, do it by all means, but let it be immediately after the flowering stage is over; in no instance should any shrub be clipped over in a rigid, formal manner.

Informal gardening is beyond any dispute more economical in every way. Not only is this the case as regards the actual amount of attention needed, but also in the preparation of the material for planting out. There should not be any hard-and-fast time for "bedding out," as it is termed. The arrangement should be such that the vacant spaces—either beds or borders—should not be actually bare of plants at any time, bearing in mind the due provision of stock to take the place of such as may be exhausted.

I have just used the word "beds." Let me say at once that I do not favour beds as compared with borders, *i.e.*, marginal borders to shrubs and the like. Rather let the one join insensibly on to the other. Do not let geometrical design be considered as any ornament in itself; better dispense with it entirely. Get rid once and for ever of all idea of formality and then try to imitate Nature, or rather work in accord with Nature. It is not easy in many cases to do this, but an effort should be made in that direction. Then, having made a start, we may feel greater confidence in extending in the immediate future.

It may be asked, "How and where would you commence to treat a garden in an informal manner?" I would start immediately contiguous to the house itself. The building itself would be of a formal character, not necessarily square or rectangular, but probably straight lines will prevail. With these one cannot associate curves, as regards beds, so as to be in harmony with the surroundings. I would therefore start away at once with the lawn, and if any planting be done near the building, let it more or less follow the lines of the building. I would not permit any terraced walks of gravel to obtrude, so to speak, on the

view. Personally, I favour a verandah on two sides at least; here an excellent opportunity is afforded of furnishing the walls with rather choice and possibly somewhat tender wall plants. It may be said, "Why have but few gravel paths?" My reply is, we often have too many of them. Paths add to the expense of upkeep, as all gardeners know. Rather expend the same amount of labour in actual cultivation, is my advice. I would in any case dispense with broad walks, and the sooner these are lost to view from the house, the better as regards effect. Let the lawn near to the house be the chief feature, with plants or shrubs of divers kinds dotted thereon. This planting should be done quite informally. Let the grass be kept closely mown for a reasonable distance away from the house. Then I would break away into a semi-wild style of gardening with the grass cut only once or twice in the year. Paths to suit the exigencies of the case will have to be arranged. Let these be of grass wherever possible and only sufficiently wide for two, or at the most three, to walk abreast. Such paths may curve according to the position and levels, but straight paths are inadvisable, *i.e.*, straight for any great distance. In a garden so treated there will be a great saving of labour in upkeep, such

shelters from the most harmful winds, notably the east and north-east. Deciduous trees act as a great break to keen, cutting winds, but I like to have some Fir trees as screens. Where no such screens exist, some should be provided, whether the garden be formal or informal. My advice was once asked anent this for a most exposed position on the East Coast. I advised the planting of Canadian Poplars. These grew well and afforded shelter to the Austrian Pines, and the latter formed the screen so much desired, and then gardening in a most successful manner was accomplished. Of course, it takes a few years to do all this.

It is only natural that I should be asked, "What is your idea of an 'informal garden'?" I will give one or two examples. First, I will allude to the Wisley Gardens of the Royal Horticultural Society. These afford an almost unexampled illustration of informal gardening, in the combination of the Wild Garden and the Rock Garden with their immediate surroundings. But it may be said there is no mansion at Wisley. True, but if such were built upon the higher ground, it would be an ideal example in every respect, healthy beyond any question, with splendid views and the informal gardens at one's feet, so to speak.

ALYSSUM SPINOSUM IN THE ROCK GARDEN. THIS PLANT IS EASILY RAISED FROM SEED.

as in sweeping, mowing, rolling, &c. No drains will have to be provided, as in the case of gravel paths, to drain off the water in order to keep them dry. With grass paths the water will soak away into the soil and be a benefit, as it should be, to the surrounding vegetation.

In the distance let the arrangement be such as to make foreground and background merge insensibly together. Do not attempt to shut out the view if it be such as one could wish. Where trees exist, let the idea be to blend all new planting with them. They may be most invaluable as

First you have the Rock Garden with the open informal garden on the east, backed up by the fine avenue of Bamboos, and the Water Garden where the *Nymphæas*, *Iris Kämpferi* and *Gunnera manicata* luxuriate. Next to these is the Wild Garden amid the shelter of the trees, a garden of the woods, a type of gardening of which more use should be made. To my mind this is the most enjoyable part of the Wisley Gardens. Onward towards the river there are ideal types of herbaceous gardening. Where the trials are conducted it must of necessity

be of a formal character for greater facilities in working. When Mr. G. F. Wilson—a keen and thorough gardener—took over this property he had an undoubted knowledge of the soil, the surroundings, and the capabilities of the estate, and of the shelter afforded. In any garden these are essentials of the first consideration, for it is far better to be able to assist Nature and take advantage of every favourable position as to soil, shelter, &c., than it is to fight against Nature and try to accomplish what is well-nigh impossible. Wisley Gardens, open as they are to all Fellows of this society, should not be merely visited from time to time, but the ideas there carried out should be studied carefully. In this way it would be possible to carry away in one's mind some practical suggestion from each part of it. Note, for instance, in the early spring the lovely effect produced by *Narcissus cyclamineus* in its moist,

FRIAR PARK REVISITED.

At whatever time of year Friar Park may be visited, an unfailing source of interest and pleasure awaits us. All that is choicest and rarest can be seen established and thriving, and old acquaintances flourishing almost beyond recognition. I was especially impressed the other day by the magnificent bush of *Daphne caucasica*, nearly 8 feet through and the same in height, growing in the Alpine Garden. One of the stronger plants of the genus, the beauty of its glistening white flowers is enhanced by the tender green foliage which appears with them. Like most *Daphnes*, it is deliciously fragrant. *Haberlea virginale* was another triumph of cultivation. A large colony ensconced upon

than he ever anticipated. Her Majesty Queen Alexandra, whose love of flowers and gardens is well known, visited the gardens for the first time last month, and was so enchanted that she repeated her visit the following day.

E. WILLMOTT

FOXGLOVES AND THEIR CULTIVATION.

ALTHOUGH the ordinary wild Foxglove *Digitalis purpurea*, is regarded by many as a common plant, unworthy of attention from a gardening standpoint, there are a great many who rightly hold different views. Certainly it is not a subject that one would select for a choice border, but for open spaces in the woodland, between newly planted shrubs, or in an odd, shady corner where little else will grow, it is really a most serviceable plant, and one that is likely to find numerous admirers for generations to come. Useful as the wild plant is for the purposes named, it is far surpassed in beauty by the modern garden strains that seedsman have given us in recent years—plants of bolder appearance with larger and brighter coloured flowers, while some have blossoms of almost pure white and others of pale yellow. These are certainly worthy of room in the best of borders or large lawn beds while, if desired, they can be utilised for naturalising in the wilder parts of the woodland, though, I must confess, I think the wilding better for the latter purpose.

Fortunately, the cultivation of Foxgloves does not call for a great deal of skill. They are usually treated as biennials, *i.e.*, seeds are sown one year to produce plants for flowering the next, the time for sowing being during May and the early part of June. No time should, therefore, be lost in getting the seeds in, where this has not already been done. I prefer sowing them outdoors, in drills a foot apart, first seeing that the soil is in a thoroughly pulverised condition. Each drill should be watered before sowing the seeds, and half an

inch of earth is ample covering. When about two inches high, the seedlings must be transplanted separately 9 inches apart in rows 15 inches asunder, preferably in soil that has been deeply dug and well manured. Here they will remain until the end of October or early November, when they can be put in their permanent positions.

The largest will flower during the summer of next year, but the smaller ones will probably continue to make leaves without producing blossoms. They will be magnificent plants for the summer of 1917. When naturalised and allowed to seed themselves, the plants are, of course, very small by the end of the autumn, and certainly will not be large enough to flower the next summer, though by the succeeding year, like the small ones specially raised, they will be excellent specimens.

A BEAUTIFUL GROUPING OF HYBRID PINKS IN THE ROCK GARDEN AT FRIAR PARK, HENLEY-ON-THAMES.

sheltered situation—one of the gems of the entire garden. Again, the Japanese Iris (*I. Kämpferi*) in early July is well worth a visit; this Iris is in an ideal spot, and it associates so well with the *Nymphæas* and the *Gunnera manicata* in the background. *Primula japonica* in varied colours, as well as other species of *Primula*, thrive amazingly in the ditches and sides thereof. Further in the wood are to be found many examples of *Lilium giganteum*, as well as other members of the same genus. I have at no time seen *L. giganteum* growing and flowering so finely as at Wisley. Many Ferns are also growing most naturally and luxuriantly in the wood and on the outskirts of it. The *Rhododendrons* and *Azaleas* are very fine in their season. I have only enumerated a few of the features in this beautiful spot.

(To be continued.)

a sheltered rocky ledge was luxuriating as though an ordinary plant of easy culture. *Primula Allionii* was growing just as I saw it in its native habitat near the Col de Tenda. *Pentstemon Scouleri* was in glorious masses such as I had never seen before. It is always a beautiful plant if well grown, but not always contented with its treatment.

All visitors are welcomed, from the highest in the land to the poor East-Enders, who spoke of his visit to Friar Park as the red-letter day of his life, adding that "everything kind of had a meaning like." The purpose of the garden is so aptly set forth upon the Stone of Precation:

"Most for thy pleasure

The gardener toiled to make the garden fair." The gardener knows he has achieved his aim; the pleasure he wished to give has extended far and wide, and the kind wish has been realised perhaps to a greater and more far-reaching degree

Although not fastidious as to soil, there is no doubt that Foxgloves appreciate a cool root-run and one that is fairly well enriched with manure. In such they will produce long, handsome spikes of flowers far in advance of those borne by plants growing in soil that is dry and deficient in nutriment. Partial shade is also appreciated by them, though by no means essential to their success. Mention has already been made of the improved garden varieties, including the white-flowered one, which is the most beautiful of all. A monstrosity often met with is named *gloxiniæflora* or *monstrosa*. At the top of the flower-spike one, or sometimes two of the blossoms have become much enlarged, and in shape resemble the flowers of the ordinary Canterbury Bell. This has given rise to the absurd supposition that the plant must be a cross between the Foxglove and the Canterbury Bell.

A. B. ESSEX.

HERBACEOUS CALCEOLARIAS.

AMONG those plants that are usually raised from seed annually for conservatory decoration, none is more worthy of attention than the above free-flowering race of Calceolarias. When well grown and lightly set up against a background of greenery, they present a charming picture. They are rather exacting in their requirements, but when these are understood the result is never in doubt. Cool treatment is essential at all times, but they will not succeed in a dry atmosphere. During the shortest days, when the temperature of the house ranges between 40° and 50°, very little damping down suffices for their needs; but from February onwards they are in full growth under warmer conditions, consequently more moisture is necessary.

Sowing the Seeds.—From the middle to the end of June is a suitable time to sow seeds to produce plants for May flowering. Whatever receptacle is used, it should be well drained and filled with light, sandy soil. Should it be necessary to give water before sowing, partially submerge the pot or pan in water. Sow the seeds as thinly as possible, sprinkle a little fine sand over them, cover with a sheet of glass, and remove to a shady corner of the greenhouse to germinate.

Treatment of Seedlings.—About eight days will elapse before the seedlings appear. The glass may then be dispensed with, followed by gradual exposure to the light; but on no account expose them to strong sunshine or allow them to need water. In the seedling stage they are rather slow-growing, but when they have made

their second pair of leaves prick them out, 2 inches apart, into boxes, and keep them close and shaded in a cold frame until established. With the majority of seedlings it is usually safe to discard the smallest; but in this case it is not advisable, as these will eventually turn out to be the brightest

Potting On.—The next potting will be in August or September, according to the strength of the plants, and in most cases 5-inch pots will be large enough for the strongest, while for those less robust a size smaller will suffice. In these pots they will pass the winter. A compost of three

A WELL-GROWN COLONY OF WHITE FOXGLOVES.

coloured and none the less robust for being backward in the early stages. When ready, pot them into small pots, and give them every attention, for no plants are more impatient of neglect, but, at the same time, none respond more readily to generous treatment.

parts loam to one of leaf-mould, with a sprinkling of wood-ashes and plenty of coarse sand to keep the soil porous, will be found suitable. Avoid hard potting and keep them close for a few days, with plenty of moisture around them, as well as shading on bright days until they have recovered

from the check; but afterwards endeavour to promote sturdy growth by carefully attending to watering and ventilating, for the more fresh air is afforded them, so long as their surroundings are moist, the better will they flourish. Green fly is their worst enemy, and must be kept in check with the aid of a good insecticide.

Winter Treatment.—Early in October remove the plants indoors, placing them in a light position on some moisture-retaining material if possible, and where they can benefit from fresh air whenever the outside conditions favour its admittance. Very little water is needed during the short days if the atmosphere is not kept too dry in the temperature previously given.

The Final Potting.—Early in February the plants commence to grow more rapidly, and towards the end of the month they may be potted in their flowering pots, the strongest into 7-inch and the lesser ones into 6-inch pots. These should be well drained with clean crocks. Over these put a thin layer of rough soil and lightly cover with soot. The compost may have rather more loam in it at this stage, with the addition of a little well-decayed manure. A sprinkling of some artificial manure will also be beneficial. But porosity must be aimed at above everything, in order to encourage a vigorous and free root action. Coarse sand liberally used generally suffices, but, failing this, crushed brick should be used. In potting, avoid injury to the roots, and on no account ram the soil too hard, or the roots cannot run freely. Water carefully for a time; but when the plants are growing freely, see that they are kept moist and freely syringed overhead on bright days.

F. J. TOWNEND.

*The Gardens, Brentwood,
Moorgate, Rotherham.*

NEW AND RARE PLANTS.

FIRST-CLASS CERTIFICATES.

Odontoglossum St. Vincent (*O. gandavense* × *O. amabile*).—The sepals and petals have an exceptionally dark ground, and are tipped with rose, which is in good contrast with a small yet pronounced white lip.

Odontoglossum Princess Mary.—A very handsome variety with tall spike. The flowers are heavily blotched chocolate, distinctly bordered white, with white lip and yellow crest. These two very handsome novelties were exhibited by J. Gurney Fowler, Esq., Pembury, Kent.

Cypripedium Curtisii Sanderæ.—This is regarded as a new albino form, and is very distinct. The pouch is pale green, sepals green and white, with slight spiral twist, the well-proportioned dorsal sepal greenish with white lines. It has the

mottled leaves of *C. Curtisii*. Shown by Messrs. Sander and Sons, St. Albans.

AWARDS OF MERIT.

Odontoglossum crispum Perfect Gem.—A white-flowered form marked with faint and comparatively small reddish blotches. From W. Thompson, Esq., Walton Grange, Stone, Staffs.

Cotyledon simplicifolia.—The spatulate leaves are not unlike those of a small *Lewisia* *Cotyledon*, above which, at 6 inches or so high, the racemes of drooping yellow flowers appear. From Miss Willmott, Warley Place; and Messrs. Waterer, Sons and Crisp, Twyford.

THE NEW POPPY PERRY'S PIGMY, SHOWN IN LONDON LAST WEEK.

Delphinium venustum.—A deep blue flowered kind raised from seeds sent from India. Its value lies in its early (May) flowering and the intensity of its almost gentian blue flowers. From Miss Willmott.

Primula Lady Bird.—One of a series of a second generation of crosses which first originated between *pulverulenta* and *bulleyana*, the resultant seedlings being then selfed and recrossed with the first named. The habit is that of *pulverulenta*, the flowers rich rose with orange red centre. From W. A. Milner, Esq., Totley Hall, Sheffield.

Oxytropis hybrida grandiflora alba.—A very handsome plant with long, Lupine-like spikes of white flowers. It is 2 feet high.

Aster alpinus Nancy Perry.—A mauve-coloured variety of this eminently useful species.

Papaver Perry's Pigmy.—A charming Poppy 18 inches high, with flowers of rich pink. These three novelties were from Mr. Amos Perry, Enfield.

Dianthus woodfordiensis.—A hybrid alpine Pink between *D. alpinus* and *D. deltoides*. The flowers are pink with light crimson zone, and in size intermediate between the parents. The glossy *D. alpinus* leafage is much in evidence. From Mr. Clarence Elliott, Stevenage.

Iris Lohengrin.—This is one of the most beautiful and distinct of the *pallida* set. The flowers are coloured rosy mauve. A variety of merit and distinction, possessed of a fine stature. From Messrs. Wallace and Co., Colchester.

Dianthus neglectus Aurora. This might well be described as a glorified *D. neglectus* of nearly 6 inches high. Flowers rose coloured with dark zone. The long, green, narrow leaves are quite distinct. From Mr. R. Malby, Woodford.

Olearia insignis.—A New Zealand plant with white flower-heads and woolly clothed stems. In the young state the leaves are white or hoary, the older leaves being dark green and buff coloured below. A handsome and strikingly beautiful plant. Shown by Mr. R. C. Notcutt, Woodbridge. See illustration, page 301.

Rose Yellow Bird.—Obviously a beautiful and profuse bloomer. The flowers are white with creamy base. From Mr. Charles Turner, Slough.

Iris Lord of June.—A good addition to the *pallida* set. The standards are lavender; falls violet with gold crest. From Mr. George P. Baker, Bexley.

Iris Rotherside Masterpiece. A bulbous kind approximating in vigour, size of flower, earliness and stature to the so-called "Dutch Irises." The standards are white; falls yellow, finely blotched gold. The texture of the flower is very remarkable. From Mr. F. H. Chapman, Rye.

Micromeles Folqueri.—The white flowers are produced in sessile bunches like many of the *Cratægus*. The ovate leaves are green above and silvery below.

Lonicera Maackii.—A bushy kind having large white, and later buff-coloured flowers.

Syringa Sweginzow.—The rather frail and twiggy growths of this distinct kind are terminated by lax trusses of equally frail-looking, though elegant lilac-coloured flowers with white lobes. These three novelties were exhibited by the Hon. Vicary Gibbs, Elstree (gardener, Mr. E. Beckett).

The whole of the foregoing plants were exhibited before the Royal Horticultural Society on June 8, when the awards were made.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Late Peaches.—The final thinning of the fruits may now be done. Young trees which are inclined to grow too strong can be allowed to carry a heavier crop than old-established ones. This will tend to keep strong growth in check. Give plenty of air both day and night, and thoroughly drench the foliage twice a day to keep it clean. Carefully tie the young shoots to the trellis, and bear in mind when doing this work that the fruits must be well exposed to the light.

Late Figs in Pots.—Where good fruits are required late in the season, it is an advantage to grow a number of trees in pots for the purpose. These can be retarded by plunging the pots in ashes behind a north wall. Watering must be done with great care, and stimulants should be used sparingly till the roots and growths are plentiful. Keep lateral growths well thinned out, so that plenty of light and air may reach the fruits.

Plants Under Glass.

Clerodendron fallax.—Young plants raised from seed must not be checked through neglect in potting when they are ready. A rich compost should be provided, and when well rooted plenty of stimulants are necessary, as the plants are gross feeders. Give them plenty of room to develop their large leaves, and towards the final stages of growth the plants will benefit by cooler conditions.

Plumbago rosea.—This beautiful plant requires liberal treatment during the growing season. Old plants must be liberally supplied with stimulants. Plants rooted in the spring will now be ready for shifting into their flowering pots. Six-inch pots will be ample in which to flower them.

Zonal Pelargoniums.—The plants which have been propagated for winter flowering must now be placed in a sunny position outdoors. Plunge the pots up to the rims in ashes. When well rooted, liquid manure and soot-water may be given alternately. Stop extra strong growths and keep the flower-buds removed till the plants are required to flower.

Salvia splendens.—When ready for their final shift, no time should be lost in potting them on, as neglect in this will cause the lower leaves to fall. Give them a rich compost, and, when potted, afford water with care till they have made plenty of fresh roots.

The Flower Garden.

Annuals.—Where these were sown in the open, the young plants will require to be liberally thinned. This must be done more or less in accordance with the characteristics of the different species. Generally speaking, annuals sown outdoors are usually left too thick, thus spoiling the best effect. Moreover, plants which are too crowded will not last in flower as long as those which have ample room to develop their true character. The staking of the plants must also be timely attended to.

Bedding Out.—While the work of bedding out is in progress, those plants which have already been put out must not be neglected in the matter of watering. Well-rooted plants will require watering every evening, should the weather be hot. This applies chiefly to plants which have been grown in pots.

Standard Plants.—Where these are used extensively for bedding out, it is necessary to train a few fresh plants every year to replace old, worn-out specimens. Heliotropes, Lantanas, Brugmansias, Plumbago capensis, Veronica Andersonii and Pelargoniums may all be grown on now for this purpose.

The Hardy Fruit Garden.

Outdoor Vines.—As soon as it can be seen which are the best bunches, the surplus ones may be removed. This will also be a suitable time to remove the surplus growths. To give the bunches every facility to ripen, the surplus growths must be regularly removed. Mildew usually attacks the berries as soon as they have set. There is nothing more effective in checking this than regularly dusting the Vines with flowers of sulphur.

Thinning Fruits.—If extra fine fruits are required, this work must be constantly attended

to. Where Plums have set thickly, no time should be lost in thinning them. Apples ought to be attended to in rotation, thinning the early varieties first. The final thinning of Pears must not be hastened, as it is possible that many of the fruits will drop. Apricots may now be given their final thinning.

The Kitchen Garden.

Short Horn Carrots.—The demand for young Carrots necessitates the sowing of small quantities of the Stump-rooted kinds all through the summer. Choose a clean piece of ground for their culture, and if the young plants are dusted with soot occasionally, the Carrot fly will give little trouble.

Tomatoes.—Those which have been planted out must be watered regularly till they have become established in the new ground. Attend to the tying of the main growths and remove all side shoots.

Runner Beans.—This crop requires abundance of water at the roots, or the flowers will fail to set. When the plants are staked, a mulch of short manure will be of great value. Another sowing may be made for late use.

Vegetable Marrows.—The plants which were put out in cold frames early in May are now making rapid progress. To obtain early Marrows, it is sometimes necessary to fertilise the flowers by artificial means. An occasional dose of liquid manure, as well as plenty of clear water, will be necessary to keep the plants growing freely.

Coleworts.—A sowing of this useful vegetable may be made now. If the ground is dry at the time, the drills should be watered before sowing the seed. A somewhat shady situation must be selected. When ready for planting, put them out about a foot apart each way.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Parsley.—A large sowing should now be made for use during the winter and spring. On light and sandy soils, where growth is uncertain, a partially shaded position must be selected, and if the weather is very dry, both soot and water ought to be given after growth has fairly started. The early raised plants which were put out last month should have either soot or fertiliser given them, and be kept well hoed and free from weeds.

Peas.—For most districts sowing of early varieties for autumn use will have to be completed within the next ten days. Even then their success very much depends upon the season. Late-sown Peas should never be sown in lines closely together. The best system is to sow, say, at 15 feet to 20 feet apart, and crop the intervening space with dwarf-growing vegetables, such as Brassicas.

Savoy and Cabbages.—The earliest of those sown outdoors are now ready for planting in their growing quarters. The varieties grown will determine the distance they are to be planted apart. A watering should be given to each plant in the evening, unless the weather is moist and showery.

Turnips.—The two early sown crops will be certain to bolt owing to the frost during May, so that any which are worth using should be taken up and the ground filled with other crops. Larger breadths may now be sown for autumn use. If the ground is very dry, the drills are best watered before sowing the seed.

Asparagus.—Now that Peas are coming into bearing, cutting of Asparagus should cease. The beds will require keeping free from weeds, and a dressing of some Asparagus manure should be washed well in to the roots.

The Hardy Fruit Garden.

Gooseberries.—Caterpillars usually get very troublesome at this season, and a sharp look-out should be kept on the bushes so as to destroy the pests before they do much damage. A few days'

delay in this matter sometimes means an entire bush stripped of its foliage. Even if it does not kill the bush, it prevents the fruits developing any flavour, and so spoils them. Hellebore powder is one of the best known substances to apply; but owing to it being poisonous, great care should be taken to see that it is properly washed off the fruits after it has killed the caterpillars.

Plants Under Glass.

Primulas and Cinerarias.—For very late flowering during the spring, a sowing may still be made of either of these flowering plants.

Thalictrum dipterocarpum.—This herbaceous plant is worthy of extended culture in pots. If given cool treatment, its culture is simple. Plants which were potted in the spring are now throwing up strong flowering spikes, which will open in August. The present is a good time to sow seed.

Cyclamen.—The earliest and most forward batch of young plants will be ready for potting into their flowering pots. After a time, when they become established, the frame-lights can be removed during the night-time to allow them to get the full benefit of dews, replacing the lights each morning to protect the plants from the sun.

The Flower Garden.

Hollyhocks.—In favoured localities where the dreaded Hollyhock disease is not in existence, a sowing outdoors might profitably be made to produce strong plants for flowering next season. If the seed is sown thinly in drills, transplanting will be more simple when the time arrives.

Humea elegans must be sown now in seed-pans in a shaded greenhouse or pit. The seed usually germinates irregularly, so that patience is sometimes required until a sufficiently large batch has been raised. Cool treatment should be given.

Aquilegias.—Either for cutting purposes or general garden display, these plants are very fine. Seed, if sown thinly outdoors now, germinates readily and makes good flowering plants by the following season. The seed can either be sown in lines or very thinly where the plants are to remain; then the seedlings can be thinned out as soon as they are large enough.

Bedding Plants are now establishing themselves, and require frequent attention in the matter of pinching to induce in some plants a dwarf and bushy habit. In others, such as Verbenas, pegging down is necessary. Watering should not be resorted to unless one is certain it is really necessary. If sufficient moisture can be retained in the soil by a frequent use of the hoe, this is much better. On light and porous soils, of course, water will be essential, even after a limited spell of drought.

Fruit Under Glass.

Strawberries.—Layering should commence outdoors as soon as the runners are sufficiently advanced, so as to get well-rooted plants ready for potting into 5½-inch and 6-inch pots in a few weeks' time. Plants secured early invariably produce well-ripened crowns by the autumn, which not only winter better in pots, but give larger and finer crops when forced early in the season.

Orchard-House.—Pot trees of Apples and Pears which have nearly finished swelling their fruits should now be removed outdoors to some sheltered border, where they are best plunged up to their rims to prevent too rapid drying up at the roots and to better withstand wind. It should be seen that all the fruits are resting secure on their supports before removing the trees. The opportunity ought to be taken at this time for going over the trees with methylated spirit if blight is present. The trees should be syringed during fine weather, and also have a portable tiffany blind drawn over them when there is bright sunshine.

Late Grapes may require an extra look over to see that each berry has sufficient room to swell without in any way pressing against others. This final thinning of late Grapes is very important, especially if the fruit is required to be kept until the following spring.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

THE DESIRABILITY OF LATE VEGETABLE CROPS.

EARLIER in the year the desirability of growing as many vegetables as possible was emphasised in these pages, and the continued increase in the price of practically all kinds of food calls for extended action in this sphere of gardening. Owing to the scarcity of labour, a good deal of work in the sowing and planting of vegetables during March and April had to be left in abeyance, with the result that in many places ground is lying idle that ought to be producing its quota of useful and wholesome food. The drought that was experienced towards the end of April and the early part of May, together with the severe night frosts that visited many districts during the closing days of the latter month, have also tended to lessen supplies; hence no apology is needed for offering suggestions on the cultivation of vegetables that may successfully be sown or planted during the next few weeks. In most gardens there will be some seed that was not required for sowing earlier in the year, so that there need be very little outlay in that respect. One result of the present war will be to bring before us vividly the cropping possibilities of the soil, and many lessons will be learned that will be of considerable benefit to the community in future years. In the notes that follow I do not propose to deal with extraordinary vegetables that need elaborate preparation or apparatus to bring to perfection, nor those kinds which yield comparatively little actual food.

Beans.—Any of the Dwarf French Beans sown now in rows 1 foot apart will yield some useful pods for gathering after those sown earlier are finished. The soil ought to be well dug and manured, and if rubbish such as lawn mowings, leaves and annual weeds that have not yet reached the seeding stage can be worked deeply into the soil, they will tend to keep it cool and moist during the hot days of August. It should be remembered that the seeds of all French Beans are perfectly wholesome and palatable, as witness the Haricot Bean; hence any pods on the earlier-sown plants that cannot be profitably gathered green should be allowed to mature.

Beetroot.—Seed of any of the round or Turnip-rooted varieties may be sown during the next three weeks with good prospect of success. Rows 1 foot apart, is the distance, and, before sowing, well water the drills. This should be done for all small seeds that are put in at this time.

Borecole or Kale.—Any of the varieties sown during June will be in ample time for good late winter and early spring crops. Sown in rows 1 foot apart the plants will be ready to go where the early Potatoes or Shallots have been lifted or where old Strawberry plants have been uprooted after the fruit is gathered. The same remarks apply to such Broccoli as Snowdrift, May Queen and Purple and White Sprouting.

Cabbages.—The date for sowing spring Cabbage is the last week in July or the first week in August. Sow as advised for Borecole. Savoy Cabbage, sown at once and planted out when ready where early Potatoes or other crops have been cleared, will give some useful, if small, heads for cutting

early in the New Year. Christmas Drumhead Cabbage and Hardy Green Colewort are other types that may with advantage be sown during the next week or two.

Carrots.—The early Stump-rooted or Horn Carrots may be sown thinly in rows 1 foot apart from now until the end of July. The young roots thus obtained will be available for use from the end of September onwards, and will prove a welcome change to the large maincrop varieties.

Kohl Rabi.—The small garden forms of this must not be confused with the coarse roots grown in the fields for cattle. Seed sown in drills 1 foot apart in well-enriched soil and treated as advised for Beans will give excellent Turnip-like roots for winter use. The seedlings must be thinned early, so that they stand from 6 inches to 9 inches asunder.

Leeks.—Although too late to sow seeds, this is just the season for planting, and doubtless in some districts plants could be obtained from the local nurseryman. They ought to go 9 inches apart in trenches 6 inches deep, these having previously been well manured, much in the same way that Celery trenches are prepared.

Peas.—It is not generally known that Peas may be sown with every prospect of success during June and the early days of July. Late Peas suffer most from attacks of mildew, brought about by the drought of August and early September; hence rather more than ordinary precautions must be taken with these late sowings. A cool, moist root-run is essential, and to secure this it is advisable to dig out a trench 18 inches wide and as much deep; then in the bottom place at least 6 inches of well-decayed manure mixed with lawn clippings, annual weeds, or any other garden refuse that is capable of retaining moisture. Some short, well-rotted manure may also, with advantage, be mixed with the upper soil that is filled into the trench. For sowing in June, one of the recognised late Peas, such as Gladstone, should be selected; but for July use an early one, such as Little Marvel, The Pilot, or Eight Weeks. These are hardier and come into bearing more quickly than the maincrop sorts. When a few inches high, soil should be drawn up to each side of the plants so as to form a small ridge, each side of which should then be mulched with short manure and lawn clippings.

Potatoes.—To many it will no doubt appear ridiculous to advocate the planting of Potatoes in June, but the thrifty cottager discovered years ago that it was better to plant old Potatoes at this time than to throw them away. Where such are available, they should be planted without delay, and with anything like a favourable autumn they will yield good crops of tubers for eating as "new" Potatoes during the late autumn.

Turnips.—It is a well-recognised rule of gardening that the best Turnips are obtained from sowings made during the latter part of July and the first week in August. Drought is their greatest enemy, and to prevent it as much as possible some precautions are necessary. In addition to working plenty of manure, grass or other garden refuse into the soil, the seed-bed should be covered, after the seed is sown, with clippings from the lawn. These prevent moisture escaping from the soil, and have been found to act as a preventive against the ravages of the Turnip fly. This crop must be grown quickly, otherwise the roots are hard and useless.

F. W. H. in *Country Life*.

PRIMROSE AND POLY-ANTHUS.

SOME PRACTICAL HINTS ON CULTIVATION.

A CORRESPONDENT, referring to the utility of these plants in the spring flower garden and in other ways is of opinion that an article dealing with their cultivation and increase would be helpful to many of our readers besides himself. Realising that the object of THE GARDEN is to be helpful to its readers, we gladly accede to the request at a singularly opportune moment, in the hope that the practical hints which are appended may assist in the direction indicated and bring into greater prominence plants which merit universal popularity. The request referred to is for an article on "Primroses (single and double) and Polyanthus, with information as to culture and other things." Single Primroses and Polyanthus raised from seeds fall naturally into one and the same category; hence the same treatment will do for each. The double Primroses are distinct, and have, for garden purposes, to be increased by division; hence they merit consideration apart.

Raising the Polyanthus from Seeds.—It is a curious fact, seeing the perfect hardiness, together with the simple cultural needs of the race, that the Polyanthus is so rarely seen in perfection, and in all probability the last named is to some extent responsible for not a little of the indifference displayed by many in growing it. The exhibitor—no matter of what class—knows well the value of systematic work.

Seed-Sowing.—Here, broadly speaking, the gardener has choice of two seasons, viz., that of sowing in the open ground soon after the crop of seeds has been harvested in early summer; and, secondly, of sowing under glass in slight heat during January or February. In each case the resulting seedlings, given proper care meanwhile, produce fine plants for bedding out at the same time, the late summer-sown plants being somewhat larger if freely grown on. If sown in the open, August is sufficiently early, the seeds to be sown thinly in very shallow drills in rich, well-prepared, somewhat shady ground. Primula seed at all times is impatient of being buried, and only the thinnest soil covering should be given. A variant of the above, excellent in every way, is that of sowing in boxes or pans at much the same season. In favourable localities the seedlings may be large enough for transplanting the same autumn, and where this is possible, examples of huge size result. Generally, however, they are permitted to remain till the following March, when they may be transplanted in rows a foot apart and about eight inches asunder. Those sown in heat under glass in January require to be transplanted when large enough to handle and grown on steadily till the end of March, when, after hardening off in frames, they will be ready for planting out. These glass-house or frame-grown plants require frequent attention to watering, dryness at the roots or otherwise being fatal to progress.

Planting Out the Seedlings.—A border having a north or north-west aspect is best for the plants, or in any case a position affording slight shade. Compared to its stature, it is insufficiently recognised that the Polyanthus is a gross-feeding subject; hence the ground should be deeply

cultivated and well enriched. In Nature the Primrose attains its highest excellence in deep loams that are uniformly cool. In such the leaf tufts may be a foot or more high, though we see caricatures of the plant less than 2 inches high on the driest banks. Such lessons the gardener cannot ignore with impunity; hence the aim should be deep and good soil, with partial shade wherever possible.

Dividing the Plants.—The Polyanthus is so eminently satisfactory when raised from seeds, yielding plants of such unmistakably superior vigour when compared to other methods, that increase by division is only rarely resorted to. In a word, the divided plant, no matter how cultivated, is inferior in vigour, stature and flowering to that raised from seed, and the specialist realises this to the full. The amateur, however, often lays store by his old plants and prefers to increase them by division, as do also many gardeners. Where seed is required, the operation must be deferred, otherwise it is best done soon after flowering. When dividing, it is best to reduce the plants to single crowns.

Double-Flowered Primroses.—These are rarely seen in perfection in the South of England, the plants succeeding much better in the North, also in Scotland and Ireland. Lovers of cool, loamy soils, like many of their tribe, experience has proved that the cooling effect of cow-manure is very helpful to them, and with this and partial shade a certain measure of success may be secured. For general garden purposes division of the clumps every second year after flowering is found suitable, though in other instances it is indulged in annually. Retentive clay soils and such as contract during heat and drought are not suitable, the plants preferring a medium where more uniform conditions are assured. In not a few instances a liberal addition of leaf-soil is an aid to success, while neglect of the essentials in the case may result in considerable loss. It is surprising to what an extent these double sorts are benefited by overhead watering during the summer, and growers who so indulge their plants are invariably well repaid. Evening is the best time for this operation. The foregoing remarks are applicable to all the double varieties save one, the exception being the old Crimson Pompadour kind (*Primula acaulis rubra flore pleno*), at once the most beautiful and rare. This I cannot claim ever to have cultivated with success in the open with the rest, though I have never seen it approach the vigour I have more than once obtained by specialising with it in a low-lying frame. Here, where no ray of sunlight ever reached the plants, in a soil well enriched with old cow-manure, daily watered for months overhead, and frequently overhead, too, with weak liquid manure and soot-water combined, the plants grew with the greatest luxuriance. By no other method have I seen such vigour or such splendid flowers. So good a subject merits any treatment to make it a success.

Pot Culture and Bedding Out.—Grown as recommended, the plants may be bedded out for spring display in October, when the beds are freed of their summer occupants, lifting them with a good ball of earth. If desired to be grown in pots for exhibition work—they are more frequently shown as lifted specimens in baskets—there is no better time than a few weeks before being required. In this way the plants regulate themselves, and more perfect leafage and clean flowers may with slight protection be assured.

E. H. JENKINS.

HORTICULTURE IN THE GOOD OLD DAYS.

AMONG the more ancient members of the community, reference is often made to the "good old days." It is, however, questionable whether the conditions of life and hours of labour which prevailed, say, half a century ago would find favour at the present time. I think not. In one respect, however, those who depend upon the commercial side of horticulture may well look with longing upon the prices which used to be charged for indoor plants.

The difference between the sums asked now and those which prevailed from thirty-five to fifty-five years ago was brought markedly home to me when looking over a series of catalogues covering these two dates. Many of the prices were such as would make the average nurseryman's mouth water. For instance, new Pelargoniums as a rule varied from one to one and a half guineas, while for new Fuchsias half a guinea or sometimes more was asked. In the catalogue of new plants issued by Messrs. Rollisson of Tooting for the year 1858 the above prices were plentiful, while such readily propagated subjects as Gloxinias, Petunias, &c., were priced at five shillings each. Of new stove and greenhouse plants, Rhododendron Princess Royal was quoted at two guineas each, the same price being asked for Begonia Rex and Gardenia citriodora, while the Golden Chestnut of California (*Castanea chrysophylla*) and Ouvirandra fenestralis were both a guinea more. In a catalogue of the same firm nineteen years later, namely, in 1877, which brings us much nearer to our own time, high prices continued to prevail. New Crotons were quoted at one to five guineas each, and from my own experience I know that these prices were not prohibitive even at a later date than that just mentioned. Five guineas, too, for *Æchmea Mariæ-Reginæ*, *Hippeastrum Leopoldii*, *Aralia elegantissima*, *Anthurium scherzerianum album*, *Dracæna (Cordylina) lentiginosa*, and some of the *Nepenthes* are very different to what any stove and greenhouse plant, however new it might be, would realise to-day. A guinea each for *Kentia belmoreana* and *K. forsteriana* is very different from to-day's prices, while the list of Palms for which one to five guineas were charged was quite a long one. It must be remembered that these prices were asked for ordinary-sized plants, not specimens.

A notable feature at that date of the Orchids is that they are practically all either species or native varieties. For many of the distichous-leaved Orchids, such as *Aerides*, *Saccolabium* and *Vandas*, particularly high prices were charged; while for the autumn-flowered *Cattleya labiata* no less than five to seven guineas were asked. That hybrid Orchids would in the future occupy the position they do now was at that time probably undreamt of.

One more notable feature stands out in Messrs. Rollisson's catalogue for 1877. It is the fact that no fewer than 225 greenhouse Heaths are enumerated. This serves to show the extent to which hard-wooded plants were at one time grown, compared with the case at the present day. One is inclined to ask how many of these are now obtainable from the ordinary trade sources.

H. P.

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish expert advice.

The Editor welcomes photographs, articles and notes, but he will not be responsible for their safe return. All reasonable care, however, will be taken, and where stamps are enclosed, he will endeavour to return non-accepted contributions.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

The Editor will not be responsible for the return of artistic or literary contributions which he may not be able to use, and the receipt of a proof must not be taken as evidence that an article is accepted. Publication in THE GARDEN will alone be recognised as acceptance.

Offices: 20, Tavistock Street, Covent Garden, W.C.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

MAY-FLOWERING TULIPS NOT DOING WELL (*Carisle*).—We feel sure that, owing to the Nasturtiums, your Tulips did not get properly ripened off last summer, and very likely were a good deal worried by slugs, as the dense foliage of the annual makes a fine harbour for them, when the stems decay there is a ready-made passage through which they can get at the tempting food below. The bulbs should have been lifted towards the end of June or early in July, when the foliage had died off, and then dried, graded into sizes and stored. The smaller ones only produce second-sized blooms and the very little ones none at all. The drying process must take place in an airy room or shed out of the reach of the sun.

HOUSELEEK FOR INSPECTION (*W. F. M. C.*).—The Houseleek is attacked by rust caused by the fungus *Eudophyllum Sempervivi*. Once attacked, the plant is likely to be attacked again, and it would be best to take out the diseased plants and replace them with fresh ones. The "dust" you speak of is composed of the spores of the fungus, by which it spreads, and the sooner the diseased plants are removed the better. Probably a rose red solution of potassium permanganate would be the best thing to spray the healthy ones with to protect them against the infection. We regret to learn you were so cavalierly treated by the exhibitor. It is quite true that many Cacti were grown on the Continent, some in Holland, some in Belgium—alas! now so much overrun by the enemy—and some in Germany, but some in this country too. There were three exhibitors of Cacti at the show you mention. Probably some of our advertisers would be able to supply your wants.

TREES AND SHRUBS.

HEDGE OF LUPINUS ARBOREUS (*J. T. Studley*). The plants of *Lupinus arboreus* will be improved by being cut back after flowering. At the same time it is advisable to remove a little of the older wood, in order that the new shoots may have as much light and air as possible. As a rule, it is not a very long-lived plant, therefore you must be prepared for plants or portions of plants dying now and then. The best results are usually secured by destroying old plants and commencing again with young ones when signs of serious deterioration are evident.

ROSE GARDEN.

ROSE MME. LAMBARD SPORTING (*Mrs. J., New Zealand*).—We are not surprised to hear you have a sport of this fine old Rose. The difficulty will be to fix it. We have seen almost similar sports, but the second flowers from the same shoot have come the normal colour. We advise you to take a cutting or a bud from the

shoot that has sported. We are glad to hear of your success, and would welcome an article from your pen dealing with your experiences in Rose-growing, and also as to the behaviour of some of our recent new Roses in your climate.

EVERGREEN RAMBLER ROSES (*Sir L. M.*).—One of the most evergreen of our ramblers is American Pillar. It carries its foliage well through the late autumn, and is indeed a grand Rose. Gerbe Rose and Jessica are two other splendid varieties, both in persistent foliage and beauty of bloom. Aimée Vibert and its yellowish sport are very evergreen and free-flowering, but they are not very fast-growing, although they make beautiful pillars. Alberic Barbier is excellent, both for holding its foliage and in giving a grand display of flowers in June, with few or many throughout the season. Silver Moon and Jersey Beauty hold their foliage well. Sylvia is a very perpetual bloomer, but not a very rampant kind. Jean Girin we have found to be perpetual, although it does not yield a profusion of bloom, yet its clusters are very pretty in the autumn. We hope to obtain perpetual-flowering ramblers through the Hybrid Musk. Such as Trier, Danæ and Moonlight are perpetual, but not very vigorous. This latter fault will probably soon be overcome. We hope to watch some of the newer ramblers this season regarding the points you write about, and shall have pleasure in giving our experiences later on.

THE GREENHOUSE.

CANKER ON MARECHAL NIEL ROSE (*Heath*).—Cut out the cankered spots and paint the cut surface with white paint, tar, or styptic. Similarly deal with all wounds.

RUST IN GLOXINIAS (*Heath*).—Rust in Gloxinias is due to the attack of a minute mite almost invisible to the naked eye, a pest which also attacks Begonias, Cyclamens and other greenhouse plants. The best remedy is to dip the plants into a wash made by kneading flowers of sulphur into a handful of soft soap and dissolving it in 1½ gallons of soft water. Repeat the operation until all the mites are killed.

CARNATIONS ABNORMAL (*Mrs. C.*).—Malmaison Carnations are sometimes liable to behave as yours have done. This may be owing to various causes, by means of which the plants have sustained a check. They may have been kept too wet or too dry, while an excess of stimulants or the absence thereof might have the same effect. A light, buoyant atmosphere is very necessary to the development of the flowers of Malmaison Carnations, as they are more affected by atmospheric moisture than the Perpetual-flowering kinds. If the hard green portion is carefully removed, the flower will sometimes develop and hide the defect. The name of the Lilac is Souvenir de Louis Späth.

ADVICE ON CYCLAMENS (*T. C.*).—If you follow the advice given you with regard to your young plants of Cyclamens, you will assuredly kill them. Young plants such as yours require very careful treatment under glass at this season. We presume your plants are still in the seed pots or pans, in which case they should, when two leaves are developed on each, be potted singly into small pots. A very suitable compost for them is made up of equal parts of loam and good leaf-mould, with a liberal sprinkling of silver sand. These should be well mixed together, and if passed through a sieve with one-third of an inch mesh, the operation of potting will be facilitated. A few broken crocks must be put in the bottom of each pot for drainage, and immediately over them a little of the rougher soil that has not passed through the sieve. In potting, the corm should be buried half its depth in the soil. You do not say what accommodation you have for growing the young plants, but they require a snug little structure where they can be kept near the glass. A liberal amount of atmospheric moisture is very necessary to their well-doing; hence they should be stood on a bed of ashes or Cocoanut refuse kept moist. If no other space is available, they may be stood in a frame shaded from the sun. Of course, the plants must be watered when required.

FRUIT GARDEN.

CARDINAL NECTARINE FRUIT CRACKING (*Herbert Jones*).—The variety is subject to this fault. The best precaution to take against this we have found is to crop rather heavier, to give abundance of air during the time the fruit is taking on its second and final swelling, mulch over the roots with well-decayed manure, and avoid very heavy waterings with liquid manure. Rather give moderate waterings and oftener.

PEAR LEAVES FOR INSPECTION (*C. J. L.*).—The spots on the Pear leaves are due to the attack of the Pear leaf-blighter mite (*Eriophyes pyri*). Each spot is inhabited by a few mites, which have hibernated beneath the bud scales and which enter the leaf just as the buds are expanding. The best remedy for this, when only a few leaves are affected, is to remove the diseased leaves and to burn them; but if many show the trouble, spray during the winter with a winter wash made by dissolving 2lb. of caustic soda in 10 gallons of water, or, better still, with the Oregon winter wash, made by mixing 3lb. of quicklime and 1lb. of caustic soda together and slaking with hot water in which 3lb. of flowers of sulphur have been well stirred. Stir the mixture, which will boil of itself, for some time, and gradually add 3lb. of common salt. Allow it to boil and then make up to 10 gallons with water. Spraying now with a nicotine wash should do

some good, though it is unlikely to rid the trees entirely of the pest. The curling of the Pear leaves is due to the presence of numerous small grubs of the leaf-curling midge of the Pear, which you may see if you unroll the curled foliage. This pest seems to be spreading in parts of the country. Probably a very fine spray of nicotine wash would kill a good many, or spreading kaint (if it can be obtained) under the trees would kill a good number of the larvae as they fall to the ground, where they hibernate about three inches or four inches down. The curling of the Rose leaves is due to a different insect entirely—the leaf-curling sawfly, which has a tiny, almost transparent, green caterpillar feeding inside the rolled-up part of the leaf. The caterpillar is difficult to see, but does a good deal of damage in the course of its life. A tree once attacked is often attacked year after year, as the flies do not travel far. The grubs drop to the ground when fully fed and pupate there 1 inch or 2 inches below the surface, and it would be well to remove the top 3 inches of soil during the winter in order to get at and destroy the pests hibernating there.

KITCHEN GARDEN.

SEAKALE: TREATMENT FIRST YEAR AFTER PLANTING (*E. M. Wild*).—Cut off the flower-stalks; allowing them to flower weakens the roots. Keep the ground clean by hoeing. The tops will die down in the winter, and should be cleared away. At the end of March cover the roots with Seakale pots which have lids to them, and the pots with littery strawy manure. In about a month's time the Seakale should be large enough to cut. During this operation cut off a small portion of the top (or crown) of the root with the Seakale. You will then secure all the leaves at one cutting. The old crowns so cut will form new ones in due time. A simpler way is to cover the roots to the depth of 15 inches with the ordinary soil of the garden. When growth starts, the Seakale tops will rise through the soil and be beautifully blanched in the process. Cut in the same way as directed above as soon as the growth of the Seakale is perceived to crack the surface of the soil.

MISCELLANEOUS.

NAMES OF PLANTS.—*Mac. Deal.*—The Rose is *Aglala*.—*G. M. Jones*.—*Gazania splendens*.—*W. P. Lees*.—*Dendrobium nobile*.—*C. C. F.*—1 and 2, Forms of *Sisyrinchium angustifolium*; 3, *Libertia formosa*.—*G. T.*—*Brunfelsia eximia*.—*Cornish Gardener*.—*Aristotelia Macqui*.—*W. Tillett*.—Feathered Elm (*Ulmus glabra* variety).—*Rev. Dr. B.*—*Mimulus glutinosus*, syn., *Diplacus glutinosus*.

PARCEL NOT DELIVERED.—A label, correctly addressed, stamped with three halfpenny stamps, and bearing the postmark "Dulce," has been sent us by the postal authorities, with the intimation that it was found unattached in the post. Will the sender please write to us?

THE EDITOR'S TABLE.

A Beautiful Laburnum from Maidstone.—Messrs. George Bunyard and Co. send us from their Maidstone nurseries a raceme of a very beautiful Laburnum that is known as Latest and Longest. This raceme was nearly two feet long, the flowers being of a particularly rich yellow colour. As its name implies, this Laburnum is among the latest to flower, and certainly has longer racemes than any other known to us. The foliage closely resembles that of *L. alpinum*.

Habranthus pratensis from Norwich.—Mr. E. G. Davison, Westwick Gardens, Norwich, sends a beautiful contribution of these glorious scarlet flowers. As stated on page 277 of our issue for June 5, Mr. Davison is more successful with these plants than anyone else we know, and the flowers now under notice are exceptionally good. The stem of each is about eighteen inches long, and it is not uncommon to find six blooms on a stem. Mr. Davison writes: "I am sending you a few spikes of *Habranthus pratensis* for your table. We have a lot of flowers at present, and could cut over four thousand spikes. One bed alone has over two thousand flowering spikes. All are growing in the open garden, and have had no protection whatever. In common with most other things, they were later coming into bloom this season."

OBITUARY.

JAMES FORDER.

THERE were not many gardeners or horticulturists in East Anglia who did not know Mr. James Forder, and they will be grieved to hear of his passing to the great majority on June 3 in his fifty-ninth year. For over a quarter of a century he represented the well-known firm of Messrs. Daniels Brothers, Limited, Norwich, "upon the road." He possessed a cheery disposition, which endeared him to all with whom he came in contact. As a mark of esteem a large number of members of the East Anglian Horticultural Club attended his funeral at Norwich. Many splendid wreaths were sent, including several of red Carnations, the favourite flowers of the deceased.

East Anglian Horticultural Club.—This club carries its meetings on each month throughout the year, and by this means keeps up a bond of fellowship with the horticulturists of the district. The June meeting was held at the Boar's Head Hotel, Norwich, under the chairmanship of Mr. John Clayton, when a very good muster was present. Mr. G. Todd read a very interesting paper upon "Summer Bedding," the main theme of it being centred upon harmony of colour rather than the crude contrasts one so often meets. This was responsible for a good discussion. Mr. H. Goude, Lecturer to the Norfolk County Council, followed this with an impromptu discourse upon "Bees and Their Relationship to the Gardener." In the course of his remarks, Mr. Goude told of the many ways he had observed, while going about the county, that hives of bees had been placed in positions to facilitate the fertilising of fruit blossoms. Several questions were put, to which the lecturer suitably replied.

Summerdown Military Convalescent Hospital, Eastbourne.—Will garden-lovers help convalescent soldiers? There are nearly three thousand wounded "Tommies" in this newly opened camp. They are digging the ground round the huts, and gardens are developing in every corner. Many plants have already been given, but the place is so large that literally thousands more would be very thankfully welcomed. Gifts should be addressed to the Officer Commanding, and other communications to the Garden Secretary.

TRADE NOTES.

"BULBS FOR EARLY DELIVERY."—This is the title of an interesting little catalogue that has been sent us by Messrs. J. R. Pearson and Sons of Lowdham, Notts. As every good gardener knows, it is highly desirable to pot such bulbs as Roman Hyacinths, Narcissi, Snowdrops and Tulips early if they are to be forced hard; while Freesias, grown under normal conditions, should go into their pots as soon as the bulbs are procurable. Messrs. Pearson make a feature of the early delivery of the kinds mentioned above, particulars of which are set out in the catalogue referred to. Copies can be obtained post free by writing to the firm.

THE "ACME" PEST ERADICATORS.—PESTS, and especially those of the insect tribe, are more prevalent than ever this year, and we have seen Rose bushes and fruit trees with distorted foliage and shoots that are far from being a credit either to their owner or the gardener. Remedies are now so plentiful and reasonable in price that pests in such degree ought not to be tolerated. The catalogue of insecticides, fungicides and weed-killers, with apparatus for their application, which we have just received from The Acme Chemical Company, Limited, Tonbridge, Kent, sets out the various uses to which these substances may be successfully and economically put, and we think everyone who is troubled with pests should have a copy by them. The firm will be pleased to post it free of charge to any reader who applies direct to them for it.

THE GARDEN.

No. 2275.—VOL. LXXIX.

JUNE 26, 1915

NOTES OF THE WEEK.

The Horticultural Club.—The committee of management of the Horticultural Club has decided to abandon the annual outing, which usually takes place in July.

June Frost in Hertfordshire.—Mr. E. Beckett, V.M.H., writing to us from the gardens, Aldenham House, Elstree, Herts, states that a severe frost was experienced there on the morning of Saturday, the 19th inst. Vegetable Marrows, Potatoes and other crops were badly damaged.

The Home Production of Food.—Among the committee appointed last week by the Board of Agriculture to consider and report what steps should be taken by legislation or otherwise for the sole purpose of maintaining and, if possible, increasing the present production of food in England and Wales, on the assumption that the war may be prolonged beyond the harvest of 1916, we are pleased to see the name of Mr. A. D. Hall, M.A., F.R.S. His interest in horticulture will, we feel sure, be a guarantee that this section of the food-producing community will not be overlooked.

A Late-Flowering Italian Apple.—*Pyrus crataegifolia* is very distinct and pleasing, flowering during the first half of June. It forms a bush or small tree and is a native of Northern Italy. The pure white flowers, which are three-quarters of an inch in diameter, are freely borne in corymbs on long, slender shoots. Trees at Kew are some 9 feet in height, and as these mature fruits, the raising of young trees from seeds is the most satisfactory method of propagation.

The Best Roses in Australia.—Recently the *Argus* asked its readers to name the twelve Roses they considered the best in Australia. The result, which will, we think, be of interest to rosarians in this country, is given below. Evidently, by Frau Karl Druschki heading the list, fragrance is not a strong point with the Australian enthusiasts: Frau Karl Druschki, 390 votes; Mme. Abel Chatenay, 382; White Maman Cochet, 319; Lyons Rose, 302; K. A. Victoria, 300; General Macarthur, 269; Belle Siebrecht, 245; La France, 219; Joseph Hill, 156; Prince Camille de Rohan, 144; Rhea Read, 139; and Pink Maman Cochet, 124.

A Hardy Yellow-Flowered Grevillea.—Though a fairly large genus, the Grevilleas are only found wild in Australia. They are thus better suited for cultivation under glass in this country, though in sheltered positions in the London district, but more particularly in the mild climate of the South and West, several species are very pleasing flowering shrubs. The hardiest is *G. juniperina sulphurea*, a native of New South Wales. Until recently, notable success attended its cultivation

in the Coombe Wood nursery of Messrs. J. Veitch, while, during May and June of this year, plants have flowered freely in a sheltered position at Kew. *G. sulphurea*, as it is grown in nurseries, is an evergreen bush reaching some 4 feet to 6 feet in height and as much in circumference. The needle-like leaves suggest a conifer. The light yellow flowers are freely borne in clusters along the branches. To the ordinary soil of the garden,

GREVILLEA JUNIPERINA SULPHUREA, A SHRUB WITH CURIOUS YELLOW FLOWERS.

peat and leaf-mould should be added for this and other species of Grevillea. Cuttings form a ready means of propagation, inserting half-ripened growths under a bell-glass in a slightly heated frame during July and August. A companion plant for sheltered positions is *G. rosmarinifolia*.

Trial of Bearded Irises at Wisley.—The trial of Bearded Irises will be continued in 1916. Of the varieties now on trial in the gardens, those

adjudged by the committee to be of sufficient merit will be grown and judged during the coming year. New varieties sent in before July 1 will be included in the trial.

A Good Rose Combination.—A few days ago we were admiring the Roses Longworth Rambler and Mme. Alfred Carrière, the one with its bright rosy crimson blooms and the other with its almost pure white fragrant flowers. These suggested a good combination for those who appreciate contrasts, and a note was made of them for planting together on an archway. On Saturday last, when visiting some of the gardens at Gidea Park, Essex, we found that the idea was already in being in one garden, and although the plants were young, they were sufficiently advanced to indicate the effect they would produce. Both have large blooms, both flower early, and both continue their display well into the autumn. It would be difficult to find two more charming and useful ramblers than these, and we hope their merits will be more highly appreciated.

A Pink-Flowered Horse Chestnut.—*Æsculus plantiënsis* is a Horse Chestnut of hybrid origin raised in the nursery of M. Simon Louis at Plantières, near Metz. The parents are given as *Æ. Hippocastanum* and *Æ. carnea*. The tree grows freely, and in this respect resembles the common Horse Chestnut; but the colour of the flowers is a pleasing delicate pink. In addition to *Æ. plantiënsis* being a beautiful tree, the fact that it does not produce fruits is an advantage in public parks, where the common Horse Chestnut often causes trouble through boys knocking down the fruits with sticks and stones. Grafting and budding are the methods of propagation, using *Æ. Hippocastanum* as a stock.

Flower Shows in London.—During the next few weeks no fewer than three large horticultural shows will be held in London. On Tuesday, June 29, the National Rose Society's exhibition will be held at the Botanic Gardens, Regent's Park. This promises to be exceptionally good, and the arrangements already made for the convenience of visitors excellent. Schedules can be obtained from the secretary, 25, Victoria Street, Westminster. On July 6 the Royal Horticultural Society's summer show will open at Holland House, Kensington High Street, and, as usual, will be maintained for three days. Then on the following Tuesday, i.e., July 13, the National Sweet Pea Society will hold their annual exhibition at the Royal Horticultural Hall, Vincent Square, Westminster. This is always a very artistic display and well worth visiting. Schedules are obtainable from Mr. H. D. Tigwell, Greenford, Middlesex.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

The Bird Cherry.—I was pleased to see a note on this neglected tree in *THE GARDEN* for May 22, page 241. Another point in its favour is that, unlike those of so many hard-wooded trees and shrubs, the flowers last well in water for ten days, where the white racemes are contrasted with the pale green foliage to advantage. A fine lasting white flower is *Achillea mongolica*, which keeps its beauty for ten days.—GEORGE BUNYARD.

Tulip Bouton d'Or.—I was very pleased to read the appreciative note in *THE GARDEN*, page 277, concerning this most useful Cottage Tulip. It is one of the good old sorts that will be a long time, I fancy, before it is superseded, even if it ever is. It is a splendid deep yellow, its blooms are shapely, and, what is of equal importance in these times, the bulbs are very cheap. I would not like to be without Bouton d'Or, and one can afford to plant the bulbs somewhat liberally. Incidentally, I may mention that, like some of the other May-flowering sorts, it increases fast, so that one can soon work up a stock. Last autumn I tried the experiment of planting Bouton d'Or on a border that only gets the sun for a short time in the afternoon, and despite the fact that the recognised rule seems always for Tulips to be planted in "a sunny place," this old favourite simply revelled in the shady corner assigned it, and it was not until the end of May that I cut the last of the flowers. I have heard of blooms of this variety being cut approaching abnormal size—as was the case at Chelsea Show—but it has not been my fortune to achieve the abnormal. That does not trouble me, however, not being an exhibitor, and I am quite content in being able to have flowers of such an intense yellow and, as I have said, from such moderately priced bulbs.—W. LINDERS LEA.

Lupinus polyphyllus.—"Garden Steward's" letter in the issue of *THE GARDEN* for June 5, page 278, in reply to my criticism on the cultivation of the above, is most interesting, and I am grateful to him for troubling to write again. My contention was the roots "several feet long," and this "Garden Steward" has amended to 18 inches or 2 feet. I quite admit, now that I know his locality and that his soil is very light gravel, that this length is attainable; but, as said previously, it seems unlikely that they would be even that length after four to six months' strong growing. If plants are put in positions such as the boundary of a shrubbery, where they can grow for three or four years undisturbed, a far greater length than 2 feet would be possible in such a soil. However, all that is beside the point. My object in again writing is to make two little corrections. The word "saved," printed in my previous letter, must be a printer's error, because I realised from the first that if "Garden Steward" could not grow Lupines, he could not very well save seed from them! I should also like to correct one of his remarks. "Garden Steward" says: "I can quite believe that *Lupinus* always remains small near Sheffield."

But he is in error. If he grew his Lupines on a hillside bordering our Derbyshire moors, exposed to winds of the greatest coldness and strength, then possibly they would not do. But here in Ecclesall, at an altitude of 650 feet to 700 feet, and exposed, according to some, "to most of the winds that blow," we grow some of the biggest Lupine plants and best spikes of flowers that our visitors say they have ever seen. Ours are no "small" plants when they get established. Our spikes are also large and full. But these plants, though big, do *not* possess roots "several feet long."—E. T. ELLIS, *Weekwood, Ecclesall, Sheffield.*

Stone Edgings to Pathway.—I do not know if you will think the enclosed photograph worth reproducing in *THE GARDEN*. It is the top path

STONE EDGINGS TO A PATHWAY IN A READER'S GARDEN IN SCOTLAND. GENTIANA ACAULIS THRIVES HERE.

in our old manse garden, and was taken about this time last year. We have no rock garden, I am sorry to say, but this is the nearest approach to it we can manage. The path itself is made of old stone slates from the roof of a farmhouse, and was laid about four years ago. We put in some round beach stones at the sides to help the plants to grow, and they certainly have grown. I am always cutting off bits. The flowers in bloom shown in the illustration are just ordinary rock plants. There are about one hundred and eighty different kinds, such as *Aubrietias*, *Saxifrages*, *Phloxes*, *Lithospermums*, *Campanulas* and *Dianthus*, and, best of all, *Gentiana verna* and *G. acaulis*. The latter grows like a weed here. The edging of it is 12 inches wide at least, and a solid mass of blue.—I. BARRON, *Dunnottar Manse, N.B.*

Wanted: A Recipe for Elderflower Wine.

I have just been told, by one who has tasted it, that Elderflower wine is far superior to Elderberry. I shall be very grateful if any of your readers will give a reliable recipe. As the ballad relates how "Mistress Jean she was makking her Elderflower wine" when the Laird of Cockpen paid that untimely call, I suppose the said wine is Scotch, or Scottish, or Scots? How shall a Southern pen essay the egg-and-sword dance amid these words without fear and trembling, any more than a Northern (I will not venture on the other term again) can learn to discriminate the uses of "shall" and "will"?—ANNE AMATEUR.

Large Vegetables.—I am amused at the letters which mine, *re* large vegetables, has called forth.

I am afraid neither the question of growing for market nor waste, as the chief objection, was the cause of my complaint, for something is always done with what is left over; but I was feeling (as usual when ordering the garden seeds) how tiresome it is that when, from motives of economy, one goes in for a "collection" instead of countless shilling packets (half of which never get sown), one is obliged to order in addition some packets of the smaller-sized vegetables, and give away, or waste possibly, those of "Mammoth" breed, because these are forced upon one in each "collection," and one is not allowed to change them. I still think, and "Anne Amateur" agrees with me, that a dish of small vegetables is preferable; and that the sight of a messed-about dish of some of the larger sorts, after even two or three people have helped themselves, is frequently a disgusting sight. It is unavoidable. This being so, it would be a comfort if more small-sized, first-rate vegetables were aimed at by the seedsmen instead of showing us so evidently that they are not, by the titles, illustrations and printing in their catalogues. I have now before me one of these, open at a page on which is a large-sized basket well filled by two Broccoli. What dish would they go into? Another page is entirely taken up by one Onion, "weighing 4lb."; another, by a Broad Bean pod 9 inches long. I shudder to think what size the Beans would be before they came into the house! I shall continue to maintain that for home growing and consumption far too many large varieties are puffed and advertised by the seedsmen, and can only hope that they will in time recognise this, and give us more "Gem" varieties and fewer "Mammoths," in pity, at any rate, for small households and for those who prefer small, sweet-tasting vegetables.—A. LA T.

Apple Cox's Orange Pippin Grafted on Irish Peach.—In your issue of May 22 there is a note on canker, or rather non-cankering of Cox's Orange Pippin when grafted on to trees of Irish Peach. I have been studying and experimenting with this trouble for the past twenty years, and I am convinced that the dying away of the bark and branches is not caused by any external agents alone, though injuries may set it up. The primary cause is much deeper. I have often wondered if canker in the vegetable kingdom and cancer in the animal are not both the same. I should

esteem it a great favour if Mr. Molyneux would answer the following questions at his leisure: (1) Why was it decided to regraft the trees of Irish Peach? (2) How many trees were grafted? (3) How much of the wood of Irish Peach was there left after the scions were put on? (4) What age were the trees when grafted? (5) To what cause or causes does he attribute such beneficial results?—OBSERVER.

About Apple Blossom.—As a reader of Dr. Watts, "Anne Amateur" will probably realise that it is vain to seek perfection upon earth. She will not, therefore, be surprised to hear that the best-flavoured Apples do not possess the most beautiful flowers, and, generally speaking, the redder the fruit the paler the flowers. Those of the Codlins are generally the richest coloured, and there are few sorts to approach Lord Derby in this respect; size and colour are here combined. Nearly equalling this are Sandringham and Nelson Codlin. All these have a rich carmine tint without and a pure white within. Of the suffused types, Golden Spire is representative. Here the colour is the same on both sides of the petal, a rosy lilac. King's Acre Pippin has a similar flower, also Venus Pippin. This type of flower is, however, not so effective, in my opinion, as the Lord Derby type. For lateness of flower Royal Jubilee, Bess Pool and Court Pendit Plat happily prolong the season of blossom. For an isolated park Bess Pool is very beautiful, forming a regular, round head and being covered with flower, even to the centre of the tree. It flowers late in May, and surely no flowering tree can be more lovely and none so useful.—EDWARD A. BUNYARD.

— "Anne Amateur" will find the following varieties interesting in the colour of their flowers, apart from the ordinary coloured blossoms of such sorts as Lord Grosvenor, Lady Sudeley and Warner's King, and, what is also in their favour, they produce good Apples: Bramley's Seedling, Sandringham, Castle Major (especially rich coloured buds and open flowers), Arthur Turner and Lane's Prince Albert.—E. M.

— As an amateur grower of dessert Apples, which include American Mother, Beauty of Bath, Cox's Orange Pippin, Coronation, The Houblon, James Grieve, Langley Pippin, Paroquet, Red Astrachan, Ribston Pippin and some newer varieties not in bearing, I should recommend "Anne Amateur" to have some trees of James Grieve planted. I consider it would be one to reach her ideal, both as regards blossom and fruit. The blossoms stand out prominent in beauty of colouring; usually a profuse display, carried on large stems. The fruits are of attractive appearance, of medium size, fit to gather in September, can be eaten from the tree, and are of first-class quality. With me the trees are good growers and regular bearers. The blooms of American Mother are very pretty and later in opening. The trees are of dwarfish growth and not so reliable in fruiting as the former.—P. WAKEHAM, *Kingsbridge, South Devon.*

FORTHCOMING EVENTS.

June 29.—National Rose Society's Metropolitan Exhibition, Botanic Gardens, Regent's Park, London. Royal Agricultural Society's Exhibition, Nottingham (five days).

June 30.—Southampton Royal Horticultural Society's Rose Show, South Stoneham House, Southampton.

A GARDEN IN THE WAR DESERT.

BY OUR SUB-EDITOR, RIFLEMAN H. COWLEY.

A PARTY of five khaki-clad riflemen and one sergeant marched at a slow pace along the main road of the ruined village of Zonnebeke. The heavy strain of many days and nights in the trenches was written unmistakably upon their unwashed and unshaven faces. The men, wearing overcoats, carried their rifles at the trail, with their bandoliers slung loosely over their shoulders. The overcoats were cut to the knee, a sign that the wearers had been through wintry days, wading in the trenches, when the lower part of the overcoats, steeped in mud and water, dragged heavily upon the wearers, and had in consequence been cut away. The party marched on through the ruined village, paying little heed to the scenes of desolation, to which they were only too well accustomed.

The writer of these notes was one of that small party, and as we proceeded I mused lightly upon a message given me by a gardening friend six months ago before leaving England with the British Expeditionary Force. It was, in effect, that should I by any chance get to the little village of Zonnebeke, I was to be sure to call at the Château, where a welcome would await me, and I should find much of interest in the garden there. I made a note of the address, but thought no more of it until our battalion was stationed on the outskirts of the old capital of Flanders, now known as the Desert of Ypres. Our road to the trenches lay through a heaped-up pile of ruined buildings, and this was the one-time pretty village of Zonnebeke. Not a building had escaped destruction, and the inhabitants had fled from their homes, not one of them being left alive in the village. A few scared and half-starved cats, still clinging to their old haunts, were the only signs of life so far as we could see. The church had shared the fate of many other grand old Flemish churches, and while much of it still stood erect, the interior, as I afterwards saw, was a heap of bricks and plaster, piled up with broken chairs and tattered paintings.

The enemy had snipers concealed behind the ruined buildings, and it was in search of snipers that our party of six had started out. We halted outside the church, and were given the order to fix bayonets. The search was then commenced. We were to start at the church and work our way back to headquarters. Leaving the church, we passed on to the wreckage of a mansion a little way back from the main road. Many grand old trees lay uprooted round about. The walls of the house were standing, but the rooms, strewn with shattered glass and broken furniture, presented a scene of hopeless chaos. Letters and other correspondence lay on the floor in one room. With a feeling of intense interest I picked up some correspondence. My suspicions were confirmed, for this indeed was the Château of Zonnebeke! There was little in the Château that had not been destroyed, save one or two oil paintings in their large gilt frames, and, singularly enough, a large mirror was left unbroken upon a wall.

It was not long before I found my way to the spacious garden behind the Château. It was a large walled-in garden of very formal design. Weeds had indeed grown apace, and were running rife throughout the garden. For all that, a bed

of Pansies made quite a brilliant display in the midst of this scene of desolation. It was an excellent strain of large, well-formed flowers of the rarest and richest colours to be found among Pansies. I imagine the owner to have spent many years in raising these flowers to such a high standard of excellence. Sea Pinks and double Daisies made a broken edging to the garden paths and beds of herbs, while one or two lovely bushes of Lavender and Rosemary caught my eye in passing. In one corner of the garden I espied a large circular pool of water that would have made a perfect home for Nymphæas and other aquatics. This hole, however, was made by one of the enemy's largest explosive shells. It was an old-world garden, containing flower borders and fruit trees. The latter had been badly damaged by shell fire, although a fair sprinkling of blossom was then seen. At one end of the garden was the conservatory. Most of the plants had perished, although signs of life were still visible in Chrysanthemums and Pelargoniums. But the good-natured Aspidistras were little the worse for their neglect, while a few succulents, natives of dry desert regions, were having the time of their lives.

There were more serious duties for our little party to perform, and, making our departure through a hole made by a shell in the garden wall, we bade farewell to the Château of Zonnebeke.

INFORMAL AND WILD GARDENING.

BY JAMES HUDSON, V.M.H.

(Continued from page 304.)

THE Wisley Rock Garden will speak for itself and grow more attractive year by year. It was not planted for immediate effect, hence all the plants have room to grow and establish themselves. It is this type of gardening I should like to see encouraged and extended, and especially the wood gardening. Bamboos are frequently seen in other gardens, but I have rarely seen them so effective as at Wisley. They are planted in an ideal position, open to the west, protected on the east, and as informally as one could desire.

Another garden still quite informal, but of greater extent than Wisley, is that at Leonardslee, Horsham, Sussex, the seat of Sir Edmund Loder, Bart. When I was allowed to visit this garden last spring, I was amazed at the extent, the luxuriance and the beauty of it, as well as at the wealth of plants. To enumerate a tithe of them would be quite impossible in the time I have at command. What impressed me most was the utter absence of formality throughout. And this is what I want to impress upon others. There are gravel paths, it is true, but they are quite of third-rate consideration, comfortable and safe enough to walk upon, but little trouble to maintain. Rhododendrons of the choicest kinds—some of them hybrids raised upon the spot—are one of the chief features. Azaleas are there in profusion, and so are many species of the coniferae, all growing in perfect *abandon*. Now why is this? It is the result of great care, forethought and discrimination on the part of the proprietor. Before planting, or extending the planting, every consideration was given to the situations and the plants to be dealt with. This has been done to

perfection. In another spot hardy Palms, *Trachycarpus excelsus*, and Camellias are equally fine; so also is the Rock Garden, where many unique examples are to be seen. This has been established much longer than the Rock Garden at Wisley, hence it is better furnished; but the whole design is quite informal.

I will now allude to a third example of informal gardening, one that is within the reach of the many. It is that at The Wilderness, Shirley, near Croydon, the residence of our energetic secretary, the Rev. W. Wilks, M.A., V.M.H. This garden is practically and to all intents and purposes

"Paths.—In a wild garden the paths must never under any circumstances be of yellow gravel, nor of asphalt or tar, nor of ashes. In open ground they should be grass, kept scrupulously mown. In woodland where grass will not grow they should be the natural soil, trodden hard, and the moss should be allowed to grow on it, if it kindly will. In autumn the leaves from trees must be swept up once a week from the grass paths, or they will kill the grass in patches and soon make it unsightly. In woodland the leaves may lie on the paths and will look very natural; the rustling sound as one walks on them is pleasant to the

run with grass. But any plant which cannot take care of itself after the first twelve months' real care is not a suitable plant for a wild garden. —From the *Royal Horticultural Society's Journal*.
(To be continued.)

SEASONABLE NOTES ON CARNATIONS.

THE time has arrived when it must be decided how the Perpetuals are to be supported. We see them sometimes with the shoots tied to one stake, which is no doubt suitable for small plants, but for those with a large number of growths one is altogether inadequate. At the same time, in going from the one extreme it is possible to swing to the other, and use more stakes than is needful. Very large plants may require four, and those rather smaller, three. Provided the shoots are each slung independently to one of the stakes, there will be plenty of space for the foliage without crowding.

The stakes may have a slight bias outwards; but, on the other hand, it is to be preferred that they should be upright, so long as they are inserted near the inner side of the pot, rather than be placed at much of an angle outwardly. The foliage of most varieties is so small that there is no need to train the plant other than upright, and this allows for the arrangement of the greatest possible number in the season of flowering. By no means should the staking of the plants be delayed. If it is delayed till the growths are advanced, weak shoots will fall over, and then can never be induced to resume the straightness of growth they have lost.

Errors of Deep Potting.—I have known a very efficient grower to lose many plants from this time onwards from plants rotting at the base of the main stem. The cause of this is deep potting, and it is infinitely better to have that part of the plant partly elevated, rather than ever so slightly covered with soil. The only means of saving a collection when potted in that way is to remove the soil from the surface till the collar of the plant is clear. Another point of some importance is to limit the number of flowering shoots. "Why!" someone may exclaim, "we stop the shoots just to increase the number." That is true. But a plant is capable of doing justice to only a limited number, and he who at this time eliminates every weak shoot will secure a finer class of bloom, and in the end a larger number of flowers.

The Last Stopping.—Just at what date to stop for the last time is a question I am not prepared to decide. I find that the dates given by growers in the South of England do not agree with those I find best. One might suppose in the North that an earlier date would be better. But, then, our plants are grown entirely under glass, so that such free-growing kinds as *Triumph* and *Lady Northcliffe* can be stopped later if flowers are not in request till the beginning of winter. Those of the habit of *Baroness de Brien* must have a much longer season to develop. R. P. BROTHERSTON.

ACHILLEA OBRISTII, A CHARMING WHITE-FLOWERED ROCK GARDEN PLANT.

Mr. Wilks' own design. True, he did not plant the fine old Oaks and other trees, but he so fitted his garden in as to take the fullest advantage of them. The house itself is comparatively new, but it fits in well with the trees and other surroundings. The garden thus appears much older than the building itself. Against the house there is a commodious verandah, then the small but well-kept portion of lawn commences at once and extends a little distance, and then at once begins the wild garden. Upon the lawn, which is kept mown, there are climbing Roses grown as specimens, each one well apart from its neighbour. The chief open view is towards the south, with a good expanse on the western side as well, where there is a mixed border of flowering plants next to the house. Both on the eastern and western boundaries there are plantations of trees, chiefly deciduous. When under the verandah there is an entire absence of formality, look where you will. In the wild garden the paths are narrow, but are kept closely mown. These paths wind in and out to suit the lie of the ground. Mr. Wilks' views, as given to me, are:

"Extent.—The planning of the wild garden must always vary with the extent of its area. A large area cannot be treated exactly like a small one, nor *vice versa*. At the same time, certain points are applicable to all alike.

ear, and they are soft to the feet. They should be swept up, say, twice, or at most three times from October to March. The paths should follow a more or less natural direction, such as anyone would take, but they should avoid turns at right angles and not be over-serpentine. Stretches of straight ahead, followed by gentle curves to right or left, are desirable.

"Ground Surface.—The ground should not be dug or cultivated in any way. Presumably the garden is begun by taking in part of a field, and, if possible, adjoining it should be a small bit of copse or thin woodland. Each wants treating differently.

"The Open Grass Area.—In planting, simply remove sufficient turf and dig a hole, break up the bottom well so as to encourage the roots to penetrate, then throw in the turf and chop it up well with a spade and plant your plant, whatever it may be. And when you have filled in and firmed down, make a sort of small circular bed all round the plant a few inches away from its centre. Give an ample watering and leave it. If this is done in autumn, it will want no more attention (unless it be staking) till March, when, if dry, it should be watered for the first twelve months once a week or so, according to the rainfall, or lack of it. The little surrounding bed should also for twelve months be kept from being over-

ACHILLEA OBRISTII.

THIS charming little plant belongs to a section of the genus which are all of dwarf habit, and have silvery foliage with white flowers. Those best known, perhaps, are *A. umbellata*, with very white leaves and flowers in corymbs, and *A. argentea*, a taller-growing, but still dwarf plant with larger white flowers. *A. Obristii* is a hybrid, probably derived from *A. umbellata*. It is very free in habit; easy to grow in any well-drained position, where it develops rapidly; very free-flowering in most seasons; the flowers last for a considerable time in good condition; while its evergreen silvery foliage is very attractive at all times of the year. Like all the others of this group, *A. Obristii* may be increased by means of cuttings in the summer or division in the spring. As it is a hybrid, seeds would not be reliable. W. I.

A BEAUTIFUL FLOWERING SHRUB.

DURING the last fortnight *Escallonia langleyensis*, a flowering spray of which is illustrated below, has been one of the most beautiful and most admired plants in the garden. It is practically evergreen, and will withstand ordinary severe winters, though a prolonged spell of frost might cut the branches back somewhat. As will be seen in the illustration, it makes long, slender, arching branches, which during June are freely studded with the charming, bright rosy carmine flowers, each about half an inch in diameter. We have it loosely tied to a south wall, where its branches can ramble at will, but it is an excellent shrub for grouping in a lawn bed or the more conspicuous parts of the shrub border. Grown in this way it will eventually attain a height of 6 feet or possibly more. So far as soil goes, it appears to appreciate that which is porous but moderately well enriched. This charming shrub is of hybrid origin, and was raised in Messrs. Veitch's nursery at Langley, Bucks, by crossing *E. philippiana* with *E. punctata*.

SOME HINTS FOR ROSE EXHIBITORS.

THE Rose shows are now upon us, and a few hints may be acceptable, especially to the beginner in exhibiting. It is not too late even now to disbud for the later shows, such as Leamington; but for the Regent's Park Show and others at the end of June, disbudding should have been done some days ago. Many amateurs make a mistake by leaving the side shoots that will start upon a growth carrying the bloom bud. It is well to check these with the thumb and finger as soon as seen, in order that all the strength may be concentrated upon the bud on that particular growth.

Tying the Blooms and Shading are two very important details. Tying is done in order to prevent the flower bursting too soon. A piece of strong wool is placed around the heart of the flower, leaving the outer petals free. Instead of making a knot, give the ends two turns and leave it at that. It can then be tightened or

released as desired. Do not tie a bloom when it is damp with dew or rain and only a day or so before the show. Tie many more than you want to stage, as all will not last till the show day. Very double Roses need not be tied, although it is advisable to place wool very lightly around such, as it helps to retain the exquisite form, the crowning beauty of a Rose. Retain the ties on the blooms until you arrive at the show; but it will be wise beforehand to look at them to see if any are too tight. Delicate-petalled Roses, and especially Tea varieties, may have tissue paper wrapped around them, leaving the point open always. Roses such as *Souv. de Pierre Notting* pay well for this attention, as their outer petals are often marred by the weather. Shading may be done some days before the show. Old straw hats, sunshades, &c., answer for shades; but best of all are the shades offered by the horticultural sundriesmen. See they are placed on a firm stake to prevent injury by wind. Shading is as necessary to secure the bloom from injury by heavy dews as it is from brilliant sunshine. A bud may be retarded two or three days by timely shading, but judgment is essential, or we may defeat our object. Roses glory in sunshine,

obtained from the schedule of the National Rose Society, which will be sent free from their offices, 25, Victoria Street, Westminster. Tubes are very important articles. A Rose is often marred by being placed in a bad tube. Purchase the Foster tubes with wire attachment. These are arranged so that the flower may be well elevated from the box, and blooms so elevated often score largely at the show. Read carefully the rules of the National Rose Society as to the points of a good flower, and endeavour to bring your blooms up to this standard. Nice green moss should be placed on the false bottom of the box. This false bottom is made to place the tubes in—a much better plan than stuffing with shavings, the old-fashioned style. One may think I am enlarging too much upon this matter of boxes; but I have seen most lamentable instances where grand flowers had been staged in most hideous makeshift affairs, an insult to the Rose as it is to the exhibition.

Spare Blooms.—A travelling box should be fitted up to take several spare blooms. I always like to have plenty of these, so that one may have a good choice at the show. A deep box with tubes nailed into the bottom and about the

A SPRAY OF *ESCALLONIA LANGLEYENSIS*, A HARDY SHRUB WITH ROSY CARMINE FLOWERS.

but where flowers are limited, one is naturally anxious to make them hold out. Some Tea Roses grow and develop better in water. I have often cut a bloom three days before a show, kept it in a cool cellar, and it has been one of the best in the winning box.

Boxes and Tubes must be overhauled well in advance, and see that the former are nice and clean, and painted a dark green colour. The sizes must also be attended to when showing under National Rose Society rules. These can be

size of a good travelling trunk, or larger, is the thing. Holes must be provided for air.

Cutting the Blooms is another important detail. Late evening is the best time, even if you are near the show grounds. If cut in the early morning, the flowers should be marked overnight, for any old bloom looks wondrously bright in the morning before the sun is up. Be careful to place the flower in water immediately it is cut. Jars of water carried around answer well, and the flowers can be transferred to the

boxes later on. If you do not know the bloom, be careful to label it when cutting, and also label the spare blooms, especially the reds and yellows, for they are very confusing to recognise when cut.

Staging the Blooms is best learnt by watching an old hand. If the day is likely to be hot, keep the boxes in a cool place, preferably outside the tent, as long as regulations permit, for the average Rose tent is a perfect oven on a hot day. Place the largest blooms in the back row, the medium next, and the smallest in the front row. Try to put the best blooms at the corners, and group the colours to harmonise. Do not place two reds together unless it be diagonally. Study well what is a three-point flower, and do not be led away by your own fancy to retain your favourite if it happens to be a flimsy sort, with which our collections abound. See that you have no duplicates, for this will disqualify. Keep the lids on

THE EARLIEST ROSES TO FLOWER.

By EDWARD MAWLEY, V.M.H.

I SHOULD like from my own experience to support "Danecroft's" excellent remarks in *THE GARDEN* for June 12, page 291, on the value of these early flowering Roses. Many of them are not only beautiful and interesting in themselves, but, being the first Roses of the year to appear, are consequently welcomed with greater delight and attract more attention than many of their more pretentious brethren which come into bloom later in the season.

As was the case with "Danecroft," the first Rose to flower in my garden this year was that remarkable variety *Rosa sericea pteracantha*, which he so well describes. It is further inter-

I have lately seen here (Berkhamsted) some plants of this variety trailing downwards over a terrace wall, where hundreds of their flowers were displayed to the greatest advantage. On June 3 appeared the first of my *wichuraianas*, *Diabolo*, with its dark glowing crimson blooms.

To go back to May, *R. xanthina* first flowered on May 25. The light and graceful upright growth of this distinct variety and its clear lemon yellow flowers make it very acceptable at this season. Then, on May 29, appeared *Irish Elegance* the most charming of all early flowering Roses of its class. But the greatest treat of all, and that earlier in the month, was provided by an old plant of Austrian Copper growing on a greenish grey fence at the top of my Rose garden. When at its best, there were over a hundred flowers fully out upon it.

It may not be generally known, but this is one of the very oldest Roses grown in this country, dating back to 1596. Moreover, it makes an excellent Rose for growing under glass. I have a plant of it which I have had for nearly twenty years. When it is taken into the greenhouse in the winter, it always looks as if it had no life whatever left in it, but invariably comes up smiling in the spring, and its flowers are as a rule much better coloured than those from plants I have in the open ground.

WHERE TO GROW CLEMATISES.

Now that many of the Clematises are flowering is the time to make notes of any particularly appropriate situations in which they may be found growing, so that when planting-time comes round, full use may be made of one's observations. There is no doubt that the majority of these charming climbers do best where they have ample space, so that their vigorous growths can ramble about almost as they please. The accompanying illustration represents large-flowered Clematises planted on either side of a bold flight of stone steps, a position that is rather unique, but one that is admirably adapted for the plants. Here the growths and flowers wreath the brick balustrades and transform the whole into a pleasing garden picture.

I remember seeing, a few years ago, the Winter Jasmine growing in a similar position, where it was most effective. G. M.

RAMBLER ROSES BY WATERSIDE.

DURING the summer one of the most beautiful effects at Kew is obtained by Rambler Roses beside the large lake in front of the Palm House. At either side of this lake the surrounding soil, which is several feet above the level of the water, is kept in position by cement walls, which, if left bare, would be entirely out of keeping with the surroundings. Some years ago the idea of planting Rambler Roses at the top of the wall was conceived, and with this end in view the soil next the wall was dug out to a good depth and to about three feet in width, and the trench filled with good, stiff loam and manure. In this new soil such *wichuraiana* Roses as *Dorothy*

CLEMATISES WREATHING STONE STEPS AT SHIPLAKE COURT.

the boxes, also the ties on the blooms, until the last moment; but the lids should be slightly raised to admit air. As the flower grows, loosen the wool, or you will mar the bloom considerably. You may remove any blemish from a flower, such as injured edges to petals. A pair of scissors is handy for this, and a camel-hair brush is also needed to press out the outer petals. Do not alter the character of the Rose by the disgraceful "dressing" adopted by some exhibitors. Judges are very severe upon this, and rightly so. Above all things, do not be tempted to use any flowers but those grown by yourself, except, of course, in the competitions in the table decoration classes, where purchased flowers are admissible. Otherwise all flowers must be grown by the exhibitor, and it is not only mean, but dishonest, to attempt to win prizes with blooms grown by another.

Eastwood, Essex.

W. EASLEA.

esting owing to its small, pure white flowers having but four petals. This was first in bloom on May 14. The next day *R. alpina* appeared. Its flowers are very freely produced and it makes a big bush, but owing to the dull shade of its rose-coloured blooms is not otherwise interesting. Four days afterwards came *R. rubella*. Owing to the clearer colour of its numerous flowers, it is, to my mind, much better worth growing than *R. alpina*, which it otherwise greatly resembles. It is further endeared to me as my two plants of it came from a garden at Reigate, where I spent many happy days of my boyhood. That most delightful silvery pink variety *R. sinica Anemone* first showed an open flower on June 1. This is a perfect gem among early climbing, trailing or pillar Roses, for the blooms, which are 3 inches across and of good substance, are refined and beautiful, and the glistening foliage sets them off admirably.

Perkins and Lady Gay were planted, and since then they have made rapid progress, so that, now the long, slender shoots hang suspended over the wall, some of the more venturesome reaching well into the water. When in flower these Roses create a charming effect, and instead of ugly cement walls, pink cascades of Roses are to be seen, the accompanying illustration giving a good idea of their beauty. Even were the bank an ordinary one of soil without a retaining wall, the same method might be adopted, though in such a case the growths would need pegging down to the soil to keep them in place. It may be well to remind those who grow these wichuraiana Roses that the old flowering wood should be cut away when the flowers have faded, so as to enable the young rods that form this year to become thoroughly ripened. If this is done there will be less danger of injury by frost during the coming winter, and the prospects for flowers another year will be enhanced. H.

trio in the character of red spider, aphides and Apple sucker. The first insect is responsible for the sickly yellowish appearance observable just now where this pest may be present on Gooseberries, and Apples in particular. Aphides, in the form of green, purplish or black flies, are familiar to all. Apple sucker is less known, but a very general pest, and its presence may be

readily discovered by the snow white globules secreted from and generally attached to its body. Their favourite resort is the inflorescence of the Apple.

As these three species may be, and generally are, present on the same tree at the same time, a general summer spray fluid is desirable. Those proprietary washes containing nicotine are

SUMMER SPRAYING OF FRUIT TREES.

SOME PRACTICAL HINTS.

THE spring of this year has proved eminently favourable to the development and multiplication of the insect enemies of fruit trees and bushes, and to those who value the healthy growth of their trees, as well as good fruit, summer spraying becomes more imperative than ever. There is no lack of summer washes on the market—one is tempted to think a surfeit—and, unless the fruit cultivator is interested in the preparation of his own washes from simple ingredients, the use of these proprietary preparations is recommended for convenient application, particularly in the case of small fruit areas. Many cultivators of fruit have an aversion to the use of those washes containing poisonous ingredients such as arsenic, copper, nicotine, &c., but in view of the very low percentage of these substances actually used in the wash, and by carefully observing the directions for application given with the preparation, no results deleterious to the human system will accrue. Moreover, further reassurance is afforded by the very general use of these particular washes by large fruit-growers. One other point to be realised is that the efficacy of an insecticide or fungicide is as much dependent upon the thoroughness of its application as upon its own intrinsic merits.

Sucking Insects.—In this category we have represented in the fruit garden a most formidable

WICHURAIANA ROSES DRAPING A CEMENT WALL BY THE WATERSIDE.

particularly suitable. A wash of this character can be made by adding 1½ oz. of nicotine (98 per cent.) to 1 lb. of soft soap dissolved in hot water, and diluting the whole up to 10 gallons. This, however, more largely concerns the large fruit-grower, since nicotine is rarely obtainable in a smaller quantity than 1 lb., at an average cost of 12s. For the destruction of sucking insects generally, nothing excels a non-poisonous wash with the following formula: Quassia chips, 1 lb.; soft soap, three-quarters of a pound; liver of sulphur, 1½ oz.; water, 4 gallons. The writer used this quite recently with complete success, young leaf caterpillars also being killed. Prepare by boiling the chips for two hours, or soaking in cold water for forty-eight hours; dissolve the soft soap and liver of sulphur, add it to the Quassia solution, and dilute to 4 gallons.

Biting Insects.—These are represented mainly by the larvæ of Gooseberry sawfly and the caterpillars of the winter moth (*Cheimatobia brumata*).

Fungoid Diseases.—Apart from Apple canker and silver-leaf of Plums—two diseases against which summer spraying is of little or no avail—there remain but three other diseases of great importance in the fruit garden, which, if present, will need prompt and thorough treatment. Reference is made to Apple and Pear scab (*Venturia inæqualis* and *V. pirini*, Aderh.) and American Gooseberry mildew. The dire character of the latter is known only too well to most people now, while the two former are responsible for much depreciation in value, appearance and premature decay of the fruits concerned. Fortunately, Apple and Pear scab is easily preventable when taken in time. As soon as the petals have fallen, spray with half-strength Bordeaux mixture, *i.e.*, copper sulphate, 1 lb.; quicklime, half a pound; water, 16½ gallons. It is much more advisable, however, to purchase a small quantity of proprietary Bordeaux paste, which can be used at whatever strength is needed. A second appli-

A PEACH "DUG-OUT." AN INTERESTING GARDENING FEATURE.

BY THE REV. JOSEPH JACOB.

THOSE familiar with old gardening books of the last century may have come across a method of growing Grapes by what was called Rivers Ground Vinery. A space of, say 14 feet in length and 2½ feet wide was paved with slates, and over this was placed a span light frame with proper ventilation. In this Grapes were grown and ripened, the bunches resting on the slate bottom and the roots being in the open ground. This had its origin in the "Curate's Vinery," which consisted of a slate-lined furrow covered with glass, in which the bunches hung. In both cases advantage was taken of the ripening power of the earth's surface, and a considerable part of their success depended upon its being utilised.

Viscountess Wolseley recently had to solve the problem of how to grow Peaches and Apricots without the assistance of a wall or of any glass structure. It was necessary that the pupils at Glynde should be taught how to prune and manage the above fruits. A happy inspiration suggested the idea of a wide trench with sloping sides, against which a wooden trellis might be fixed on which to train the trees. As will be seen from the illustration on this page, this has been done, and Lady Wolseley has had the satisfaction of knowing that it works very well.

I ought to explain that her garden is on the side of a steep hill facing nearly due south, so there has been no difficulty about drainage. The following are some of the principal measurements: Distance of trellis from the side of the trench, 2 feet; width of trench at the bottom, 6 feet; height of slope facing due south, 5 feet. The ends are made use of, but not the slope facing

north. I fancy, however, that it would be quite feasible to grow Morello Cherries or Apples in this position, especially if the bottom of the trench were made a little wider, or even if the trellis on the south slope was only a foot away from its surface instead of 2 feet. The trees which are at present on the trellis are Apricots Breda and Waterloo, and Peaches Amsden June, Dr. Hogg and Early Alexander.

As there are gardens all over Great Britain which are situated upon the slopes of hills, or where adequate drainage can be given with but little expense, it has occurred to me that there are some who will be glad to know of the Peach tree trench. At any rate, it may suggest a scheme whereby this delicious fruit may be grown at a minimum of cost. In giving the dimensions of the trench at Glynde, I do not mean to say that these are the only ones suitable. Each trench must be made according to local requirements and necessities.

AN INTERESTING METHOD OF GROWING PEACHES AT GLYNDE, SUSSEX.

The Gooseberry sawfly larvæ, easily identified by their jet-spotted, green, caterpillar-like bodies, are deplorably neglected, though so easily destroyed. Against them the Quassia wash recommended for sucking insects will be found effective, and will in no way interfere with the gathering and using of the berries. "Katakilla" is another excellent non-poisonous wash. Finally, there is Hellebore powder, which may be dusted on the leaves or mixed carefully with water (half an ounce to a gallon) and sprayed on with a syringe or a knapsack sprayer. This latter method is the more economical and effective. In spraying, particular attention should be paid to the lowest and central leaves of the bush.

Against winter moth caterpillars no specific is superior to lead arsenate, half an ounce to a gallon of water. This is obtainable in a paste form in even such a small quantity as a pound. Apply it to trees immediately after, but not before, flowering is finished.

cation is urged within a fortnight of the first. Bordeaux paste can now be obtained in combination with arsenate of lead, and wherever caterpillars are present and an outbreak of scab is feared, this mixture should be used.

American Gooseberry mildew is the most frightful of fruit diseases. Growers ought to be ever on the alert for its appearance. An occasional spraying of 1 oz. of liver of sulphur to 2½ gallons of water as a preventive is a wise course if the disease is present in the district. Should the disease appear in a slight and sporadic manner, as many of the affected leaves and shoots as is practicable should be carefully removed and dipped in paraffin and burnt. Then proceed at once to spray with the above solution of liver of sulphur, or, if the berries have been gathered, use full-strength Bordeaux mixture. American Gooseberry mildew is, of course, notifiable.

Morpeth.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Layering Strawberries.—There will now be plenty of runners suitable for layering if a planation has been made for this purpose. Fill a number of 2½-inch or 3-inch pots with loam, and plunge these between the rows of plants in the bed. The extra labour involved now in plunging the pots will be amply repaid during very hot weather, as the plants will not require so much attention to watering as they would if the pots were exposed to the sun. Select only the best runners, and secure these to the pots with pegs or short pieces of raffia pressed firmly into the soil. Damp the layers frequently with a rose can till they have rooted into the new soil. I have not yet found a better Strawberry for forcing than Royal Sovereign.

The Early Vinery.—If a suitable room is available, the last few bunches can be cut from the Vines and placed therein, where they will keep quite as well as though they were left on the Vines. The Vines may then be given a good soaking of clear water. If red spider is present, the foliage must be thoroughly drenched with an insecticide on two or three occasions. Afterwards the Vines can be syringed every evening with clear water. The ventilators may now be thrown wide open day and night.

Plants Under Glass.

Humea elegans.—These are now developing their inflorescences, and if the plants are not required at the present time in the conservatory, they should be placed in a shady position outdoors. Water must still be applied with great care, or some of the plants may yet be lost. Shift on the young plants as they become large enough, but do not overpot them or afford water carelessly. Keep them shaded from bright sun.

Chrysanthemums.—Pot the plants into their flowering pots as they become ready. They may then be arranged in their summer quarters. Recently potted plants must be carefully watered till they have become fairly established in the new soil. A good spraying with the garden engine is necessary twice daily during hot weather. If time will allow, the decorative plants should be plunged in ashes; this will save a great deal of time in watering, and will also be of considerable benefit to the plants.

Lilium speciosum.—The growths of this beautiful Lily will now need the support of stakes. Give the plants a top-dressing of rich soil, as roots will now be plentiful. Syringe them occasionally with an insecticide to keep them free from aphids.

Streptosolen Jamesonii.—Young plants rooted in the spring must be potted on as required. To keep them shapely, the strong shoots should be kept pinched. During the latter part of the season they may be placed in a sheltered position outdoors, plunging the pots in ashes. This charming plant can be used effectively both in the conservatory and in the flower garden.

Lapagerias.—Where these are trained to wires, the young growths must be regulated almost daily. If the plants are grown in pots or tubs, plenty of stimulants must be given. An occasional light fumigation will keep them free from aphids.

The Flower Garden.

Ornamental Gourds.—These are interesting objects for growing over pergolas, arches or lattice-work. They may also be used for covering the faces of large boulders. When in active growth, they need plenty of water. The growths must also be thinned and regulated.

Early Flowering Chrysanthemums.—Give these plenty of water at the roots, and syringe them occasionally with an insecticide to keep them clean. A mulch of short manure should be placed over the roots. To prevent damage from strong winds, the plants must be supported with stakes.

Agapanthus.—To keep these in good flowering condition, the plants need plenty of stimulants all through the summer months; therefore this must not be lost sight of while they are flowering. Liquid farmyard manure suits these gross-feeding plants well.

General Work.—When the bedding-out is finished, advantage should be taken of fine weather to destroy weeds in the shrubberies. Grass edgings will need clipping, and weeds must be removed from roads and paths. Mulch gross-feeding plants as much as possible, and hoe frequently between herbaceous plants during hot, dry weather.

The Hardy Fruit Garden.

Protection of Fruit.—Much disappointment will be saved by taking early measures to protect fruit from birds. The protecting materials should be so adjusted that the fruit may be gathered without removing the nets.

The Kitchen Garden.

Globe Artichoke.—This valuable vegetable requires abundance of water at the roots, also plenty of liquid manure, in order to have the best crowns. A mulch of some manurial substance is invaluable during the summer months.

Spinach.—A cool situation should be chosen for growing this vegetable during the summer months. It is a crop which needs plenty of water, and if a light dusting of well-seasoned soot is scattered between the rows prior to watering, the plants will derive great benefit.

Peas.—The plants which are in bearing must be watered during dry weather, or the pods will fail to fill. If this work is done in the evening, the plants may be sprayed; indeed, it is an excellent practice to spray them every evening during hot weather. Late Peas should be given a good mulch as soon as they are staked.

General Work.—After heavy rains the ground between all crops should be hoed. The hoe must also be kept constantly on the move during long spells of drought. Persevere with the mulching of such crops as Runner Beans, Dwarf Beans and Peas. Onions which have been planted with a view to getting very large bulbs should also be mulched. Well-seasoned horse-manure is excellent for this purpose.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Hardy Fruit Garden.

Summer Pruning.—Plums and Pears should now be pruned to admit more light to develop the fruit, also to assist in the ripening of the remaining wood. In the case of wall trees, the shoots which are retained for the extension of the trees will require tying into position. This is more easily done at the present time than later, when the growths have hardened, as they are then more unwieldy.

Insect Pests are usually more troublesome on trees growing against walls, and require occasional spraying with Quassia Extract or other insecticides to keep the trees clean.

Strawberries.—Stock required for planting new Strawberry ground should be raised early by layering in pots as soon as runners are available. This practice may entail a little more time and trouble, but repays itself by producing better established plants for setting out at the proper time.

Fruit Under Glass.

Young Peach and Nectarine Trees which are being grown for filling up the places occupied by any older, worn-out trees should be kept very clean and free from insect pests. If disbudding received proper attention earlier, no cutting out of growths will be needed at any time. The young shoots must be tied in as straight as possible, and any that are forming laterals should have them pinched off.

Early Peach-House.—The trees, having been cleared of their fruit, must have a thorough cleansing with an insecticide. Good growing conditions should exist, keeping the atmosphere humid by syringing twice daily; this ought to be done with a fair amount of force to try to keep red spider in check. Assistance with manure should be given at each watering of the border,

which will require water fairly frequently if the trees are well established and the drainage in the good order that it should be.

The Flower Garden.

Shrubs and Trees which were transplanted during early spring require a certain amount of attention during this season if they are to recover from the check of removal. This especially applies to large specimens. Water may be needed at the roots, but too much should not be given, for it might prove harmful, as in the case of Rhododendrons and Yews. By far the best treatment is to try to encourage growth by frequent syringing, and even shading by some means will be of great help during the hottest part of the day.

Rock Garden.—The present time is a good season for propagating many subjects of this garden. As a number of species are very often short-lived, young stock to take their place must be obtained from both seeds and cuttings. Some of the kinds are best sown on the site which they are to occupy. All cuttings should be inserted in a frame containing plenty of sharp, gritty sand and must be kept plump and fresh until rooted by occasional light sprayings, and also by keeping the frame closed and shaded.

Plants Under Glass.

Chrysanthemums.—The plants will now be rooting freely in their flowering pots, and should be staked before there is any danger of wind breaking off the foliage or shoots. The single-stemmed plants can then be secured to wires drawn tight by posts. The bush plants can either be secured to wires or partly plunged, to protect them against wind. This latter method has great advantages if the season is a dry one. If fly is present in the points of any growths, Tobacco powder can be used, or an insecticide applied by spraying. In very warm weather a damping down of both plants and the immediate surroundings will be very beneficial if done during the afternoon.

Calceolarias for spring flowering should now be sown. Use a light, open soil containing plenty of leaf-soil and sand. After sowing, stand in a well-shaded cool pit, and continue to give cool treatment after the seedlings appear.

Hydrangeas can now be propagated, which is very easily done by inserting cuttings of half-ripened wood singly in 3-inch pots and keeping them close and shaded for a time, either in a frame or under hand-lights.

Calanthes, which are now growing apace and getting well rooted, will be ready to receive additional food when being watered. Liquid made from cow-manure is generally best, but substitutes, such as a little guano or soot-water, will do if applied in a weak state.

The Kitchen Garden.

Cauliflowers.—The planting of all Cauliflowers must now finish for this season. Any plants which have turned blind should be replaced. The proportion of blind plants is usually big, even in that finest of all maincrop varieties, Veitch's Autumn Giant.

Leeks.—The main crop will be ready for planting. The best method when putting in large numbers is to make a hole with a dibble 7 inches or so in depth and just allow sufficient soil to fall in; enough to cover the roots. Early raised plants which were put out in trenches should have assistance from manure, which must be given with an application of water.

Lettuces at this season quickly run to seed; therefore it is necessary to make successional sowings at not greater intervals than a fortnight. The hoe should be used between the plants frequently to encourage quick growth; but if the ground is very dry, watering will be necessary. To get Lettuces crisp and tender, they should be sown on good ground which has been treated liberally with manure; this ensures quick growth, which is necessary to obtain good Lettuces.

Broad Beans.—To hasten the development of this crop, the tops of the plants should be nipped off. This will also be the means of destroying undesirable insects, which are nearly always to be found in the growing points of Bean plants.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

SHOW AND FANCY PELARGONIUMS.

AMONG flowering plants that were at one time exceedingly popular but have now almost dropped out of cultivation must be included the members of these two sections of Pelargoniums. It is not so many years since they were to be met with in all gardens, and large specimen plants used to form a prominent feature at the various summer exhibitions, particularly at some of the more extensive provincial shows.

One often hears show Pelargoniums referred to nowadays, but very few of the true show varieties are in cultivation. The old-time florists used to look upon the following features as constituting a show Pelargonium: In the first place, it was very necessary for the edge of the petals to be quite smooth and the lower ones self-coloured, or, at all events, without pronounced spots or blotches. The two top petals were very dark, almost black, with a narrow, bright-coloured edge and a light centre. The last raiser of the true show Pelargoniums was the late Mr. Foster of Clewer Manor, near Windsor, and his new varieties used to be propagated and distributed by Mr. Charles Turner of Slough. The annual advent of these new varieties was eagerly anticipated, and prices ruled high, namely, from 15s. to one and a-half guineas each. A few of Mr. Foster's varieties are still grown, but only to a very limited extent. Their decline in popularity was, no doubt, owing to the fact that in order to obtain flowers as perfect as possible and very brightly coloured, the process of in-and-in-breeding was carried to such an excess that many of the newer kinds were of so weak a constitution that as decorative plants they were not the equal of the numerous varieties grown for market, and known as decorative, French or spotted Pelargoniums.

Varieties of these different sections are now often referred to as shows, though they are markedly different from the true show flowers, of which a typical kind still occasionally seen is Achievement, a particularly bright flower, with almost black upper petals. The trusses, however, are too few flowered to please the average gardener, though, as far as individual blooms are concerned, it is unsurpassed.

The fancy kinds, which originally, no doubt, sprung from a different species to those referred to above, have small flowers, for the most part lightly coloured, but borne in the greatest profusion. Though these were often grown as specimens, the plants, as a rule, were not as large as those of the show varieties. The universal desire for size which is such a marked feature of the present day is, no doubt, the reason of the decline in favour of the fancy Pelargoniums. H. P.

ROSE SOUVENIR D'ELISE VARDON.

WHY is it this beautiful old Rose has fallen into comparative desuetude? I have before me as I write a most lovely specimen cut from a maiden plant, and for exquisite form I have seen few blooms its equal this year. It was thought when William R. Smith was introduced we had obtained

a variety that would supersede Souvenir d'Elise Vardon, but it has failed to do so. Although one may have grand blooms of the newer Rose, a very large proportion of them appear "split" or "cracked," as a fellow judge would continually term them when I was judging with him last year. In most catalogues Souvenir d'Elise, as it is most generally named, comes under the appellation "recommended for exhibition only," and I could not advise the novice to grow it. I am, however, certain that this variety is typical of many Roses we have almost lost in its need of special treatment, and given that treatment it would be a success.

My firm belief is that for such Roses we need to spare the knife, but to generously feed the plant. Once obtain a vigorous plant established in a good, deep soil in a sheltered position, it is capable of giving us glorious bloom in abundance. I have a fine plant of Marie van Houtte, growing against a west wall, that has had no pruning this year, but has had abundance of liquid manure. It is now yielding lovely blooms of most charming tinting. I do not say Souvenir d'Elise Vardon will grow quite like this, but it will make wood if allowed to do so.

We have abundant evidence of the success of the "let-alone" principle as regards Tea Roses in specimens met with under glass. I have seen plants of Niphetos, Souvenir d'un Ami, and even of that superb Rose La Boule d'Or grow into huge specimens under glass when sparsely pruned. These plants were nourished with blood manure and other rich food, and were a glorious picture of robust health. Of course, outdoors we have the frosts to contend with, and this is a serious drawback to success; but if we can only bring the plants through the winter and spring with their old wood uninjured, we may have splendid blooms in abundance. Such grand Roses are worth the expense of special glass covering for the winter, and this could easily be managed by the aid of pit lights. I would advise growing some of these fine old Teas on the Polyantha stock. They make plants double the size in the one year.

This stock, long ago recommended by that very observant rosarian, the late Mr. Girdlestone, is one all who love Tea Roses should endeavour to use for the true Teas. Even that poor grower, George Schwartz, will make quite good plants upon it, and Lena and such-like are very fine, big plants this year. Souvenir d'Elise Vardon was sent out in 1854, and it figured largely in the prize boxes of the early sixties. DANECROFT.

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish expert advice.

The Editor welcomes photographs, articles and notes, but he will not be responsible for their safe return. All reasonable care, however, will be taken, and where stamps are enclosed, he will endeavour to return non-accepted contributions.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

The Editor will not be responsible for the return of artistic or literary contributions which he may not be able to use, and the receipt of a proof must not be taken as evidence that an article is accepted. Publication in THE GARDEN will alone be recognised as acceptance.

Offices: 20, Tavistock Street, Covent Garden, W.C.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

IRISES DISEASED (N. S.).—The Irises are attacked by the disease known as rhizome rot, due to the entrance into the plants of a bacillus which produces a kind of soft rot. This disease is apparently encouraged by lime, and usually follows damage to the plant by frost or some similar cause, the more tender Irises being most liable to it. The best treatment is to remove the parts of the plants suffering and to replace the soil about them with fresh, in which superphosphate at the rate of about three ounces to the square yard has been mixed.

CALCEOLARIAS FOR INSPECTION (H. E. H.).—Your Calceolarias are attacked by a disease, probably of fungus origin, which very frequently attacks these plants. It is unwise to grow them year after year in the same soil, and if you desire bright yellow flowering plants, it might be possible to put such a subject as *Tagetes signata pumila* in their place. In addition to "rotation of crops," so to speak, the addition of lime to the soil in the autumn, according to the directions we have frequently given, is very desirable. Nothing can profitably be done this year.

TREES AND SHRUBS.

ALMOND LEAVES FOR INSPECTION (Boris).—The Almond leaves sent are attacked by the fungus which causes the too well known leaf-curl or blister of Peaches—*Exoascus deformans*. Recent experiments in Australia, California and this country suggest that the disease may be kept in check by spraying while the plants are dormant, about the middle of February, with Bordeaux or Burgundy mixture, or even with potassium sulphide.

HOW TO GROW CEANOTHUS (E. T.).—If you can procure a plant of *Ceanothus veitchianus* in a pot, you may plant it at once. It will succeed against a wall with a south, east or west exposure, and should be given well-drained, moderately light, loamy soil. Any necessary pruning should be done as soon as the flowers fade. Prune back any secondary branches that are not required for the extension of the plant. Such branches may be cut back to within two or three eyes of the older wood. September is the best month to divide plants of Pink Mrs. Sinkins. Cuttings may be taken as soon as the flowers fade. They should be inserted in light, sandy soil in a close frame.

WISTARIA FLOWERS FALLING (E. S. Martin).—It is probable that root trouble has to do with the flowers of your Wistaria falling before they open. If the roots have penetrated into very poor soil, such a result might be expected, while the same result would occur if the soil were liable to become very wet or very dry. We advise you to have the soil removed from about the outer parts of the roots and make up the deficiency with rich loamy soil. If you find that the soil about the roots is very dry, give it a thorough good watering. The Magnolia will doubtless bloom freely in a few years' time. Young plants are often shy flowerers, especially if they have been raised from seeds. You cannot, with safety to the plant, do anything to hasten flowering.

ROSE GARDEN.

SPORTING OF ROSA LUTEA (J. C. S.).—Yours is no uncommon experience. We have frequently seen branches of the Yellow Austrian Briar, known as Rosa lutea, appearing upon a plant of the Copper Austrian. The explanation is that the Copper Briar sported originally from the Yellow, and it now and then reverts back to the original. The Copper Briar, known as bicolor and also punicea, has been very lovely this year, the colour being most gorgeous in the brilliant sunshine. We fear the Yellow form is often sold for the Copper, simply through error in taking buds from the sportive branches.

THE GREENHOUSE.

ACHIMENES NOT THRIVING (Enquirer).—The Achimenes have apparently been attacked by mites.

The best thing to do will be to prepare a "dip" for them by kneading a quantity of flowers of sulphur into a handful of soft soap and dissolving the whole in $1\frac{1}{2}$ gallons of warm water. Dip the foliage into this two or three times at intervals of a few days.

FRUIT GARDEN.

GOOSEBERRY SHOOTS FOR INSPECTION (Miss A. J. S.).—The shoots of Gooseberry sent are in such a dried-up condition that it is impossible to tell what is the trouble with them or to what it is due. They are certainly attacked by aphids, and this may possibly be all, but there may be something else. Spray with Quassia and soft soap. Correspondents would make the work of identifying diseases and pests, as well as the naming of plants, much more easy and certain if they would always wrap the specimens in a piece of soft paper and enclose them in a tin, wood or strong cardboard box.

KITCHEN GARDEN.

ASPARAGUS-BEDS A FAILURE (E. M. Wild).—Heavy soil is not good for Asparagus, which is a native of our coasts, and grows naturally in sandy soil. Your best way to make a new start will be to dig up the beds now, adding more manure and plenty of road grit, thus raising the surface of the bed 5 inches or 6 inches above the level of the soil of the garden. This will cause the soil of the bed to be warmer and better suited to the growth of this plant. Instead of planting roots, sow the seeds now. It is rather late, but not too late. Sow three seeds where the plants are to remain. As soon as the young plants are above the ground, carefully pull up the two weakest plants, leaving only one (and that, of course, the strongest) to become the permanent occupant of the bed. It will take a little longer before the beds come into bearing, but you will find it more satisfactory in the end than planting three year old roots.

MISCELLANEOUS.

FUNGI FOR NAMING (Mrs. M. B.).—No; the fungi you send are not Truffles, but Puffballs. Truffles grow completely underground, and never emerge into the air. No doubt the mycelium (or spawn) of the Puffballs lives and feeds upon decaying vegetable matter, grass roots and the like in the soil.

GRUBS FOR INSPECTION (J. Burney).—The grubs you send are those of the daddy-long-legs, or crane fly. They are often called leather-jackets, and are very destructive pests to all sorts of garden plants. Constant stirring of the soil, so as to expose them to such birds as starlings, is a great aid in keeping them in check. The next best thing, where the area is small, is to trap them by means of pieces of Carrot or Potato placed near their haunts and examined at frequent intervals.

INFORMATION ABOUT PLANTS (F. E. C., St. Asaph).—The specimen marked No. 1 is the Cucumber Tree of North America (*Magnolia acuminata*). It should be propagated by seeds, which sometimes ripen in this country, but are usually imported. Good loamy soil forms the best rooting medium, although it appreciates a little leaf-mould or peat placed about the roots at planting-time. No. 2 is the Cotton Lavender (*Santolina Chamæcyparissus*). It can be easily increased by means of cuttings dibbled into sandy soil in a close frame in the summer.

INSECTS FOR IDENTIFICATION (Colonel D.).—The insects sent are weevils, called Raspberry weevils, belonging to the genus *Otiorhynchus*, to which we have frequent cause to refer in our "Answers to Correspondents" columns. They are destructive pests, and damage a variety of plants, especially fruit trees of various kinds and Vines. The curved white grubs feed at the roots of greenhouse plants, Ferns and the like. Injection of carbon bisulphide into the soil where they are feeding checks them; but the best means of dealing with them is (1) clean cultivation (especially absence of grass); (2) shaking the attacked trees or bushes over a newspaper or cloth after dark, or suddenly shining a bright light upon them; (3) spraying the bush on which they are feeding with lead arsenate.

PLANTS TO GROW IN EMPTY ROOM (Dolchin).—Plants likely to succeed under the conditions named are decidedly limited in number. Nothing is said as to the ventilation of the structure, upon which in plant culture so much depends. In the lightest portion of the room you may grow such subjects as are to be seen in cottage windows, such as Pelargoniums of the Ivy-leaved and Zonal sections, Begonias, Fuchsias, Heliotrope, *Francoa ramosa*, Harrison's Musk, Lantanas, &c.; while in the more shaded parts, plants that succeed in the dwelling house are available. Aspidistras, Palms, *Araucaria excelsa*, *Aralia Sieboldii*, *Asparagus Sprengeri*, *A. plumosus*, *Cordylina australis*, Myrtle and the hardier forms of greenhouse Ferns would be suitable. We are advising you on the supposition that there is sufficient heat in the winter to keep out the frost; if not, the choice is even more limited. In that case you would probably find a collection of hardy Ferns to give you as much pleasure as anything. In the lightest part, if safe from frost, a collection of the more interesting and showy Cacti could be grown.

MAKING A PAVED WALK (E. W.).—If you require a paved walk that will also permit of plant-growing, it would be necessary to remove all the gravel to a depth of 9 inches at least between the stones and of a sufficient

depth under the stones to permit of their being sunk to the proper level. The interstices between the stones would have to be filled with moderately good sandy loam freely mingled with grit or old mortar, a mixture which would suit many plants. If the sandstone to which you refer weathers and wears well, and is available in thin, slab-like form, it would do quite well. All that is required of the stone is that it should have one flat surface to permit of walking on in comparative ease. Doubtless such a stone is available near by, though, as we know, most of the sandstones are of solid block formation. If you have had no experience in the matter, it would be better to confer with a specialist on the spot. Should you decide to do this, we might probably be able to name someone suitable.

LIME FOR CLAY SOIL (M. B.).—The best form in which to add lime to clay soil is that of unslaked lime; the second best, slaked lime. Ground unslaked lime is the most convenient form; but if this is not readily obtainable, the lumps may be used. If ground lime is available, it should be dusted on the soil at the rate of a bushel to each two square rods. If the stone lime is used, use it at the same rate and put it in heaps covered with soil for about three weeks, when it will be found to be in a powdered condition and easily spread. It should be applied in the autumn, when no crops are on the ground and before the autumn digging. Do not put farmyard or stable manure on the soil at the same time, unless it is dug in immediately. Bees usually pollinate Marrow flowers, but if there are no bees, it would perhaps pay to hand pollinate them. If you examine the flowers of the Marrow, you will see they are of two sorts, the one with the unformed Marrow below the flower and visible from the outside, the other without the young Marrow, but with five yellow bodies filled with dust—the pollen—inside. The former are called pistillate flowers, the latter staminate. The dust from the latter has to be carried to the former and placed upon the rough yellow surface you find inside the flower in the middle, which portion is called the stigma. The process of placing this pollen on the stigma is frequently called fertilisation, but is more accurately designated pollination.

NAMES OF PLANTS.—*Woodstock*.—The plant is a Geum, and we think the variety Mrs. Bradshaw. It is impossible, however, to name plants with certainty from a single, crushed flower sent in an envelope. *Curious*.—1, *Jacobinia magnifica*; 2, *Ribes aureum*; 3, *Viburnum tomentosum plicatum*; 4, *Rhus Cotinus*; 5, *Centranthus ruber*.—*A. L. Ford*.—*Asperula stylosa*.—*John Clark*.—*Oenaria stellulata*.—*Mrs. Lane*.—1, *Calycanthus glaucus*; 2, *Staphylea pinnata*; 3, *Salix pentandra*; 4, *Saxifraga* species, specimen too small for identification.—*H. Ostlere*.—*Saxifraga Walacii*, so far as can be seen without flowers. You cannot do better than treat the Ivy as you have done in the past. *Kilmarney*.—1, *Populus tremula*; 2, *Cupressus pisitiera*; 3, *Pinus sylvestris*.—*Mrs. Hancock*.—*Spiraea discolor*.—*G. Hancock*.—1, *Mme. Jules Gravereaux*; 2, *Mme. Alfred Carrière*.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

THE fortnightly meeting held on June 22 was characterised by much fullness, hardy flowers being everywhere and in great variety. Roses were superbly shown, and there were many good exhibits of Carnations. Sweet Peas from Reading were a great feature. Orchids were very sparsely represented.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), and Messrs. E. A. Bowles, R. C. Notcutt, F. W. Harvey, J. Hudson, W. J. Bean, G. Reuthe, C. Dixon, R. Hooper Pearson, R. W. Wallace, J. Dickson, H. J. Jones, C. E. Shea, J. T. Bennett-Poë, W. P. Thomson, E. H. Jenkins, G. Paul, J. Jennings, J. W. Moorman, J. F. McLeod, J. Green and C. R. Fielder.

Messrs. R. H. Bath, Limited, Wisbech, staged a very handsome lot of Pæonies, with occasional groupings of Delphiniums and a fine central feature of the same. Among these latter were *Pannonii* (Oxford blue), Mrs. Creighton (violet and purple), Mrs. K. F. Caron (single, of gentian blue colour), Mme. Zaiser (mauve) and Malana (deep blue and white centre). Some good Pæonies were Mandarin (rose with gold petaloids, a very beautiful combination), Her Grace (flesh pink double), 609 (a Japanese of crimson lake with gold and scarlet petaloids, one of the most striking in the collection), M. C. Lévêque (flesh pink double, very beautiful), Marie Lemoine (white) and Mme. de Vetry (very fine cream). The Spanish Iris Goldmine was also very good.

Messrs. Barr and Sons, Covent Garden, W.C., displayed a group of English Irises in variety, together with Iris ochroleuca, I. o. Innocence, I. Monspur Premier, Delphinium Moerheimii, Heucheras, Day Lilies and the welcome *Salvia virgata nemorosa*. Spanish Irises and early Gladioli were alike good.

Messrs. Stuart Low and Co., Enfield, showed some admirable vases of Roses, such as Old Gold (a most lovely orange tone), Duchess of Wellington, Marquise de Sinety (very rich in colour), Countess of Shaftesbury (pink), Queen Mary (pink and gold), Mme. Abel Chatenay, and Mrs. Andrew Carnegie (white). Messrs. Low also exhibited Malmesbury Carnations in variety, many exceedingly fine.

Messrs. Waterer, Sons and Crisp, Bagshot and Twyford, occupied tabling covering the whole of the western end

of the hall with an exhibit of herbaceous plants, Water Lilies, alpine plants and Roses, showing each in much excellence and variety. *Anchusa italica* Dropmore variety, *Gaillardias* and *Delphiniums* were all in striking groups. Pinks were delightful in their fragrance. *Cotyledon simplicifolia* was interesting and rare, and *Campanulas raddeana* and *Miss Willmott* were both beautiful. *Convolvulus althæoides* was very charming. Of Roses, Mme. Edouard Herriot, Mrs. Andrew Carnegie, Irish Fireflame and Mrs. George Norwood (fine fragrant pink) were among the best in a very fine lot.

Messrs. H. B. May and Sons, Edmonton, filled a table with miscellaneous greenhouse flowering and foliage plants, the former including Lantanas, Hydrangeas, Fuchsias, Salvias and other ornamental plants. The Fuchsias were in well-grown specimens and considerable variety. Ferns were employed as a groundwork, and constituted a good foil.

Mr. B. Ladhams, Shirley, Southampton, had an exhibit almost wholly of Pinks, than which no hardy border flower is more popular or appreciated. Some few good ones were Miss Vince (white), *Dianthus casius* Morning Star, The King, Inchmerry (pale pink), Elsie (pink, crimson centre), Market Favourite, Favourite (flesh pink, crimson centre) and Lady Hopkins. *Erigeron* B. Ladhams (pink) was most charming.

Mr. L. R. Russell, Richmond, displayed a table of flowering plants, in which Clematises largely predominated. Of these, Belle of Woking (double mauve), Sieboldii (deep blue), Ville de Lyon (red), lanuginosa candida Lady Northcliffe (fine blue), *Jackmanii* rubra and Marie Boisselot (white) were the best. *Erythrina Crista-galli* was also in good flower. *Clematis tangutica* (yellow) was most distinct.

Messrs. W. and J. Brown, Peterborough, staged Roses in excellent form. Such as Lyon, Irish Elegance, Irish Fireflame, Mrs. Rosalie Wrinch (rose, single, very charming), Sarah Bernhardt, Mme. Edouard Herriot, Marquise de Sinety, Margaret Molyneux and Juliet were very fine. *Lilium colchicum* and *Ostrowskia magnifica* were both well shown.

Messrs. Thomson and Charman, Bushey, had nice groups of *Dianthus neglectus*, Pink Excelsior, Geum Mrs. Bradshaw (scarlet) and *Delphinium* Bell donna semiplena, the latter most charming. *Pæonia lutea splendens* and *Linum arboreum* were also noted.

Mr. A. F. Dutton, The Nurseries, Iver, showed the perpetual border *Carnation* Iver Yellow, a shapely and beautiful flower of good yellow tone. The variety possesses a fine petal texture.

Messrs. W. Paul and Son, Waltham Cross, displayed three very fine vases of their new Rose Queen of Fragrance, a lovely pink-flowered garden Rose of unique fragrance and charm. *Titania*, of orange and scarlet tone, is another novelty of great beauty.

Messrs. J. Cheal and Sons, Crawley, arranged a small group of flowering shrubs, *Olearias*, *Buddleia globosa*, *Carpenteria californica*, *Abutilon vitifolium*, *Solanum crispum*, *Clematis integrifolia carulea*, *Chionanthus virginica* (Fringe Tree) and *Magnolia glauca* being among the best.

Messrs. Piper and Sons, Barnes, contributed alpine and succulents, together with a variety of seasonable herbaceous plants. *Origanum Dictamnus* and *Gentiana straminea* (white) were among distinct things.

Messrs. Carter Page and Co., London Wall, had an exhibit of Dahlias, several sections—Collarette, Cactus, Paony-flowered and decorative—being well represented.

Mr. Clarence Elliott, Stevenage, showed alpine in pots, the chief being *Campanula* Miss Willmott, *C. pulia lilacina*, *C. excisa*, *C. pulloides*, with *Saxifragas*, alpine Pinks and others.

Mr. G. Reuthe, Kes' on, Kent, showed a great variety of things, Pæonies, Ixias, many choice alpine, *Eremuri* in plenty, *Bahia lanata*, *Coronilla iberica*, alpine Pinks, *Scutellaria Pittonii* (nice blue), and much besides.

Messrs. Wallace and Co., Colchester, displayed a fine variety of *Eremuri* in rich masses, Warei (brunzy orange), with Bungei, Salmon Queen, and others being very fine. *Calochortus venustus* and *C. Eldorado* in variety were delightfully shown. *Erigeron hybridus* Asa Gray, soft buff with orange centre, was very striking. Pæonies, Irises, *Gaillardias* and *Delphiniums* were also very beautiful.

Mr. G. W. Miller, Clarkson Nurseries, Wisbech, had a showy group of Delphiniums, *Gaillardias*, *Pyrrethrus*, *Ornithogalum lacteum* (*O. thyrsoides*), with Pæonies and *Verbasums*.

Messrs. Blackmore and Langdon, Bath, had a group of Delphiniums, some of the noble spires fully 6 feet high, Mrs. A. J. Watson, D. Glory, D. Harry Smeetham and D. Le Danube being among the more imposing.

Messrs. George Paul and Son, Old Nurseries, Cheshunt, showed very fine Roses, Lemon Pillar, a lovely creamy white, being very fine. Rayon d'Or, Butterfly (pink), Mrs. A. Kingsmill (pale pink), Irish Glory and Irish Elegance were also included. The Hybrid Briar Naiad, of softest pink with brownish anthers, was very distinct.

Mr. James Box, Hayward's Heath, had a rich display of Pæonies, Delphiniums and *Pyrrethrus*, all in good variety. With these were associated English Irises, Pinks, *Incarvilleas*, Lupines and *Heucheras*. *Dictamnus caucasicus* was very finely shown, as was also *Inula glandulosa*.

Messrs. Carter and Co., Raynes Park, S.W., had a broad table of English Irises, showing these admirable summer flowers in great variety. *Othello* (deep violet), Duc de Abruzzi (mauve), Franz Hals (pale blue), Mont Blanc, Grand Lilas and L'Adorable (white and rose) were among the more important. All were set up in a particularly tasteful group.

Messrs. G. and A. Clark, Dover, showed *Erigerons*, *Campanulas*, *Pyrrethrus*, Pæonies and *Alstromerias*.

Messrs. Godfrey and Son, Exmouth, had a remarkable display of Canterbury Bells in pink and blue shades, both having very handsome flowers. Delphiniums and Potentillas were also freely shown.

Messrs. Kelway and Son, Langport, had a full table of Delphiniums, showing many leading sorts. Geraldine Kelway (pale blue), Lady Faire (pale mauve), Mrs. James Kelway (mauve), Lovely (mauve and blue, very large) and Star of Langport (pale blue and mauve) were all very fine.

The Misses Hopkins, Shepperton-on-Thames, showed a variety of alpine plants, with Pinks and Primulas.

Mrs. Lloyd Edwards, Bryn Oerog, near Llangollen, contributed some new Heucheras, Beauty, Lady Harlech, King George and Queen Mary all being of brilliant colour.

Messrs. B. R. Cant and Sons, Colechester, had a lovely table of Roses, making a great centre of the new Hybrid Tea Cupid, a pillar Rose of great size, and remarkable for freedom and the great charm of its flesh pink single flowers. Autumn Tints, Irish Fireflame, Betty, Chateau de Clos Vougeot (crimson), Sallie and Mme. Edouard Herriot were all very fine.

Messrs. Whitelegg and Page, Chislehurst, Kent, had a showy group of Delphiniums, with Heucheras, Erigeron hybridus roseum, Geum Mrs. Bradshaw and a pretty variety of alpines.

Messrs. Young and Co., Cheltenham, staged Carnations excellently, such as Cecilia, Mary Allwood, Circe (a handsome heliotrope fancy), Mikado and Duchess of Devonshire being among the more important.

Mr. M. Prichard, Christchurch, showed alpines very finely in pots, arranging them in groups of one variety. Campanula garganica in several shades, Erythraea diffusa (rose), Genista humifusa, G. dalmatica (golden), Coronilla iberica, Campanula pulla, C. barbata, C. b. alba and Asteriscus maritimum were all delightfully grown. Campanula garganica erinus was one of the most beautiful.

Mr. E. Hicks, Twyford, showed Roses. Princess Mary, Ada Paulin (pink) and Joanna Bridge were all very fine.

Mr. G. Ferguson, Weybridge, showed some admirable Delphiniums, Louvain (pale mauve), Queen of the Belgians (rich deep blue), Treviso (deep purple) and Bukovina (rich gentian blue) being very handsome.

Messrs. R. Tucker and Sons, Oxford, had Silene Elzabetha, Dianthus alpinus x neglectus, Primula sikkimensis, Androsace pubescens, A. helvetica, Saxifraga cochlearis, S. c. minor and Convolvulus Incanus in a choice lot of alpines on rockwork. Aquilegia pyrenaica was also good.

Messrs. G. Bunyard and Co., Maidstone, showed admirably such plants as Iris ochroleuca, I. o. intermedia, Delphinium Harry Smetham (intense blue) and a great variety of Paeonies in many good sorts. Flowering shrubs in variety were also contributed by this firm.

Messrs. Bide and Sons, Farnham, had a lovely display of Sweet Peas, Violet Crabb Improved (a fine blue), Bide's Cream, Ruth Bide (scarlet) and Wenvoe Castle being excellent.

Messrs. Allwood Brothers, Hayward's Heath, had a lovely gathering of Carnations, without doubt one of the finest displays seen this year, Bishton Wonder, Cinderella, Benora, Wivelsfield Wonder (all fancies), Princess Dagmar, Salmon Enchantress, Mary Allwood (very fine), Wivelsfield White, Yellow Stone and Champion (scarlet) being a selection of the best.

Messrs. Peed and Sons, West Norwood, showed a very fine strain of Gloxinias, many delightful selfs and fancies being admirably displayed.

Messrs. T. S. Ware, Feltham, showed finely Delphiniums, Paeonies, Gaillardias, Erigeron hybridus B. Ladhams, with Scabious, Alstroemeria and other flowers.

Lord North, Wroton Abbey, Banbury (gardener, Mr. E. R. James), contributed a grand lot of Sweet Peas, for which a gold medal was awarded. Some of the finer vases were Walter P. Wright, King Manoel, Norvic (white), Anglian White Improved, Clara Curtis, R. F. Felton (mauve), and Robert Sydenham. The flowers were of the finest quality throughout, some hundred varieties being staged in splendid condition.

ORCHID COMMITTEE.

Present: J. Gurney Fowler, Esq. (chairman), Sir H. J. Veitch, Sir Jeremiah Colman, and Messrs. R. A. Rolfe, Pantia Ralli, T. Armstrong, Walter Cobb, J. Charlesworth, W. H. Hatcher, A. Dye, S. W. Flory, W. Bolton, R. B. White, Gurney Wilson, C. J. Lucas and J. O'Brien.

Messrs. Stuart Low and Co., 'Enfield,' showed Cattleya Mendelelii, C. Mossie, Saccolabium Blumei, Phalaenopsis rimstadiana, of Vanda-like growth with brilliant scarlet flowers, Oncidium and others.

Mr. W. Thompson, Stone, Staffs, contributed some very fine hybrid Odontoglossums in variety. The group included some very beautiful spotted varieties.

Mr. R. G. Thwaites, Streatham Hill, had a small group, in which Cattleya Mossie Wagneri was perhaps the most important item.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION

As we announced some weeks ago, the committee of the above thoroughly deserving Institution decided not to hold the Festival Dinner this year. In place of that function it was decided to make a special appeal to those interested in horticulture, and we give the first list of subscriptions and donations which have been promised

or given. Further contributions, which are urgently required, should be sent to the secretary, Mr. G. J. Ingram, 92, Victoria Street, Westminster, London, S.W. We specially appeal to our Colonial and foreign readers to give some substantial support.

Elstree and Boreham Wood Horticultural Society.—The annual show in connection with this society is to be held in the grounds of Aldenham Park, Elstree, on Wednesday, July 1. An excellent schedule has been prepared, copies of which can be obtained post free from Mr. W. J. Pritchard, High Street, Elstree.

United Horticultural Benefit and Provident Society.—The monthly meeting of this society was held at the Royal Horticultural Society's Hall on Monday, June 14, over which Mr. C. H. Curtis presided. Three members were allowed to withdraw double the amount of interest from their deposit, viz., £4 os. 8d., £4 8s. 10d. and £4 12s. 6d., and one member withdrew from his deposit the sum of £10. The sick pay for the month on the ordinary side amounted to £38 9s. 8d., on the State Section to £28 18s. 6d., and maternity claims to £19 10s. A discussion took place on the advisability of associating for the purpose of valuation with the State Section, and it was agreed that a special committee meeting should be held to discuss the subject.

Seeds for Soldiers.—At the request of the Commandant of a large Base Depot for troops at the Front, Messrs. Webb and Sons, Limited, of Stourbridge have sent a quantity of flower seeds for the soldiers to cultivate during the time they are in camp. After the strain and stress of trench warfare the growing of flowers will provide enjoyable and healthy recreation for our devoted men, and as the Commandant remarks, "It will remind them of their homes in England." Messrs. Webb have also sent collections of flower seeds to various military hospitals at home. These have been gratefully received by the respective Commanding Officers, one of whom says, "The results will, I am sure, be much appreciated by the sick and wounded soldiers."

Fruit Crops in Calvados, Normandy.—The Board of Agriculture and Fisheries have received from His Majesty's Vice-Consul at Caen a report on the prospects of the fruit crops by Le Directeur des Services Agricoles du Calvados, as follows: "Cider Apples and Pears promise plentiful crops as in the last three years, and as the markets are more limited than before the war, low prices must be expected as in 1914, when they were about 4s. per cwt. In the Honfleur district, where table fruits are especially grown, the prospects for wall Pears are bad, not exceeding a quarter of an average crop; but standard Pears promise a plentiful crop. There will be a moderate yield of Currants, and a poor crop of Plums."

TRADE NOTE.

"EUREKA" WEED KILLER.

AT this season of the year, when so much calls for attention and time seems all too short for doing all that should be done, the gardener is glad to have any "time-saver" brought to his notice. In this matter the famous "Eureka" preparations are a great boon. Although Messrs. Tomlinson and Hayward, Limited, of Lincoln manufacture several most serviceable gardeners' sundries, we would particularly refer to the "Eureka" Weed Killer, with which paths may be kept free from all vegetable life for a season after only one or two applications. A pamphlet giving full information may be had free from the manufacturers.

THE GARDEN.

No. 2276.—VOL. LXXIX.

JULY 3, 1915.

NOTES OF THE WEEK.

New and Rare Plants at Vincent Square.—

We are informed that at their last meeting the Council of the Royal Horticultural Society ordered that a special table space was in future to be set aside at all the fortnightly meetings at Vincent Square for new and rare plants. These plants are to be entered with the clerk of the floral committee, and the floral committee is to decide whether each plant comes under the above denomination and is to be placed on this special table or not. This move on the part of the Council will, we feel sure, be much appreciated by visitors, and we hope the rule will be strictly enforced.

Fruit Prospects at St. Malo.—

The Board of Agriculture and Fisheries have received a report from His Majesty's Vice-Consul at St. Malo to the effect that Apples, whether for cider, cooking or table purposes, promise an abundant yield in his district. Plums afford a better prospect than usual; Gooseberries and Currants are about an average; while Cherries are a good medium, if not a large crop.

A Grey-Leaved Speedwell.—

One of the most beautiful plants in the rock garden just now is *Veronica incana*, a native of South-Eastern Europe. This makes a dense though somewhat ragged tuft of grey foliage, which at present is surmounted by spikes of deep blue flowers. These rise to a height of about a foot, and the deep blue colour harmonises splendidly with the glaucous tint of the foliage.

A Dwarf Evening Primrose.—

Those who find the ordinary Evening Primrose too large and cumbersome should make a note of *Oenothera fruticosa* Youngii, so that when autumn comes plants can be procured. It is of comparatively dwarf stature, its average height being 18 inches, and it is a true perennial, coming up year after year with but little attention. The flowers, which remain open all day, are bright yellow and beautifully veined, contrasting well with the cinnamon red tint of the buds. In addition to its value in the garden, this Evening Primrose is also excellent for cutting.

The Great Rose Show.—

The National Rose Society's metropolitan exhibition, which is being held in the Royal Botanic Gardens, Regent's Park, just as this issue is going to press, is a magnificent show. Although, perhaps, not quite so large as in previous years, the quality of the blooms is excellent, notwithstanding the fact that maiden

plants, from which the best exhibition flowers are obtained, are very backward this year. Garden Roses have never been better, the cooler weather suiting them better than excessive heat. In our next issue we shall publish a detailed report of the show, with full descriptions and illustrations of the new Roses that are recognised by the judges. We advise readers who require extra copies to order them in advance.

double flowers, but as the trees get older to produce only single ones.

Deep Red Heather.—What is probably the deepest red of all the hardy Heaths, *Erica cinerea atrosanguinea*, is just now making quite a vivid patch of colour in the quarters devoted to these plants. Of quite dwarf and tufted character, it is admirably adapted for an edging to the border, its dense heads of flowers almost obscuring the dark green foliage. The colour is a glowing rosy red, which is seen to the best advantage under strong sunshine. It varies somewhat in intensity on different plants, but this Heath is certainly one that ought to find a place in every garden where Heather is appreciated and where the soil is free from lime.

A Charming Single Rose.—

The Rose which is grown under the name of *Rosa Vorbegii* is a beautiful one. It is about seven or eight years since it was first sent out by Messrs. Späth, who described it as a hybrid of *R. lutea* × *R. spinosissima*. It forms a neat little bush from 2 feet to 3 feet in height, with wiry branches clothed with foliage closely resembling that of *R. lutea*. The deliciously fragrant flowers are opened very early in the season, early June finding it at its best, and as it flowers with the greatest freedom, the bush presents a very attractive appearance when in full bloom. In general appearance the flowers resemble those of *R. spinosissima*, but they are much larger than in that species, being fully 3 inches across. The petals are white, with a delicate flushing of yellow—no doubt derived from *R. lutea*—and the colour is enhanced by the conspicuous boss of golden yellow stamens in the centre.

Rose Arthur R. Goodwin as a Standard.

Ever since it was introduced in 1910 we have had a high opinion of this Rose grown in bush form, and we were pleased to find it a few days ago

doing well as a standard. Budded on the Briar stock it makes a neat head, its sturdy, though thorny shoots standing out well and showing off the orange buff flowers to the best advantage. In the half-opened stage these are of exquisite shape, and when full blown the blooms hang for a long time before dropping their petals. It is stated by some that Louise Catherine Breslau is likely to supersede Arthur R. Goodwin, but we must "wait and see."

ROSA VORBEGII, A CHARMING HYBRID GROWING IN THE GLASNEVIN BOTANIC GARDENS.

Double Apple Flowers.—At the last meeting of the scientific committee of the Royal Horticultural Society, Mr. H. M. Eddie of Kerrisdale, British Columbia, wrote concerning a young Apple tree having double flowers of remarkable size, being 3 inches in diameter and with twenty-eight to thirty petals each. It will be interesting to see whether the doubling is maintained as the plants become older, for it is no unusual thing for young Apple trees to produce

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

A Beautiful Dwarf Pink.—A few days ago we received from Mr. Spencer H. Bickham, F.L.S., Underdown, Ledbury, some flowers of the charming little dwarf *Dianthus* that bears his name. It is generally regarded as a hybrid, and is, we think, the best and most brilliant of all. The flowers are brilliant rose red in colour, and, as will be seen in the accompanying illustration, the plants make dense tufts of foliage and blossom. Mr. Bickham also sent flowers of another *Dianthus*, of much paler colour, which he stated is being sold by some people as Spencer H. Bickham. When the true plant can be obtained, it is worthy of a place in the choicest rock garden.

Rhubarb and Raspberry Cup: A Refreshing Drink for Hot Summer Days.—Ingredients:

THE DWARF HYBRID PINK SPENCER H. BICKHAM IN THE ROCK GARDEN.

1lb. Rhubarb, two tablespoonfuls of Raspberry vinegar, 4oz. of sugar; optional, a little grated nutmeg; and a few crushed leaves of Borage, Balm or Mint. If needed for colour, a few drops of cochineal. Method: Cut the Rhubarb with a silver knife into inch lengths. Boil in a quart of water for twenty minutes; then strain the liquor through muslin. Add 4oz. of sugar and stir till the sugar is dissolved. Add two tablespoonfuls of Raspberry vinegar and stir well for a few minutes. A little grated nutmeg may be added if liked. Serve very cold, with crushed leaves of Borage, Balm or Mint. The above will make about two quarts of "cup." Soda water or plain water can be added if desired.

—ANNE AMATEUR.

Berberis pinnata in Hertfordshire.—At the present moment, when so much interest is centred in this family, the remarks in your issues for April 24 and May 1, re the tall specimens stated to be *Mahonia Aquifolium*, are most interesting. No

doubt Sir Herbert Maxwell is correct in stating that *M. Aquifolium* does not grow to the height quoted by Mr. Comfort and "C. T." *Berberis pinnata* is, I believe, generally considered to be identical with *B. fascicularis*, though I am inclined to think it is a variety of it. I am enclosing a photograph of a specimen growing near here in the gardens of F. Cordrey, Esq., The Fortress, Letchmore Heath, which measures upwards of 12 feet in height and 30 feet in circumference. There are several of this variety practically the same height in the same garden. It is a charming plant and well worthy of extended cultivation.—E. BECKETT, V.M.H., Aldenham House Gardens, Elstree. [The photograph kindly sent by Mr. Beckett showed a remarkably fine specimen, but, unfortunately, it was not suitable for reproduction.—ED.]

Foxgloves and Their Cultivation.—I was much interested in the article and beautiful illustration in THE GARDEN, issue June 19, pages 304 and 305.

they are for the town garden and the wild garden, for they grow very freely and flower profusely. Of course, there are many splendid varieties, some reaching a height of 3 feet or more, and others 5 feet and developing into magnificent specimens; but despite these and the many other grand varieties so useful for placing near the back of borders, I have a great fondness for the old wild Foxglove. We never have to sow seed of this here, for we always get a certain number of plants coming up as weeds. These, with good treatment, give us fine spikes of bloom. They are, of course, simpler and much less magnificent than those fine florists' varieties, and this is why I like them. I use them for dotting about in my mixed borders, and sometimes strong plants are put close to the edge of the borders to show them off well. They are not allowed to seed themselves all over the place, or we should have colonies of them. The writer says "treat them as biennials," but I find I can let mine go on for three or four years before I renew them, as several spikes are formed on each old plant.—E. T. ELLIS, Weetwood, Ecclesall, Sheffield.

The New Division of the Leedsii Daffodils.

Under this heading, in your issue of June 19, page 300, your correspondent Mr. R. Morton suggests that certain varieties now classified as Giant Leedsii belong rather to the Incomparabilis, and quotes as examples Hon. Mrs. J. L. Francklin and Norah Pearson. Being the raiser of these two Daffodils, I cannot let Mr. Morton's article go unchallenged. First, the parentage of these places them under the Giant Leedsii heading, as they were raised from Minnie Hume and Mme. de Graaff. I would not give this as sufficient reason for their classification, for it must be confessed that the same cross has given flowers which nine experts out of ten would call Incomparabilis. But I do say that their breeding, coupled with their "obvious" Giant Leedsii appearance, should undoubtedly place them under this heading. Certainly the cups of both varieties are of a deeper yellow than those of most Leedsii, and the colour does not fade with age; but the texture of the blooms, with the habit and foliage of the plants, both proclaim their origin. If my memory is not at fault, I think Mr. Morton will find that there are other Leedsii of the older, small-flowered section which have yellow cups that do not fade to white. Is not Amazon an example? Of course, all this classification is more or less arbitrary, and is only undertaken for the convenience of exhibitors and exhibition committees, so that it might be argued that it does not matter much under which heading they are placed so long as they are placed somewhere and everyone who possesses the Royal Horticultural Society's Official List can find them and will know in which section to exhibit them at the Daffodil shows. I do not agree with this, neither, I am sure, do the classification committee, the members of which have worked hard to place an enormous number of Narcissi, both new and old, in their proper sections. Mistakes have been made, we all know, but I cannot agree that any mistake has been made with Hon. Mrs. Francklin and Norah Pearson. In classifying Daffodils the question of measurements and colour must be the principal factors in determining into which section a variety is to be placed; but unless the use of the rule and colour chart be tempered by a little common sense—and in difficult cases reference to parentage

I always had a great fondness for Foxgloves, not the least for the wild one, *Digitalis purpurea*. As a youth I annually looked forward to the hundreds, I may say thousands, of spikes of blossom rearing their heads above the Bracken Fern clothing the sides of Beeston Castle in Cheshire. It was an ideal place for Foxgloves and Ferns. "A. B. Essex" rightly praises the modern garden strains. I have seen many fine specimens during the past few years, but none to equal some I saw a few days ago in an old thatched cottage garden. The plants were growing informally in groups, the spikes were magnificent, the individual flowers equally so and the colours most pleasing.—GEORGE GARNER.

— I was very pleased to see the notes on "Foxgloves and Their Cultivation," by "A. B. Essex," in THE GARDEN for June 19, page 304, and I agree whole-heartedly with the writer when he says they are undeservedly neglected plants. My own experience shows me what ideal plants

—many glaring mistakes are bound to occur. It will be noted that the word "obvious" used before is given in the Royal Horticultural Society's List (Division V., Triandrus Hybrids) as the *only* guide in "placing" flowers of this breeding; while "parentage" is the *only* guide for classifying Jonquilla hybrids. Therefore I feel safe in pleading for these points to be always kept in sight when the classification of a flower is under discussion.—J. DUNCAN PEARSON, *Lowdham, Notts.*

Ancient Home-Made Ointments, Perfumes and Cordials.—Such an article as that suggested by "M. H." on page 300 of *THE GARDEN* for June 19, 1915, would be most interesting. The difficulty is not to find ancient recipes, but to arrive at the necessary old-time furniture

of a still-room. Much about this might be gleaned from the careful perusal of the details of how to distil this or boil that which are scattered over the pages of the little books which deal with the subject. For example, in the volume I am about to mention under the head of "The Art of Confit-making, Teaching How to Cover All Kinds of Seeds, Fruits or Spices with Sugar," there is an inventory of the utensils required for these purposes. "First you must have a deepe bottomed bason of fine cleane brasse or latton . . . you must also have a broad panne to put ashes in . . . you must also have a fine brassen ladle . . . you must also have a brassen slice." I am the fortunate possessor of this rare work, in excellent preservation, which contains as Part I., "A Closet for Ladies and Gentlewomen, or the Art of Conserving and Candyng," and as Part II., "Delights for Ladies to adorne their Persons, Tables, Closets, and Distillatories." The second of the two is dated 1617, and is probably a posthumous work of Sir Hugh Platt; who was very famous as an agriculturist and horticulturalist in the later years of Queen Elizabeth's reign and in the early ones of King James. The first has no name appended, and it is very possible that it was not the work of the celebrated knight. Some of the recipes are quaint. Their ingredients sound strange to modern ears. No. 11 is "To

candy Marigolds, Roses, Borage and Rosemary-flowers." No. 51 is "To make conserve of Strawberries." The final stage is "then boyle them in wine and sugar till they be stiffe." On the personal side we find directions "how to take away any pimple from the face," how to make "sents for gloves," and all about "a delicate stove to sweat in." A little volume like this is hardly the sort of thing we would expect our V.M.H.'s to break out in to-day. Yet it probably was not accounted strange then, when there was such a close connection between the kitchen and herb gardens and the still-room. More than a century later, in 1744, we have "Adam's Luxury and Eve's Cookery," which is partly about how

to grow vegetables, and partly about how to cook them and certain fruits. About the same period or a little later a pamphlet of forty-two pages was published called "The Art of Making Wines of Fruits, Flowers and Herbs." Roses, Cowslips, English Figs, Blackberries, Strawberries, Elderberries and Mulberries are some of the flowers and fruit for which directions about how to make them into wine are given. The much-derided Gooseberry wine is said to have so many virtues that I am sure "M. H." would long to make some. It is "jolly good," too, independent of any medicinal or health-giving properties. I will never forget some a head-gardener once gave me. It was delicious, but certainly not a temperance drink. He would be a very hardened old toper who would

THE NEW GODETIA LAVENDER SHOWN BY MESSRS. J. CARTER AND CO. IN LONDON LAST WEEK. (See page 330.)

say of it, as one of that fraternity said of some poor whisky, "There ain't a headache in a big bottle." But I am writing an article instead of a reply, so please, Mr. Editor, I must stop.—JOSEPH JACOB.

FORTHCOMING EVENTS.

July 6.—Royal Horticultural Society's Summer Show, Holland House, Kensington (three days). Gloucester Rose and Sweet Pea Show.

July 8.—Manchester and North of England Orchid Society's Meeting, Coal Exchange, Manchester. Finchley Horticultural Society's Show.

THE LILY DISEASE AND HOW TO COMBAT IT.

LIKE most other plants, the Lily is subject to more diseases than one, but there is one that is particularly prevalent almost through the length and breadth of the land. It is characterised, in the first place and in mild attacks, by brown, dead spots on the foliage; later and in bad attacks by similar areas on the stems. If these dead areas occur, as they often do, low down on the stem, the water supply is interrupted, and all the parts above the spot collapse long before the normal time arrives when the foliage might be expected to die of old age, and sometimes long before the flowers open.

The common beautiful white Lily, *Lilium candidum*, is perhaps the most liable to attack, but we have seen instances of the disease in many species. *L. Hansonii*, *L. giganteum*, *L. Martagon* (usually slightly), *L. colchicum* and even the hardy *L. croceum* are all more or less liable to it.

The late Professor Marshall Ward, by one of the most painstaking researches ever carried out, definitely proved the origin of the disease to be the common fungus *Botrytis cinerea*. This fungus is exceedingly prevalent on all sorts of dead vegetation and forms the well-known grey mould, which has only to be sought to be found on dead, moist leaves in any garden. It is in many ways a remarkable fungus. It usually, and perhaps normally, grows on dead vegetable matter; but Mr. George Masee found he could train it by very simple means, such as might occur in certain circumstances in Nature, to invade living tissues, and this it not infrequently does, so that it is not only a devourer of dead matter (a saprophyte), but a parasite as well at times.

Further, once in, it produces a poison which invades cells in advance of the fungus, kills them, and lays them open in turn to the ravages of the fungus, so that the brown, dead spot caused by its first invasion quickly spreads if the conditions are favourable.

We thus have these facts. The fungus *Botrytis cinerea* is common and abundant wherever dead vegetable matter exists, and it is capable of invading living Lily leaves and stems and causing their death if conditions are favourable to it.

The bulbs are rarely attacked, though they are sometimes, and, so far as they are concerned, the main damage is done by the premature destruction of the leaves. Foliage is the food-maker, and to destroy it is to stop the manufacture of food, and so reduce the reserves available for the growth of the plant in the next season. If a plant is attacked season after season, the bulbs gradually get weaker and weaker, and at last succumb to starvation. A bulb once attacked

is not necessarily diseased, but may produce perfectly healthy plants in another season.

The Remedies for the Disease, or rather the preventive measures, to be adopted are, therefore, so far as is possible, to reduce the amount of the fungus in the immediate neighbourhood of the plants, to prevent the germination of the fungus upon them, and to place the plants under such conditions as will be least likely to lay them open to attack.

Something may be done in each of these directions, and I will deal with them in order. The soil in which the bulbs are planted should not be rich in organic matter, and especially the top few inches. All dead foliage should be cleared off and not permitted to decay. Where plants have been attacked, the top 2 inches of soil should be removed and replaced with fresh containing little organic matter in it, but mixed with lime rubble to promote decay, and in early spring dusted over with flowers of sulphur to check the growth of saprophytic fungi like the *Botrytis*. It would be of considerable interest if those who have experience of growing the white Lily in chalky soil, or soil mixed with limestone chips, would relate it, giving the exposure of the plants and any other notes bearing upon the matter.

To prevent the germination of spores of *Botrytis*, spraying the plants frequently with liver of sulphur (roz. to 3 gallons), or less frequently with Bordeaux mixture, might be of service; but of greatest service is attention to the third point. Briefly, any condition which checks the plants suddenly is apt to lay them open to the attack of this ubiquitous pest. Of these conditions the chief are: Late frosts while the flowering stems are forming; cold east winds at the same time; and stagnant water at the roots. Avoidance of these conditions will, more than any other measures, protect white Lilies from the attack of *Botrytis*. SCIENTIST.

A TALL-GROWING BROOM.

FLOWERING during June and July, when most of the *Genistas* are over, the tall-growing *G. cinerea* is valuable. It forms an open, comparatively upright bush of shapely habit, with arching twigs, and eventually reaches 9 feet to 10 feet high. The slender branches are freely clothed with rich yellow blossoms, borne in clusters. For large beds on the lawn or groups in the shrubbery border *G. cinerea* is a most desirable Broom, while dotted in groups or singly about in the open woodland the effect is most pleasing.

INFORMAL AND WILD GARDENING.

BY JAMES HUDSON, V.M.H.

(Continued from page 314.)

"The Grass.—Let the grass grow all over the field at its own sweet will, only cutting it with sheep-shears just round the newly planted plants. The grass blossom and the glorious crimson of the Sorrel heads will add greatly to

JAPANESE IRISES GROWING NATURALLY IN LADY DU CANE'S GARDEN AT MOUNTAINS, WITHAM, ESSEX.

the charm of the wild garden. In November and early December, when the autumn-blooming Crocuses are over, the whole of the grass should be cut down with a bagging hook and left where it falls, unless it is wanted as a mulch to newly planted Rhododendrons and such-like plants.

"Plants for the Grass Land.—These will vary according to the nature of the soil. For example, Rhododendrons, Pernettyas and such-like plants will not be planted in chalky or limy soils. But speaking generally, and following the

year round, there will be among more or less bulbous plants: Winter Aconites (these not more than a foot back from the paths), Snowdrops, Snowflakes, Crocuses, Daffodils, *Liliums croceum*, *candidum*, *pardalinum* in wet spots, and *tigrinum*, *Camassia esculenta*, *Fritillarias*, *Cypripedium*, *Calceolus* and *C. speciosus* in damp spots, *Colchicums*, *Crocus speciosus*, yellow Water Iris in wet spots, *Iris sibirica*, *Crinum capense*.

"Among flowering plants: *Trollius*, *Caltha palustris*, Lady's Smock, Lady's Mantle, Forget-me-not in wet spots, all British Orchids, all British Heaths (unless on chalk), wild Scabious, wild Centaurea, Blue Alkanet, Viper's Bugloss, *Helianthemums*, *Salvia pratensis* and its allies, *Verbascums* of all sorts and kinds, Foxgloves in half shade, Purple Loosestrife, Yellow Loosestrife, *Spiræas*, *Campanula Trachelium*, Ragwort, Golden Rod, *Michaelmas* Daisies, Ox-eye Daisies, large white Autumn Daisies, *Campanula rotundifolia*, *Inula ensifolia*, *Centaurea macrocarpa*, Marjoram, *Crambe cordifolia*, Mallow (pink and white), St. John's Wort of all sorts, Toadflaxes, Monk's hood, *Polygonums*, *Senecio* in variety, Solomon's Seal, Teasels, *Geraniums*, *Geums*, *Anemone Pulsatilla*, Rest-harrow, Betony, *Aquilegias*, *Epilobiums*, *Chrysanthemum uliginosum*, *Phyteuma orbiculare*, &c.

"Among flowering trees and shrubs: Laburnum, Almonds (pink and white), Lilac (only singles), Hawthorns (use the coloured ones very sparingly), *Cistus* of all sorts, *Cytisus* of sorts, Double Gorse (not single, it sows itself all over the place, and is not half so beautiful a plant, in or out of flower, as the double), single and semi-double and all *Wichuraiana* Roses (but none of the show Roses), Guelder Roses, *Forsythia suspensa*, Double Cherries, *Osmanthus*, Hollies, Tree Ivies, Bamboos, Magnolias, Spindlewood, Flowering Raspberries, *Spartium junceum*, *Cydonia*, Rhododendrons (but use the red ones very sparingly), Azaleas, *Pernettyas*, *Stuartia Pseudocamellia*, *Berberis* of all sorts, Lavender, Rosemary, *Potentilla* (shrubby), *Ribes sanguineum*, Wayfaring Tree, Veronicas, Bog Myrtle in wet places.

"In the Copse or Thin Woodland.—Encourage Ivy and moss to grow over the whole of the surface wherever either will do so.

"Plants for Woodland.—Snowdrops, *Anemone blanda*, *A. ranunculoides*, *A. apennina*, and all varieties of *A. nemorosa*, such as *robinsoniana*, *Alleni*, &c.; *Scilla nutans* and *S. n. alba*; all the hardy Cyclamen, particularly *neapolitanum*; *Trillium grandiflorum*, Primroses (yellow and white, not coloured), *Campanula latifolia* and

C. l. alba, *Narcissus cyclamineus* and *N. triandrus*, *Chionodoxa sardensis*, Dog's-tooth Violets, white Wood Violets, *Helleborus foetidus*, Wood Sorrel (white and pink), and Ferns in abundance (the wild British are by far the best, and the curious crested and other forms should be used most sparingly, not more than one in twenty-five), such as *Lastrea dilatata*, *L. Filix mas*, *Athyrium Filix foemina*, *Polystichum aculeatum*, *angulare* and *munitum* (which is Canadian), *Scolopendrium vulgare*, *Polypodium vulgare*, *Dryopteris* and *Phegopteris* (both the latter in rather damp spots), *Osmunda* in wet places. There is nothing looks so beautiful in woodland as Ferns. Both for them and for the flowers the wood must not be too dense or too dark. It must be essentially a thin wood. In light soils the Ferns will, in a hot, dry summer, want watering once in three weeks, giving a big plant a gallon at a time and a small plant half a gallon, but they are well worth it."

What I admired so much in Mr. Wilks' garden was the way in which all the garden blended in one harmonious whole. In the distance and under the shelter of the eastern screen of trees were the orchard trees—Apples, Pears and Plums. When in flower these could be nearly all seen from the house itself, and thus add to the beauty of the garden. Quite in the distance I noted a fine row of Scarlet Runners, which added greatly to the effect. Mr. Wilks, I may add, is a most enthusiastic gardener, practical to a degree. In gardening he finds the relaxation and delight so essential to a very busy man.

The garden at East Burnham Park, near Slough, the country residence of Sir Harry J. Veitch, F.L.S., V.M.H., affords another excellent example of fitting in a garden with the surroundings, taking every advantage of the well-grown Oaks and other trees. Around the house itself there is an approach to formality, it is true, but as one gradually leaves that behind and arrives at the wild garden everything is quite informal, and the utmost use is made of the woodland adjoining. In an open spot are collections of fine foliage plants with some small pools in the foreground, with appropriate water plants, and stepping-stones across and between the pools. On one side are the relics of an old pathway, made with small paving-stones, among which are to be seen various dwarf, close-growing plants, Stonecrops and the like. This is quite unlike any arrangement I have ever seen, in every way most picturesque and charming. In the woods are to be seen Bamboos and other plants which thrive in the shade, with the walks quite informal and of such material as can be easily kept clean; thus the

one essential of inexpensive maintenance is followed.

Informal Gardens and Old Mansions.—Quite in contrast to many gardens is that of Lady Du Cane at Mountains, Witham, Essex. One, as a rule, associates formal gardens with such houses as hers. This is, however, quite an exception to that rule. I never saw, nor have I heard of, a more informal garden than this, or one that is more charming and picturesque. I have had the pleasure of seeing it in various aspects, both in the spring with the Daffodils in their beauty, and later on with the Roses which thrive so well, growing quite in *abandon*, and still later when the herbaceous plants are at their best. In each instance it has been perfectly lovely, like Mr. Wilks' garden in one sense, that of being composed of nearly all hardy plants. No lines

MAY-FLOWERING TULIPS AND WALLFLOWERS.

A RETROSPECT.

IT is often pointed out that Wallflowers associate well with Darwin and Cottage Tulips, flowering as they generally do about the same time, but comparatively few take much trouble in bringing about colour combinations. May I be permitted at this time, when Wallflower seed may still be sown, to give my experience of the past season? I grow both Darwin and Cottage Tulips, and it occurred to me last October that it would be worth while if, in planting out, special regard were had to the various groups. The little extra trouble—if such it could be called—more than

LASTREA DILATATA IN THE REV. W. WILKS' WOODLAND GARDEN. THIS FERN IS 7 FEET 9 INCHES ACROSS.

are followed, everything being informal to a degree. In the ravine there is a well-arranged rock garden, with a little rivulet running through it. Here the Japanese Iris thrives remarkably well. This garden is an example of what may be accomplished within a limited area when the owner is a keen gardener and takes a real interest in the garden.

My desire throughout this paper has not been to advise curtailment in the garden in any sense, but rather an addition to its beauty and attractiveness by the introduction of a greater variety of plants which are adapted for informal gardening, and may be grown in a more natural manner. All needless labour in upkeep should be avoided, not to reduce the amount of labour expended, but so as to give more attention to the one great essential—cultivation, in such parts of the garden as need real cultivation.—From the Royal Horticultural Society's Journal.

justified the effort, and the result was a charming display. The Tulips were grouped in borders among herbaceous subjects—about nine bulbs in each group—and between the next lot of herbaceous plants Wallflowers were planted, out in threes, and this is the arrangement:

I give the Darwin Tulips first. Mrs. Potter Palmer, large purple violet blooms which last well, in conjunction with Primrose Monarch Wallflower; Pride of Haarlem, with Harbinger Wallflower, richest brown; Salmon King, salmon carmine, with Blood Red Wallflower; Clara Butt, rosy salmon pink, and Mr. Farncombe Sanders, glowing carmine rose, with Purple Queen Wallflower; Rev. H. Ewbank, silvery heliotrope, with Fire King Wallflower. Cottage Tulips.—Orange King with Blood Red Wallflower; Inglescombe Pink with Orange Bedder Wallflower. The old and popular Tulipa gesneriana major,

with its vivid scarlet blooms rising out of Primrose Monarch Wallflower, showed up to great advantage; as did Bouton d'Or among Blood Red Wallflower, the yellow of the former and deep tones of the latter producing vivid contrasts. Particularly effective were other Darwin Tulips like Sultan, with deep purplish shades, along with Primrose Monarch Wallflower. Queen of the Roses, a very beautiful rose Tulip, and Harbinger Wallflower were much admired.

I ought to mention, for the benefit of those who like Tulips for cutting, that one of the cheapest sorts, and at the same time a most beautiful variety, is to be found in the old Cottage gardeniana rosea, a comparatively dwarf grower. This I had planted in close proximity to a group of Tom Thumb Yellow Wallflowers, and it came as a surprise to not a few who saw both that such a splendid array of colour could be got together for a trifling sum.

I do not agree with the somewhat scathing remarks of "A. B. Essex" "that the Wallflower has been almost spoiled by so-called improvements. Those with blooms of dirty creamy yellow hue or a nasty magenta purple are mere caricatures of a dear old fragrant flower." It depends a good deal upon the associations as to the effect produced, and planted on the lines indicated with Tulips, even what, standing alone, appear washed-out colours have a beauty mingled with the bewitching colours of the Tulips. W. LINDERS LEA.

LARGE - FLOWERED RAMBLER ROSES.

A STURDY post, some 6 feet high, and clothed from base to summit with the rambling form of that superb pink Rose, Caroline Testout, reminds one that these large-flowered Roses of scandent habit should play a more important part in our gardens during the summer and autumn months. The plant mentioned produces blooms equally as large and full as those found on the original bush forms, but in such quantities that one need not hesitate to gather them lavishly for the house. Many of these large-flowered rambling Roses also bloom earlier than the majority of the cluster varieties, and, what is even of greater importance, frequently give a good display well into the autumn.

Until comparatively recently they formed a set quite by themselves, but at the recent Chelsea Show a magnificent scarlet Rambler, that attracted and held the attention of every Rose enthusiast who visited the exhibition, proved that hybridists have been crossing the large-flowered Roses with the clustered wichuraiana set.

Although the majority of those that I will name are only vigorous enough for pillars, some grow so rampantly as to induce one to give them a place on the pergola or a wall of the house, where their sturdy growths can travel over a con-

siderable space and produce flowers by the hundred. As an example of this vigour the illustration of Conrad F. Meyer will serve well. The photograph was taken in an Essex garden on June 2 of this year. At that date the plant, only a small portion of which is illustrated, was over nine feet high, yet it was planted as recently as February, 1913, when it was obtained from a nursery and cut nearly to the ground-level. It is a Hybrid Rugosa Rose, and the large, exquisite blooms are a beautiful shade of silvery pink, emitting the true Rose fragrance that everyone appreciates. What better plant could one have for surrounding, as this does, the doorway and dining-room window?

THE HYBRID RUGOSA ROSE CONRAD F. MEYER. THE LARGE, SILVERY PINK BLOOMS ARE VERY FRAGRANT.

Keeping it company on the other side of the doorway are Gloire de Dijon and Grüss an Teplitz, a twain that every rosarian loves. Both have large flowers, both are fragrant, the former having the true Tea Rose scent and the latter that so characteristic of crimson Roses, and both bloom over a very long period. Indeed, Gloire de Dijon is about the first to open, and once it starts, a well-grown plant is never without flowers until the frosts come in autumn.

Some Hints on Management.—This is not the time to go into details concerning the treatment of soil and planting. These are better dealt with in autumn, but in passing one may, perhaps, just throw out a reminder that the soil must be

good, even more so than for bush Roses, as rapid growth during the first two or three years is more desirable than quantity of bloom. A complaint that is usually made by those who grow large-flowered ramblers is that after a year or two the plants become bare for several feet from the soil. There is no doubt this is a serious drawback, yet it is one that is easily overcome. It may be done in two ways. One is to unfasten several of the rods at pruning-time, bend them over arch-wise and tie the end of each to a peg thrust in the earth. They remain thus until the lower buds have burst and have made shoots several inches long, when each rod may be fastened

back in its original position. A more convenient way, where there are sufficient rods to allow it, is to leave a number nearly full length and to cut others at varying heights. Thus one could be cut to within 3 feet of the ground, another 4 feet 6 inches, and another 6 feet. Treated in either of these ways, there will not be any more cause for complaint regarding bare bases of pillars, arches or walls. Unlike the wichuraiana Roses, which are best pruned when the flowering is finished, these large-flowered ramblers are to be cut in spring, just before the bush Roses are pruned.

The Best Varieties.—In addition to those already mentioned, there are a good number of scandent Roses with large blooms, and I will name those I consider the best. The word "climbing" is used as a prefix to such varieties as Liberty, as it will be found in practically all catalogues, though the purist will know that it is wrong. "Rambler" is a much better term, and the word "climber" ought to be reserved for such plants as Clematis and Virginian Creeper.

Nova Zembla.—This is a white-flowered counterpart of Conrad F. Meyer, already described and illustrated herewith. It grows vigorously, and its large blooms, which open pale blush and change to white, are sweetly scented. Good for pergola or wall.

Ards Rover.—A beautiful crimson-flowered and sweetly scented Rose with large, handsome foliage. Rather subject to mildew in autumn. Pillar or wall.

Longworth Rambler.—Like the old Gloire de Dijon referred to, Longworth Rambler continues to bloom over a very long period. With me it

started the first week in June, and past experience leads me to expect that it will not be without flowers until well into the autumn. They are bright red in colour, and are borne in clusters of several blooms. Pillar, arch or pergola.

Mme. Alfred Carriere.—This charming and sweetly scented old white Rose makes a fitting companion to Longworth Rambler. It is almost continuous flowering, and will grow in nearly any soil or position. It is one that is disposed to go bare at the base, and should be treated as before advised. Beyond that, hard pruning is not advisable. Pergola, arch or red wall.

Bouquet d'Or.—This may be regarded as an improved Gloire de Dijon, its buff yellow blooms

coming a better shape. It is not, however, so free-flowering. Pergola, pillar or south wall.

Cheshunt Hybrid.—An old but very fragrant Rose that still deserves a place. The colour is cherry carmine, but when exposed to strong sun takes on a rather objectionable magenta hue. Pillar or west wall.

Florence Haswell Veitch.—A comparatively new Rose, with exquisitely shaped and fragrant flowers of glowing crimson colour. It flowers early and continues over a long period. Pillar.

Gustave Regis.—When discussing this Rose with Mr. E. Mawley, the president of the National Rose Society, some months ago, he confessed his

Climbing Lady Ashtown.—A very good pillar Rose with deep pink, fragrant flowers. Rather subject to mildew.

Climbing La France.—The ordinary La France is a silvery pink Rose, too well known to need description. The scandent form is its counterpart in every way except habit. Pillar.

Climbing Liberty.—This and the rambling form of Richmond I have not, so far, been very successful with, though I have seen them doing well as pillars. Both are beautiful glowing crimson flowers of exquisite shape and are fragrant.

Mme. Isaac Pereire.—This is an old Bourbon Rose that is worth growing for its delicious

ROSE-GROWING IN TOWN GARDENS.

CLOUR in relation to the Rose is of the first importance, yet it is, unfortunately, the attribute which is the most easily lost. To such an extent is this the case with many varieties that it is quite exceptional to see really typical blooms of them, and especially so where the plants are grown under the adverse conditions usual in town gardens. There are a number of causes contributing

THE RAMBLING FORM OF ROSE CAROLINE TESTOUT ON RUSTIC ARCHES.

inability to grow it satisfactorily. Enquiry elicited the fact that it had been treated as a dwarf bush. It should be grown as a pillar or over a low fence. Although not over-large, its nankeen yellow blooms are exquisite and particularly good for button-holes. Flowers well in autumn.

J. B. Clark.—This is a very large flowered Rose of cherry red colour. The fragrant blooms open early and continue for a long period. Pillar.

Juliet.—Although this fragrant variety does best when the growths are permanently pegged down, it succeeds well as a pillar, providing the shoots are tied down after light pruning until growth is well advanced. The colour is bright rose, with old gold on the reverse of the petals.

fragrance. The large blooms are produced freely, but they are of poor shape, and the rather dull rose carmine colour is somewhat objectionable. It grows vigorously and makes a good pillar.

Climbing Mrs. W. J. Grant.—Except in habit, this is a counterpart of the bush form, the large, deep rosy pink blooms being produced in abundance. It is one of the earliest to flower, and excellent for a pillar or light-coloured wall.

Zephyrine Drouhin.—This is commonly known as the Thornless Rose, as its branches are devoid of spines. It is a beautiful variety for a pillar 5 feet or so in height, producing its bright carmine pink flowers in great profusion. They are exceedingly fragrant.

F. W. H.

to this loss of colour, not least of which is the weather; but whereas some varieties will only appear at their best during a dull and humid spell, there are others which benefit and take on a deeper tint under the full rays of the sun, so that it is impossible for all to be suited. Apart from the weather conditions, there are several other factors which conduce to improvement of colour, over which it is possible to exercise control, so that we may to some extent improve the beauty of the blooms by studying their requirements.

The first essential is vigour in the plants. No one who has grown Roses, even on the smallest scale, can have failed to notice that weakness in the tree makes itself evident in the hue as well

as the size and shape of the bloom. Any check during the period when the buds are expanding, such as is caused by dryness at the roots, will also have a bad effect upon the colour.

The grower needs to bear in mind that the flowering period puts the greatest strain upon the energies of the plants, consequently the roots are then at their busiest gathering and assimilating sufficient food to enable them to produce the blooms, and unless sufficient supplies are present in the soil, the results are likely to be imperfect.

As nourishment can only be taken up in liquid form, it is obvious that any dryness at the roots means starvation to the plants. Many of the root fibres are near the surface of the beds, and, indeed, the object of the grower is to encourage them there, since they are then more easily fed and aerated.

their growth is most active and they are requiring nourishment upon a larger scale in consequence.

The effect of these supplies of food when carefully administered is that the growths remain unchecked, the blooms open more quickly, and their colour is then seen at its best.

Many of the red Roses lose greatly by exposure to the sun, and in the case of these, when the blooms are required for exhibition or decoration, they must be cut in as early a stage as possible and allowed to expand subsequently in water. J. B. Clark, as an instance, must be gathered directly the outer petals have turned back, either late at night or first thing in the morning. Red is not by any means the only colour affected, the combinations of yellow and pink tints being among the most fugitive, and in this case it is nearly always the yellow that disappears, leaving the

Godetia Lavender.—This cannot fail to become immensely popular by reason of the profusion of its mauve-coloured cups. The colour towards the base shades to white, with a touch of red at the centre. More shapely than many of its tribe, the flowers, three or more in a cluster, terminate the wiry 18-inch-long stems, which render it ideal for cutting. We think very highly of what was generally pronounced to be an ideal subject for the garden. From Messrs. Carter and Co., Raynes Park, S.W. See illustration page 325.

Rose Cupid (H.T.).—A pillar Rose of fine growth, abundant flowering and great charm, which, by reason of its large size and exquisite colouring, is destined for universal popularity. The dominant colour of the expanded flower is delicate salmon pink, merging to flesh, with which the large array of golden anthers is in delightful harmony. We know of nothing to approach the exquisite colour tone. (See illustration.) From Messrs. B. R. Cant & Sons, Colchester.

Iris filifolia.—Mr. W. R. Dykes, Godalming, exhibited a vase of this handsome species, which, so far as we remember, has not been seen before at these meetings. It is described in Mr. Dykes' book of the Iris and in that of Mr. Lynch. The plant now referred to has rich reddish purple, compactly built flowers, with a conspicuous orange blotch on the falls, and is quite distinct from the blue-flowered form which often bears the name, and which approximates to *I. tingitana*. Mr. Dykes' plants were raised from seeds gathered at the top of the Rock of Gibraltar.

Campanula pusilla Miss Willmott.—We imagine everybody who cultivates alpine plants knows this beautiful silvery blue, dwarf-growing Harebell. If not, they should make its acquaintance without delay. It is quite one of the best and most distinct. Shown by Mr. Clarence Elliott, Stevenage.

Delphinium Queen of the Belgians.—A lovely semi-double variety of Cambridge blue colouring. The flowers are large and arranged in a rather close spike. From Mr. W. Ferguson, The Hollies, Weybridge.

Linaria macedonica.—A very handsome and effective plant for grouping. The flowers are large, rich yellow, with deep orange-coloured throat. The neat, ovate, glaucous foliage is also striking. It is about two and a-half feet high. From Messrs. Waterer, Sons and Crisp, Bagshot and Twyford.

Odontioda Red Cross (Odontioda Gooksonii × Odontoglossum ardentissimum).—The flower is of medium size, of brighter red tone than is usually seen, finely edged white, with white lip.

Lælio-Cattleya canhamiana Fowler's Variety. A large-flowered variety, having long, rather narrow sepals and petals coloured delicate lilac pink. The lip is very bold and imposing, wholly coloured rich purple. These two novelties were from Mr. J. Gurney Fowler, Pembury, Kent.

The whole of the foregoing novelties were exhibited before the Royal Horticultural Society on June 22, when the awards were made.

THE NEW PILLAR ROSE CUPID SHOWN IN LONDON LAST WEEK BY MESSRS. B. R. CANT AND SONS.

Hence if the drought penetrates even a little way, ill-health will often result.

Assuming that the moisture in the beds has been well maintained, a Rose is capable of extracting a much larger amount of food from the soil during the early summer months than it requires during the remainder of the year. It is necessary to make certain that the requisite supplies are present in a form that is readily available, and for this reason we give an early spring dressing of manure, artificial or otherwise, containing phosphates and potash in a form which becomes available soon after application and lasts for the remainder of the growing season.

Nitrogen, if given in the shape of sulphate of ammonia, is much quicker in its action, a veritable stimulant which should be given only when the plants are actually in need of it; that is, when

pink predominating, as in Prince de Bulgarie, Lyon and Joseph Hill. Careful shading and early gathering will have some effect in preserving the colour.

P. L. GODDARD.

NEW AND RARE PLANTS.

AWARDS OF MERIT.

Erigeron hybridus Asa Gray.—This charming plant requires to be seen in groups amid suitable environment. The flower-heads are pale buff colour with orange-toned disc, and arranged in front of the towering bronzy spires of *Eremurus Warei* or *E. Shelford* the effect is very fine. A most profuse-flowering subject, not quite two feet high. Shown by Messrs. Wallace and Co., Colchester.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

The Fruit Garden.

Late Vines.—The final thinning of late Grapes should be completed without delay. Those varieties required for the latest supplies must be well thinned out, especially in the centre of the bunches. When the trellis has been covered with foliage, all laterals must be removed as they appear. If not already done, the borders must be mulched with rich farmyard manure, after which a good watering should be given. During warm, congenial weather ventilate the house liberally, especially during the period when the berries are subject to scalding. If mealy bug is present on the rods, this pest must be diligently sought after, as it is most important that late Grapes should be free from it.

Midseason Vines.—Give plenty of air to Grapes which are ripening, and during very warm, congenial weather fire-heat may be dispensed with. When there is no heat in the pipes, the house must not be damped late in the afternoon. Cover the glass with a double thickness of fish-netting, or syringe limewash on the glass when the Grapes are ripe.

Muscat Grapes.—In very hot weather it is necessary to place a shading on the glass, or the foliage will scorch. Reduce the fire-heat to the minimum when the weather will allow. On certain occasions fire-heat may be dispensed with altogether.

Plants Under Glass.

Ipomœa rubro-cœrulea.—This beautiful greenhouse climber is very useful for the decoration of breakfast or lunch tables if suitable receptacles are provided. Here we raise a batch of plants at the present time for flowering in late autumn and winter. The plants are flowered in 10-inch pots and trained over the roof of a house with a temperature of 60°.

Carnations.—Attention must now be given to the layering of Malmaison Carnations. Place a frame on a partially shaded border in which to layer them. A suitable compost is one consisting of sifted loam and leaf-soil and coarse sand. Keep the frame rather close and shaded from bright sun till the layers have rooted, then gradually inure them to cooler conditions. Other Carnations may be layered in the same manner.

Chrysanthemums.—The young plants which have been struck for flowering in 5-inch or 6-inch pots should now be ready for their final potting. Give them a rich compost and pot firmly. When potted, plunge the pots in ashes in an exposed position.

Hydrangeas.—When flowering is finished, cut off the flower-heads and place the plants outdoors in a sunny position. The pots should, if possible, be plunged in ashes; the plants will not then require so much attention in regard to watering.

The Flower Garden.

Spring-Flowering Plants.—Seedling plants of Wallflowers, Pansies, Aubrietias, Alyssums and Silenes may be pricked out into the reserve beds. See that the ground is well broken up and raked to a fine tilth, and should it be dry, give a good soaking of water. Polyanthus should be pricked into boxes or frames till they are large enough to be planted out in the open. Old plants may be divided and planted in a shady position. Delphiniums, Anchusa, Chelone or any perennials which have been raised from seed may now be transplanted in well-prepared ground in the open.

Geum Mrs. Bradshaw.—Seeds of this effective border plant may be sown now in boxes of fine soil. Place the boxes in a cold frame, and keep them shaded till the seeds have germinated. When large enough, the seedlings may be potted into 3-inch pots. These plants will flower early in the spring. Another sowing may be made in the autumn for flowering later.

Pinks.—A fresh stock of Pinks may be raised either by layering or by inserting cuttings. If the latter method is adopted, the cuttings should be inserted thickly in cutting-boxes and kept in a close frame till they have rooted. The frame must be shaded, and the cuttings syringed two or three times a day. When rooted, gradually expose them to more air.

The Hardy Fruit Garden.

Figs.—Pay timely attention to the removal of all superfluous growths, so that the sun and air may penetrate right through the trees. Retain the growths which are short-jointed and of moderate strength. Give the trees a vigorous washing two or three times a week with the hose-pipe. If not already done, a mulch of short manure should be placed over the roots. Plenty of stimulants must be given to trees carrying full crops of fruit.

Thinning Apples.—These promise an abundant crop this season, and if Apples of the finest quality are desired, many of the fruits must be removed. Recently planted trees which are not over-strong should not be allowed to carry fruits at all. This will help to put vigour into the growth of the trees.

The Kitchen Garden.

Vegetable Marrows.—The plants are now in active growth, and unless the shoots are thinned and regulated about once a week, the crop will be of short duration. Give abundance of water during dry weather, and supplement this with an occasional dose of liquid manure.

Lettuce.—Small sowings of this valuable salad should be made every ten days. During showery weather transplant seedlings.

Onions.—Those which were planted with a view to obtaining very large bulbs must be watered liberally. Before water is given, artificial manure or soot should be dusted between the plants. An occasional dose of diluted farmyard drainings will also be beneficial.

Cauliflowers.—A good plantation of Autumn Giant Cauliflowers should be put out now on a piece of ground which has been well manured. A good quantity of autumn Broccoli must also be planted to succeed the Cauliflowers. Keep them well supplied with water till they have made a good start in the new ground. All vacant ground must be prepared for planting winter crops without delay.

Shallots.—This crop should now be ready for lifting. Spread the bulbs out on the ground to dry preparatory to storing them in a cool shed.

—E. HARRISS.

(Head-gardener to Lady Wantage.)
Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Flower Garden.

Roses.—Both dwarf and climbing plants must be kept free from insects by occasional sprayings with Quassia or similar insecticides. Climbing plants will require the temporary tying up of young growths. They are best not tied permanently until after flowering, when pruning and thinning out of the growths that have flowered should take place. If mildew is prevalent, spray with an effective mildew specific, or dust with sulphur. Should the ground get very dry owing to insufficient rainfall, watering will have to be resorted to, and some stimulant should be given at the same time.

Dahlias.—If good individual flowers are required, a certain amount of attention must be given to disbudding and restriction of the number of growths. The old-fashioned method of trapping earwigs by placing inverted flower-pots partly filled with moss on the tops of the stakes is a good one, and should be practised. If the pots are examined frequently, the insects trapped can then be destroyed.

Sweet Peas.—The plants raised in pots from seed sown during the autumn are now flowering freely, and the question of watering will largely depend on what rain has fallen. The harm through insufficient watering shows itself by flower-buds dropping when quite small. If hoeing is done regularly and frequently, ten days should elapse between the applications of water. Plants which are disbudded and restricted to only two or three stems, require tying weekly. This may seem unnecessary work to some, but it is only possible to get first-class blooms by this system. The flowers should be cut as they open, whether they are required or not, so as not to waste any energy of the plants in developing seed-pods.

Plants Under Glass.

Gardenias.—Spring-rooted plants will be ready for another potting on, which should be into 4-inch or 4½-inch pots. Use good fibrous loam and a fair proportion of peat. During bright weather the blinds will be constantly in use, but should be pulled up whenever the sky becomes clouded. Damping down must be frequent, and the plants constantly dipped and sponged to keep down insect life.

Celosia pyramidalis.—If sown during the next fortnight, it is possible to have these plants in flower from November until February without any very special treatment. They flower quite well in 3½-inch and 4-inch pots. A warm greenhouse or intermediate temperature suits them.

The Kitchen Garden.

Broccoli.—Early winter varieties, such as Veitch's Self-Protecting, should now be planted. As very rich soil is not required, the ground which is being cleared of early Potatoes would do, and will not require any manuring previous to planting. As it is also undesirable for late winter and spring varieties to grow to a large size, owing to their not being able to withstand the winter so well as small and firm plants, the planting of these should be delayed still further.

Spinach which has run to seed can be cut down and dug into the ground. More might be sown for later use in some moist or shady border.

Endive.—This salad is not usually in much demand until Lettuces are scarce during the winter. If, however, it will be required during the autumn, seed should be sown now.

Celery.—Planting must continue as the plants become ready for setting out. They should be well watered immediately, and those planted out at an earlier date must not be neglected in this important matter if the weather is dry.

Vegetable Marrows.—Plants which are commencing to bear should have the fruits removed before they become large, whether required for use or not; this encourages more young fruits to swell. Where the plants are in an exposed position, it is safest to peg down the growths to prevent them becoming twisted and broken.

Fruit Under Glass.

Melons.—Being essentially a summer fruit, there is no great demand for Melons after the approach of cold weather in October and November. During the next week will be quite late enough to make a final sowing if the fruits are to develop that fine flavour that can only be had by the influence of abundant bright sunshine. As late crops are liable to get infected from earlier crops infested with red spider, every care should be taken to prevent this happening.

Ripe Grapes which are still uncut in the early viney will be better cleared for use, both for the sake of the Vines and the fruit, as with continued sunshine the berries will commence to shrivel. After cutting, the entire house should receive a good hosing or syringing to cleanse the woodwork, glass and the Vines. Syringing should be done daily, both in the morning and afternoon, and abundance of air admitted. A fair amount of food should still be applied whenever the borders require water.

Figs.—Where one has a number of Figs, the trees will be at different stages in separate houses. The early Figs are fast developing their second crop, and should have liberal treatment with manures, both in the materials used for top-dressing and by applying them when watering. Where Figs are ripening, a slightly drier atmosphere must rule, and the fruits should not be gathered until they show signs of cracking.

The Hardy Fruit Garden.

Peaches.—During dry weather the trees will benefit by a good syringing between 4 p.m. and 5 p.m. Insect life must be watched for, and destroyed on making its first appearance by spraying with a reliable insecticide. The trees must again be gone over to reduce the number of fruits, and the young growths nailed in their places, or, if the wall is wired, they ought to be tied in position. Laterals which may appear on the young growths should be pinched off when young and tender.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

SEASONABLE NOTES ON CHRYSANTHEMUMS.

NEW VARIETIES ON TRIAL.

It is always very interesting to watch the progress of the plants of new varieties, as many of them, like Roses, have distinctive foliage. It is quite possible for an expert to tell the names of the varieties of Chrysanthemums from the foliage.

Sports bear the features of their parents, but new ones emanating from seeds often have very distinct foliage, and the cultivator, growing them for the first time, must guess as to height and other details.

The Buds.—Undoubtedly the most interesting and absorbing feature is the bud of the new variety. If only one plant is grown, there is not much choice for selection, as either early or very late buds must be depended on. If several plants are grown, then both classes of buds can be selected, and I would advise cultivators to secure both kinds; then if the blooms from the early buds are disappointing, those from the later ones will probably be very satisfactory, and afford full compensation for the sacrifice of the others.

Tying and Training.—The plants are now growing freely, and all that are healthy will continue to do so with added vigour as the autumn days come. The shoots of all plants do not require tying every day, but certain ones will, and thus the cultivator will have some tying to do every day if he wishes to keep all shoots secure against strong winds. There are two methods of tying—one, the fastening of each shoot to the stake to within 2 inches of the point; the other, looping several of the shoots to one stake. When the latter method is followed, the strand of matting is passed round the shoot about nine inches below its point; that part of the stem is fairly hard, and does not readily break off when bent by the wind. This is a good way of securing the branches of specimen plants and others grown for the production of cut flowers and for greenhouse furnishing. Always allow space for the swelling of the stems, else the latter will buckle and break off. After a shower of rain the tying material slips down and becomes very tight; allowance must be made for this. It is also advisable to examine the ligatures on exhibition specimens and put them right again.

Side Shoots.—These grow rapidly, too, and must be removed while quite small, else they will rob the plants of much strength. All plants should be restricted to main stems and main leaves, and, later on, to crown or terminal buds in addition. If the side shoots growing in the axils of the leaves are left to attain a large size, it is scarcely possible to remove them without doing some damage to either the leaf or stem. If cut away, then more shoots grow. So the best plan is to pinch them out with the fingers and thumb while quite small.

The First Top-Dressings.—The up-to-date cultivator does not rely on one, or even two, top-dressings, but begins in July and continues to put on thin layers of a suitable compost as frequently as the roots require it. We will presume that ample space has been left for top-dressing material. Probably some of the plants were finally potted early in May. By the present time the new soil will be filled with roots, and it would be bad policy to wait until a certain date before giving them the assistance they stand in need of from a surface mulch. The compost should consist of rich loam, passed through a half-inch

mesh sieve, one part; sweet leaf-soil, also sifted, one part; some good rotted manure, one part; and sand and a reliable concentrated manure, as advertised in the pages of this paper, one part. A fairly large bulk of compost may be prepared and stored in a cool shed, to be used as necessary. Pick out all those plants that show roots on and near the surface. See that the ball of soil is watered thoroughly, and then put on a sprinkling of the mixture prepared, just enough to nicely cover the surface. Afterwards all water and liquid manure must be applied through a rosed watering-can, so as not to disturb the new soil and injure the roots permeating it. Always rap the pot to ascertain if the old ball of soil is moist enough below, otherwise the wet appearance of the top soil might prove misleading. The roots will soon enter the fresh compost and show on its surface like little white knuckles. When advanced as far as this, it will be time to apply another top mulch, and so the work should go on until the space is filled up. The steady progress of the plants is better ensured thus than when one heavy surface-dressing is given.

"Taking" Buds.—It seems early to be thinking about the work of "taking" buds, but it is not too soon, as the first-crown buds of some of the naturally late-flowering varieties will appear during the last few days of July. Now, if these buds are removed, the next ones will be too late, especially for exhibition purposes. Begin to "take" them when they are quite free of the side shoots by pinching out one shoot every other day. By August 5 the buds will be "taken."

AVON.

SEASONABLE NOTES ON VEGETABLES.

MUCH detail work with the various vegetable crops has to be gone through at this season if success is to be achieved. A spell of dry weather brings much work, and unless prompt steps are taken to combat the evils of drought, the work of months may be undone. For instance, a crop of Peas just coming into bearing may easily be ruined by an attack of mildew consequent on drought at the roots; whereas a timely heavy watering, afterwards mulching each side of the row with short manure or decayed vegetable refuse and old potting soil to conserve the moisture, will save the crop. I drew attention to this subject some few weeks ago; but the matter is so important, having such a wide bearing on the success or otherwise of the crop, that I offer no apology for again drawing attention to the matter.

The Value of Surface Cultivation.—Among such crops as Carrots, Parsnips, Beet and Turnips, where it is not practicable to apply mulchings, or even water, stirring the surface soil 1 inch or 2 inches deep with a Dutch hoe is of inestimable value, preventing cracks being made in the soil, and so retaining moisture.

Broad Beans.—Following a mild winter those sowings made in October or November have proved a success; full crops of good Beans have been secured much earlier than from spring sowings. The plants now podding should have assistance with heavy waterings of liquid manure if possible. If extra good pods are required, thin the clusters, thus giving the plants less to

support. Later batches now coming into flower should be topped, to induce a quicker setting of pods and to destroy black fly, which quickly infests the growths during dry weather. Plants badly affected should be syringed with some insecticide, such as Tobacco water and soft soap.

Asparagus.—This crop has been a huge success this season where cultivation is of a reasonable character. It is surprising how well Asparagus grows in stiff soil if properly prepared by deep trenching and heavy manuring. Cutting should cease by this time, and, where possible, young plantations should be assisted with copious supplies of liquid manure or sewage water. Indeed, old beds would receive much benefit by such treatment, as the more robust the growth now, the greater is the prospect of improved returns next season. Keep the soil quite clear of weeds.

Cauliflowers.—April-sown plants will now be ready for putting out in quantity. Mammoth, for instance, will not require so much space as Autumn Giant. Water in when planting; then the next day loosen the soil about them, and keep them regularly supplied with moisture until finally established.

Celery.—The early sown batches are now making rapid headway. Plants required for use in August should have the first paper bands put on instead of blanching with soil, as under the former method the plants can be regularly supplied with water to increase the size of the stems. Continue to put out plants in trenches for the general crop. Double rows answer as well as single, and economise space. Some plant three rows in one trench, and although this method will succeed, it is much more difficult to earth up the plants properly. Well water newly put out plants, dust them lightly with soot occasionally, and sprinkle the plants overhead with water in the evening after a hot day.

Parsley.—Make a sowing for winter use, choosing a sheltered site in a district where there is any difficulty in keeping up a supply during the winter months, or, what is better still, sow on a south border where a frame can be put over the plants in the autumn. For autumn use, continue to put out plants from the first sowing on a border as an edging to a path, where it is handy to pick from. Plants that have done duty during the winter and spring are now running to seed, and should be pulled up, as they are useless. Manure and dig over the ground, and put in another crop of some kind.

Vegetable Marrows are growing away freely, and need quantities of water to ensure full and early crops of quickly grown Marrows. Thin out the shoots to prevent overcrowding, which is a hindrance to a full crop, often resulting in the premature dropping of small fruits, even when they are thought to be safely "set" and swelling. Want of moisture at the roots is also often the cause of this trouble. Excessive manure for the roots to ramble in will also cause this premature casting of fruit.

Outdoor Tomatoes are now growing freely, and should be encouraged to do so as much as possible by nightly syringings after a hot day, especially when the plants are at the foot of a south wall. Until a full crop of fruit is set, liquid manurial stimulants are not required; in fact, such may do harm, as too gross a growth might result, causing premature dropping of the fruit blossom.

Swanmore Park, Hants.

E. MOLYNEUX.

ANSWERS

TO CORRESPONDENTS.

FLOWER GARDEN.

DOUBLE DAFFODILS NOT FLOWERING (A. B. C., *Laues*).—The bulbs have obviously been too long in their present position, and have become crowded and weak; hence their not flowering. We presume they are healthy, as you say nothing to the contrary. The remedy is lifting, division and replanting. Allow the growth to fully mature, and lift the bulbs any time during the first half of July, laying them out quite thinly in any airy shed or shady place on a hard bottom in the open. By the end of July they will have dried sufficiently, and may be divided, separated into two or three sizes, and roughly cleaned ready for replanting. The largest bulbs may be replanted in a bed or border; the others had better be planted in a reserve plot in lines a foot asunder and an inch or so between the bulbs. Four inches deep will be sufficient for all. Plant the larger bulbs 3 inches to 5 inches apart in beds; this will afford them room to develop, and may suffice for three or four years. Do not replant any in the old positions, but choose a fresh site for the bulbs. In this way they get the benefit of new soil, which is most important. Let the ground be deeply cultivated and moderately manured. Keep the manure well below the bulbs. Replant any time in August, the earlier the better. It is highly probable that the bulbs will not flower next year owing to weakness, but by adopting the above measures you will be laying the foundation for future success.

MISCELLANEOUS.

CUTTING DOWN PÆONIES AFTER FLOWERING (Clogher).—It would be unwise to cut down the Pæonies immediately after flowering, as it would undoubtedly very considerably weaken the plants, and in all probability prevent them flowering next year. It should be remembered that a plant feeds through its leaves almost as much as through its roots, both sources being necessary for proper development. The seed-pods ought to be removed immediately they are formed.

STARTING A BUSINESS (Tea Planter).—We have referred your letter to an expert of long standing in these matters, who sends the following reply: "It is not easy satisfactorily to answer the questions submitted from the particulars given. The land may be cheap or dear, depending upon its quality, the possibility of approach and the distance or nearness to a railway station, since all the goods produced will have to be sent some distance. That there is plenty of land in the district named eminently fitted for bulb-growing is well known, though it does not follow that the field referred to is included therein. If you have seen it, you should be the better judge. The price for the glass houses and sheds appears reasonable on the face of it, but may be cheap or dear according to material supplied, viz., wood, glass, quality and number of coats of paint, hot-water piping and general efficiency of heating. Tomatoes under glass are only really profitable when obtained quite early, i.e., ripe in June and July, and, in order to secure this result, not only is an early start necessary, but absolute efficiency in heating. In any case the number of plants named—3,000 per house—is far in excess of what could reasonably be accommodated, and overcrowding has to be paid for pretty dearly at times. Generally speaking, the price for the glass houses, if these were isolated—that is, separately built—would be considered reasonable, and dear if arranged on the compound plan. We note they are all of one size, whereas a smaller structure apart for raising the young plants is, in our opinion, essential. Have you not been supplied with a specification of what is to be done for the amount named? This is most important from every point of view, in your own interests and as concerns the stability and due execution of the work. If you have a specification, you should confer with an expert to go through it with you, as only by a critical examination of it could any satisfactory conclusion be reached concerning the cost. As the estimated initial outlay is considerable and much other expense must be faced before any return is possible, we think your better plan, seeing you have no practical knowledge of the subject, would be to obtain independent advice before proceeding further in the matter."

NAMES OF PLANTS.—A. B.—We cannot name plants for anonymous correspondents. Please see and observe rules which appear nearly every week.—*Stewart Irwin*.—*Zephyranthes carinata*.—W. H. S.—1, *Quercus rubra*; 2, *Cotoneaster frigida*; 3, *Coronilla varia*; 4, *Geranium Endressii*; 5, *Erodium Manescavii*; 6, *Veronica Tuericum*; 7, *Erodium macradenum*; 8, *Helianthemum vulgare venustum*; 9, *Rose Goldfinch*; 10, *Sedum species*.—A. T. *Somercote*.—1, *Sedum album*; 2, *Sedum species*; 3, *S. rupestre*. These names are provisional, for the specimens were too small for correct determination.—W. C. B.—*Akebia quinata*.—J. G. K.—*Burning Bush* (*Dicamnus albus purpureus*).—*Hedgerley*.—*Sea Milkwort* (*Glaux maritima*).—R. H. *Chard*.—*Rose Clio*.—E. H. W.—The Maidenhair Fern Tree (*Ginkgo biloba* or *Salisburia adiantifolia*).—R. M. E. Y.—1, *Paul Perras*; 2, *Paul Ricaut*; 3, *Mrs. J. It is a semi-climber, and makes a fine big bush. No. 2 is *Lady Waterlow*.—A. *Hodgson*.—*Mrs. Stewart Clark*.—A. G.—*Primula japonica* and *Ranunculus aconitifolius*.

SOCIETIES.

CITY OF LONDON ROSE SOCIETY.

THE third annual show in connection with the above society was held at the Cannon Street Hotel on Thursday, the 24th ult., and proved a great success. Indeed, it was the best show the society has held. The blooms were excellent, and in most classes competition was very keen. The arrangements reflected the greatest credit on the energetic hon. secretary, Mr. A. E. Prothero, and the committee. In the evening the flowers were sold on behalf of the British Red Cross.

NURSERYMEN'S CLASSES: EXHIBITION ROSES.

In the nurserymen's champion trophy class, forty-eight blooms, distinct varieties, were asked for. There were six competitors, Messrs. B. R. Cant and Sons, The Old Rose Gardens, Colchester, being placed first. Though not over-large, their blooms were very clean and even, and no doubt this carried weight with the judges. Kil-larney, H. V. Machin, J. B. Clark, Mrs. W. J. Grant, Freda, Edward Mawley and Mrs. George Norwood were a few of the best blooms. The second award went to Messrs. R. Harkness and Co. of Hitchin, who had large, well-coloured flowers, notable among them being George Dickson, Mrs. A. Hawsworth and Mildred Grant. Messrs. Chaplin Brothers, Waltham Cross, were third.

In Class 2, for twelve distinct varieties, three blooms of each, there were five exhibits, Messrs. B. R. Cant and Sons again occupying the premier position. Their blooms were clean and good, Augustus Hartman, St. Helena and Mrs. George Shawyer being the best. Messrs. D. Prior and Son of Colchester were second, Maréchal Niel and Mildred Grant being in splendid condition here. Messrs. Alex. Dickson and Sons, Limited, Newtownards, Ireland, were third, their blooms of Dean Hole being very fine.

For eighteen blooms, distinct varieties, Teas and Noisettes, three competitors tried conclusions, the premier award going to Mr. George Prince, Longworth, Berks, for some very fine, well-coloured flowers. Maman Cochet, Medea, Mme. C. Soupert and Nita Weldon called for special mention. Messrs. Frank Cant and Co., Braiswick, Colchester, were placed second, their flowers being good, but rather small. Comtesse de Nadailac and Mme. Jules Gravereaux were their two best. Messrs. D. Prior and Son of Colchester were third.

DECORATIVE ROSES.

The class for eighteen bunches, distinct varieties, was very charming, three exhibitors staging some very attractive bunches. Messrs. Frank Cant and Co., Braiswick Rose Gardens, Colchester, were first, such varieties as Rayon d'Or, Lady Pirrie, Lady Hillingdon, Lady Battersea and Una showing to great advantage. Messrs. W. and J. Brown of Peterborough were a good second, Mrs. Rosalie Wrinch, Sarah Bernhardt and Irish Fire-flame being very charming. Mr. George Prince of Longworth was third, his flowers also being clean and good.

The class for seven baskets of cut Roses was rather spoiled by the baskets being staged in different parts of the building. Messrs. Chaplin Brothers, Waltham Cross, were a good first with a magnificent display, their Irish Fire-flame, Lady Ashtown, Old Gold, Mrs. Herbert Stevens and Mme. Edouard Herriot being exceptionally pleasing. Mr. E. J. Hicks, Hurst, Berks, was second, his baskets including his new crimson single Princess Mary and Rayon d'Or. Mr. George Prince was a good third.

For twelve blooms of new exhibition Roses, distinct varieties, introduced in 1912, 1913 or 1914, five competitors tried conclusions, the first prize going to Mr. George Prince, Longworth, for a really wonderful dozen. Edgar Burnett was a magnificent bloom, and Mrs. Forde also called for special mention. Mr. E. J. Hicks, Hurst, Berks, was second, his box including a marvellous bloom of the new crimson Augustus Hartman. Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, were third.

OPEN AMATEURS' CLASSES: EXHIBITION ROSES.

In the open amateur trophy class, twenty-four blooms, distinct varieties, were asked for, and four exhibitors tried conclusions, Mr. H. L. Wettren, Sanderstead, Surrey, winning the trophy with some remarkably good blooms. William Shean, Amy Hammond and Mildred Grant were of exceptional merit. Second honours went to Mr. G. C. Sawday, Weybridge. We noticed St. Helena, Mrs. J. H. Welch and Mrs. Foley Hobbs in grand form here. Mr. W. Onslow Times, Hitchin, was placed third.

For twelve blooms, distinct varieties, there were five boxes staged, the best coming from the Rev. F. R. Burnside, Great Stambidge Rectory, Essex. Mrs. W. J. Grant and Mme. Melanie Soupert were two notable flowers. Mr. G. C. Sawday, Weybridge, was a good second, his flowers of St. Helena and Mrs. J. H. Welch being exceptionally fine. Third prize went to Mr. L. Courtenay Page, Enfield.

MEMBERS' CLASSES: EXHIBITION ROSES.

Open Only to Members of the Society. Twelve blooms, distinct varieties, had to be shown for the City of London Championship Trophy. There were two competitors, Mr. H. L. Wettren winning the first prize in fine style. His blooms were large and good throughout, and we have rarely seen Bessie Brown and Mrs. Foley Hobbs shown better by an amateur. Mr. J. Hart was a good second, his flower of Mrs. J. H. Welch being magnificent.

For six distinct varieties, three blooms of each, there were only two competitors, the premier award going to Mr. H. L. Wettren, Water Lane, E.C., for some remarkably good blooms. His William Shean and Lady Ashtown were especially noteworthy. Mr. J. Hart, Spital Square,

E.C., was awarded second prize, his blooms being small, but good.

For nine blooms, not fewer than six varieties of Teas and Noisettes, there were only two competitors, Mr. J. Hart being placed first with good, solid flowers. His White Maman Cochet and Mme. Jules Gravereaux were very deep and fine. Mr. H. L. Wettren was second, his flowers being rather badly weather-marked.

For six blooms of any one variety, Mr. H. L. Wettren was first out of two competitors with a grand half-dozen of J. B. Clark. Mr. J. Hart coming second with rather small blooms of William Shean.

Open Only to Growers of Fewer than 1,000 Plants of Exhibition Roses.

For nine blooms, not fewer than six varieties, Mr. Lewis S. Pawle, Stock Exchange, was first out of six competitors, his Mrs. J. H. Welch and Mildred Grant being grand. Mr. H. Shurey, Tudor Street, E.C., was second, and third prize went to Mr. W. E. Moore, 43, Hatton Gardens.

In the class for six blooms, any one variety, there were six entries, Mr. L. S. Pawle coming first with Bessie Brown; Mr. R. de Escotet, 55, Holborn Viaduct, second with Florence Pemberton; and Mr. C. W. Edwards, Sutton, Surrey, third with Mme. Jules Gravereaux.

Class 15, for six blooms, not fewer than four varieties of Teas and Noisettes, brought only four boxes, all of which were rather poor.

Open Only to Growers of Fewer than 500 Plants.

For nine blooms, not fewer than six varieties, eight boxes were staged, first prize going to Mr. H. Shurey for a very good lot of blooms, J. B. Clark being his best. Mr. W. E. Moore was second, followed by Mr. C. W. Edwards.

For five blooms of any one variety to be shown in a vase, eleven vases were staged, Mr. A. E. Coxhead, 30, Milk Street, E.C., being first, Mr. A. E. Clarke second, and Mr. S. B. Langton third.

Open Only to Growers of Fewer than 250 Plants.

For six blooms, distinct varieties, Mr. W. Fortescue was first out of three competitors, being followed in the order given by Mr. A. Palk and Mr. E. J. Syer.

In Class 19, for six blooms, not fewer than three varieties, Mr. S. F. Chamberlain was first out of six competitors, his bloom of Mrs. J. H. Welch calling for special comment. Mr. W. Fowler was second, and Mr. W. A. Shipley third.

For three blooms of any one variety, to be shown in a vase, Mr. A. Palk was first out of ten competitors with good blooms of Mme. Melanie Soupert, being followed by Mr. W. Fortescue and Mr. A. E. Stanger.

Open Only to Growers of Fewer than 150 Plants.

In Class 21, for six blooms, not fewer than four varieties, six boxes were staged, Mr. W. E. Winstone, Stanning Lane, E.C., coming first with good blooms. Mr. D. Ribbons was second, and Mr. A. F. Blades third.

For three blooms, any one variety, to be shown in a vase, Mr. W. E. Winstone was a good first with three blooms of George Dickson, one of which secured the medal for the best bloom shown in Classes 18 to 25. Mr. E. C. Owen was second, and Mr. A. F. Blades third.

Open Only to Growers of Fewer than 100 Plants.

For six blooms, not fewer than four varieties, nine boxes were staged, the premier award going to Mr. W. Alstrom, 76, Great Eastern Street, E.C. Mr. S. H. Gregg was second, and Mr. F. G. Pocock third.

For three blooms of any one variety, to be shown in a vase, there were eleven entries, Mr. W. Alstrom being first with Mme. Melanie Soupert. Mr. G. Haward was second with Mme. Jules Gravereaux, and Mr. A. J. Collins third, Dean Hole being his variety.

In a similar class for growers of fewer than fifty plants as per list, Mr. L. R. Goddard was first, his blooms of Miss Cynthia Forde and Lady Alice Stanley being very fine. Mr. G. Haward was second, and Mr. W. Markham third.

METROPOLITAN CLASSES.

For twelve blooms, distinct varieties, four boxes were staged, the premier one coming from Mr. R. de Escotet, Dulwich. He had a magnificent bloom of William Shean, which secured the medal for the best flower shown in Classes 26 to 31. Mr. A. E. Clarke, Kent, was second, and Mr. A. E. Coxhead third.

The class for six blooms, distinct varieties, brought forth seven competitors, Mr. A. E. Stanger, Streatham Park, Mr. W. A. Shipley and Mr. A. Wilkinson winning in the order named.

For three blooms, distinct varieties, to be shown in a vase, ten vases were staged, Mr. W. Alstrom being first, followed by Mr. W. E. Winstone and Mr. R. S. Fitter.

INNER SUBURBS.

For nine blooms, distinct varieties, the trophy went to Mr. R. de Escotet, Dulwich, who had good, clean blooms. Mr. A. W. Burgess, Honor Oak, and Mr. W. A. Shipley, East Dulwich, were second and third respectively.

DECORATIVE ROSES.

For twelve bunches, distinct varieties, there were three entries, the first prize, including the decorative championship trophy, going to Mr. A. C. Turner, 29, Great St. Helens, E.C., for a most creditable lot of flowers, his La Tosca calling for special mention. Mr. H. L. Wettren had a very fine lot of blooms in his second prize group, but evidently lost points in arrangement. Third prize went to Mr. G. Gally.

For six bunches there were also three entries, Mr. A. C. Brown coming first with some very beautiful and well-arranged flowers. Mr. J. Walter Smith was second, and Mr. A. E. Clarke third.

For three bunches Mr. H. P. Page was first out of four competitors, his Aglaia being very charming. Mr. R. Woosnam and Mr. A. G. Warren followed in the order given.

For nine vases, distinct varieties, Mr. H. L. Wettern and Mr. A. C. Turner were the only competitors, winning first and second prizes respectively. Mr. Wettern's flowers were exceptionally well coloured, his Lady Hillingdon and Warrior calling for special mention.

For three vases Mr. P. L. Goddard was a good first in strong competition, staging Mme. Edouard Herriot, Mme. Leon Pain and Richmond in good condition.

LADIES' ARTISTIC CLASSES.

For a bowl of cut Roses with Rose foliage there were seven competitors, the Ladies' Challenge Vase being won by Mrs. A. C. Brown, Brakes Lodge, Reigate, with a very light and graceful bowl. Mrs. Alex. Robinson, Park Hill, Carshalton, was second, and Mrs. L. Courtenay Page, Enfield, third.

For a vase of cut Roses Mrs. A. C. Brown was again first out of five competitors, her vase being very lightly and artistically arranged. Mrs. A. P. Page was second, and Mrs. H. Straker third.

SPECIAL OPEN CLASSES FOR AMATEURS.

Class 40 was for nine vases of Roses, distinct varieties, not more than seven or fewer than five in a vase. There were five entries, the Red Cross Cup going to Mr. G. C. Sawday, Beechfield, Weybridge, who was a good first with magnificent blooms, his Mrs. J. H. Welch calling for special mention. Mr. H. L. Wettern was a close second, his G. C. Waud being exceptionally good. Mr. G. Marriott was third.

Class 41 was for five vases. The Rev. F. R. Burnside was first in strong competition, his Mme. Melanie Soupert and Betty being wonderfully well coloured. Mr. C. A. L. Brown was second, and Mr. A. E. Passingham third.

THE BEST BLOOMS IN THE SHOW.

Classes 1 to 6, Killarney, shown by Messrs. B. R. Cant and Sons.

Classes 9 to 17, Maréchal Niel, shown by Mr. J. Hart. Classes 18 to 25, George Dickson, shown by Mr. Winstone. Classes 26 to 31, William Shean, shown by Mr. Escotet.

NON-COMPETITIVE GROUPS.

Mr. W. Easlea, Danecroft Rosery, Eastwood, Essex, arranged a very beautiful group, comprising many new as well as some of the older varieties. Lady Bowater, a pale bluish Hybrid Tea of grand vigour, form and substance, attracted much attention. It is a new Rose that exhibitors will find very useful. Mme. Edouard Herriot, Lady Hillingdon, Irish Fireflame and Old Gold were others that called for special mention. Gold medal.

The Rev. J. H. Pemberton, Romford, had an artistic group composed mainly of the perpetual-flowering ramblers raised by him in recent years. A new one named Thisbe is very promising, the colour of the flowers somewhat resembling that of William Allen Richardson. The clusters are large and free.

Mr. E. J. Hicks, Hurst, Twyford, Berks, staged a large collection of ramblers and bush varieties, these attracting much attention. Among the larger flowers the new, very fragrant pink Mrs. George Norwood was very fine. The new Mrs. Charles Reed, cream, flushed deep pink, was also very good. Gold medal.

Messrs. Carter Page and Co., London Wall, had a fine group of Violas tastefully arranged in flat bowls, with Asparagus Sprengeri and Adiantum furnishing the necessary greenery.

CROYDON HORTICULTURAL SOCIETY.

THIS vigorous society merits congratulations from several standpoints to-day, though chiefly from the fact that the exhibition on June 23 was the forty-eighth held under the auspices of the society, and, with its jubilee in sight, is still going strong, and the equally important fact that the proceeds of the show were to be devoted to the Mayor's War Relief Fund. Patriotic in the highest degree, we think many other societies might have done likewise, thereby securing the sympathy of the public and turning horticulture to the best possible service in this hour of the nation's need. There were many excellent exhibits on view, though the Roses, both for quality and numbers, would be difficult to beat.

The Lady Eldridge Challenge Cup, for forty-eight Roses, distinct, brought three competitors, Messrs. B. R. Cant, The Old Rose Gardens, Colchester, who last year had the honour of winning the nurserymen's challenge cup outright, again occupying the premier position with an admirable lot, from which we selected Lady Helen Vincent, Edward Mawley (fine red), Mme. Melanie Soupert, Juliet, Lyon Rose, Elizabeth (very beautiful), H. V. Machin, George Dickson, Marquise de Sinety, Dean Hole and Killarney. Messrs. F. Cant and Co., Colchester, were second with many good flowers, Mrs. J. Bateman, H. E. Richardson (red) and Ulrich Brunner being among the best. Messrs. Prior, Colchester, were third.

For twenty-four Roses, distinct, four contested, Messrs. Chaplin Brothers, Joyning's Nurseries, Waltham Cross, being placed first, having superb examples of Mrs. J. H. Welch (pink), George Dickson, J. B. Clark, Mildred Grant, Mrs. C. E. Russell (pink) and Mrs. Chaplin. Mr. George Prince, Oxford, was second.

For twelve Roses, one variety, eight competitors entered, Mr. Elisha J. Hicks taking the place of honour with the rich pink, highly fragrant Mrs. George Norwood, the flowers being very fine; second, R. W. Hammond, Esq., Burgess Hill; third, Messrs. B. R. Cant, both showing Lady Ashtown.

Eighteen trebles, distinct: First, Messrs. B. R. Cant, Colchester, who staged Lady Helen Vincent, Margaret, J. B. Clark, Mildred Grant, Mabel Drew, British Queen, Lieutenant Chauré and others; second, Messrs. Chaplin Brothers.

Eighteen Teas or Noisettes, distinct: First, Mr. Henry Drew, Longworth, Berks, whose best were Mrs. Foley

Hobbs (silver medal), White Maman Cochet, Golden Gate (pink), Souvenir de Pierre Notting, Mme. Constance Soupert and F. V. Marshall (rose); second, Mr. G. Prince.

Twelve bunches of garden Roses: First, Mr. Elisha Hicks, Lady Hill, Lady Pirrie, Mrs. H. Stevens and Rayon d'Or being the best.

For five baskets of cut Roses in five distinct varieties, Messrs. Chaplin Brothers, Waltham Cross, were first with Duchess of Wellington, Mme. Edouard Herriot (very fine colour), Mme. Segond Weber, Richmond and Miss Cynthia Forde; second, Mr. Henry Drew, Longworth. A very attractive class.

AMATEURS' CLASSES.

Twenty-four Roses, distinct: The first prize, the Society's Challenge Cup, was won by Mr. H. L. Wettern, Sanderstead, who had superb examples of Edward Mawley, H. V. Machin (red), Lady Ursula (pink), Mrs. J. Laing and Mme. Jules Gravereaux. Dr. T. E. Pallett, Earl's Colne, Essex, was second, his Lieutenant Chauré gaining the silver medal.

Dr. Pallett was first for eight trebles, and secured the Frank Cant Challenge Cup, again showing Lieutenant Chauré admirably among others.

Dr. Pallett was again in the place of honour for eighteen Teas and Noisettes, having The Bride, Bridesmaid, Mrs. Foley Hobbs and White Maman Cochet.

Eighteen Roses, distinct: First, Dr. C. Lamplough, Kirkstall, Alverstone, Mme. Jules Gravereaux (silver medal), George Dickson, Mme. Constance Soupert and Mildred Grant being excellent.

Six Roses, one variety: The first prize (a piece of plate presented by the Mayor of Croydon) went to Mr. H. L. Wettern for a superb lot of J. B. Clark.

The finest lot of Sweet Peas came from Mr. W. Humphreys, Loampits, Tonbridge, his dozen including Hercules, Marvel (an improved Margaret Atlee), Mark's Tey (purple), Barbara (a most lovely orange), Elsie Herbert, King Manoel, Lavender George Herbert and others. The flowers were very fine.

Mrs. Wettern secured the first prize for a table decoration of cut Roses, employing Irish Elegance and light Rose trails to great advantage.

For a group of plants staged for effect, Mr. J. W. Colyer, gardener to A. H. Allen, Esq., Wandie Court, Beddington, was first, employing Crotons, Gloxinias, Begonias, Caladiums, Odontoglossums, Palms, Kalanchoe flammea and Ferns with considerable skill. Every plant, indeed, told. The group was well finished off with a border of Panicum variegatum.

NON-COMPETITIVE EXHIBITS.

In the non-competitive section Mr. Elisha J. Hicks had a superb stand of Roses, among which Mrs. George Norwood (fine fragrance, pink-flowered), Rayon d'Or (very rich in colour), Ada Paulin (a seedling raised by the exhibitor from Anna Olivier), Lady Hillingdon, Duchess of Wellington, Irish Fireflame and Princess Mary stood out conspicuously.

Messrs. Young and Co., Cheltenham, contributed a fine stand of Carnations, Bath's Premier (yellow), The Geisha (fancy) and Mikado being noticeably good vases.

THE WINDSOR ROSE SHOW.

By kind permission of His Majesty the King, the Windsor Rose and Horticultural Society held their twenty-fourth annual exhibition in the private grounds at Windsor Castle on Saturday, June 26. The exhibits were numerous and of the highest quality, and the competition was keen throughout. There were a large number of visitors, and all enjoyed the excellent music supplied by the 2nd Life Guards Band.

OPEN CLASSES.

The coveted King's Cup, presented by His Majesty as first prize for forty-eight blooms, distinct varieties, was won by Messrs. B. R. Cant and Sons of Colchester; second, Messrs. R. Harkness and Co., Hitchin; third, Messrs. Alex. Dickson and Sons, Newtownards; fourth, Messrs. D. Prior and Son, Colchester.

Class 2, eighteen distinct Teas: First, Messrs. Frank Cant and Co.; second, Mr. Henry Drew; third, Mr. G. Prince, Oxford.

Class 3, twelve distinct varieties, three blooms of each: First, Messrs. B. R. Cant and Sons; second, Mr. Henry Drew; third, Messrs. Alex. Dickson and Sons.

Class 4, twelve Hybrid Perpetuals or Hybrid Teas: First, Mr. A. Hartman; second, Mr. Henry Drew; third, Mr. Elisha J. Hicks with Mrs. G. Norwood.

Class 5, twelve Tea Roses: First, Messrs. D. Prior and Son; second, Messrs. Burch, Peterborough; third, Messrs. R. Harkness and Co. All three exhibited Mme. Jules Gravereaux.

Class 6, eighteen bunches of decorative Roses, distinct varieties: First, Messrs. B. R. Cant and Sons; second, Mr. Charles Turner, Slough; third, Messrs. George Jackman.

Class 7, twelve crimson and twelve white: First, Messrs. B. R. Cant and Sons with Edward Mawley and Mrs. A. Carnegie; second, Mr. Henry Drew; third, Messrs. R. Harkness and Co.

OPEN TO AMATEURS.

Class 8, twenty-four distinct varieties: First and the Windsor Challenge Cup, Mr. F. Denniston. This exhibit contained the best Rose in the show, to which the society's silver-gilt medal and award of merit were given. Oberhofgartner being the variety. Second, Mr. H. L. Wettern; third, Dr. T. E. Pallett.

Class 9, the Islet Challenge Cup, eight distinct varieties, three blooms of each: First, Mr. F. Denniston; second, Dr. Lamplough; third, Dr. T. E. Pallett.

Class 10, twelve Tea Roses, distinct: First, Mrs. Henry Balfour; second, Dr. Lamplough; third, J. B. Fortescue, Esq., Dropmore.

Class 11, eighteen blooms, distinct varieties: First, J. B. Fortescue, Esq.; second, the Rev. J. B. Shackie.

Class 12, challenge cup presented by Lady Julia Follett: First, Dr. Lamplough; second, Mrs. H. Balfour; third, J. B. Fortescue, Esq.

Class 13, twelve blooms, distinct varieties: First, Dr. Lamplough; second, Mrs. Henry Balfour; third, Mr. L. S. Pawle.

LOCAL CLASSES.—OPEN TO AMATEURS WITHIN TEN MILES OF WINDSOR.

Class 14, twenty-four blooms, distinct varieties: First, Mr. Dixon H. Davis. This exhibit contained the best Hybrid Tea in the local classes, for which the bronze medal was awarded, the variety being Mrs. Theodore Roosevelt. Second, C. Romaine, Esq.

Class 15, challenge cup presented by Lady Mary Arkwright for six blooms, distinct: First, Mr. G. C. Sawday; second, Mr. L. S. Pawle. This exhibit contained the best Hybrid Perpetual Rose in the local classes, for which the bronze medal was awarded, the variety being Hugh Dickson. Third, Mr. G. Bishop.

Class 16, challenge cup presented by Mrs. Bevil Fortescue, for eighteen Teas or Hybrid Teas, distinct varieties: First, Mr. G. C. Sawday; second, E. G. Mocatta, Esq.; third, C. Romaine, Esq.

Class 17, nine Teas: First, the Rev. J. B. Shackie; second, the Rev. F. G. Phillips; third, Mr. G. C. Sawday.

Class 18, six Hybrid Perpetuals or Hybrid Teas: First, E. G. Mocatta, Esq.; second, A. L. F. Cook, Esq.

Challenge cup presented by Lady Evelyn Mason for six Tea Roses: First, Mr. E. W. Bishop; second, the Rev. R. H. Tower; third, Mr. R. Arkwright.

Challenge cup presented by S. Osborne, Esq., for twelve blooms, distinct varieties: First, Mrs. S. Monkland; second, Mr. J. G. Carey.

Challenge cup presented by Lady Dyson for the most tastefully decorated dinner-table: First, Miss M. Fairbank; second, Mrs. Rice.

Challenge cup presented by A. L. F. Cook, Esq., for twelve varieties of Sweet Peas: First, Lord North; second, Major L. Lubbock.

Cup presented by Mrs. Fortescue for twelve varieties of Sweet Peas: First, A. L. F. Cook, Esq.; second, Mr. F. A. Bishop; third, F. Ricardo, Esq.

VEGETABLES.

Special prize offered by Messrs. J. Carter and Co.: First, Lady Barry; second, Miss Langworthy.

Special prize offered by Messrs. Sutton and Sons, Reading, for the best collection of vegetables: First, Miss Langworthy; second, Lord North; third, Viscountess de Janze.

NON-COMPETITIVE EXHIBITS.

There were several non-competitive exhibits, and these included a very fine collection of herbaceous plants from Mr. Allgrove, Langley, Bucks, among which were fine spikes of Eremuri, Delphiniums, Primula capitata, P. bulleyana, P. beesiana, P. sikkimensis, P. vittata, Lavatera Olbia, Lychnis grandiflora and Gaillardia Lady Rolleston.

Other exhibits came from Messrs. Young, Cheltenham; Mr. Elisha J. Hicks, Messrs. Jackman; Messrs. Bide, Farnham; and Mr. C. Turner, Slough.

* * * The Yearly Subscription to THE GARDEN is: Inland, 6s. 6d.; Foreign, 8s. 9d.

Mrs. PYM'S FAMOUS PLANTS

Strong, sturdy, perfectly satisfactory plants, half-price to clear. Postage extra; 4d. for orders up to 2s.; 5d. for 3/- worth, and so on.

15 Antirrhinums 6d	6 Marguerites, single

THE GARDEN.

No. 2277.—VOL. LXXIX.

JULY 10, 1915.

NOTES OF THE WEEK.

Planting Potatoes During July.—With the price of almost every necessity showing a considerable increase, it is the duty of everyone to grow as much wholesome food as possible. We therefore remind readers that sound old potatoes, planted now, will, if the weather proves all favourable, give excellent crops for lifting and eating late in the autumn. Ground that has been occupied by early Peas, Shallots and Cauldads, if forked over, might be utilised in this way. Short Horn Carrots, Turnip-rooted Beet, Turnips and winter Onions may all be sown during the next three weeks with every prospect of success. The Onions may be sown as late as the second week in August.

A Beautiful Dwarf Erigeron.—The award of merit granted by the Royal Horticultural Society a fortnight ago to *Erigeron Asa Gray* should tend to draw more attention to a useful but comparatively little-known race of hardy plants. The accompanying illustration represents one of the prettiest, and one that can be purchased at about fourpence a root, yet it is seldom seen in even good gardens. A native of the Northern United States, it has been known in this country for many years under the name of *E. glabellus*. As will be seen, it forms a neat plant about a foot in height, its lavender purple flowers, each about an inch in diameter, being produced in abundance during June and early July. It is one of the easiest plants to grow and will thrive in almost any soil.

Pink Roses and *Nepeta Mussinii*.—A few days ago, when visiting an old-world garden in the South of England, we found a long border planted with the ordinary Pink Monthly or China Rose and carpeted with *Nepeta Mussinii*. The effect was particularly pleasing and will not readily be forgotten. The Roses were like fountains of pink rising out of a carpet of grey and pale blue, created by the foliage and flowers of the *Nepeta*. We advise readers who appreciate harmonies in the garden to note this in their diaries, so that when the planting season comes it may be carried into effect.

The Sweet Pea Show.—We would remind readers that the annual show of the National Sweet Pea Society is to be held in the Royal Horticultural Hall, Vincent Square, on Tuesday next, the 13th inst. The following day members will visit the

Society's trials at Boyton Hall, Roxwell, Chelmsford, and later in the day the seed-growing establishments of Messrs. Dobbie and Co. and Messrs. Alex. Dickson and Sons, Limited, Mark's Tey, Essex. Full particulars of the exhibition can be obtained from the secretary, Mr. H. D. Tigwell, Greenford, Middlesex.

The Windsor Rose Show.—In the report of this show, which appeared in our issue for last week, the first prize in Class 6 for decorative Roses was credited to Messrs. B. R. Cant and Sons. It was won by Messrs. Frank

charming flowers should secure a copy of No. 4 of the *Kew Bulletin* for 1915. This contains a long and comprehensive article entitled "Some Additional Species of *Meconopsis*," by Sir David Prain, Director of the Royal Gardens, Kew. A large number of species are fully described, and the article will certainly prove of considerable value for reference. Copies of the bulletin may be obtained through any bookseller, price 6d.

King Pink.—Those who appreciate refinement and good habit in garden Pinks will extend to that named King Pink a hearty welcome. It is, we

believe, one of Mr. James Douglas' specialities, and is at the present time one of the most charming plants in the garden. The flowers, which are of medium size and semi-double, are borne on stiff, branching stems, which do not require staking. The colour is deep yet soft salmon red with a crimson zone surrounding the stigma, while in form the blossoms are superb. It is a Pink worthy of a place in every garden, on account of its unique colour and good habit.

About Cornflowers.—With most flowers our seedsmen have brought about improvements, giving us varieties with better-coloured blooms and plants of more robust habit. In the case of the Cornflower, however, the opposite has been the result. Instead of the old-fashioned deep blue flowered plant that used to do such excellent duty, we now find, even in humble cottage gardens, it is being ousted by varieties that have blooms of dull claret or dirty grey-white hues. We make no apology for putting forward a plea for the old-fashioned blue flower of our cornfields, which, in our opinion, is better than any of the modern garden varieties.

Rose American Pillar in Wet Weather.—The high opinion that we have had of this beautiful

Rambler Rose ever since its introduction has been further enhanced since Wednesday, June 30, when our garden was swept by a storm of almost tropical intensity. The extraordinary rain and wind created havoc among the Roses, and all, with the exception of American Pillar, were ruined. This, as most of our readers will know, has large clusters of deep rose pink, single flowers, yet these came through the trial practically unscathed. It is true the blossoms were in a comparatively young state, but those of other varieties that were equally young looked as though they had been scalded.

ERIGERON GLABELLUS, A HARDY NORTH AMERICAN PLANT WITH LAVENDER PURPLE FLOWERS.

Cant and Co., Braiswick Rose Gardens, Colchester.

Virginian Stock for the Autumn.—Any bare places in beds or borders should be sown thinly at once with Virginian Stock. This little annual grows and flowers very quickly, and the result of sowing now would be sheets of flower during September and well into October. The seed can be purchased very cheaply in separate or mixed colours.

Information about *Meconopsis*.—All who take more than a passing interest in this genus of

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Roses Mme. Alfred Carrière and Carmine Pillar.—These two Roses, in juxtaposition in the charming gardens of Mr. Robinson-Douglas at Orchardton, Castle Douglas, Kirkcudbrightshire, have been affording a pleasure-giving picture on a wall this season. Mme. Alfred Carrière is one of the best of white wall, pillar or trellis Roses, and it blooms with great freedom almost everywhere. At Orchardton it covers a good breadth of wall, and close beside it Carmine Pillar was giving a profusion of its brilliant blooms. The two formed a beautiful contrast—not too harsh, yet quite pronounced. They looked well against the grey walls, and aided greatly to complete the general delights of the beautiful garden in which they grow.—S. ARNOTT.

The Viburnums, or Guelder Roses. These now rank among the most desirable flowering shrubs, and no collection, however small, should be formed without including some of the best and most distinct. The latest introductions from China are in most cases worthy of inclusion. There are very many of these, but in my opinion two of the very best, though not new, are *V. macrocephalum* and *V. plicatum*. This year these have been very beautiful. I am sending a photograph of *V. macrocephalum*, which I hope you may be able to reproduce. The charm of these plants is in the length of time they are attractive. Even before the trusses are fully expanded, the plants are a conspicuous object in the shrubbery, and almost any kind of soil will suit them.—E. BECKETT, V.M.H., Aldenham House Gardens, Elstree.

"Improved" Wallflowers.—In the latter portion of his article, which appears on page 328 of July 3 issue, W. Linders Lea takes exception to my remarks that the Wallflower has been almost spoiled by so-called improvements. This, of course, he is quite at liberty to do, but in the succeeding paragraph he unwittingly supports my contention. Flowers that "appear washed-out" and have to be associated with others to make them tolerable we can surely do without. Does your correspondent contend that the dirty-looking cream and magenta purple Wallflowers are as beautiful as the old blood red, bright yellow and brown varieties? In my opinion they are not, and for that reason I contend they are not improvements, but retrogressions.—A. B. ESSEX.

Reseda alba Self Sown.—Last autumn I drew attention in THE GARDEN to the value of the white Mignonette as a decorative plant for the open border, and while I commended it to the attention of others, I suggested that there might be a difficulty in obtaining seed, as I had never seen it listed. An Indian correspondent, thinking that I might be anticipating difficulty in obtaining seed myself, kindly sent me a packet from one of the Government Public Gardens of which he has charge. In addition to this supply I, however, managed to save seed from our own plants, and so had no difficulty in raising a good

stock of plants this season. Judge of my surprise, however, when recently inspecting a bed which had been dug and sown with *Platystemon californicus*, I found it studded with seedlings of white Mignonette. It was the bed where this plant was grown last year.—CHARLES COMFORT, Midlothian, N.B.

Spring Flowers in Association.—I was very pleased to notice in THE GARDEN for June 12, page 287, the note on White Swan Tulips and Maggie Mott Violas as a pleasing combination for a spring bed. A large bed planted here with blue Hyacinths, White Swan Tulips and Maggie Mott Violas, the whole edged with blue Aubrietia and Muscari Heavenly Blue and *M. plumosum*, has been very effective for some time and much admired. By adding a few plants of *Antirrhinum Nelrose*, now that the Tulips are over, the bed looks like lasting bright for some time. In the

A BEAUTIFUL GUELDER ROSE, *VIBURNUM MACROCEPHALUM*, IN THE GARDENS OF ALDENHAM HOUSE.

rockery, or, rather, stony border, *Phlox canadensis* and the alpine Wallflowers have been remarkably bright this season. *Cheiranthus alpinus major* and *C. Dibleii* have been extra good. *Androsace Chumbyii*, *Morisia hypogaea* and *Houstonia cærulea*, although tiny plants, have been interesting. *Cytisus incarnatus*, planted three years ago in very heavy soil, has produced a wealth of bloom this season. Indoors, *Calceolaria Clibranii*, *Clarkia Sutton's Firefly* and *Antirrhinum Nelrose* have been very useful, needing but little warmth and causing very little labour to bring them to perfection.—A. S. ASHWELL, Rutland.

Escallonia langleyensis.—I was pleased to see the appreciative note and illustration of this delightful shrub in THE GARDEN for June 26. It is indeed, as stated, a most desirable subject for clothing a wall or fence. In proof of this I may mention that in my garden at Wimbledon is a black tarred fence 6 feet in height, such as

are so often met with in suburban districts. This fence faces south-east, and is partially clothed with this *Escallonia*, whose beauty during the month of June is so pronounced as to make one wish that it occupied the entire fence. The main branches are secured to the fence, and the minor ones allowed to dispose themselves at will. The result is a veritable cascade of gracefully disposed, slender shoots, and when these are wreathed with bright carmine rosé coloured blossoms its beauty may well be imagined. In this neighbourhood the soil is very stiff and cold, and this is perhaps the reason why my specimen loses practically all its leaves in the winter. It is not in the least affected thereby, and with the return of spring it is quickly covered with new leaves. I find that cuttings taken during the summer, inserted in a shady spot and covered with a hand-light, soon root. This *Escallonia* was given an award of merit in 1897, but it well deserves the higher honour of a first-class certificate. In the list of certificated plants issued by the Royal Horticultural Society, *E. philippiana*, one of its parents, is referred to as *E. virgata*.—H. P.

Gentiana acaulis.—Mr. J. Gardner, page 281, June 5, in writing of this plant says that "light, sandy soil is unsuitable," which conclusion is at wide variance with the fact. In some of the Derbyshire nurseries it was in the past grown in quantity—and may be so cultivated in these to-day—in soil of the lightest description, soil, indeed, which would be considered ideal for the hardy Heaths. At the present time I have it growing freely and well in a similar soil; while for twenty-five or more years in the Hampton district of Middlesex the plant was a complete success in growth, increasing and flowering in a soil not only exceedingly light, but which, resting on a subsoil of gravel and sand many feet deep, always became dust dry during the summer months. At the Royal Horticultural Society's Gardens, Wisley, the plant develops into luxuriant tufts in a soil peculiarly light and very sandy. Nor can one forget one's early experiences of forty odd years ago at Tooting, where, in a soil of exceptional lightness, of a very sandy nature, and resting on a deep bed of gravel and sand, this *Gentian* was everywhere a success, and most pro-

digal of flowering as an edging to many of the hardy plant beds and walks in various parts of the nursery. For the latter no more preparation than would have been made for the laying of a Box edging was indulged in. In short, I have never had the least difficulty in getting the plant to grow and flower well in many classes of light soils; hence it is not correct to say that these are "unsuitable." Many classes of loamy soils suit it equally well, the plant being the least happy—also shy of flowering—in heavy clay soils. Even in some of these it will make a good growth, though it is by no means reliable in such generally. I consider September and October the best season for planting it.—E. H. JENKINS.

Apple Cox's Orange Pippin Grafted on Irish Peach.—With pleasure I reply to the queries of "Observer," page 312, issue June 26. 1. Irish Peach was of no market value. 2. Ten trees were grafted. 3. The trees of Irish Peach were cut

down to within 2 feet of the ground. No extra wood of Irish Peach was left beyond the branches on which the scions of Cox's Orange Pippin were put. 4. The Irish Peach trees were about fifteen years old. 5. To the vigorous, clean growth which this variety (Irish Peach) usually has, I, too, am convinced (in spite of what scientists tell us) that canker is not caused by any external agents, any more than Larch canker is caused by the same reason. Unhealthy root action is the main cause.—E. MOLYNEUX.

Large Vegetables.—Will you please permit one more letter on the subject of small vegetables for table? I think the mammoth vegetables only exist in the seedmen's catalogues. They possibly have to exaggerate slightly to attract, and there are always those to whom the biggest of anything is everything. Most gardeners can grow their vegetables to suit the wishes of the particular family they provide for. A little less manure would doubtless reduce the size enough to satisfy "Anne Amateur" or "A. La T.," and if one Cauliflower does outgrow the others, it is delicious if torn to pieces when nearly cooked and served *gratinée*. As a gardener of some years' experience, may I say I consider the system of buying a collection of vegetable seeds an extravagant one. There is sure to be too much of some and not enough of other varieties, and some not needed at all, and so the collection needs much supplementing, thus bringing up the cost.—GRACE GARDENER.

—Would it not be well to call a compromise on the question of large *versus* small vegetables? When I was a boy at school, I never cared very particularly what the Cabbage was, whether Drumhead or otherwise. Peas were just Peas, and I did not give points for flavour so long as I could get enough. Even now I would not like to be called dainty, but advancing years have brought a more discerning palate, and I enjoy a Custard Marrow more than I do a slice out of one of the "whoppers" for which there is great competition at village shows. But I am not narrow-minded, and it does not follow at all that because I, in my small way, do not care for big, flavourless things, they have not their uses; of course they have. Those who have the management of large institutions have to purchase cheaply and in quantity, and when I become the inmate of a certain large institution which I have in my mind, I shall, no doubt, have to be content to devour four-pound Onions and Broad Beans from pods 9 inches long; but until then I hope I may be forgiven for preferring quality to quantity.—F. HERBERT CHAPMAN.

How to Make Perfumes.—In THE GARDEN for June 19, page 300, "M. H." writes enquiring how to make ointments, soap and perfumes. I am not a member of the Pharmaceutical Society, and regret I cannot help "M. H." with information on the making of ointments and soap, but the following is a recipe given me years ago by a Scotch friend for the making of perfumes, which, although I have not actually tried it myself, I know is used largely in Italy and in other places abroad, as well as by people in England, for the making of perfumes: "Get a large earthenware dish (a small 'panchon' will do very well). Into this put the fresh petals of the flowers you wish to get the perfume from. They may be Roses, Stocks, or any and every other sweet-smelling flower you like to put in, provided you have a good number of them. But keep each sort of petal separate, and do different flowers on different

days. The petals must not get dried up at all, and should only be gathered on the morning required. As soon as the petals are in the receptacle, melt some beeswax (or even lard will do) in a saucepan. You should melt a good deal if there are many petals, so as to have plenty for the purpose. As soon as it is completely melted, take it off the hob or fire and gently pour it into the receptacle holding the petals. Get someone to stir them in the wax while you pour it on, and when it is all poured in and thoroughly mixed with the petals, 'clean up' the sides of the 'panchon' and let all the wax settle to the bottom and get cold." The perfume is now in the fat, and the problem is to get it in a convenient form. The recipe continues: "Allow some days to elapse, and then pour on to the fatty residue alcohol or spirit unadulterated with 'methyl' alcohol. Stir this spirit in as well as you can and pour it off later. It will then contain the perfume." I am afraid this recipe is somewhat vague, for it gives no idea of how much wax should be used to a definite weight of petals or how long the wax should remain in contact with the petals, or, again, how long the spirit should be left in the receptacle. Perhaps other readers will give more definite data, though it is unlikely that "M. H." will be able to get very full information, as I believe the secrets of making several ancient perfumes are carefully guarded by those who possess them. With regard to the spirit used for extracting the perfume from the fat or wax, it is of the utmost importance that this should be alcohol or spirit unadulterated with methyl. "M. H." will, I fear, have some difficulty to get this pure spirit, as chemists are apt to make difficulties about selling it. She should, of course, explain what she wants it for, or she is very likely not to get it at all. Reason tells us at once, however, that it is useless to use methylated spirit for the purpose, because of its strong smell. I can only offer one suggestion to "M. H." about distilling the perfume to concentrate it, and I cannot say whether this will act, for I am not a whisky maker or distiller! However, I should get a small glass retort with a long neck, and lead the neck into a flask surrounded by cold water. The retort itself would contain the diluted perfume, and would be immersed in a beaker of water, which can be gradually brought to the boil by a Bunsen Burner. The first part of the material which comes over would be thrown away, the second part kept as the concentrated spirit or perfume, and the third part wasted. It might be necessary to distil three or four times before really concentrated perfume was obtained. If the spirit or perfume distils too quickly, the temperature must be reduced, and the condenser must be kept as cold as possible (preferably by means of running water). I hope these few notes will be of some use to "M. H." Lastly, I may remark that she should not try "blending" the perfumes without much thought and some small experiments.—E. T. ELLIS, *Weetwood, Ecclesall, Sheffield.*

FORTHCOMING EVENTS.

July 10.—Red Cross Rose Show at Cranford, Leamington Spa, 12 noon to 7 p.m.
July 13.—National Sweet Pea Society's Exhibition, Royal Horticultural Hall, Vincent Square, Westminster, 1 p.m. to 6 p.m.
July 16.—The North Lonsdale Rose Society's Show at Ulverston (two days).

ALPINES AS BORDER PLANTS IN SCOTLAND.

SOME years ago we planted a long, narrow border here with Roses, but for some reason these never succeeded, and two years ago they were removed. There was considerable discussion as to what should be put in their place. Eventually it was decided to have a dwarf alpine border, but without the use of stones. This has been a great success, and every visitor has admired it, although when first planted one could not help noticing that various people considered we were only working for disappointment.

The border runs east and west, is about six feet wide and 35 yards in length. A large Apple tree occupies the centre and somewhat interferes with the carrying out of our colour plan, as so many plants would fail to thrive in this position. However, we planted a large mass of *Arabis albidiflora* pleno under the tree, and it has been a wonderful success. The original idea was to plant in various sized clumps or patches, and these in irregular shapes, and this has been rigidly adhered to. From early April until nearly the end of June it is the most interesting border in the garden, and requires but little attention except to pull out the few weeds that appear and to trim back some of the plants that encroach on their neighbours.

One or two kinds have failed us, or, rather, we find them unsuitable for this method of culture; but by another year these will be removed and more suitable subjects established. The unsuitable plants are *Dryas octopetala*, *Draba aizoides*, *Arenaria cæspitosa aurea* and *Gentiana verna*.

That lovely blue alpine *Lithospermum prostratum* was finer last year than I have ever seen it anywhere; but, unfortunately, it suffered dreadfully in the winter, and is now rather shabby. Very fine are *Phlox subulata* and its varieties *G. F. Wilson* and *Perfection*, and the same may be said of *Aubrietias* and *Saxifrages*. Both named varieties and seedlings are employed, and, if anything, the seedlings are the more interesting. Of the named *Aubrietias*, *Moerheimi* is probably the best, being compact and very floriferous, while the bright pink flowers are extremely pleasing. *Arenaria montana*, although inclined to overrun its neighbours, is very beautiful. *Alyssum saxatile* and *A. s. variegata* are bright and telling, but are used somewhat sparingly, otherwise they would overpower quieter shades. A few clumps of *Helianthemum* help to prolong the display, while at the beginning of the season several fine clumps of *Polyanthus Munstead Strain* (white and yellow shades), give a lively and pleasing tone to the whole. These latter were put in as stop-gaps at first, but are so beautiful that they are to become permanent features, although the sites will be changed, fresh seedlings having been raised for the purpose.

Other plants used successfully are *Candytuft* *Little Gem*, *Gentiana acaulis* (has not flowered much yet), *Dianthus integer*, *D. arenarius*, *D. neglectus*, *Arabis aubrietoides* and *D. albidiflora* variegata. Many of the plants were raised from seeds, and if good strains of the various kinds are obtained, the results are excellent. Others can be raised from cuttings, so that this form of gardening can be indulged in at very moderate cost.

C. BLAIR.

Preston House Gardens, Linlithgow.

NEW ROSES AT THE "NATIONAL" SHOW.

AS usual, the greatest interest to visitors to the National Rose Society's metropolitan exhibition, held in London last week, and a report of which appears on another page, were the new seedling Roses. About twenty were staged for awards, the judges finally granting gold medals to two and certificates of merit to eleven. Descriptions of those that received recognition are given. Whether all will fulfil the expectations of the adjudicators remains to be seen.

Paul's Scarlet Climber.—This is a large-flowered Hybrid Wichuraiana of wonderful scarlet colour, the shape and size of the flowers resembling Grüss an Teplitz. The colour, however, is a much brighter scarlet-red, and the flowers are slightly fragrant. The foliage is leathery and deep green. Undoubtedly this magnificent Rambler has a very brilliant future before it. (See illustration.) Raised and shown by Messrs. William Paul and Son, Waltham Cross. Gold medal.

Lemon Pillar.—A large-flowered Noisette Rose of vigorous pillar habit, and the result of a cross between Maréchal Niel and Frau Karl Druschki. The blooms are very full and creamy white in colour, emitting a delightful fragrance. In appearance they resemble those of Pernet-Ducher's Entente Cordiale, but they are much larger. This should prove a very valuable large-flowered pillar Rose. (See illustration, page 339.) Raised and shown by Messrs. George Paul and Son, Cheshunt. Gold medal.

Each of the following received a certificate of merit:

Cherry Page.—This is a Hybrid Tea that should prove an exceedingly useful decorative Rose. It has a vigorous, branching habit, blooms freely, and continues its display over a long period. The colour is quite unique, being best described as rich glowing cerise, shaded with golden yellow. In the bud and half open state it is very attractive. Raised and shown by Mr. W. Easlea, Danecroft Rosery, Eastwood, Essex.

Cupid.—A Hybrid Tea pillar Rose with very large single flowers borne in clusters of six to ten. The colour is soft shell pink, the buds flecked with flame. Habit very robust, and foliage large and leathery. (See illustration on page 330 of last week's issue.) Raised and shown by Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester.

Flame of Fire.—This is a beautiful seedling Hybrid Tea of rather small size, and specially recommended for bedding and garden purposes. The blooms are of long, pointed shape and suitable for button-holes. Colour deep orange yellow. Habit moderately vigorous and branching, and stems very spiny. Slightly fragrant. Raised and shown by Messrs. S. McGredy and Son, Portadown, Ireland.

Florence Spaul.—A large-flowered seedling Hybrid Tea of considerable substance. The

flowers are of Lady Alice Stanley shape, with some of the glow of that variety in the centre. The general colour, however, is a deep rich pink, and the blooms are very fragrant. Raised and shown by Messrs. B. R. Cant and Sons.

Johanna Bridge.—In general appearance this closely resembles Margaret Molyneux, and the flowers are of the same semi-double character. They are very beautiful in the bud state, where the yellow, orange and pink tint shows to perfection. The habit is vigorous and branching. Raised

the edges. The blooms are produced in moderate-sized clusters, and emit a slight fragrance. Habit branching. Raised and shown by the Rev. J. H. Pemberton.

Queen of Fragrance.—As its name indicates, this is a particularly fragrant Rose, and one specially suitable for the garden. When shown at Holland House last year, it won the cup offered by Messrs. Clay and Son for the most fragrant new Rose not then in commerce. The flowers are large and soft shell pink in colour, and it is stated to be a good autumn-flowering variety. (See illustration on page 340.) Raised and shown by Messrs. William Paul and Son, Waltham Cross.

Sallie.—A large-flowered Hybrid Tea of the Pharisæa class, but with rather more orange blush suffused through the petals. Habit branching and vigorous, with fine leathery foliage. Slightly Tea-scented. Raised and shown by Messrs. B. R. Cant and Sons.

Titania.—A China Tea seedling of dwarf, branching habit, the blooms being of medium size, such as we find in *Crépuscule*. Colour a mixture of coppery crimson, salmon red and yellow. In the fully open state the petals are prettily reflexed, and the blooms possess the Tea Rose fragrance. It should prove a good bedding variety, and also useful for cutting. Shown by Messrs. William Paul and Son, Waltham Cross.

THE GOLD MEDAL ROSE SCARLET CLIMBER, SHOWN BY
MESSRS. WILLIAM PAUL AND SON LAST WEEK.

and shown by Mr. E. J. Hicks, Twyford, Berks.

Lady Bowater.—This is a large and beautifully shaped exhibition and possibly garden Rose. As will be seen by the illustration on page 342, it is of conical form, with great depth and substance of petal. The colour is creamy white often flushed with apricot pink. The bush has a vigorous and branching habit, and this new-comer should prove a valuable addition to the large Roses of this shape. Its parents are Frau Karl Druschki and Pharisæa. Raised and shown by Mr. W. Easlea.

Prince Charming.—This is a very free and branching Hybrid Tea specially suited for button-holes. The flowers are small, long and pointed, the colour being a sort of bright orange scarlet. Foliage very glossy and green, the young leaves being deep red. Raised and shown by Messrs. Hugh Dickson, Limited, Belfast.

Queen Alexandra.—A large-flowered single, perpetual-flowering Hybrid Tea of bushy habit. The petals are large and shell-like, pale lemon in colour, with a faint suffused blush at

month of April, and were old, rather ill-looking plants. Now we have twenty-five good-sized pieces, some being as large as my hand, and flowering as well and richly as in the high Alps of the Valais. Last year we could collect very good seeds from them, and now I see that several of them are well covered with seeds. They were, last week, covered with flowers, quite as well and as beautiful as in the highest Alps.

That *tourbière* is for me the best solatium to the anguish of the war. I have there a very nice lot of the best of alpine. You will understand it if I say that we had there in April in full flower, and as brilliant as in the Alps, the following: *Gentiana verna*, *G. angulosa*, *G. verna alba*, *G. v. caerulea*, *G. v. rosea*, *G. v. atrocærulea*, *G. bavarica* (quite covered with beautiful flowers as numerous as in the highest Alps—last year it flowered again in autumn), *G. angustifolia*, and the pure white form of *G. acaulis*. We had, too, the very rare *G. Rostani*, the slender *G. brachyphylla*, *Primula Allionii* and *Ranunculus glacialis*. Now we have beautiful tufts of the deep blue *Gentiana utriculosa*, a plant which is flowering

MORAINÉ PLANTS AT FLORAIRE, GENEVA.

WE have now in our *tourbière*—what you probably would call a moraine—a rich and very healthy

colony of *Eritrichium nanum*. They were planted there last spring in the

for the first time with me, and *Arnica montana*, a very common plant in the Alps, but rarely succeeding in our Swiss gardens.

In that *tourbière* I have now the whole collection of the *Pinguiculas*—*alpina*, *longiflora* (a rare plant from the Maritime Alps), *leptoceras*, *Reuteri* (a pink variety found in our Jura by the Swiss botanist Reuter), *vulgaris* and *grandiflora*. They are all in flower now, and are exceptionally beautiful.

Some of the new *Primulas* from Professor Balfour of Edinburgh are very healthy in the same position, and particularly the new Chinese ones. Seedlings of *Gentiana tenella* and *G. nivalis* are coming up well; also lots of Orchids like the *Nigritellas*, *Calypso borealis*, *Orchis laxiflora*, *Herminium monorchis* and *Liparis Loeselii*. *Stachys corsica*, *Anagallis tenella*, *Lobelia linnæoides* and *Houstonias* are weeds, although they are succeeding with us for the first time.

Some delicate Ferns, such as *Allosorus crispus*, *Asplenium foesianum*, *A. germanicum* and *A. septentrionale*, are beautiful. But the pearl is certainly that exquisite Fern, *Asplenium fissum*, which we found last year on the north side of the Col de Tende. For more than twenty-five years I tried unsuccessfully to get the true *A. fissum*. Twice I was at the classical station and could not find it.

Last year I came with my head gardener to a little valley bearing a different name, and there, facing the burning sun, between the chalk-stones of a very hard *pierrier*, the finest of the Ferns, the queen of them, was lying and flourishing in numerous masses. Now it seems to be very happy here with us, thriving as well in the *tourbière* as in the wall and in the pots. It is certainly the most beautiful of all the Ferns.

This *tourbière*, from which we have obtained such good results, is a new creation. We made several attempts, till we finally came to the conclusion that a large number of the choicest of the plants must be watered from below. For many years I cultivated the most delicate in *Sphagnum*, and had nice results. But in pans, as we grew them, it was rather expensive and hard work. So three years ago I tried to have a bed which was watered from below. The result was exceedingly good, but not quite convincing. The bed was not quite watertight. So I made another bed 14 metres long and 1½ metres wide, with a depth of 1 metre. The third part of it was covered with rolled stones, and these were covered with a bed of Moss or *Sphagnum*. Then on this we put the soil, different in character, according to the treatment required by the respective plants. The results were immediately surprising for me. Now, I consider my *tourbière* bed as the first thing in my garden, and this is the opinion of everyone who knows anything of cultivation and botany.

Florairé, Geneva.

H. CORREVON.

SOME HINTS ON WATERING.

THE operation of watering presents many problems to gardeners, so perhaps a little advice based on practical knowledge will be useful to readers. Watering is really divided into several headings, such as watering at the roots, "damping over" to freshen or clean the foliage only, and feeding with liquid artificial or animal fertiliser. In the present article I speak only of outdoor watering in these branches, for annuals, perennials and bedding plants. I hope at some future date to deal with the watering of vegetables.

There is a certain important preparation for watering which should always be made, if possible, and this is the hoeing and stirring of the surface soil. If this is not done, the soil is apt to cake,

The best of all watering is, of course, watering at the roots. Many times I have denounced surface waterings, sprinklings and "dampings over" to be no good at all except for giving an external appearance of freshness to the foliage. Damping over is done by "waving a can of water with a fine rose lightly about over the foliage of the plants in the borders"! It is useful at its proper times, i.e., when the roots are sufficiently wet from recent rains and only the foliage wants freshening up, but it is practically no good as summer watering. As said previously, root watering is the essential, but this is, of course, modified as necessity arises by spraying the foliage of the plants as well.

Several problems arise on this watering. The question of the quantity to give, the sorts of roses to use, and the question of when to apply all claim our attention and study. "At what time of the day is it most suitable to give water?" This question is still capable of being strongly debated, and as it is not my desire to start a controversial correspondence in THE GARDEN, I will not be over-dogmatic on the subject.

Readers will, of course, well know that though the sun rises very early in the summer months, it does not get very much power (except in the very sunny South) before eight o'clock, or sometimes nine o'clock, in the morning. That suggests to us the probable advantage of watering in the very early morning, and my experiments have shown me that the advantage arising out of early morning watering is very great indeed. However, it is not always easy or even advisable. After a roasting hot day one's annuals, especially in the early stage, most certainly require water, and in this case it is certainly better to give a thorough soaking at night.

The question of roses to use on the can presents a problem to many amateurs. For my own part I have roses for different purposes. Strong established plants can well do with the moderately heavy shower of rain from a coarse rose; but dwarf and tender plants would be easily damaged by such a thing, and the soil (especially if they are planted on the now old-fashioned raised borders or beds) would probably be washed away. A large "spray" rose is essential for the quick watering of large beds and borders of small plants, but this is not much good for penetrating to the roots of perennials in herbaceous borders. Readers should use discretion when choosing cans and roses.

In really dry weather, big clumps of perennials, Lupines, Delphiniums

and many more must be watered. I find in a thickly planted border it is much better to carefully pour the water straight into the clumps with care from the neck of the can in such cases.

And now we come to the quantity of water to give, purposely left to the last of these questions on watering, as it is vitally important. The advice may be summed up in two words: "Water thoroughly." The intentions of many readers

THE NEW ROSE LEMON PILLAR, SHOWN BY MESSRS. GEORGE PAUL AND SON AT THE NATIONAL ROSE SHOW.

(See page 338.)

and in that case most of the water runs off (especially if applied with a coarse-rosed can). It may be urged that it is not possible to do this on borders filled with bedding plants or in which annuals have been planted out. And there is something in this also. But the difficulty is got over by pricking up the ground with a small fork (this can always be done unless the bedding plants and annuals are set too thickly).

who wield the water-can and the hose-pipe are good, but they do not all know what thoroughness means. In watering, however, do not remain spraying a single plant with your rose for several minutes, or a pool will result (in a soil of our description—coal measures). Spray each plant for a short time, and then go on to the other parts of the border, returning after a time to the plants watered earlier and water again, for the first lot of water will have soaked in. In really dry times it may be necessary to return two or three times to ensure the water reaching the roots. A mere surface watering is no good in dry weather. Water thoroughly if at all.

Feeding Plants.—A word must be said of summer feeding, which comes, of course, into the category of watering. Liquid, if given at all, should be given weak and frequently rather than strong and very seldom. Liquid animal manure should be clear and almost like weak tea. It should be kept off the plants themselves, and given only after watering in the strong growing season. Everyone knows how to make it, so I do not give details of it here. But those who do not for various reasons like to have a tub of smelling liquid manure should obtain one of the many excellent proprietary fertilisers and use it in water instead.

Experiments with simple chemicals, such as nitrate of soda, sulphate of ammonia, sulphate of potash, calcium cyanamide, nitrate of potash, nitrate of ammonia, phosphate of ammonia, superphosphate of lime and many another manure, are to be commended, as these find out the likes and dislikes of plants. Such chemicals should be handled carefully and given in strict moderation (never over an ounce to the gallon, and sometimes less). The effects of these should be carefully noted, and clear water given between the applications of the chemical. This comes under the experimental side of summer feeding, and I am sure the Editor of *THE GARDEN* would be only too glad to receive and publish the results of any such interesting experiments.

Those with comparatively small gardens can carry out such experiments even better than those who have more space at their disposal. *Weetwood, Ecclesall, Sheffield.* E. T. ELLIS.

WAHLENBERGIA VINCEFLORA.

This is one of the best blue-flowered perennials now in bloom. Growing, when established, 18 inches or so high and flowering for many weeks on end, it is one of the most profuse flowering of herbaceous plants. It belongs to the Bellflower family, the intensely coloured blossoms being produced on thin, wiry stalks. It is well suited to the rock garden, and likes deep, warm soil and a sunny situation.

OURISIA COCCINEA.

SOME PROBLEMS OF CULTIVATION

THE Chilean *Ourisia coccinea* presents an almost insoluble problem in the way of cultivation in numerous gardens. It is virtually impossible to persuade it to flower in many places; in others it gives merely a spike or two on even a large plant; and, worst of all, there are many, many gardens in which it cannot even be established. What is the cause of this? Is it possible

endeavours to come to a satisfactory conclusion regarding the causes. In one garden, in particular, there were for years spreading masses of *O. coccinea* in a border in semi-shade, and growing in light loam, rather poor and dry. Here these did exceedingly well, but pieces removed to apparently more favourable conditions, to a rather moist, peaty soil, failed to succeed and dwindled away. In other gardens I have known apparently healthy plants which would survive for a year or two, would give a few flowers, and eventually disappear. In others, again, after becoming established, hardly a flower would repay the troubles of the cultivator. Of course, there are some who tell us—and that quite truly—that they have no difficulty with the *Ourisia*, and I know plants and masses of plants which give the keenest delight to a flower-lover as he looks upon these wrinkled leaves surmounted by many spikes bearing the most brilliant scarlet flowers.

A moist, peaty soil is recommended by many. Some suggest a heavy loam. Some, again, say, "give it half shade and moisture." Others recommend a gritty peat; and others, again, loam, leaf-soil and sand. Yet the fact remains, as has been remarked by an able cultivator, that it is "of rather uncertain habit in cultivation," and he who could supply us with the "royal road" to success so many ardently desire would indeed confer a boon upon lovers of such a charming plant as this. Mr. Reginald Farrer, in "*My Rock Garden*," tells us in an amusing way of his *Ourisia* experiences. I cannot quote this at length, but the substance of the tale is that, after trying all manner of recipes and making all kinds of preparations, a cheap lot of *Ourisia* planted in a rough fashion became quite at home and ramped about everywhere. He adds that it appears to be most successful in shady places. And this high up in Yorkshire in a naturally cool atmosphere! My own successes—and these have not been many—have been in cool, rather damp soil of a light nature and away from the sun.

Dumfries.

S. ARNOTT.

ROSE QUEEN OF FRAGRANCE, SHOWN BY MESSRS. WILLIAM PAUL IN LONDON LAST WEEK. IT RECEIVED A CERTIFICATE OF MERIT. (See page 338.)

to arrive at a sound conclusion which will enable us to find a way out of the troubles and to induce this brilliant flower to favour us with an abundance of its spikes of scarlet flowers? I fear not, but others with long experience may be able to give us some hints to turn to advantage.

One of the puzzling things which confront us in our endeavour to cultivate the *Ourisia* is the fact that in certain situations it may succeed in a garden, but that if removed from these precise places to other positions in the same garden it will pine away and finally vanish. More than a few instances of this have come under my notice, and I confess that I have been baffled in my

the stock of any of the occupants of the rockery, a frame should be set apart for that purpose. If cuttings are to be taken, the frame should be made up almost entirely of sand. Many of the *Phloxes*, *Lithospermums*, *Pinks* and *Saxifrages* will root freely, and in this connection it is not at all necessary to make the cuttings as one would those of a *Geranium*. Simply pull them off and put them in as they are, and the chances are they will root much better. Others, again, must be increased by division. These had better be potted into small pots and wintered in what should be the alpine frame.

INCREASING ALPINES.

WHERE it is intended to increase

JAPANESE IRISES.

(I. KÆMPFERI.)

WHILE the genus *Iris* is rich in beauty and variety, and affords material for either the amateur, professional, or enthusiast-specialist gardener to revel in for nearly six months of the year, the section above named stands not only pre-eminent of its race, but equally so among moisture-loving flowering plants at any season of the year. In a word, the Japanese *Iris* is unique, whether viewed from the standpoint

of the plant's requirements was constant partial submersion in water, the heavy toll paid for so doing quickly telling the intelligent cultivator it was wrong. Twenty-five or more years ago, when many were urging the water-side as the only possible way of growing these *Irises*, I had them in considerable luxuriance in richly manured field soil, which in summer-time became dust dry many inches deep, a near neighbour growing them equally well in old potting soil in a worked-out gravel pit; hence it will be seen that the amateur or artisan with a solitary bed may score a success equally with the millionaire who appears to possess conditions more approaching the ideal. Professional cultivators, too, for some years past

success is to be ensured, is raising the soil of the water-side planting area a foot or more above water-level, at which height the roots will descend and get all the moisture the plant requires. It is a far safer plan than the risky one of submerging, or even of having the roots continually in wet ground. These, then, are the things that matter in their cultivation; at once those to adopt and those to avoid.

The amateur to whom only a solitary bed is perhaps possible should arrange the surface of the bed slightly below the surrounding level, so that during growth and approaching the flowering period an occasional soaking of water may be applied with advantage. An item worthy

A BEAUTIFUL GROUPING OF JAPANESE IRISES AND GUNNERAS. THE IRISES CAN ALSO BE GROWN IN THE BORDER.

of the splendour of the floral display and the living pictures the flowers create in garden scenery, or because of hardiness, amenability to the British climate, or because of the several ways which they may be employed with good results in gardens regardless of their size. This much is said advisedly, since there existed in the past—the idea is less prevalent to-day—that these plants could only be successfully grown at or near the water's edge. The idea was wrong, and led numbers into planting them in such places regardless of soil. In not a few instances clay of a most uncongenial type surrounds natural water basins, and this the Japanese *Iris* detests. Equally bad, or worse—it was in many instances attended by fatal results—among the early misconceptions

have realised the truth of the above statement, while the fact that the plants lend themselves so well to various positions in the garden should make of the latter—large or small—a more beautiful place than was possible before the whole truth concerning the likes and dislikes of these *Irises* was revealed.

True, they are moisture-loving in the highest degree. True, too, that they associate admirably with water areas and are specially adapted for water-side gardening. For this they are ideal. At the same time it should be remembered that water is not their all-in-all. Equally important is a rich vegetable soil in which the roots can ramify freely; close, tenacious soils they abhor. Then of almost paramount importance, if perennial

of committing to memory, too, is that these plants have a voracious appetite, the established clumps forming huge mats of fibrous roots; hence a rich soil is much to their liking. In the case of light soils I prefer to employ a heavy dressing of cow-manure, the cooling effects of which rather than its manurial value I find excellent for the plants. Incorporating some that is well decayed with the soil, a further layer a foot deep is good as a retainer of moisture and in other ways.

These Japanese *Irises* come to us at the end of June, and a long way into July provide a rare feast of colour beauty in the garden—white, blue of many degrees, rich violet, crimson, purple, rose and other shades which defy description, a fitting finale to a race which for months

past has played an important part decoratively and otherwise. And while the colour effect appeals strongly, perhaps even greater do the waving picturesque flowers appeal—flowers comparable to nothing but themselves, whose beauty no pen-picture could possibly portray. E. H. JENKINS.

A BEAUTIFUL TAMARISK.

THE common Tamarisk (*Tamarix anglica*) is a well-known shrub to those who reside near the sea. Its slender stems, clothed with delicate green leaves, render it a beautiful and conspicuous object during the whole summer. A newer and much more ornamental kind is that known as *T. Pallasii*, a native of Afghanistan, and quite suitable for growing in all kinds of gardens in this country. It forms a slender, upright shrub several feet high, and during July is clothed with long, pendulous spikes of small pink flowers, which, owing to their weight, give a drooping appearance to the whole plant. A variety grown by the writer, and named *T. Pallasii rosea*, is even more beautiful during its flowering period, owing to the flowers being a brighter rose pink colour. This Tamarisk is sometimes known as *T. æstivalis rosea*. These shrubs appear to be suitable for practically all soils, and when once established little attention is needed, except to cut back straggling shoots each spring. A large specimen noticed in a small lawn bed in a garden last year had had its stems tied up moderately tight to a stout stake nearly 4 feet high, and then allowed to hang down from the top. It formed a perfect weeping standard of pink.

SOME SCARLET-FRUITED ELDERS.

THOSE who only know the Elder family by the common, black-fruited shrub have no idea of the beauty that characterises some other kinds. The scarlet-fruited Elder, *Sambucus racemosa*, is a very distinct and handsome shrub when carrying its usual crop of scarlet berries, and for planting in beds in the lawn its several varieties are excellent. The most beautiful of these has plume-like, golden-hued foliage, and is listed by nurserymen under the rather unwieldy name of *Sambucus racemosa plumosa aurea*. It is well worth growing for its foliage alone. Another variety with scarlet fruit is known as *laciniata*, the foliage of which is very much lacerated, which gives the shrub quite a distinct appearance. When we come to the varieties of the common, black-fruited Elder, we find two that are worth including in all gardens where bright foliage is appreciated, viz., the golden variegated and that with greenish leaves margined with yellow.

To bring out this golden hue to the fullest extent the plants should be given a sunny, exposed position, and the two last named associate well with the variegated Japanese Maples. All the Elders need deeply worked and

well manured soil, and may be planted any time during late autumn or winter.

THE DECIDUOUS CYPRESS.

IN the Deciduous Cypress of the Southern United States we find one of the few hardy coniferous trees that shed their leaves in winter. Apart from this it is an interesting tree, because its foliage gives us two distinct colour displays during the summer and autumn months. In summer we find a beautiful, soft, verdant hue so characteristic of the Larch in spring, but in autumn the leaves take on a pretty, warm shade of brown, and usually remain in this condition for some time

ROSE LADY BOWATER. THIS WAS SHOWN BY MR. W. EASLEA AND RECEIVED A CERTIFICATE OF MERIT AT THE NATIONAL SHOW. (See page 338.)

before falling. This Cypress is an ideal tree for planting by the water-side; indeed, it appears to like to push its matted roots far into the water, and the reflection of its upright, pyramidal head clothed with graceful foliage is very effective.

Although so useful for the water-side, such a position is not essential for its successful culture; at Kew, where the natural soil is dry and sandy, two good-sized trees are thriving not far from the main entrance and far away from a pool or stream.

No doubt the beds in which the trees are growing were filled with good soil previous to planting, but the natural dryness of the surrounding soil must have an effect on the beds. H.

GOOSEBERRY CATERPILLARS.

MANY complaints have been received this year of caterpillars devouring the leafage of Gooseberry bushes, hence it may be of use to draw attention to these pests, which are difficult to get rid of. Two distinct caterpillars attack the Gooseberry and, in a lesser degree, Red and White Currants. The first of these to appear is that of the magpie moth, a pretty insect that may be seen hovering in gardens on quiet autumn evenings. It may be easily recognised by its broad wings, which are white, dotted freely with black. This lays its eggs on the foliage early in autumn, and these soon hatch into caterpillars, which feed on the foliage, but at that time do no appreciable damage.

After a short period of feeding they hibernate for the winter, usually an inch or so below the surface, or in clusters of dead leaves in nooks of walls. In the spring they come forth once more, and at that time, and in early summer, when the leaves are comparatively young and succulent, inflict much harm. The caterpillars, like the moth, are yellowish white with black dots, and about three-quarters of an inch in length.

The other caterpillar that attacks bushes of these fruits is that of the sawfly, a small yellowish-coloured insect. It usually appears in May, and lays its eggs on the under sides of the leaves and close to the veins or ribs. These quickly hatch, and the caterpillars, which are small and pale green in colour, will quickly strip the bushes of their foliage. These caterpillars after a few weeks turn into chrysalides, enter the soil, and subsequently return again later in the summer as flies. These lay more eggs, the last batch of caterpillars remaining in the chrysalis state an inch or 2 inches under the soil for the winter. Leaves on which eggs have been deposited should be sought for, picked off and destroyed. Caterpillars may also be picked off

by hand and destroyed where only a few bushes are affected.

Various washes composed of Hellebore powder or Paris green have been found effective, and dry Hellebore powder may be dusted on the leaves; but as both substances are poisonous, one hesitates to recommend their general use. A safe and moderately effective remedy is to dust the bushes while damp with lime and soot, repeating the applications at frequent intervals. The best time to combat both pests is the winter, when the soil beneath the bushes to a depth of 2 inches should be removed and either burned or buried very deeply in some other part of the garden where the pests will have no chance of regaining the surface. E. G.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Tomatoes.—Seeds may be sown now for raising plants to fruit in the late autumn and winter. Endeavour to grow the plants as sturdily as possible by potting firmly and keeping them growing near to the glass in a light structure. The seeds must be sown thinly, so that there shall be no danger of the plants becoming drawn while in the seed-pans. Plants in fruit should be given every encouragement to perfect their crops by watering with stimulants and top-dressing the roots with fresh materials.

Cucumbers.—Much attention is needed in the thinning and regulating of Cucumbers at this time of the year. The plants must be gone over at least every ten days for this purpose. When in full bearing, frequent small top-dressings of loam and well-seasoned horse-manure will keep the plants in a healthy condition. Plenty of stimulants should also be afforded when watering. Liquid farmyard manure alternated with a sprinkling of fertiliser will be suitable.

Cucumbers in Frames.—Much care is necessary in ventilating the frames when the weather is cold and stormy, or mildew will attack the plants. Keep the growths regularly thinned and stopped, and give the plants the same liberal treatment as advised above. Should mildew appear, dust the leaves with flowers of sulphur.

Plants Under Glass.

Asparagus Sprengeri.—This is a most useful plant for cutting, and easily raised from seed. For cutting we grow a number of plants in 6-inch pots. Plenty of growths are then available during the autumn and winter.

Smilax.—The back wall of a vinery is an excellent position in which to grow this useful plant. When planted out, the growths will quickly reach the top of the house. The soil must not, however, be too rich, or the growths may grow too strong.

Lapagerias.—Plants growing in large pots or tubs must be liberally supplied with manures. The young growths should be regulated and tied at intervals of a few days. Mealy bug must be watched for, or it will quickly smother the plants. Methylated spirit, applied with a small brush, is an effective remedy.

Campanula pyramidalis.—Keep the plants well watered, or the lower leaves will fall, thus detracting from the appearance of the plants. Their blooming may be retarded by plunging the pots in ashes behind a north wall. If not already done, seeds may be sown for producing plants for next season.

The Flower Garden.

Carnations.—It may be necessary in some cases to thin the flower-buds. Keep the plants neatly tied to stakes, or place wire supports among them. Layering must be attended to as soon as the plants have flowered. Next month, cuttings of the Perpetual-flowering kinds may be inserted for flowering in the borders. Mrs. Burnett, May Day and Britannia are all suitable for outdoor flowering.

Gladioli.—The flower-spikes will require the support of stakes to prevent damage from rough winds. A top-dressing of old Mushroom-bed manure or something similar will be beneficial during dry weather.

Dahlias.—Cut out the weak, useless growths from the plants and securely stake those remaining. These plants have needed abundance of water during the long spell of drought which we have experienced during the greater part of May and June. Beds of Dahlias should be mulched with some moisture-retaining material.

The Hardy Fruit Garden.

Late Strawberries.—The main crop of Strawberries has been of short duration, due to the abnormally hot, dry weather. Those who have a plantation in the shelter of a north wall will be fortunate. It is a good plan to make a small plantation every year in a cool situation. In the event of a continuation of the drought, late Strawberries must be carefully watered, or the latest fruits will fail to swell.

Autumn-Fruiting Strawberries.—If the fruits are required in the autumn, the flower-spikes must still be kept picked off. Keep the plants free from runners and weeds, and give plenty of water. It is a good plan to grow a batch of plants in pots, as then they can be grown on a shelf in a cool house when the nights become too cold.

The Kitchen Garden.

Cabbage.—A sowing of Cabbage may be made towards the end of the month, and another early in August. Sow in drills about a foot apart in an exposed situation. If the ground is dry at the time of sowing, the drills must be watered.

Turnips.—It has been necessary to frequently water this crop to prevent bolting. Well-seasoned soot has been of great assistance, both as a stimulant and in preventing the ravages of the Turnip fly. A good sowing may now be made for autumn supplies.

Winter Onions.—These have done well this season, and the bulbs will soon be fit to lift. Winter Onions will keep for a considerable time if they are lifted at the proper time, thoroughly dried, and placed in a cool shed.

Salads.—Mustard and Cress is best grown in a cold frame where it can be easily shaded from bright sun. Radishes must be grown in a shady situation and watered frequently. Sow Lettuce and Endive regularly till the end of the month, and prick out young plants from earlier sowings, watering them frequently till they have recovered from the check. It is a good plan to sow Lettuce thinly where the plants are to mature. Thin out the young plants as soon as they are large enough to handle.

E. HARRISS.

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

Plants Under Glass.

Malmaison Carnations.—Plants which were layered in frames about the middle of June will be commencing to root, and must have more air admitted accordingly. The shading should be put on about 10 a.m. and removed about 4.30 p.m. whenever the weather is bright. Too free a use of the shading is apt to encourage a soft, green growth not desirable in Malmaisons and more liable to be attacked by rust. As soon as it is certain the plants are sufficiently rooted, the layers can be severed from the parent plant previous to potting.

Climbers in both stove and greenhouse need constant tying and regulation of growths. *Clerodendron Balfouri* when it has passed out of bloom should have the shoots that have flowered shortened. *Streptosolen Jamesonii* is a very fine climber for the greenhouse. This plant resents too free a use of the watering-can, so care is necessary to get it to flower successfully.

Eupatoriums can now be potted into their flowering pots. A cold frame will suit them up till September if it is shaded from bright sunshine and kept moist.

Salvia splendens may still be potted into the final pots, but plants which were potted earlier have the best chance to make large specimens, as after they are well rooted in the soil they respond freely to liberal applications of liquid manure. Plants which are to be grown as standards must now be allowed to form heads, so that they will be of a presentable size by September, when they commence flowering.

The Kitchen Garden.

Carrots may still be sown if the variety chosen is a Short Horn, which quickly matures. The earlier-sown ones are at the stage when they are most likely to be attacked by the Carrot fly, so should be frequently dusted with soot to prevent this pest from getting a footing.

Celery.—Early plants are growing apace, and must be kept continually moist. The foliage, when wet with dew or rain, should receive an occasional dusting of stale soot.

Peas which are exhausted must be cleared off, the haulm burnt, and the ground filled up with such vegetables as Broccoli, Savoys or winter greens. If used for growing late Broccoli, the ground need not be dug. All that will be necessary is to clear off the weeds and plant the Broccoli with a trowel. No matter how hard the ground may be, it will encourage a dwarf, firm growth, which will more readily withstand the winter.

Mulching Peas.—In very dry weather the cropping of Peas can be greatly assisted by applying a mulching after watering. Material from a spent Mushroom-bed is best for the purpose; but, failing this, some short litter or half-rotted stable manure will answer well enough.

Lettuces require to be sown more frequently during hot weather, as they run to seed more rapidly. Cos varieties, which do not turn in very readily, should be tied up to hasten the formation of the heart.

Fruit Under Glass.

Melons in Frames.—Plants grown in frames are usually more difficult to fertilise to get an even set of fruit. Especially is this so if there is a period of dull, moist weather when they are in flower. The best course is to again pinch a number of the laterals, in the hope that there may be more sunshine when flowers appear on the sublaterals. Try to maintain a minimum temperature of 70° during the night, and ventilate very carefully during the daytime, letting the weather conditions decide how much air is to be admitted.

Late Peach-Houses.—Houses containing trees which are required to fruit as late as possible should not be retarded too much by too free a use of the ventilators, otherwise the trees are apt to get dried too quickly, with the result that red spider appears. Try to prevent this by keeping the atmosphere sufficiently moist by syringing morning and afternoon, and also see that there is plenty of moisture in the borders, not forgetting to add food when watering.

Late Vineries.—The Grapes are now at the critical stage when stoning is in progress. This is the time when certain varieties are very apt to scald, so that great care is necessary, paying strict attention to all the smaller details of cultivation.

The Hardy Fruit Garden.

Wall Trees.—The trees growing against walls, naturally, do not receive their fair share of rainfall. It is therefore necessary to make this good by artificial means. It is also noticeable that the soil close to the wall dries up more quickly than that in the open. After applying water, a mulching should be given around the trees and the hoe must be used constantly.

Netting Fruit.—This necessary guard against attacks from wild birds should not be delayed unduly, especially during dry weather, as it is at such a time that some of the birds' natural food is scarce; consequently they commence to feast on fruit often before it is ripe. Whenever possible, the nets must be supported clear of the fruit trees and bushes; this is advantageous in every way. If wire netting is available, the part to be netted should be surrounded by this, as it prevents the nets coming in contact with the ground, where they quickly rot if the weather is wet. When netting wall trees, the nets should be hung clear of all the growths and fruit by using short stakes and supports.

The Flower Garden.

Roses.—The season for budding is now here, and the stocks which are intended for Rose bushes can now be budded. Some varieties, of course, may not be yet fit for operating upon; but this is easily ascertained when commencing to remove the bark, which, when ripe enough, should part readily without much persuasion. The material used for tying up the buds must not be of such a kind as would cut or strangle the stems, which naturally expand as growth proceeds. Standards which are to be budded should have the support of a stake to prevent the wind loosening them. It is usually possible to discern within a fortnight whether the buds are going to "take" or not, so that if looked over in time the unsuccessful ones can be replaced by putting on others either above or below the original bud.

ANSWERS TO CORRESPONDENTS.

FLOWER GARDEN.

ALYSSUM SAXATILE FAILING (F. H.).—We can only suggest that the soil is either too rich for this rock-loving subject or that the plant, by repeatedly being bedded there, has become sick of the place and soil. In either of these cases a dressing of lime would act as a corrective, or a very considerable addition of old mortar siftings might be even better. The Alyssum, owing to the nature of its roots, does not retain much soil, and is not one of the best subjects for transplanting: this might prove a predisposing cause of the failure. A remedy for this would be growing the plants in 5-inch pots, and, raised early from seeds, sturdy examples would result. Have you been growing the plants too liberally for the purpose? We ask the question advisedly, since it is the grossly grown plant which is usually the first to fail. Pot-grown examples would produce a more compact growth and be far more reliable and prodigal of flowering.

FLAG IRISES FAILING (M. M. K. C.).—The list of Irises you submit are not all strictly of the germanica set. Two are, however; the others belong to the sections known as neglecta, plicata, variegata and pallida, all of which are recognised under the general definition of Flag or Bearded Irises, and not infrequently referred to as Iris germanica. The pallida section is by far the most important, and of this your list contains but one representative. The clumps you send are quite rotten, and in forty years we have not seen their equal in this respect. All such should be lifted and burnt without delay. As far as can be judged by the plants and the particulars given, we should consider the failure due in part to the deep burying of the rhizomes, though, most of all, to the excessively wet conditions caused by flooding in conjunction with the heavy water-holding nature of the soil. If you have no higher or drier ground and cannot raise the soil of the present site so as to be immune from the flooding, perhaps something could be done to render the drainage more perfect, so that the water would more quickly pass away. Road sweepings or any light material would do to raise the height of the bed, and gravel and sand liberally applied in conjunction with deep, open trenches, if such are possible, would make the drainage more efficient. Lime may also be added to the soil. It would be best to wait till early September, and at that time make the soil as light as possible. In replanting, employ only the freshly formed rhizome of the current season, discarding all else which is useless to the plant and the planter. Never replant big clumps intact; they are better broken up. Replant the Lupines at the same time as the Irises; they are equally hardy and enduring, though what effect the "occasional flooding" will have upon them will depend very much upon its duration and the severity of the weather at the time.

FRUIT GARDEN.

MELON LEAVES FOR INSPECTION (T. L.).—The Melons are attacked badly by the root eelworm, which has produced numerous "knots" or galls upon them. Nothing can now be done to save them, though earthing up might prolong their life a little. As soon as they are done with they should be rooted out and burned, and the whole of the soil removed and either burned or spread on a pasture, not on the garden. The house should be thoroughly cleansed and disinfected before any further attempt to grow Melons, Cucumbers or Tomatoes in it.

MISCELLANEOUS.

VARIOUS QUESTIONS (Kerlique).—The Apple trees have been badly attacked by the leaf-curling aphid, which has been particularly prevalent this season. The insects on the leaves sent are, however, friends, No. 1 being the larva of the ladybird and No. 2 that of one of the hover flies, both devouring green flies with great avidity and doing much to diminish the number of those pests. The insects damaging the Strawberries are probably the black beetles of which you speak. They may best be captured by sinking smooth-walled jars or basins, so that the level of the top rim coincides with the level of the soil. Bait them with pieces of meat, of which the beetles are very fond. It is only at this season of the year that the beetles eat any but a flesh diet. The small millepedes are also troublesome, and may be captured by burying pieces of Potato near their haunts and examining them at frequent intervals.

NAMES OF PLANTS.—*Sister M. Francis.*—Mesembryanthemum edule.—*Boris.*—1, Mme. C. Joigneaux; 2, Jean Cherpin; 3 and 4, Lælia; 5, Prince Arthur; 6, Baroness Rothschild; 7, La Rosière. In future please send 3 inches or 4 inches of growth.—*E. T.*—1, Erigeron philadelphicus—this is not obtainable in other colours; 2, Clematis integrifolia; 3, Campanula persicifolia alba.—*Miss E. A. Patsh.*—Dictamnus albus.—*E. H.*—1, 2 and 3, Seeding garden Pinks; 4, Myosotis, too poor to recognise; 5, Saxifraga canaliculata; 6, Boronicum plantagineum; 7 and 8, forms of Sedum acre; 9, S. album brevifolium; 10, Galium verum.—*H. H. Cot.*—Cist s ladaniferus mac lat s (Gim Cistus).—*P. H.*—1, Trillium grandiflorum; 2, Scrophularia aquatica variegata; 3, Vinca minor aurea; 4, Polygon m cuspiatum; 5, Anemone angulosa; 6, Anemone canadensis.

THE NATIONAL ROSE SOCIETY'S SHOW.

THE metropolitan exhibition of the National Rose Society, held in the Royal Botanic Gardens, Regent's Park, on Tuesday of last week, though not quite so large as some previous shows, was exceedingly good. The quality of the blooms throughout left little to be desired, and owing to the dull weather they remained in excellent condition until the end of the show. Table decorations were superb, but we hope the Council will in future prevent members of the trade displaying quantities of advertising literature on these tables. Anything more incongruous and undignified could scarcely be imagined. The descriptions of new Roses will be found on page 338.

NURSERYMEN.—EXHIBITION ROSES.

Champion Trophy Class.—Seventy-two blooms, distinct varieties: First, Messrs. B. R. Cant and Sons, Colchester, whose superb collection contained a wonderful flower of Coronation (pink, silver medal), and excellent examples of Mrs. W. J. Grant, Edward Mawley, Mildred Grant, H. V. Machin, O. Terks, Freda (pink), Mrs. G. Norwood (fragrant, pink-flowered), Earl of Gosford (scarlet), St. Helena, Mme. Jules Grolez, A. Hartman, Mrs. Forde, Frau Karl Druschki, Ethel Malcolm, Countess of Gosford, White Maman Cochet, Lyon Rose, George Dickson, Florence Forrester (a very good white), J. B. Clark, Lady Barham, Colcester (pink), Mrs. Cornwallis-West, Ulrich Brunner, H. E. Richardson (crimson) and Molly Sharman Crawford. A formidable and powerful lot, well away in the front place. The second prize was taken by Messrs. Frank Cant and Co., Colchester, whose admirable lot included George Dickson, Edward Mawley, Mrs. Theodore Roosevelt, Alice Lemon, Ethel Malcolm, Lady Mary Ward (orange), C. J. Grahame, Albatross, General French, Dean Hole, George C. Waud, Sunburst, Avoca, William Sheen and Mme. Melanie Soupert. Third, Messrs. D. Prior and Sons, Colchester, whose best flowers were H. V. Machin, Lady Barham, Mrs. Charles Russell, Florence Forrester, Ethel Malcolm, Elizabeth, Mme. Melanie Soupert, Joseph Hill, Juliet, Mildred Grant, Mme. Jules Graveraux, Mrs. J. H. Welch and Mrs. Myles Kennedy (pinkly white). Fourth, Messrs. A. Dickson and Sons, Newtownards.

Forty distinct varieties, three blooms of each: First, Messrs. B. R. Cant and Sons, Colchester, whose best were Lady Ashtown, Lohengrin, St. Helena, H. E. Richardson (crimson), Frau Karl Druschki, H. V. Machin (scarlet), Lady Helen Vincent, British Queen (white), Mrs. Andrew Carnegie (white), A. Hartman (scarlet), Mrs. J. H. Welch, Yvonne Vacherot, J. B. Clark, Mrs. George Shawyer, Mrs. Arthur Coxhead, Edward Mawley, Mrs. W. J. Grant, Leslie Holland, Dean Hole, Bessie Brown and Lady Barham were all exceptionally fine. Second, Messrs. Alex. Dickson and Sons, Newtownards, whose Margaret Dickson Hamill (golden), Mrs. Moyna (pink), Mildred Grant, H. V. Machin, Mrs. J. Campbell Hall, Mrs. George Shawyer, Lady Barham (pink), Florence Pemberton, Mrs. W. J. Grant, George C. Waud, Bessie Brown and Lady Greenall were all good. Third, Messrs. Frank Cant and Co., Colchester, whose Mrs. Theodore Roosevelt, Mrs. Andrew Carnegie, Lady Ashtown, Mildred Grant, Ethel Malcolm, Mrs. J. H. Welch and Captain Hayward were among the best.

China Trophy Class.—Forty-eight blooms, distinct varieties: First, Messrs. Hugh Dickson and Sons, Royal Nurseries, Belfast, whose Gorgeous (orange), Hugh Dickson, British Queen (fine white), Mrs. Charles Russell, Mme. Jules Graveraux, Mrs. Hugh Dickson, J. B. Clark, Mrs. Foley Hobbs (silver medal, probably the most magnificent Rose bloom ever seen at an exhibition), Brilliant, Dean Hole, Muriel Dickson, Edward Mawley, George Dickson and Sir William Q. Ewart were superb. Second, Mr. H. Richards, Warsash, Hants, whose Florence Forrester, Edward Mawley, Mildred Grant, Lieutenant Chauré (rich cerise red), Lady Ashtown, Snow Queen, Mrs. Foley Hobbs, Mary Alexander Lippiatt, Marquise de Sinety, Königin Carola, J. B. Clark, Mrs. J. H. Welch and Her Majesty were the best. Third, Mr. George Longley, Chapel Lane Nurseries, whose Countess of Shaftesbury, Mrs. George Shawyer, Marquise de Sinety, Mrs. H. Stevens (very fine white), Joseph Hill, Lyon Rose and Colonel N. S. Williamson were very good. There were six contestants, high-class flowers being the rule.

Twenty-four distinct varieties, three blooms of each: First, Messrs. G. and W. H. Burch, Peterborough, who showed Souvenir de Pierre Notting (very rich in colour), Mrs. W. J. Grant, Mrs. J. H. Welch, Lyon Rose, Mrs. Theodore Roosevelt, Mrs. George Shawyer, Lady Ashtown, Ethel Malcolm, Mme. Jules Graveraux, Edward Mawley, H. A. Moore and Margaret in excellent condition. Second, Messrs. J. Burrell and Co., Cambridge, who had fine examples of Mrs. Foley Hobbs, Coronation, Mme. Melanie Soupert, Candeur Lyonaise (white), Lyon Rose and Mme. C. Soupert. Third, Mr. J. Pigg, Royston.

Twenty-four blooms, distinct varieties: First, Mr. Henry Drew, Longworth, Berks, who staged Dean Hole, Lyon Rose, Mrs. J. H. Welch, Mildred Grant, Edward Mawley, George Dickson, H. V. Machin and William Sheen very finely; second, Mr. W. R. Hammond, Burgess Hill, whose Mrs. Foley Hobbs, Mme. Constant Soupert and Mildred Grant were excellent. Mr. J. Mattock, Oxford, was a good third. Eight competitors staged collections in this obviously popular class.

For twelve distinct varieties, three blooms of each, Mr. Henry Drew, Longworth, was again in the place of honour with a capital set. His best examples were those of Mildred Grant, Mabel Drew, J. B. Clark, George Dickson, Dean Hole and Mrs. Andrew Carnegie (a really superb white). Mr. J. Mattock, Oxford, was second, having

Mrs. Charles Russell, Mildred Grant, Mrs. George Norwood, Dean Hole, Bessie Brown and Mrs. J. H. Welch, among others. Third, Messrs. Chaplin Brothers, Waltham Cross. There were four entries in this class.

EXHIBITION ROSES, TEAS AND NOISSETTES.

D'ombrain Cup.—Twenty-four blooms, distinct varieties: First, Mr. George Prince, Oxford, whose best blooms were those of Mrs. Foley Hobbs, Mrs. Edward Mawley, Maman Cochet, Mrs. Campbell Hall, Maréchal Niel (very good colour) and Mme. Constant Soupert; second, Mr. Henry Drew, Longworth, whose White Maman Cochet, Mrs. Edward Mawley, Mme. Constant Soupert, Ethel Brownlow and Mrs. Foley Hobbs were very fine. Messrs. Frank Cant and Co., Colchester, were third. Five competitors staged in this class.

Twelve blooms, distinct varieties: First, Mr. J. Mattock, Oxford, who showed Mrs. Foley Hobbs, White Maman Cochet, Muriel Grahame and Mrs. Hawksworth (very good); second, Mr. H. Richards, Warsash, Hants, his Hugo Roller being very good; third, Messrs. J. Burrell, Cambridge.

Sixteen distinct varieties, three blooms of each: First, Mr. G. Prince, Oxford, who staged superb Mrs. Foley Hobbs, Molly Sharman Crawford, Mrs. E. Mawley, Maréchal Niel, Nita Weldon, Mrs. M. Kennedy, Maman Cochet and Mme. Melanie Soupert very finely; second, Mr. H. Drew, Longworth, whose Maman Cochet, Nita Weldon, Comtesse de Nadaillac, White Maman Cochet and Mme. Constant Soupert were very fine; third, Messrs. D. Prior and Son, Colchester, whose best blooms were White Maman Cochet, Mrs. Foley Hobbs and Mme. Jules Graveraux.

EXHIBITION ROSES IN VASES.

Twelve distinct varieties, seven blooms of each: Usually this is one of the most effective classes in the show, and brings many exhibitors. On this occasion only one firm put in an appearance—Messrs. Prior and Sons, Colchester—and were awarded first prize for a really good lot. The best vases were Richmond, Ethel Malcolm, Mme. Edouard Herriot, Lyon Rose, General Macarthur, Caroline Testout and M. S. W. J. Grant.

For nine distinct varieties, Teas and Noisettes, seven blooms of each, Messrs. Prior and Sons were again placed first, showing White Maman Cochet, Mme. Constant Soupert, Mrs. Foley Hobbs and Mme. Jules Graveraux; second, Mr. George Prince, Oxford, whose Comtesse de Nadaillac, Mrs. H. Stevens, Mrs. Dudley Cross and Nita Weldon were all good; third, Mr. J. Mattock.

PERPETUAL-FLOWERING DECORATIVE ROSES.

This section includes the basket classes, which, without exception, are the most decorative of the whole show. On this occasion the competition was keen throughout, no fewer than six competitors staging in that for nine baskets of Roses, distinct varieties. First, Messrs. Hugh Dickson, Limited, Belfast, who with a superb lot this year won the Kilbee-Stuart Cup outright. Ulster (standard, single scarlet), Irish Elegance, Ethel Malcolm (flesh colour), Mme. Melanie Soupert, Lady Pirrie, Lyon Rose, Mrs. George Shawyer, Mrs. David McKee and Lady Ashtown were the varieties staged. Messrs. Chaplin Brothers, Waltham Cross, were second, staging Rayon d'Or, Mrs. Herbert Stevens, Joseph Hill, General Macarthur, Old Gold, Mme. Melanie Soupert, Lady Hillingdon and Mrs. George Shawyer. Third, Mr. J. Mattock, Oxford, who also had a very fine lot.

For five baskets of Roses seven entered, and, as evidence of the keenness of the competition, equal first prizes were awarded to Mr. W. Easlea, Eastwood, Leigh-on-Sea, and Mr. George Prince, Oxford, the former showing Lady Hillingdon, Mme. Edouard Herriot, Chateau de Clos Vougeot (one of the darkest of Roses), Mrs. H. Stevens and Louise Catherine Breslau; the latter having Lady Pirrie, Lady Hillingdon, General Macarthur, Mrs. H. Stevens (a superb white) and Richmond. Needless to say, both sets were in every way admirable.

Eighteen distinct varieties, in vases, not more than seven stems of each variety: Messrs. D. Prior and Son, Colchester, and Messrs. Chaplin Brothers, Limited, took first and second prizes respectively, each having a goodly assortment. Third, Mr. G. Longley.

Nine distinct varieties, not more than seven stems each: First, Mr. George Prince, Oxford, who staged Josie Nicholson, Queen Mary, Mme. Edouard Herriot, Lady Hillingdon and G. C. Waud as his best. Second, Mr. W. Tayler, Hampton, whose Lady Ashtown, Ecarlate, Marquise de Sinety, Mme. Abel Chatenay, Mme. Alfred Carrière and Mme. Melanie Soupert were very good.

DECORATIVE ROSES.

A. C. Turner Cup.—Thirty-six distinct varieties, not less than three nor more than twelve stems of each: First, Mr. J. Mattock, Oxford, who had Irish Flame, Ecarlate, Lady Hillingdon, Mme. Edouard Herriot, Iona Herdman (rich golden), Irish Elegance and Simplicity (single white). Second, Messrs. F. Cant and Co., who staged Mrs. A. Tate, A. R. Goodwin, Rayon d'Or, Irish Beauty (single white) and Duchess of Wellington.

Twelve distinct varieties, conditions as before: First, Mr. Frank Spooner, Horsell, Woking, whose very fine lot included Ecarlate (crimson), Lady Hillingdon, Mrs. A. Tate, Irish Beauty, Mrs. H. Stevens, General Macarthur, and Trier (white climber). Second, Mr. C. Turner, Slough, who had Old Gold, Mrs. H. Stevens, Simplicity, Lady Hillingdon and Butterfly (pink single, very beautiful). Third, Mr. G. Longley, Rainham, Kent. Seven competed.

Twelve distinct summer-flowering Roses, Hybrid Perpetuals, Hybrid Teas, Teas, Chinas and other perpetual-flowering varieties not admissible. There were five entries, the first prize going to Messrs. F. Cant and Co., Colchester, who had Seagull, Helena, Lady Curzon, Rosa Mundi and Aglaia, among others. Second, Mr. F. Spooner; third, Mr. Elisha J. Hicks.

For nine distinct varieties of new decorative Roses five entered, the first prize going to Mr. C. Turner, Slough, who had Mme. Edouard Herriot, Old Gold, Cissie Eastlea, Pearl (single white) and Queen of the Musk; second, Mr. Elisha J. Hicks, whose best were Cherry Page, Princess Mary (very fine single crimson) and Iona Herdman (rich golden) among others; third, Messrs. Frank Cant and Co.

Twelve distinct Dwarf Polyantha Roses: First, Mr. Elisha J. Hicks, who had Jeanne d'Arc, Echo, Erna Teschendorf and Ellen Poulsen; second, Mr. G. Prince, Oxford, whose Marie Pavic, Jessie, Perle d'Or and Canarienvogel (yellow) were his best.

For twelve distinct wichuraiana varieties in vases, Mr. Elisha J. Hicks was again first, having Alberic Barbier, Shower of Gold, Aviateur Blériot, Diabolo and Gardemia; second, Mr. G. Prince, whose Jersey Beauty, Elise Robichon, Shower of Gold, René André and Diabolo were his best blooms.

For a representative group of Roses placed on the floor in a space of 250 square feet, two competitors appeared, Messrs. Hobbies, Dereham, being first with a magnificent setting of Teas and Hybrid Teas under a superb lot of standard and weeping sorts. The former were in basket groups, such as Rayon d'Or, Jonkheer J. L. Mock, Mrs. Amy Hammond, Mrs. G. Sawyer, Mrs. A. Tate, Duchess of Wellington and Betty being admirable. Of standard sorts, Hiawatha, Lady Gay, John Green, Delight, Lady Godiva, Pemberton's White Rambler and White Dorothy were all charming and good. A pretty arch of Roses led into the interior of a very delightful group. Second, Messrs. George Paul and Sons, Cheshunt, whose strength lay in the Hybrid Teas in the front of the group. These were very beautiful and in great variety, some of the more conspicuous being Duchess of Wellington, Marquise de Sinety (both rich and good in colour), Naiad (flesh tinted pink, very charming), Paul's Lemon Queen, Mrs. David McKee and Little Dorrit. Polyantha and allied sorts were in the background.

Royal Botanic Society's Cup.—For a representative group of cut Roses 33 feet by 3 feet, two competitors appeared, the first prize going to Messrs. W. and J. Brown, Peterborough; second, Messrs. Stuart Low and Co., both of whom staged very fine collections.

For a representative group of cut Roses on a space not exceeding 20 feet by 3 feet, four competitors staged exhibits, the first prize going to Messrs. George Jackman and Sons, Woking, for a superb lot of blooms. Stands of varying heights were employed with vases of flowers in the foreground, and a fringe of Jessie or nearly allied sort along the front. The best stands were those of Melody, Lady Pirrie, Rayon d'Or, Le Progrès, Duchess of Wellington, Gustave Regis, Lady Hillingdon, and Lady Ashtown. The group was well staged and of an imposing character. Second, Messrs. B. R. Cant and Sons, Colchester, whose central grouping of Cupid, a new flesh-coloured single of great freedom of flowering, was charming in the extreme. A. Hartman (cerise scarlet) was quite superb, and hardly less so the admirable stands of Autumn Tints, Betty, Countess of Derby, Mme. Melanie Souper and Queen Alexandra (a charming lemon, flushed pink single greatly admired by Her Majesty when passing through the tents). Third, the Rev. J. H. Pemberton, Havering-atte-Bower, who, staging a particularly good lot, also showed not a little courage in contesting in such a class. Basket groups of Lady Pirrie, the rich crimson scarlet Ecarlate (a China bedding Rose 18 inches high) and Countess of Shaftesbury were very good.

OPEN TO NURSERYMEN AND AMATEURS.

For twenty-four Roses in two varieties, twelve white and twelve crimson, five competitors staged, the premier award going to Messrs. B. R. Cant and Sons, Colchester, for an admirable lot of Mrs. Andrew Carnegie and Edward Mawley, white and crimson respectively. Messrs. W. and J. Brown, Peterborough, were second, having Mrs. Foley Hobbs (white) and J. B. Clark (crimson), the latter being exceptionally fine.

Eighteen blooms of any Hybrid Perpetual, to be shown in a basket: First, Mr. H. Drew, Longworth, with Gloire de Chedane Guinoisseau (scarlet). Second, Messrs. Stuart Low and Co., Enfield, who staged Mrs. C. Russell (pink) in capital form. There were five competitors.

For eighteen blooms of any Rose other than Hybrid Perpetual, Tea or Noisette, to be shown in a basket, no fewer than twelve exhibitors staged, the first prize going to Mr. Elisha J. Hicks, Twyford, for the shapely, pink-flowered and highly fragrant Mrs. George Norwood, a beautiful variety in every way. Second, Mr. H. Richards, Warsash, Hants, who staged Mrs. Andrew Carnegie (white). Third, Messrs. Stuart Low and Co. with Mrs. D. McKee.

Eighteen blooms of any Tea or Noisette in a basket: First, Mr. J. Mattock with Mrs. Foley Hobbs (very fine); second, Messrs. Chaplin Brothers, Waltham Cross; third, Mr. H. Drew.

For one basket of pernetiana Roses nine exhibitors came to the front, Messrs. Stuart Low and Co., Enfield, taking first place with Mme. Edouard Herriot; second, Mr. J. Mattock, who had good Rayon d'Or; third, Messrs. Chaplin Brothers with Mme. Edouard Herriot.

Nine blooms of any new Rose: First, Messrs. B. R. Cant and Sons, Colchester, who had the rich red, fragrant A. Hartman; second, Mr. Elisha Hicks with Mrs. G. Norwood; third, Mr. W. R. Hammond, Burgess Hill, with Annie Crawford, an extra fine pink variety.

Twelve blooms of new Roses, distinct varieties: First, Mr. Elisha Hicks, who had Candeur Lyonnaise, Mrs. George Norwood, H. V. Machin and Florence Forrester; second, Messrs. B. R. Cant and Sons with A. Hartman, Mrs. Andrew Carnegie and Florence Forrester; third, Mr. G. Prince. Seven exhibitors competed.

OPEN ARTISTIC CLASSES.

A decoration of cut Roses for dinner-table was a very excellent competition, the five exhibits exemplifying floral art very satisfactorily. First prize was awarded to Mr. Elisha J. Hicks, Twyford, Berks, for a table decoration of his new seedling Hybrid Tea Princess Mary (single, sweetly scented). This is a very fine Rose, and an exquisite crimson colour. It is a really glorious flower. During the afternoon this table was strewn with postcards, which quite spoiled the beautiful effect. A splendid decorated table of Irish Elegance secured second prize for Mrs. Alex. Robinson, and an equal second prize was awarded to Mrs. F. M. Bradley, Peterborough, for a rather formal arrangement. Third prize was secured by Miss Chaplin, Waltham Cross, for an interesting exhibit of Irish Fireflame.

There were eight exhibits in the class for three sprays of Roses suitable for ladies. A pretty series won first prize for Mrs. F. H. Cooke, Birch, Colchester. Second prize was won by Mrs. Oakley Fisher for a richly coloured series, and a superb set won third prize for Mrs. F. M. Bradley, Peterborough.

For a bowl of cut Roses with foliage only and buds five competed, the premier award going to Miss Chaplin, Waltham Cross, for an artistic arrangement of Bessie Brown with coppery foliage. Equal second prizes were awarded Mrs. A. Bide, Farnham (who had Lady Curzon), and Mr. Elisha J. Hicks (who arranged a fine bowl of the single crimson Princess Mary).

AMATEURS' CLASSES.

The discerning visitor could scarcely fail to be impressed by the quality of the principal exhibits. Each year the best amateur collections bear more favourable comparison with those in the trade classes, and the exhibits at Regent's Park this year show how skilful the best amateurs have become.

The championship class was won by Mr. H. L. Wettern with thirty-six exhibition blooms of first-rate quality. There was not a "weak" bloom in the exhibit, which was characterised by size, perfect form and very fresh condition. As being the very best, mention may be made of Mrs. J. Laing, Lady Ashtown, Avoca, Bessie Brown, Florence Pemberton, Elizabeth, Augustus Hartman, George Dickson and Mrs. J. H. Welch. Dr. T. E. Pallett, who won the trophy and gold medal last year, was an exceedingly good second, showing excellent blooms of Lieutenant Chauré, Augustus Hartman, Nita Weldon and J. B. Clark. Mr. F. Dennison was third.

Mr. Wettern also won the first prize for twenty-four exhibition blooms with another splendid exhibit, which included beautiful blooms of Margaret, Ethel Malcolm, Florence Pemberton, Mrs. J. H. Welch, Lady Greenall, Lady Alice Stanley and General Superior Janssen. Dr. T. E. Pallett was again second, and his outstanding varieties were Mildred Grant, White Maman Cochet and Mrs. Andrew Carnegie. Mr. G. A. Hammond was third.

The class for trebles of twelve varieties is an exceedingly trying one for amateur growers who have a limited number of plants, but the first prize collection of Mr. F. Dennison was particularly rich in trios of Dean Hole, Lady Ashtown and Bessie Brown. Mr. Conway Jones, who was awarded second prize, had a slightly less even exhibit, but included delightful trebles of George Dickson and Coronation.

Dr. T. E. Pallett, showing Mildred Grant in splendid condition, won the first prize for twelve blooms of any Rose other than Tea or Noisette, and Mr. A. Hill Gray was second.

The Hobbies Cup, offered for twenty-four exhibition blooms, always induces a strong competition at the summer show, and this year's was no exception. The class is restricted to growers of fewer than 3,000 plants, and the cup was won by Mr. W. O. Times with a splendid collection of twenty-four blooms, of which we selected William Shean, George Dickson and Coronation as being the very best. Mr. C. C. Williamson was placed second, and Mr. H. R. Darlington third.

With magnificent blooms of Mildred Grant Mr. Times also won the first prize for twelve blooms of any variety other than Tea or Noisette, and here Mrs. J. B. Fortesque was second.

In the class open only to growers of fewer than 2,000 plants the best twenty-four blooms were shown by Mr. W. J. Thorp, who had a most praiseworthy exhibit, of which British Queen was the outstanding variety. The eighteen varieties were also exceedingly good, and here Mr. R. de V. Prior with especially good blooms of Jonkheer J. L. Mock and William Shean won the piece of plate, and Mr. P. T. Davies was second with a remarkably even set of Mrs. Andrew Carnegie.

The first prize for nine blooms of any Rose other than Tea or Noisette was won by Mr. D. H. Davies, who also won chief honours in the extra class for Divisions E and F, requiring six varieties in trebles, with remarkably fine trios of such as Mrs. Theodore Roosevelt and Dean Hole. Mr. John Hart was second.

The Ben Cant Memorial Prize, restricted to growers of fewer than 1,000 plants, brought a magnificent board of twelve blooms from Dr. C. Lamplough, who won the first prize.

Showing splendid examples of Dean Hole, Mrs. Henry Balfour had the best nine blooms of any Rose other than Tea or Noisette in this division.

Mr. E. B. Lehmann, who included a superb bloom of William Shean, won the chief prize in the division for growers of fewer than 750 plants; and in the extra class for the above two divisions there was an exceedingly good competition, Mrs. Henry Balfour winning the first prize with a splendid collection, which included a perfect bloom of Mrs. Theodore Roosevelt.

The first prize exhibit by Dr. W. P. Panckridge among the growers of fewer than 500 plants was also of much

more than average merit, and he also won the first prize in the extra class which required trebles of four varieties with another excellent set.

In the tyro's class Mrs. R. Biffen had a magnificent exhibit, and easily won the first prize. Her blooms of Ulrich Brunner and George Dickson were especially good.

The metropolitan classes were well contested, and showed that really good Roses may be grown within eight miles of Charing Cross. Mr. R. de Escotet, who is always successful at the City of London Rose Show, won the chief prize.

Class 72 was extra for amateurs generally, and here Dr. Pallett was decidedly first with a splendid board of twelve varieties, the blooms of Mildred Grant and Mrs. Theodore Roosevelt being magnificent.

The Hammond Prize, also open to amateurs generally, but for six blooms of new Roses, was also won by Dr. Pallett with remarkably fine blooms of such as Augustus Hartman and Colleen.

The Tea and Noisette Trophy and the Prince Memorial Prize were both won by Mr. A. Hill Gray with excellent exhibits. In the first his bloom of W. R. Smith was exceedingly beautiful, while of the twelve Teas White Maman Cochet and Maman Cochet were delightful.

Of the trebles of distinct varieties the best were also shown by Mr. A. Hill Gray, and here he had especially good trios of Auguste Comte and of W. R. Smith.

In the class for growers of fewer than 500 Teas and Noisettes, Mrs. Henry Balfour won the chief prize, and Dr. Lamplough was similarly successful among the growers of fewer than 200 Teas and Noisettes.

AMATEURS.—LADIES' ARTISTIC CLASSES.

For a basket of cut Roses lightly arranged, in Class 97, there were four exhibits. The exhibit gaining premier honours was made up of Irish Elegance and double Roses of kindred tones of colour, and was put up by Mrs. L. Colston Hale, Warminster. A very dainty little basket of Lady Ashtown secured second prize for Mrs. G. W. Cook, Whetstone, who had lovely flowers of this beautiful pink Rose deftly disposed. A basket of Irish Elegance, rather sparsely arranged, won third prize for Mrs. Oakley Fisher, Harrow.

There were no fewer than twelve entrants in the class for a vase of cut Roses lightly arranged with any Rose foliage, and the exhibits were pleasingly varied. The vase that gained the coveted first prize was shown by Mrs. Howard Williams, who set up lovely blooms of Mme. Melanie Souper and most appropriate foliage in a very attractive fashion. A rather formal arrangement gained second prize for Miss E. M. Robinson, Hornchurch, who used Irish Elegance exclusively. A really lovely vase of Irish Elegance and double Roses of kindred tones of colour gained third prize for Mrs. L. Colston Hale.

There were only four entries in the class for a decoration of cut Roses for a dinner-table, lightly arranged with Rose foliage only. First prize was won by Mrs. Oakley Fisher, Sudbury, Harrow, with a charming decoration of Irish Fireflame. Good use was made of the foliage, and a few more open flowers would have made this exhibit even more attractive. A beautiful decoration secured second honours for Mrs. Alex. Robinson, Carshalton, for a light arrangement of Irish Elegance. Third prize was won by Mrs. R. Allen Hope, Addlestone, Surrey, who also used Irish Elegance. A richly coloured table decoration won fourth prize for Mrs. A. D. Ruff, Sharnbrook, Beds, who used Irish Fireflame most effectively.

There were eight exhibits in the class for a table decoration, in which any Rose except single-flowered varieties was to be used, and these made a welcome feature of this show. First prize was won by Mrs. J. B. Langton, Hendon, N.W., in which this well-known exhibitor used Mme. Melanie Souper, Gustave Regis and Joseph Hill. In making a refined decoration, good use was made of Rose foliage. Second prize was awarded to a unique table decoration of Iona Herdman (McGredy), a lovely orange yellow Rose that is most effective. This exhibit came from Mrs. L. Colston Hale, who deserved a better position. Third prize was secured by Mrs. Alex. Robinson, who had a lovely colour scheme of Lady Pirrie, but the large flowers were used too freely. It was a handsome exhibit, however. A very dainty table of Melody secured fourth prize for Mrs. Courtenay Page, Enfield, and there were favourable comments on this display.

There were five vases of exhibition Roses, all very beautiful. A really lovely vase of Ophelia easily won first prize for Mrs. A. E. Brown, Reigate. The arrangement left nothing to be desired. A vase of crimson Roses secured second prize for Mrs. Sawday; and with a poorly arranged vase of Ophelia, Mrs. Courtenay Page was placed third. This exhibitor had a lovely series of blooms, and it was a pity she had not sufficient time to finish the arrangement.

Class 102 was for a bowl of cut Roses (decorative), open to lady members, and there were nine exhibitors. A refined bowl of Mrs. Herbert Stevens, with bronze growths of the Rose deftly disposed, won first prize for Mrs. Alex. Robinson; this exhibit was nicely finished. Second prize was awarded to Mrs. Sawday for a bowl of orange and buff Roses attractively set up. Third prize was secured by Mrs. J. Walter Smith, Bushey Heath, for a bowl of Irish Elegance that was somewhat crowded. A really good exhibit gained fourth prize for Mrs. Tisdall, Woodford Green, who had Lady Hillingdon splendidly set up.

No fewer than eleven vases of cut Roses were shown, making a fine display as a whole. Mrs. L. Colston Hale was placed first with a beautifully coloured arrangement of Irish Elegance and double Roses of a similar colour. With sprays of buds and fine growths, a pretty picture was made. Miss M. E. West, Reigate, won second prize with Mme. Abel Chatenay. The blooms were lightly arranged with bronze-coloured growths most effectively.

With Lady Hillingdon Mrs. Tisdall was a very easy third; as a matter of fact, this exhibit deserved a better award. Fourth prize was secured by Mrs. G. W. Cook, who had Molly Sharnan Crawford daintily arranged.

Five exhibits in Class 104, for a basket of cut Roses, found Mrs. L. Colston Hale leading with a richly coloured scheme of arrangement. Irish Fireflame predominated. A very beautiful basket of Liberty secured second honours for Mrs. A. E. Brown, Reigate. With bronze-coloured growths this richly coloured exhibit was most attractive. Soft tones of colour won third prize for Mrs. F. Peters, Wood, Weybridge. This was a bold arrangement of large flowers. Fourth prize was won by Mrs. Sawday with crimson flowers.

In Class 105, for six button-holes, there were seven entries. A nice series won first prize for Mrs. R. Pearce, Claygate. A very beautiful series was awarded second prize: this came from Mrs. R. Allen Hope, and was neatly finished. Third prize was awarded to Mrs. Courtenay Page, but the flowers were unduly large.

Six exhibits in the class for a bowl of wichuraiana Roses was not so good as usual. A lovely bowl of Francois Juranville won first prize for Mrs. R. Allen Hope, and was much admired. With Diabolo (single) Miss J. B. Langton was placed second, and third prize was secured by Mrs. Chaffley Giddins, South Mymms.

A bowl of decorative cut Roses was asked for in Class 108, and there were four exhibits. A pretty bowl of Irish Elegance set up by Miss Vesta Cook, Whetstone, was placed first, and deservedly so. With a bowl of Old Gold, Miss Cherry Courtenay Page, Enfield, was placed second, and a capital bowl of Irish Elegance set up by Mrs. Stafford Charles, Stanmore, was awarded third prize.

Four table decorations in Class 107, open only to lady amateurs, were a welcome feature in the decorative tent. A very showy table of Irish Elegance was daintily set up by Miss Vesta Cook, gaining the first prize quite easily. With Old Gold, Miss Cherry Courtenay Page was second. A lovely table of Mme. Ravary that deserved a better position was placed third. This was shown by Mrs. Stafford Charles. The freshness and beauty of this exhibit were quite pronounced.

THE HOLLAND HOUSE SHOW.

THE great summer exhibition of the Royal Horticultural Society, held by kind permission of Mary Countess of Ilchester in the grounds of Holland House on the 6th, 7th and 8th inst., proved a great success. Although not quite so large or comprehensive as in some former years, the quality throughout was good, and reflected great credit on the exhibitors.

SWEET PEAS.

If the Holland House Sweet Pea exhibits were any criterion, we may assuredly expect to see a remarkable display at the National Sweet Pea Society's Show next week. One may safely hazard that at no previous Royal Horticultural Society's Summer Show has there been a finer Sweet Pea display than on this occasion. In not a few instances the exhibits were remarkable, not only for quantity, but for quality, high colour and effective staging. In almost every instance the flowers were of the exhibition type, which goes to prove that however much one may dislike the super-exhibition methods of culture, it is incumbent upon exhibitors to grow their plants on the one, two or three stem principle, otherwise there is little hope of attracting the attention of either judges or the general public.

Not the least important exhibit was that of Messrs. J. K. King and Co., Coggeshall. Strength of stem and size of flower were noticeable feat res, while the staging was effectively carried out. Arches covered with blooms formed a background for the splendid vases in the foreground. Particularly notable varieties were King White, Lavender G. Herbert, Czarina Spencer, Charles Foster, King Manoel, Anglian Fairy, Walter P. Wright, Scarlet Emperor and Royal Purple.

Two hundred square feet were covered by Messrs. Alex. Dickson and Sons, Newtownards. Backed by black velvet, which, by the way, seemed to be an accessory adopted by most firms, the tall pillars and effectively set-up vases showed up to perfection. Some of the flowers were, perhaps, on the coarse side; but, taken as a whole, the quality was superb. Fiery Cross and The President were two as yet undiscovered varieties that stood out most strongly. Hawmark Gladys was easily among the leading cream pinks. Royal Purple, Elsie Herbert, Mrs. Damerum (a new cream), John Ingham (still unbeaten), Mrs. J. Balmer (a very pretty fancy), Blue Picotee, Wedgwood and King White were a few of the many good things shown.

Messrs. Hobbies, Limited, Derham, had a very effective display. Dispensing with pillars, the firm mounted the vases on tall rods in the rear, while the remaining spaces were filled with well-arranged vases. Several seedlings, obviously of the Mrs. Hugh Wormald type, were shown; but a few other telling varieties noted as we hurriedly passed along were Lavender G. Herbert, Rosabelle, King Manoel (which, by the way, seems to have displaced nearly all other maroons), Hercules and R. F. Felton.

We are so used to the magnificent displays of Messrs. Dobbie and Co., Edinburgh, that nothing they set up nowadays surprises us. Vividity of colour is always a strong point, and, coupled with most skilful staging, one perhaps gets at the real explanation of Messrs. Dobbie

and Co.'s phenomenal displays. Others may have stronger and longer stems, but stems do not count for everything. The Scottish firm's dominating position was due largely to the foregoing features. A few of the varieties exhibited are hereunder mentioned, but they were not picked out because of their super-excellence. Dobbie's Orange, Jean Ireland (easily the finest cream-ground picotee yet exhibited, and as shown it confounded those experts who last season opined it to be Mrs. C. Breadmore over again), Miss Burnie (the new blush white), Margaret Fife (a fine rich blue), Hercules (in gnat form), Royal Purple, Old Rose (a really delightful new variety), Dobbie's Cream, Henry Ohn and New Marquis. It is worth mentioning, perhaps, that the light in the tents was most deceptive. When one was considering Sweet Peas, bright blues became greyish mauve, and rich rose shades took on a salmon tint.

Messrs. G. Stark and Sons, Great Ryburgh, had a pretty little stand. Purely field-grown blooms were shown, but while lacking in stem, the flowers were large and highly coloured. Nearly all the varieties shown were the firm's own special stocks or seedlings, and of the latter quite a number were shown, several of them of the Duplex type. Pathfinder (a fine salmon rose), Fair Maid Improved, Lord Northcliffe, Mrs. H. Williams and many others were also shown, the centre of the stand being filled with the new perpetual-flowered Tritomas.

Very good quality was noticed on the stand of Mr. James Box, Lindfield. No elaborate staging nor startling novelties were shown, but all the most popular varieties were to be seen. An Improved Dorothy struck one as a first-class mauve, and other good flowers were Mrs. Gibbs Box, James Box, Scarlet Empress, Orange Perfection, Prince George, Charles Foster and King White.

A neat little display was also put up by Messrs. Jarman and Co., Chard. Mrs. Townsend was in very good form, while Elsie Herbert, King Manoel, Hercules and Mark's Tey were others that caught the eye.

Robert Sydenham, Limited, Birmingham, were well represented by a comprehensive though not extensively large collection. Several novelties were shown, including Lord Fisher (a fine maroon), Mrs. A. G. Gentle (white, flushed rose pink) and Mrs. Acombe (white, heavily flushed lilac). Other varieties that were very well shown were Edith Taylor, Norvic, Princess Mary, Lady Evelyn Eyre, Lillian and Maud Holmes.

Considering the fact that all his blooms were culled from ordinary seed rows, Mr. J. Stevenson, Wimborne, made an excellent display. Money-maker, Golden Glory, Honor Bright, Peace (a new deep cream pink), Warrior (a promising red maroon), Scarlet Emperor and Hercules were a few of the varieties on view.

Messrs. E. W. King and Co., Coggeshall, had a very effective display. A central mound topped by a tall pillar was surrounded by outer pillars, which were connected to the centre by arches, tastefully furnished. This highly decorative exhibit was interesting, inasmuch that, apart from all the popular Anglian varieties and others, such as Hercules, King Manoel, &c., there were also several new seedlings, including the cream-ground Mrs. Cuthbertson, a new and true stock of that troublesome yet beautiful variety Audrey Crier, and Miss Burnie, or, rather, a seedling that to all appearances was this as yet undiscovered blush white.

Few, if any, ventured to stage so many varieties as Messrs. S. Bide and Sons, Farnham, who made a splendid display in the Orchid tent. Well set up and carried right up to the roof, this exhibit was highly attractive. A few of the many varieties on view were Empress Eugénie, Edward Cowdy, Royal Purple, Zillah Smith, Morning Mist, Mrs. J. Balmer, Violet Crabbe, Ruth Bide, Dick Bide, Robert Sydenham and King White. Generally speaking, this collection embraced practically all the season's novelties and most of the popular favourites.

A remarkably fine exhibit was that staged by the Right Hon. Lord North, Banbury (gardener, Mr. E. R. Jones). Despite the enormous strength of the stems, the flowers were by no means coarse, and we may safely hazard that no finer private exhibit has ever been staged at a Royal Horticultural Society's Show. Many of the latest varieties were shown, together with a great number of the older favourites. A most striking collection, and from all appearances Mr. Jones is proving himself a worthy pupil of the older exhibitors who have in the past shown the road that leads to success.

HERBACEOUS PLANTS.

These were shown in their highest beauty and excellence, and just as we look for—and are never disappointed—extensive exhibits of rock gardens and the choice alpine at the great spring show of the society held each year in the Hospital Grounds at Chelsea, so do we expect a great gathering of the finer herbaceous plants at the summer exhibition held in the grounds of Holland House. To this department alone some three dozen or so firms from all parts of the country contributed, not small or makeshift groups—some, indeed, excelled all previous efforts—but such as might be termed thoroughly representative.

Far and away the finest thing of its kind in the exhibition was the combined terrace and water garden arrangement by Messrs. R. Wallace and Co., Colchester, with which was associated imposing groupings of Japanese Irises, Lilies, Eremuri, a right royal feast of the newest and choicest Water Lilies, and much besides. Each of these practically constituted a show alone, the wealth of blossom, contrasting here and harmonising there, emphasising the masterly art which had so well conceived it all and so admirably carried it into effect. The central feature was of Japanese Irises, huge waving blossoms of dinner-plate dimensions in blue, white, rose, pink, violet and other shades to the water's edge from a foil of Bamboos, Grasses and light material. On the

immediate right was the terrace garden, ideally executed and suggestive. Then followed a wealth of Eremuri such as has never before been seen, hybrids all, save such as Sheldford and the giant forms of Bungei (raised from the last named) and the white-flowered Olga. Of these alone, springing from a setting of Ferns and Funkias, there were some 200 spikes—White Queen, Primrose Queen, Rose Queen, with Bungei superbus, B. pallidus, and others of orange, bronze, &c. So fine, indeed, were these Eremuri that Sir Harry Veitch, who presided at the Press luncheon the day before the opening, selected them for special remark, and certainly nothing in this great exhibition merited it more. A fine set alone and of the highest garden value, it represents a great work among these indispensable summer flowers, whose towering spires afford new pictures in garden scenery. Nor can we omit the beauty of the Water Lilies, such as Attraction (rich red), Moorei (yellow and rose), Formosa (rose, with crimson picotee edge), Escarboucle (superb crimson), Mrs. Richmond (rose pink) and William Falconer (deepest crimson). Lilies, Delphiniums, Calochorti and much more contributed their quota of beauty and interest to one of the most imposing arrangements we have seen.

In another direction Mr. Amos Perry, Enfield, contributed a group of hardy Ferns, Larkspurs and Lilies of exceptional merit, the latter quite a strong feature of the group. Of these the outstanding kind was Amos Perry, which has resulted from crossing L. Humboldtii and L. Parryi. It is of rich orange yellow colour, of large size and copiously spotted crimson; in all probability the finest hybrid Lily for many years. Other good Lilies were Roezli (of which there was a magnificent group), L. pardalinum Johnstoni, L. Parryi (rich golden), L. Grayi, L. regale, L. columbianum, L. Martagon dalmaticum, L. parvum luteum and L. canadense. Of L. parvum luteum several spikes were carrying upwards of forty flowers. Some good Larkspurs were Queen Mary (sky blue), Lily A. Henslow (dark), La France (mauve) and Rev. E. Lascelles (of which there was a handsome group). Some hundred varieties of hardy Ferns occupied a central place.

In an adjoining tent Messrs. H. J. Jones, Limited, Lewisham, set up a magnificent exhibit of herbaceous Phloxes, the pot-grown examples being staged in the finest condition. In addition to the plants, which were very numerous, were some hundreds of cut spikes arranged in the background, the whole constituting quite a sumptuous feast of these early summer flowers. The following were good and distinct: Mrs. Alder (new, pearl pink), Goliath (salmon red), G. A. Stroheim (scarlet), Dr. Charcot (lilac), Selma (delicate pink), Elizabeth Campbell (pink, white eye), F. A. Buchner (white) and Baron von Dedem (brilliant scarlet). Canterbury Bells of many lovely shades and with giant cup-and-saucer flowers were also on view.

Mr. R. C. Nuttall, Woodbridge, had a fine showing of Delphiniums, of which Rev. E. Lascelles, Mrs. R. C. Nuttall, Mrs. Brewster (metallic rose) and Prince Henry (purplish plum, white eye) were a few. Cut Roses in great variety were also shown. Of more than ordinary interest were two fine groups of Statice Suworowi (pink) and S. S. alba, the peculiar inflorescences of these affording quite a picturesque effect.

A showy group from Mr. G. W. Miller, Wisbech, included several towering spikes of Lilium giganteum, together with a superb lot of L. pardalinum and such fine Delphiniums as Rev. E. Lascelles, King of Delphiniums, Chaucer (deep blue), Princess Mary (azure, white eye), Gloriosa (rosy mauve) and Alake (the best deep plum purple).

Messrs. W. H. Cutbush and Son, Highgate, had a superb showing of Lilium Humboldtii magnifica, staging two fine groups of this handsome form. In addition was the pretty L. Grayi, with Delphiniums, Scabiosa, Astilbes, a lovely lot of Water Lilies in a low-placed streamlet, and many choice water-side and other plants. Iris ochroleuca was very fine.

Messrs. W. J. Godfrey and Son's (Exmouth) exhibit contained a rich array of herbaceous Phloxes, together with an excellent strain of Scabiosa caucasica, the fine Delphinium Star of Devon and others, and a particularly choice lot of the Exmouth strain of Canterbury Bells of the cup-and-saucer section. The mauve, rose, pink and light blue tones of these, in addition to handsome pyramids of blossoms, made a particularly fine show.

Messrs. Whitelegg and Page, Chislehurst, staged a sumptuous group of herbaceous cut flowers and plants, flanked at either end with Roses and the "New Berry." The former were chiefly Delphiniums in variety, Romneya Coulteri, fine groupings of Gaillardia Lady Rolleston (self yellow), Ourisia coccinea, Eriogonum speciosa, &c. Arendsi (rose and white), Verbena chamædrysoides (scarlet) and Gentiana Przewalskyi (rich deep blue).

Messrs. Thompson and Charman, Bushey, showed Delphiniums very finely, Thalictrum dipterocarpum, a lovely lot of Water Lilies, as Nymphaea Marliacea carnea, N. M. chromatella, N. gladstoneana, N. Laydekeri purpurea and others.

Messrs. A. A. Walters and Son, Bath, the raisers of that unique Delphinium Rev. E. Lascelles, displayed that variety in fine style, with, in addition, Gaillardias, Phloxes, Lychnis chalcedonica and a variety of Chrysanthemum maximum.

At the end of Tent No. 2 Messrs. Kelway and Son, Langport, arranged a selection of the choicest Delphiniums, rich and varied in colour, handsome in spike and fine in flower. A few of those of outstanding merit were Bayard (rich plum), Ragged Robin (light blue), Sir Edward Fry (azure and purple), Dusky Monarch (reddish purple, dark eye), Monarch of All (rich purple) and Drake (a superb sky blue, and probably the finest of all).

THE GARDEN.

No. 2278.—VOL. LXXIX.

JULY 17, 1915.

NOTES OF THE WEEK.

The Royal Horticultural Society's War Relief Fund.—We understand that the Royal Horticultural Society will be pleased to send a supply of their Letters of Appeal for promises of subscriptions to the War Horticultural Relief Fund to horticultural societies holding flower shows during the next month or so, in order that they may be issued with the show schedules or circulated in the show grounds. Will those able to help in this way kindly make application to the Secretary, Royal Horticultural Society, Vincent Square, Westminster, London, S.W., stating the number of copies they wish sent?

Seedsmen in the British Army.—Messrs. Sutton and Sons inform us that the number of their staff who have now joined His Majesty's Forces is 104. Of these we regret to say that two have been killed and three wounded. Mr. E. M. Medlicott has been promoted second lieutenant in the 9th Royal Berks Regiment, and Mr. R. Haigh second lieutenant in the 1st Royal Berks.

Rose Arthur R. Goodwin.—In our issue for July 3 we referred to this charming Rose growing in standard form. An artist friend has since sent the photograph reproduced on this page, which represents a bed of this Rose in the Royal Gardens, Kew. The illustration depicts the suitability of Arthur R. Goodwin for this method of cultivation, the thin carpeting of white Violas effectively clothing the soil beneath the trees.

Scarlet and White in the Border.—One of the most effective displays we have seen lately in a herbaceous border was a good group of *Lychnis chalcedonica* intermixed with *Achillea Ptarmica*. The Pearl. The brilliant scarlet heads of the *Lychnis* stood just above the graceful sprays of the *Achillea*, with beautiful effect, suggesting two suitable subjects for a large bed.

A Beautiful Hybrid Rock Rose.—The name *Cistus cyprius* suggests that the subject of this note is a native of Cyprus, but present-day authorities incline to the belief that it is a hybrid between *C. ladaniferus* and *C. laurifolius*. The large white flowers, 3 inches across, with a crimson blotch at the base of each petal, suggest *C. ladaniferus*, while the clusters of flowers and leaves

more resemble *C. laurifolius*. For hot, sunny borders and banks of light soil, masses of this Rock Rose are a beautiful sight in June and July. When not in flower *C. cyprius* is a pleasing evergreen, and hardier than most of the Rock Roses.

Lieutenant Bayley Balfour Killed in Action.

It is with regret that we are informed of the death in action on June 28 at the Dardanelles of Lieutenant Bayley Balfour, the only son of Professor Isaac Bayley Balfour, Regius Keeper of the Royal Botanic Gardens, Edinburgh, and of Mrs. Balfour. Lieutenant Bayley Balfour was twenty-five years of age, and was gazetted to the Army in January last as an officer of the 14th

was in his thirty-eighth year, and was a civil engineer by profession. He was highly esteemed by all who knew him, and was much respected for his thoroughness and uprightness of character.

Mr. George Forrest on Alpines in Yunnan.—At the Royal Horticultural Society's fortnightly meeting on Tuesday next, Mr. George Forrest, the famous traveller and plant collector, is to give an exhibition of lantern slides of a number of the finer alpine plants which he saw in Yunnan and photographed where he found them growing in their native homes. At the same time he will deliver a lecture, when it is his intention to enlarge upon the peculiarities of each and their possibilities under cultivation.

The Washington Thorn.

One of the first Thorns introduced, 1738 being given as the year, *Crataegus cordata* is a most distinct and useful species. Its most valuable character is the flowering season, which is the end of June and early in July, at which time all the well-known Thorns are over. Freely borne in terminal and axillary corymbs, the creamy white flowers are scarcely half an inch in diameter. These are followed by scarlet fruits in the autumn. As a lawn specimen the Washington Thorn forms a pleasing, round-headed tree of moderate height. It is a native of the Eastern United States and may be readily raised from seeds, which ripen freely on the trees in the winter.

New versus Old Potatoes.

The President of the Board of Agriculture and Fisheries desires to call attention to the fact that there is a considerable supply of last year's crop of Potatoes

remaining unconsumed. At this season there is a general demand for new Potatoes, and these—although they are undersized because of the dry weather, are already being disposed of in great quantities. This is a waste of the national resources, since most of the new Potatoes if left in the ground would increase considerably in weight. Consumers are therefore urged to make use of the remainder of last year's Potato crop before making large demands upon the new one. As suggested in our last issue, it would be even better to plant the old Potatoes at once where ground is available.

ROSE ARTHUR R. GOODWIN AS A STANDARD WITH WHITE VIOLAS CARPETING THE GROUND.

Royal Scots. He was attached to the 1st King's Own Scottish Borderers. Lieutenant Bayley Balfour was a young man of high promise, and a general favourite. Deep sympathy will be felt for Professor and Mrs. Balfour in their severe trial.

The Late Captain Whitton.—We also have to record the death in action at the Dardanelles on June 28 of Captain Peter I. Whitton, the only son of Mr. James Whitton, V.M.H., Superintendent of Glasgow Parks, and of Mrs. Whitton. Captain Whitton, who was married and leaves a widow and one child, to whom, with his parents, our readers will extend their sincere sympathy,

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

A Cobweb Houseleek.—The enclosed photograph may be of sufficient interest to reproduce in THE GARDEN. *Sempervivum arachnoideum*

ONE OF THE COBWEB HOUSELEEKs GROWING IN A READER'S GARDEN.

Laggeri giganteum is not as common in gardens as it deserves to be, for the rockery certainly contains no more interesting or handsome plant. The large rosette shown in the photograph measures nearly 2½ inches in diameter, and is beautifully clothed with the cobweb threads so characteristic of the species. Like most members of the genus, it is easily grown, and thrives in medium soil containing a large proportion of grit. Full sun is, however, essential, or the leaves lose their dark red colour.—NORMAN BOOTHROYD, *Holmleigh, Bailey.*

A Recipe for Bottling Peas.—The Peas must be gathered while young. Choose those of a good cooking variety, shell them, and immediately throw them into boiling water to which some salt has been added. Allow the Peas to boil two minutes, then strain, and fill the bottles with the Peas and the water in which they were boiled. Place the glass stoppers loosely on the bottles, then stand them in the steriliser, the water in which should be warm, gradually bring to the boil, and allow them to boil for five minutes. Take out the bottles and screw down quickly.—(Mrs.) E. BECKETT.

Stone Edgings to Pathway.—The photograph reproduced on page 312, issue June 26, of a stone path and rock plants reminds me of some similar in Lancashire, where stones and stone slabs are largely used in gardens. Many of the stones there are grey and weathered in appearance when first put down, and give one the impression that they have been in that particular position for many years. The majority of the border and rock plants, I noticed, seemed to like the stone edgings, as they grew remarkably well and soon spread over them. The general effect is enhanced when, at intervals of a few feet, the stones are so arranged as to form a small rockery encroaching on the border itself, with suitable subjects planted among them. I have used them also in a formal

manner to enclose a narrow border a foot wide under large trees, the drip from which soon spoiled grass and many other edgings; but Ivy, planted and pegged down between the stones arranged as before stated, was a great success.—G. G.

White Sun Roses Growing Wild.—When visiting Weston about a fortnight ago, I spent a day on Brean Down, a peninsula which juts out to the west. On the north side were thousands of clumps of Cowslips, which evidently had flowered well earlier in the season. Just going over, in a sort of dell, were lovely wild Hyacinths, and among them a bright pink Campion, with one or two paler specimens. The Bracken was just appearing. On the rocks at the western point were lovely tufts of pink Thrift, which crept along gradually, getting less towards the south side. Here was the greatest surprise of all, for above the rocks on the stony slopes were masses and masses of white *Helianthemum*, or Sun Rose, with large flowers and grey foliage. There was also one plant of a pale cream colour. Among the white were clumps of yellow *Stonecrop*. The whole was a perfect natural rock garden shining in the sun.—RUTH B. CANNON, *Painswick, Gloucestershire.*

Myosotidium nobile in Somerset.—I enclose a photograph of *Myosotidium nobile*, which may be of interest to your readers. I think it the finest plant of the Forget-me-not tribe. This plant was put in on February 10, 1914, with only three small leaves. The photograph was taken fifteen months later, on May 10, 1915. It grows in partial shade. During the winter it withstood frosts of 8°, 10° and 12°. Twelve feet from it I have a small pond which had over an inch of ice on it. The plant is now covered with large seed-pods, which I hope will ripen.—J. D. A., *Somerset.*

Home-Made Ointments, Soap and Perfumes.—With reference to the question raised by "M. H." in the issue of THE GARDEN for June 19, page 300, on "Home-made Ointments, Soap and Perfumes," She will find a large amount of information in

the fifth edition of "*Piesse's Art of Perfumery*," written by a member of the well-known firm of Piesse and Lubin, formerly of New Bond Street, now of 28, South Molton Street, London, by whom the book is published. I cannot state the price of the book, but it is a thickish volume, and, as stated on the title page, it gives "instruction for the manufacture of perfumes for the handkerchief, scented powders, odorous vinegars and salts, snuff, dentifrices, cosmetics, perfumed soap, &c." With regard to preparations of a medicinal character, some information may be obtained from Barton and Castle's "*British Flora Medica*," a new edition of which I revised in 1877, and was published by Messrs: Chatto and Windus.—JOHN R. JACKSON.

Lilium candidum : A Note from the Fighting Line.—This year my garden knows me not, and what that privation means to me all gardeners will understand. I have to content myself with the gardening papers, and in your issue of July 3 I read with interest the article by "Scientist" on the Lily disease. In this he expressed the hope that those who have had experience in growing the white Lily in chalky soil would give their opinions. It happens that during the last few weeks I have been in a part of our line where the soil is exceedingly chalky, and I have been particularly struck by the healthy appearance of the many clumps of *Lilium candidum* that I have seen. In the garden of an evacuated and much-knocked-about house, where I was quartered for several days, the soil was more chalky than I had ever seen anywhere in my life, and there, among a tangle of weeds, red Poppies and Cornflowers, were the finest white Lilies of all. The foliage was perfectly healthy, and showed no sign of *Botrytis cinerea*.—H. V. WARRENDER, *British Expeditionary Force, France.* [We thank our esteemed correspondent for his interesting letter, and hope he may soon return safely to his garden and the flowers that he loves.—ED.]

The Second Flowering of Pyrethrums.—If, instead of allowing Pyrethrums to weaken themselves by permitting old flowers to remain longer

MYOSOTIDIUM NOBILE GROWING IN A SOMERSET GARDEN. THE FLOWERS ARE BLUE.

than necessary, one will remove them and give the plants an impetus by mulching with manure, it will be found that a second crop of bloom will follow, perhaps a little inferior to the first, but very useful to those who desire variety in cut blossoms. Particularly are the flowers of the single varieties useful for table decorations, and any plan to ensure a further instalment of blossoms should be remembered. In a dry time Pyrethrums need copious supplies of water, and this duty should not be relaxed after the first bloom if a second crop is desired.—W. LINDERS LEA.

Elderflower Wine or Frontignac.—I see there is an enquiry in *THE GARDEN*, page 312, issue June 26th, for a recipe for Elderflower wine. I have one in an old recipe book belonging to my mother. I know nothing about it, but all the recipes in the book which I have tested are very good ones, so I am sending it for your correspondent. "To six gallons of water add 18lb. of lump sugar. Boil it half an hour, and when new-milk warm put to it five pints of Elderflowers (picked clean from the stalks), the juice and rinds of six Lemons, 6lb. of raisins (cut small); add five tablespoonfuls of new yeast, work it four days, stirring it twice a day; then put it into the cask with half an ounce of isinglass dissolved in a little of the liquor, and close it well up. In about six weeks the wine will be ready to bottle. It must be strained before it is put into the cask. The flowers should be used the same day as they are gathered, otherwise they will lose their colour."—GERTRUDE WELBY.

—In reply to "Anne Amateur," I enclose a recipe taken from a manuscript book of my mother's. If the wine I had when a young man was made from this recipe, as I imagine it was, I can testify to its being extremely good, and like sparkling Moselle. (I have some raisin wine now which was made more than sixty-five years ago.) "Boil 18lb. of white sugar in six gallons of water and two whites of eggs. Skim it, and shortly before taking off the fire put in a quarter of a peck of Elderflowers. When cool, stir it and put in six spoonfuls of lemon juice and three or four spoonfuls of yeast; beat well into the liquor and stir it well every day. The third day tun it, putting 6lb. of raisins into the cask. Stop it close and bottle in six months." Another similar recipe says it should be made from the tree which bears white berries.—T. W.

An Old-Time Recipe for Making Pot-Pourri. The gentle art of making pot-pourri requires far more care than might at first be considered necessary. The writer is acquainted with an old lady whose one great joy in life seems to be the making of pot-pourri, which gives her rooms a delicious fragrance when the covers are removed from old urns and Chinese jars containing the Rose petals. For many years this lady has followed, almost to the letter, the following recipe, taken from "A White-Paper Garden," by S. A. Shafer: "Gather the Roses on a fair, clear morning after the dews have dried. Take them into the spare chamber, on the floor of which fresh linen sheets have been spread. Crumble the petals gently from the hearts of the Roses, and sprinkle the sheets thickly with them. Open the window towards the sun until evening. The next day the leaves will be so withered that what filled two sheets may now be spread on one, and freshly gathered Rose petals may be strewn on the empty spaces. On the third morning the leaves will be still more dried, so that you may gather up the first day's Roses and place them in an

empty basket. Stir occasionally, and every day add to them the petals dried to the proper texture. When all are dried, prepare a bowl of sweet spices, which shall contain small bits of dried Orange and Lemon peel, sticks of Cinnamon and buds of Allspice, Cloves and Cassia, bruised. Add a Tonga Bean cut into fine shreds, and much violet-smelling Orris-root, well grated. A grain of Musk is liked by some, and amid so many divine perfumes is not obtrusive. Of handfuls of Lavender be not sparing, nor of the sweet leaves of Rose, Geranium, and of dried sprigs of Citronella as much as you may. Now into your Chinese jars or old painted French urns place Rose leaves and spices alternately until they are lightly full. Put on the covers, which are to be removed when the room needs refreshing."—MEMORY.

A Miniature Moraine.—It may interest your readers to hear of a miniature moraine garden of a novel type, which brings a tiny glimpse of alpine loveliness within the reach of everybody. Like the window-sill garden of which I wrote to you half a dozen years ago, and which is still as flourishing as ever, this can be enjoyed by even those who have no plot of garden ground. A balcony, a yard or a flight of outdoor steps would give the only accommodation needed. Three years ago two chimney-pots were removed from this house, pots of the common type, in which a short cylinder springs from a rectangular base. I was struck with the idea of using them in a reversed position as a receptacle for alpine. Each forms an oblong trough of red earthenware, pleasantly weathered, the inside measurements 14 inches by 10 inches, standing some 14 inches from the ground, and so raising the contents conveniently nearer to the eye. I obtained a small quantity of chips and sweepings from a stonemason's yard, and with the coarser portion the cylindrical base was first filled to afford ample drainage. Then came a thin layer of freshly cut turf, and above this the square trough was filled with the usual moraine mixture of stone chips, silver sand, a little loam and peat. In this I planted alpine of a thoroughly sun-loving character, chiefly Sedums and Saxifrages straight from the Swiss mountains, placing among them a few rough pieces of mountain stone. After three years the surface of each little moraine is completely covered. There are fine cushions of Encrusted Saxifrages with graceful white spires. A tussock of the Cobweb Houseleek shows ten spikes of crimson bloom, and *Sempervivum montanum*, seventeen. The front is draped with an overflow of trailing Sedums, covered with milky white and golden flowers. Doubtless many other species of alpine might be made equally happy. These little gardens are watered perhaps once or twice during a prolonged summer drought, and each is covered through the winter with a single pane of glass. The result of such little trouble and expense is at the present moment a charming picture of varied colour, and throughout the year an object of unfailing interest and beauty.—M. KENNY, *Cambridge*.

FORTHCOMING EVENTS.

July 20.—Royal Horticultural Society. Exhibition of Flowers, Plants, &c., 1 p.m. to 6 p.m. Royal Horticultural Hall, Vincent Square, Westminster.

July 22.—Carnation and Picotee Show, 1 p.m. to 6 p.m. Royal Horticultural Hall, Vincent Square, Westminster.

ROCK PLANTS ON WALLS.

SOME weeks ago there were letters in *THE GARDEN* respecting rock plants, and some mention was made as to their growth on walls. Perhaps my experience as an amateur may interest readers. I moved to my present house at Michaelmas, 1913, and decided I would grow as many rock plants as the small villa garden allowed. The garden was in a very rough state, and my first work was to put two men to root up everything and burn it. Nothing was spared.

On the east side the neighbouring garden is on higher ground, so I built a rock retaining wall to the border against that fence, which is about 26 yards long by 2 feet high, and is built of sandstone. At the end of the garden is an island bed 21 feet long by 9 feet wide at one end, tapering to 2 feet at the other and 2 feet high, and built of sandstone. A half tub is sunk on this and filled with water, and another in a corner is surrounded by Ferns—such as *Osmunda*, *Beech*, *Oak*, *Male* and *Hart's-tongue*, and *Adiantum cuneatum*—*Primula japonica* and *Scillas*. At the back of the long border I have planted *Phloxes*, *Michaelmas Daisies*, *Delphiniums* and similar plants; and on the front are my rock plants, in some cases trailing down the face, and in others in crevices and pockets. The garden is sheltered by a high wall on the north (covered by *Roses*), so is fairly warm. The house screens the sun somewhat from the west, but it is open to the south, and on the east my neighbour has a fence and a row of pollarded trees.

I have been more successful than perhaps I deserve in getting a good display of colour lasting over many months. Among some of my plants are *Daphnes Cneorum* and *Mezereum*; *Campanulas muralis*, *garganica* (which I find likes squeezing between rocks), *carpatica* (blue and white), *isophylla*, *pumila* (blue and white, which ramps, but I have not the heart to stop it) and *pulla*; *Saxifragas aizoides*, *Clibranii*, *Cotyledon cuneifolia*, *sancta* (which is a shy flowerer with me), *hypnoides*, *Rhei*, *Guildford Seedling*, *scardica*, *lingulata*, *Bellardii*, *labradorica* (? given me as such), *incurvifolia* (sold me as such, but not to be found in books), *Carl King*, *Aizoon rosea*, *decipiens grandiflora*, *longifolia*, *Cherry Trees*, *Wallacei* and *burseriana*. These have all flowered this year. Then I have the following *Primulas*, viz., *Auricula*, *cashmeriana*, *japonica*, *sikkimensis* (which dies in winter if it gets too wet, it seems), *denticulata*, *cortusoides*, *rosea*, *farinosa* (grown from seed), *capitata* (just coming into flower), *pulverulenta*, *frondosa*, *Sieboldii*, *hirsuta* (flowered last year, but not this) and a white one I think must be *nivalis*.

Then I have two patches of *Gentiana verna*, which have flowered gloriously and have constant care as to watering and top-dressing; *Androsaces lanuginosa*, *Chumbyii* and *sarmentosa*; many *Dianthi*, including *alpinus*, *neglectus* and *Cheddar Pink* (which I can only succeed with if squeezed in a chink).

The usual rock plants, such as *Aubrietia*, *Alyssum*, *Helianthemum* and *Cistus*, I, of course, have. *Myosotis rupicola* I lost, but *M. Rheistonii* is increasing. I mention the names to show a few only of the plants I am growing on my short length of rockwork and with only the experience I am daily gathering, which teaches one how really ignorant I am of the habits of my treasures.

The interest lies in discovering the natural likings of the individual plant, and not in coddling

it. Anyone who has the luck, for instance, to obtain a good flowering patch of *Gentiana verna* is well repaid for any trouble. Surely it is better to grow in a small patch of a town garden 154 different varieties of rock plants, flowering practically throughout the year, than the few herbaceous plants it would be only possible to get into the space.

Dorking.

ENTHUSIAST.

RAISING FUCHSIAS FROM SEEDS.

I HAVE more than once called attention in the pages of *THE GARDEN* to the great interest attached to the raising of seedling Fuchsias. Where this is intended to be followed, the best season for the pollination of the flower is now with us; hence this note. I have always found that from flowers fertilised in early summer not nearly so many good seeds are obtained as if the operation is carried out in July and in the first half of August.

As the organs of generation in the Fuchsia are very conspicuous, and the pollen is not shed nor the stigma in a receptive mood till at least a day after the flowers expand, there is no difficulty in effecting the crossing of different kinds.

Whether it will be successful, however, is quite a different matter, for although the berries may attain a good size and ripen thoroughly, it frequently happens that they do not contain a single fertile seed. Some very promising varieties have with me always proved to be barren, and that is also the experience of other raisers. The late Mr. Thomas Todman, an old-time successful raiser, who induced me to take up the raising of seedling Fuchsias, told me that such was his experience, and advised me that once I had a good seed-bearer, on no account to part with it. He quoted, for instance, a seedling of his own whose flowers were too poor to render it of any value from that standpoint. It, however, produced plenty of seeds, and from them several good and dissimilar varieties were raised. Strange to say, these were all remarkably shy in seed-bearing.

As far as my experience extends, it is useless to attempt to cross those varieties having white tubs and sepals with either the dark flowers or those with white corollas. Still, some day this may be accomplished, for in proof of the uncertainty that prevails in such matters, I may mention that for years the various raisers attempted to cross the varieties having white corollas with the dark kinds. For a long time this was unsuccessful; then all at once the stumbling-block seemed to disappear, and raisers experienced no further trouble in that direction. During the last two decades this cross has proved to be the most prolific in fertile seeds of any that I have carried out.

Though I have already mentioned that large and promising berries are frequently devoid of fertile seeds, there is another caution to be given to the raiser; this is that no disappointment must be felt if nothing of particular merit is the result. The pleasures of anticipation are worth something, and the great variety to be found even among the occupants of the same berry are very interesting, and furnishes ample food for reflection.

As the season advances and the berries ripen, great care must be exercised in gathering them. Some of the varieties change colour long before they are ripe, and in order to prevent a mistake in gathering an immature fruit and thus throwing away all chance of fertile seeds, I, whenever possible, prefer to let the berries drop, or at all

easy matter, as there is no difficulty in distinguishing between them and the abortive ones. If transferred from the point of the knife to a piece of blotting-paper, the seeds will soon dry.

I prefer to keep the seeds till the middle of February, when they are sown in well-drained pots in a mixture of loam, leaf-mould and sand. In a temperature of 55° to 65° the seeds will soon germinate, and the young plants with care grow away freely. In order to learn something of the natural habit of the plant, it is as well not to stop them at all. Many of them will flower towards the end of the first season, but it is only in the second year that their merits can be fully determined. As several varieties of my raising are now in general cultivation, I may claim a certain amount of success in this direction.

H. P.

THE NEW DAY LILY, *HEMEROCALLIS GOLDEN BELL*, SHOWN BY MESSRS. R. WALLACE AT HOLLAND HOUSE. (See page 354.)

events to remain until the stems shrivel. When this takes place, it is evident that all connection is cut off from the plant, and the fruit will derive no further nourishment therefrom.

In the case of many seeds that are embedded in pulp, a practice often followed is to rub up the berries with some dry silver sand and pick out the seeds therefrom. I tried this, but found that owing to the small number of fertile seeds it was a very tedious process, and a few precious seeds might easily be overlooked. After this the method adopted was to cut open the berries when they were quite ripe, and pick out the perfect seeds with the point of a penknife. They being, as a rule, but very few in number, this is a very

THE LONG-SPURRED AQUILEGIA IN SCOTLAND.

NO other early summer flower can quite compare with the *Aquilegia* for beauty and usefulness, and I often wonder why it is not much more

widely grown in gardens. For a number of years we have made a special endeavour to have this exquisite flower in good condition, selecting the finest forms only, and eliminating any that may appear poor in form or colour. This year they have made a wonderful show in the garden, besides affording large quantities of sprays for decoration.

They are much more effective in beds by themselves than when dotted about the mixed border, although if good clumps are planted they have a distinctly pleasing effect even there. I find, also, that the *Aquilegia* thrives remarkably well in partial shade, for the finest plants I have are growing in a bed on the north side of a wall. I expect on light soils this would be the best position in which to grow them.

Their culture is fairly simple, and is always best begun from seeds, as the plant, in its finer forms at all events, very much resents being divided or disturbed. I always sow the seeds early in spring in slight warmth, as I consider by so doing the plants are much stronger and bloom well the following year; whereas, if

sown outdoors in April they sometimes require an extra year before doing much good. On light soils I would, however, incline to sow early in July in the open, scattering the seeds very thinly and allowing the plants to remain in the seed-bed until the following spring, when they could be pricked off into nursery rows and finally planted where they were to bloom when strong enough.

Fairly rich, well-worked soil is a necessity if the best results are to be looked for, and in dry weather an occasional soaking of clear water is most beneficial to the young plants. When once well established, this watering is seldom necessary.

These high-class *Aquilegias* have one serious fault—they are comparatively short-lived. It is

safest, therefore, to raise a quantity each spring, so that a full stock of vigorous plants can be maintained at all times. When well cared for, the flowering season extends to several weeks, and no one could fail to admire a really fine strain.

Preston House Gardens, Linlithgow. C. BLAIR.

A BEAUTIFUL AND INTERESTING
PÆONY.

IN addition to being an exceedingly beautiful hardy flower, the Pæony illustrated herewith, and named *P. officinalis lobata*, is of considerable interest. It has been known in this country for nearly eighty years, possibly longer, because it was illustrated in Sweet's "British Flower Garden" as long ago as 1838. It has, undoubtedly, been in cultivation in this country since that time, yet it is seldom found in gardens, and even the collection at Kew does not at present contain a specimen. It was brought to my notice a few weeks ago by Mr. F. Gifford of Hornchurch, Essex, who sent an invitation to go and see a bed of well over a hundred plants that were carrying a total of something like 600 flowers. Although used to seeing beautiful flowers, I do not remember coming across anything more charming than this bed. The blooms are about three inches in diameter, and their colour may best be described as glowing orange scarlet or, in the deepest part, tomato red. In addition to this wonderful colour the flowers are exceedingly graceful, and their shape is well shown in the illustration. The foliage is finely lacinated, and the flower-stems attain a height of about eighteen inches.

F. W. H.

THE PLUME POPPIES.

IN the wild garden, open parts of the woodland, or even at the back of a large herbaceous border where plants of a bold and distinct growth are required, the Plume Poppies, *Bocconias*, should find a place. Two are eminently suited for such positions, these being known respectively as *B. Cordata* and *B. microcarpa*. Both are hardy herbaceous plants, and during the summer each attains a height of about nine feet, the large shoots having a very much branched habit. The flowers, though small, are produced in profusion during July and August, and form plume-like masses from which the plant derives its popular name. The two kinds do not differ very considerably, *B. microcarpa* being the best coloured of the two. These Plume Poppies will grow in almost any soil that has previously been well dug, though a rather clayey medium will give the best results. When planting in the herbaceous border, care must be taken not to place them near weaker-growing and choicer plants, as they are voracious feeders and take a vast amount of nourishment from the soil which their roots traverse. Propagation is easily effected by division of the roots in early spring, a season when they may be transplanted. A mass of these plants in the wild garden is very pleasing.

THE OAK TREES OF THE
WORLD.

AT page 289 of *THE GARDEN*, issue June 12, "Hurstcot" has some historical notes on the Oak, using the name in a generic sense, and he incidentally mentions that "notes regarding little-known specimens would be welcome." Almost exhaustive information on cultivated and wild specimens of Oaks of various kinds will be found in Elwes and Henry's "The Trees of Great Britain and Ireland" and in Bean's "Trees and Shrubs Hardy in the British Islands." These are rather expensive works, but they may be consulted either at Vincent Square (Royal Horticultural Society) or at Kew. I do not intend to supplement "Hurstcot's" notes on Oaks

Quercus, among them *Euphorbia*, with approximately 1,200 species; *Eugenia*, with 700 species; and *Ficus*, with 600 species. Each of these genera is represented both by shrubby and arboreal species, and *Euphorbia* by a large number of herbaceous and fleshy, Cactus-like species associated with a relatively small arboreal element.

Of the many branches of botany, the present (and past) distribution of plants over the surface of the globe is not the least interesting. Taking the trees of Great Britain—the Alder, Ash, Beech, Birch, Elm, Holly, Hornbeam, Lime, Maple, Oak, Pine, Poplar, Willow and Yew—each genus to which these trees belong presents peculiarities in distribution, as well as in number of species, not easily explained by the student of plant geography. Each of these elements of our woods and forests has its climatic limits, and each

PÆONIA OFFICINALIS LOBATA, A BEAUTIFUL BUT LITTLE KNOWN HARDY FLOWER.

growing in this country, but some particulars of the Oaks of the world may be of interest to readers who have not the advantages of access to comprehensive libraries.

One sentence in "Hurstcot's" communication calls for comment. He says: "There is no tree with the same number of species and varieties as the Oak." It is not quite clear what the author means, but it may be assumed that he intends to include all the known species of Oak—*Quercus*. Even in this extended sense the statement quoted is open to some modification. The genus *Quercus* comprises at least 300 species (leaving varieties out of the estimate) and probably as many as 350 species, large areas in China and Malaya still awaiting botanical exploration, and it is in these countries that Oaks find their densest concentration in the Old World. But with regard to mere numbers of species, several genera surpass

presents biological complexities constituting unsolved problems.

I will give in illustration of these facts and factors the broad outlines of the present distribution of the genus *Quercus*, which girdles the northern hemisphere and extends southward in America to the State of Colombia, but not reaching the Equator, and in the East to New Guinea. Oaks are numerous in species, and spread all over the temperate regions of North and Central America, in diminishing numbers, in the mountain southward. They are characteristic of the Atlantic forests, but relatively rare in the Pacific forests, where they yield to coniferæ, and the species are mostly different in the eastern and western regions. Something like fifty species, perhaps more, are restricted to Mexico and the other Central American Republics. Very few have a wide range. *Quercus virens* is exceptional in

this respect, ascending from the sea-coast in Cuba and the Gulf of Mexico to several thousand feet, and latitudinally from the South-Eastern States of North America to Cuba and Costa Rica. The British Oak, *Q. Robur*, in a broad sense, has a wide area, ranging from North Africa and Western Asia all across Europe almost to the Arctic Circle, and *Q. Ilex* extends from the Mediterranean region to China and Japan. There is a considerable aggregation of species in Western Asia, through the Himalayan mountains to China and Japan and southward, through Burma and Malaya eastward to New Guinea. The naturalists of the Challenger Expedition collected acorns in the Fly River Drift. No fewer than seventy species, on the authority of the late Sir Joseph Hooker, inhabit tropical districts.

No species is recorded from Africa south of the Atlas Mountains, and none from Australia. *Q. Guppyi* from the Solomon Islands, based on imperfect material, is a Laurel. An Oak, however, may almost invariably be recognised by its fruit or acorn, which varies in different species from a quarter of an inch to $2\frac{1}{2}$ inches in diameter, and presents a great variety of elegant shapes. As a contrast, I may add that the genus *Fagus* (Beech) numbers about a score of species, and belts the world in north temperate regions, reappearing in extra-tropical South America, New Zealand and Australia, with no congeners or close allies in the whole of the intervening country. Some botanists treat the Southern species as generically distinct, under the name of *Nothofagus*, but that does not alter the fact that the two groups of species are more closely allied to each other than to anything else.

W. BOTTING HEMSLEY.

DAFFODIL NOTES FROM NEW ZEALAND.

WITH us, at the time of writing, *i.e.*, May 17, Daffodils are beginning to push up their green noses, while their *avant-coureur*—the Paper-White—has been flowering in increasing numbers since the middle of last month. Other kinds of *Polyanthus* *Narcissi* will take up the running into July, when the first early yellow trumpets herald the advent of the *Narcissus* proper and the coming of spring.

The Rev. J. Jacob's notes on "Technical Terms in Describing Daffodils" in your issue of March 13, with Mr. Pearson's rejoinder in April 3 issue, are of general interest, and the subject is, I think, worthy of serious attention, and might profitably occupy some pages of the "Daffodil Year Book, 1915."

I take it Mr. Jacob's article is tentative, something in the way of a feeler to elicit opinions and suggestions from others; so I venture to make a contribution, trusting that, coming from the Antipodes, it will not be altogether too stale when it reaches you.

With Mr. Pearson, I am inclined to think that some of Mr. Jacob's terms and illustrations are capable of improvement, and with due deference I mention some instances. As grown out here, *Lucifer* is not regarded as a "hooded" flower. It is at times apt to be somewhat weak in perianth, and so to suffer in rough weather, but normally presents a fairly flat perianth. "Elliptical," as Mr. Pearson remarks, needs some thinking out; while "claw-shaped," frequently applied to a similar character in the petals of Cactus Dahlias, is easily understood. Similarly, the meaning of "rectangular" is not immediately apparent, referring also to the profile of the flower. The definitions given of "loose," "loosely built"

while "incurved," suggested by Mr. Pearson calls to mind the form of *Chrysanthemum* with which the term is identified. May I suggest "involute" (rolled inward from the edges) or "partly involute" as more descriptive of the type? Mr. Pearson does not like "flanged," nor do I; it always makes me think of a drain-pipe. Would not the expression "rolled" or "rolled back," used in some catalogues, suffice? Then, I think a word is wanted to express that kind of trumpet mouth variously called "gashed" (ugly word), "serrated," "lobed," &c.

Now, I expect Mr. Jacob will say I have done nothing but criticise without helping, which I admit. Still, I have further ventilated some of the wants or shortcomings of the Daffodil vocabulary, and Mr. Jacob and his *confrères* may be entrusted to supply or remedy them.

While talking of Daffodils, I should like to ask: How long does a seedling remain a seedling? In other words: How long is a seedling eligible for the seedling class; what is the difference between a "seedling" and a new variety; when does the former merge in the latter; and when do they become full-fledged and take their places as standard varieties? If I correctly interpret the Midland Daffodil Society's schedule, a seedling retains that character until it goes into commerce, when it becomes a new variety for four years, after which, if it survives, it is regarded as a standard variety, though still eligible for the Bourne and Walter Ware Challenge Cups. I should be glad to know if this is correct and generally recognised, and to have any other information on the subject that will serve for our benefit and guidance in compiling schedules out here.

A. E. GRINDROD.

Auckland, New Zealand.

CANTERBURY BELLS AND ALKANET.

A FEW days ago, when visiting a garden on the East Coast, I was greatly pleased with a magnificent grouping of the Dropmore Alkanet, *Anchusa italica* Dropmore variety. This was in a large mixed border, and in front pink Canterbury Bells were flowering profusely. The effect created by this combination of rich blue and pink was particularly good, and seeing that both plants are so easily raised and grown, I thought the idea might be worth passing on. Of course, it is now too late to sow seeds of either plant; but seedlings of the Canterbury Bell can be obtained from some nurserymen and florists, and these should be planted out 9 inches apart without delay. The plants can, of course, be lifted in October and transferred to the flower border. The *Anchusa*, I find, increases readily by division of the roots during the autumn, almost any little piece growing and making a good plant. These divided portions do not always flower the first year, but will certainly do so the second.

S. X.

ROSE COLCESTRIS, THE NEW PINK VARIETY AWARDED THE "CLAY" CUP AT HOLLAND HOUSE FOR THE MOST FRAGRANT NOVELTY. (See page 354.)

and "starry" do not seem to me sufficiently distinct, and I should regard Frank Miles as a starry flower rather than loosely built.

The use of the words "rough" and "smooth" to indicate either the set of the perianth segments or the texture of them seems rather vague, and calculated to leave one in doubt as to which was intended. "Reflexed" is defined as "when the perianth bends back towards the corona." Should not this read "away from the corona," or "towards the ovary"? I have always taken the word "twisted" to indicate the form of segment similar to a propeller blade, and it does not, I think, properly describe the Frank Miles type;

particularly good, and seeing that both plants are so easily raised and grown, I thought the idea might be worth passing on. Of course, it is now too late to sow seeds of either plant; but seedlings of the Canterbury Bell can be obtained from some nurserymen and florists, and these should be planted out 9 inches apart without delay. The plants can, of course, be lifted in October and transferred to the flower border. The *Anchusa*, I find, increases readily by division of the roots during the autumn, almost any little piece growing and making a good plant. These divided portions do not always flower the first year, but will certainly do so the second.

THE CULTIVATION OF STRAWBERRIES.

THE garden Strawberry of to-day is a giant compared with its early type, and as far as is known is the complex result of the intercrossing of several wild types known by the generic name *Fragaria*, founded upon the Latin word *Fragum*, applied by the Romans

direction. Mr. Knight only described eighteen out of 400 seedlings, and perhaps the single one out of all his productions which is still grown is Elton Pine. Mr. Michael Keens of Isleworth, Middlesex, also raised a number of seedlings early in the century. Keens' Seedling, raised in 1823, was one of his productions. From 1840 to 1860 Mr. Myatt of Deptford raised a number of seedlings, several of which have proved of sterling merit, one of them being the still famous British Queen, and justly so on account of its high flavour.

1868, the first being Traveller, followed, after an interval of some years, by King of the Earlies and Noble. The crossing of these two varieties gave him the celebrated Royal Sovereign Strawberry, which was sent out in 1893, since which period the firm of Laxton have been able to make considerable improvement. The Laxton, Bedford Champion, The Bedford, Laxton's Latest, Utility, also King George V., The Earl, Maincrop and The Queen are new varieties of 1912. Strawberries naturally vary in different soils

MIXED BORDERS, WITH BOLD GROUPINGS OF CANTERBURY BELLS AND ALKANET.

to the fruit of the Wood Strawberry, known to them only as a wild plant. We believe that the size has been chiefly derived from the Chilian Strawberry, being intercrossed with the Wood, the Alpine and the Scarlet Strawberry, but the evolution has been slow and without any records as to the origin of the earlier types. Definite attempts at intercrossing the species of *Fragaria* were no doubt rare, until Mr. T. A. Knight related the results of his numerous experiments in that

Mr. J. Barnes of Bicton raised Bicton Pine about 1845. Willmott of Isleworth and Trollop of Bath were also raisers about that period. Mr. Powell of the Royal Gardens, Frogmore, sent out several seedlings, of which Coxcombe was the best. Samuel Bradley, gardener at Elton Manor, near Nottingham, was the raiser of that fine market variety, Sir Joseph Paxton, in 1862, and also Dr. Hogg. The late Mr. T. Laxton commenced his experiments with Strawberries about the year

and localities, but there are some that appear to do well in almost any locality, notably Royal Sovereign, The Bedford, Bedford Champion, Sir Joseph Paxton, Givon's Late Prolific, Viscountess and Laxton's Latest. Strawberries are gross feeders, require generous treatment, and should be planted on land that has been well manured and deeply dug. Rooted runners should be planted during August time and made very firm, as loose planting is one of the chief causes

of failure. Strong-growing sorts should be given 2 feet 6 inches between the rows and 18 inches between the plants; dwarf growers, such as British Queen and Dr. Hogg, may be planted 2 feet by 18 inches. Pot plants are much to be preferred to open-ground plants, as, having been potted into good soil in 2½-inch pots from early runners, they are finer plants and can be lifted without disturbing the roots. They will bear a full crop the first season, and can safely be planted early, even in dry weather.

Fungoid diseases, such as mildew and shot-hole fungus, may be prevented and cured by spraying with liver of sulphur, an ounce to a gallon of water.

Selection of Varieties.—The best Strawberries for jam are Viscountess and Scarlet Queen; best early, Royal Sovereign; best forcing, Royal Sovereign; best second earlies, Laxton's Leader, Bedford Champion and Laxton's Reward; best main-crop Strawberries, The Bedford, Sir Joseph Paxton and Rival; best late Strawberries, Givon's Late Prolific, Laxton's Latest and Laxton's Utility; best flavoured Strawberries, British Queen, The Queen, Pineapple and Epicure.

NEW AND RARE PLANTS.

FIRST-CLASS CERTIFICATES.

Odontoglossum Georgius Rex.—Without a doubt the noblest *Odontoglossum* yet produced, the well-branched inflorescence carrying no fewer than twenty-eight magnificent flowers. The ground colour of the flower is white, yet almost obliterated by dark purple blotches. An unusually large white margined lip characterises the variety, which, with feathered golden crest, renders it very striking. In addition to the first-class certificate, the Lindley medal—a rare award—was granted to this unique novelty. Exhibited by J. Gurney Fowler, Esq., Brackenhurst, Pembury, Kent. (See illustration.)

Cattleya Warscewiczii Mrs. E. Ashworth.—An exquisitely chaste flower of delicate pink throughout; sepals long, narrow and pointed; petals broad and well proportioned. The large, handsome lip is touched with yellow in the throat. From Messrs. Charlesworth and Co., Hayward's Heath.

Lilium regale.—This noble Lily has already received an award of merit as *L. myriophyllum*, the older name, which therefore takes priority, being as above. It is a trumpet kind from China, with whitish, yellow-tubed flowers and golden anthers. The buds are coloured deep rose, and this colour is prominent on the exterior of the open flower. Miss Willmott, who exhibited several handsome vases of it, appears to possess a particularly good type of this handsome species, which, happily, also is one of the most tractable of the trumpet class. At Warley, where it is an unqualified success, it grows nearly seven feet high.

AWARDS OF MERIT.

Hemerocallis Golden Bell.—The rich yellow flowers of this fine Day Lily have somewhat of the form and proportions of *H. aurantiacus* major. It is a very handsome sort, 3 feet to 4 feet high, and very profuse flowering. From Messrs. R. W. Wallace and Co., Colchester. (See illustration, page 350.)

Sweet Pea Jean Ireland.—The flower is of deep cream, with an irregular suffusion of rose red colour at the tips. From Messrs. Dobbie and Co., Edinburgh.

Begonia Lord Methuen.—A double-flowered variety of very large size and brilliant scarlet colour.

Begonia Mrs. Cuthbertson.—A pink self of

is very slight, though the whorl-like leaf arrangement is identical with that kind. It is a very striking and beautiful novelty. From Mr. Amos Perry, Enfield, Middlesex.

Verbena chamædryoides.—An old species originally from Brazil, this during recent years has come into greater prominence by reason of its brilliant scarlet colour and a degree of hardiness not before suspected. In favoured districts it winters fairly well in the open. Shown by Mr. Reginald Prichard and other hardy plant specialists.

Erica cinerea atrorubens.—The name is descriptive of a deep, well-coloured form of this popular summer-flowering Heath. From Mr. G. Reuthe, Keston, Kent.

Rose Queen Alexandra.—A single pale lemon variety, with which colour is a suffusion of pink. It is a bush variety of the Perpetual-flowering class. Exhibited by the Rev. J. H. Pemberton, Havering-atte-Bower, Romford.

Rose Queen of Fragrance.—This is the remarkable pink-flowered variety which a year ago at Holland House Show was awarded the Clay Cup for fragrance. Possessing this latter in marked degree, the variety has the attributes of colour, freedom of flowering and constitution which a good garden Rose should possess. From Messrs. William Paul and Sons, Waltham Cross.

Lælio-Cattleya Fascinator-Mossiae var. Moonlight.—A medium-sized flower which from the front view is of the purest white throughout, save for a suspicion of green in the throat, which emphasises the white. Externally the sepals are marked by a faint pink line. It is an exquisitely chaste-looking variety.

Odontoglossum crispum virginianum var. Madonna.—A handsome white variety of great purity and beauty. The golden crest on the lip adds to its charm. The plant bore a large raceme of flowers. These two were sent by Messrs. Charlesworth and Co., Hayward's Heath.

Cattleya Paula (*C. Clarkæ* × *C. dowiana aurea*).—A most distinct hybrid. Sepals and petals rosy red, the lip of intense maroon with purple suffusion, being succeeded by a golden-coloured throat lined with crimson. From Messrs. J. and A. McBean, Cooksbridge.

Cattleya Mendelii Mrs. Smee.—Sepals and petals of the most delicate pink, lip heavily fringed, throat golden with crimson markings. A very handsome variety. Shown by Sir Jeremiah Colman, Bart., Gatton Park, Reigate (gardener, Mr. Collier).

Rose Colcestris.—This was awarded the Clay Cup, offered for any new Rose possessing the true old Rose scent. It is a pink-flowered variety of considerable merit. Raised and exhibited by Messrs. B. R. Cant and Sons, Colchester. (See illustration, page 352.)

The whole of the foregoing were exhibited before the Royal Horticultural Society at Holland House Show on July 6, 7 and 8, when the awards were made.

THE WONDERFUL ORCHID, ODONTOGLOSSUM GEORGIUS REX, SHOWN BY MR. GURNEY FOWLER AT HOLLAND HOUSE.

the fringed class and of giant size. These were exhibited by Messrs. Blackmore and Langdon, Bath.

Lilium Amos Perry.—This is perhaps the most remarkable hybrid Lily seen for many years. Raised from crossing the rich yellow *L. Parryii* and *L. Humboldtii* magnifica, the greater leaning of the flower, both in colour and form, is towards *L. Parryii*, though it is much less drooping than in that well-marked kind. Rich golden, mingling with refined orange in colour, the petals are long, tapering to an acute point. Internally the flowers are copiously spotted crimson. In the specimens shown, the tendency to reflex in the perianth segments—a marked characteristic of *Humboldtii*—

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Orchard-House.—The final thinning of the fruits on the late trees must not be longer delayed. Keep the centres of the trees clear of superfluous growths, thus letting in all the light possible to the fruits. Trees on which the fruits are finally swelling must be well supplied with stimulants. A surface-dressing of well-decomposed horse-manure will also be beneficial. Drench the foliage twice daily with rain-water.

Late Grapes.—Examine carefully the bunches and remove the surplus berries where they are considered to be too thick. See that there is no crowding of the berries in the centre of the bunches. The variety Lady Downe is very subject to scalding just before the berries commence to colour; but this can be avoided to a great extent by reducing the amount of moisture in the house and admitting plenty of air both top and bottom. The hot-water pipes should also be kept slightly warm.

Outside Fruit Borders.—Where the roots of Vines, Peaches and other fruits are outdoors, it will have been a difficult matter this season to have kept them well supplied with water, unless they were mulched with manure early in the season. It is not too late now to mulch borders, especially those of late Vines and Peaches.

Plants Under Glass.

Chrysanthemums.—Staking and tying will require much attention from now onward. The staking of decorative plants is often overdone, far too many stakes being used. Many of the plants need no more than one good stake to support them, so long as the tying is done carefully. Many of the large-flowered kinds may be showing their flower-buds; but these must be rubbed out, as it is too early yet to retain the buds. Syringe the whole of the plants regularly with an insecticide to keep them free from aphids.

Freelias.—The old bulbs which were placed in frames to ripen can now be shaken out of the soil. Select the most promising bulbs, and place them in a cool room till they are required for potting. New bulbs should be ordered at once if required.

Begonia Gloire de Lorraine.—The earliest plants will now require attention to staking and tying. Only in the case of very large specimens is it necessary to use more than one stake. Green Bamboo tips make the neatest supports, and if green raffia tape is used for tying, there will be nothing to mar the beauty of the plant. Little fire-heat is necessary to grow Begonias at this time of the year, so long as the best use is made of sun-heat.

The Flower Garden.

Antirrhinums.—If the plants are required to flower in May or June, seeds must be sown at the end of the present month or early in August. The seeds may be sown in boxes and placed in a cold frame, where they can be shaded from bright sun till they have germinated.

Violas.—These must be frequently watered, or they will quickly pass out of flower. A little soot or artificial manure, if sprinkled about the roots just before watering, will help to stimulate the plants. Keep the old flowers regularly removed.

Roses.—Keep the dead flowers removed every few days. If the petals are required for pot-pourri, they should be placed on a clean base in a dry shed. They must be turned every day till they are quite dry. If mulching was not done in the spring, it may be done now, as it will be of immense value to the autumn flowers.

Violets.—Occasional light dustings with well-seasoned soot is an excellent preventive of red spider, as well as a stimulant to the plants. Should this pest attack the leaves, syringe them with an insecticide late in the evening. To keep the plants in healthy growth, they should be sprayed with the hose-pipe every evening.

The Hardy Fruit Garden.

Pears.—There seems an excellent prospect of a good crop of Pears. It will be safe now to thin the fruits where they are too thick. Plenty of

water must be given to trees on walls, and where liquid manure is available, an effort should be made to convey this to the roots.

Newly Planted Trees.—It has been a very trying season for trees that were planted during the last planting season. Those well mulched will have passed through the ordeal safely. The roots must be regularly watered during dry periods, and where practicable the foliage should be sprayed late in the evening with the garden hose.

The Kitchen Garden.

Cauliflowers.—The latest planting of Cauliflowers may be made now. The ground should be well prepared by deep cultivation, and the plants must be given every encouragement to grow freely. Give plenty of water to earlier plants, and if liquid manure can be procured, a little should be given to each. Examine frequently the plants which are turning in. If a cool shed or cellar is available, the heads should be lifted when ready and placed therein, where they will keep fresh for several days.

Early Potatoes.—Where the ground is required for other crops, the tubers may be lifted and stored in a cool shed. The seed-tubers must be left on the ground for a day or two to harden. They may then be placed on shelves in an airy shed.

Spinach.—The ground should be prepared for the planting of winter Spinach, which may be made towards the end of the month. The seed can be sown in drills about fifteen inches apart.

French Beans.—Frames which have been used for growing early Potatoes may be planted with Dwarf Beans. Sowings can be made at intervals of a week or ten days till the end of August.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Spring Cabbage.—This crop is best sown in two batches, as its growth very much depends upon the weather during August. The chief and first sowing should be made about July 23, and followed up with another sowing ten days or a fortnight later. If the ground where the seed is to be sown is very dry, a watering must be given some time previous to sowing. Flower of Spring and Harbinger are both reliable varieties for sowing at this season.

Savoy.—A large planting should be made of these reliable and hardy vegetables. The small varieties turn in quicker, and must be planted closer together than the large sorts. The large ones are invaluable during January and February.

Broccoli.—When planting these a fair amount of ground should be devoted to the Purple Sprouting Broccoli, which is very hardy and not particular as to soil.

Potatoes.—Any early crops which have completed their growth and not been used up to date will be better if lifted and stored to make more room for successional crops of other vegetables.

Cucumbers in bearing should be given occasional top-dressings and have the number of fruits and growths regulated with the object of lengthening the supply from the existing plants. Red spider must be kept in check by frequent syringing, also by keeping the atmosphere as humid as possible by damping down the floors and borders of the pit.

Late Peas ought to have stakes placed to them before they are too far advanced. Water should be given if it is required, and keep the hoe well plied whether necessary for keeping down weeds or not.

The Hardy Fruit Garden.

Apples.—The summer pruning ought now to be proceeded with, partially shortening all growths except the leaders, which should remain and be allowed to grow unchecked. This pruning not only admits more light to help the development of the present crop but, further, has the

tendency to create more fruit-buds for the succeeding year. Water should be given to trees requiring it; especially is this necessary in sandy soils. When manure can be afforded, now, while the fruit is swelling, is a good time to apply it, as the quality and weight of the crop can be improved considerably by its use.

Budding.—Such trees as Apples, Pears and Plums can now be budded where this is necessary. If the weather is bright and dry, the operation should be carried out promptly, for if the buds are allowed to dry in the process, failure is inevitable.

Fruit Under Glass.

Grape Muscat of Alexandria.—To get this Grape to finish with fine colour and flavour, suitable conditions are necessary. Air must be admitted freely in bright, fine weather, and a slightly drier atmosphere maintained; this latter detail, however, should not be overdone. Although harm would come from overwatering the borders at this stage, the soil must never be allowed to get so dry as to endanger the loss of any roots near the surface through lack of water. A minimum temperature of 70° to 75° at night should prevail.

Fruit-Houses.—Trees of which the crops have been gathered should receive every attention as regards watering and feeding, also in keeping the foliage syringed to ward off attacks from insect pests. Mealy bug must be dealt with, methylated spirit being applied with a small brush wherever it is found.

The Flower Garden.

Rhododendrons and Azaleas.—All the seed capsules found on these shrubs should be picked off to concentrate the energy of the plants in the formation of young growths and flower-buds for the following season. Although these plants resent a wet, undrained soil, they quickly suffer from drought, especially bushes that may have been transplanted. Any specimens requiring water should be attended to promptly.

Herbaceous Border.—If drought continues, watering will have to be resorted to. Even where hoeing has been constant, the vigorous growth of some subjects has absorbed all the remaining moisture. Plants which flower during the autumn can be assisted to make better growth by the help of manure given in liquid form.

Plants Under Glass.

Schizanthus.—A sowing might be made by those who desire this annual to flower during the autumn. At this season it quickly commences to flower, and is therefore much dwarfer than the autumn-sown batch which flowers during the spring. The wisetonensis hybrids are mostly favoured, but there are splendid strains of all the sections to be had. When large enough, three or four of the seedlings should be pricked off in a pot, and be grown as cool as possible with a moderate amount of shade.

Malmaison Carnations.—Plants that were potted into 8-inch and 9-inch pots during the spring should now have each growth staked separately. Thin canes or Bamboo tips are very suitable. When inserting the stakes, it should be seen to that they are pushed right down to keep them rigid when supporting the growths as they become larger. The layering of the main batch ought soon to be completed, to get well-rooted plants before the autumn is far advanced.

Cyclamen.—The plants that were dried off after flowering in the spring are now commencing to make new growth, and must be partly shaken out of their present pots and potted into slightly larger ones. Frames which can be shaded will suit them well. Careful watering and an occasional fumigation to keep thrip in check will be all their further needs.

Chrysanthemums.—A start can now be made by giving top-dressings of fine soil to which has been added a fair proportion of Chrysanthemum manure. They should be made firm without injuring any of the lower leaves, and, when applying water afterwards, a rose should be used until the soil becomes settled and firm.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

Malmaisons in variety were shown by Mr. Charles Turner, Slough, three prominent varieties being The Colonel, Princess of Wales and President Viger. The plants were very well grown.

Mr. A. F. Dutton, Iver, made a magnificent display with about fifty varieties, staged in vases. Quality was the keynote of this exhibit, and several very striking varieties were to be noted. Chelsea easily stood out as the best flaked Perpetual-flowering variety; while Mrs. A. F. Dutton, Carola, Louvain (a new rosy salmon), Snowstorm (very fine), Lady Meyer, Queen Alexandra, Champion and Scarlet Glow were also shown in splendid form. The new Perpetual-flowering border variety Iver Yellow was also well to the fore.

No one can match Mr. James Douglas of Great Bookham as a grower of border Carnations, and on this occasion he made a most imposing display. Several new seedlings were shown, including Miss Rosa Joseph (a deep rose terra-cotta), Henry Brett (crimson), and Terra-cotta (orange red). Skirmisher, The Linkman and many others were shown in superb condition.

Messrs. Laxton Brothers, Bedford, confined themselves wholly to their new Bedford Belle, a very fine salmon pink Perpetual-flowering variety. A charmingly arranged basket and a large number of vases of this variety were shown.

Mr. H. Lakeman, Thornton Heath, made a capital display with a combination of border and Perpetual-flowering varieties. The former were extremely good, a few of the most notable being Lieutenant Shackleton, Lady Hermione, The Linkman, Daffodil, Forrester and Mrs. E. M. Smith (a very fine white).

Messrs. Young and Co., Cheltenham, were accidentally allotted more space than they required; but they, nevertheless, made a very good display with tall stands and vases of Hon. Lady A. Neeld, Mikado, May Day, Empire Day, Duchess of Devonshire (a very good crimson), White Enchantress and others.

One usually expects a good display from Mr. H. Burnett, Guernsey, and on this occasion he made an excellent show. Without any fancy staging, a large number of well-grown flowers were shown to advantage. Notable varieties were Carola, R. F. Felton, Mandarin, Mrs. C. W. Ward, Marmion, White Enchantress, Mikado and Mrs. C. F. Raphael.

ALPINE PLANTS.

These were not numerous, and we imagine we have seen them much finer generally.

Mary Countess of Chester, Holland House (gardener, Mr. C. Dixon), had a highly interesting lot of alpinists, chiefly *Sempervivums* and *Saxifrages*. The Cobweb Houseleeks were very beautiful, such as *arachnoideum rubra*, Dr. Hooker, Lageri Houseleek, *cenophyllum*, *gnaphaloides* and *murale*. The *Saxifrages*, too, were in interesting variety and beauty.

The Misses Hopkins, Shepperton-on-Thames, showed alpinists in boxes, *Genista humifusa*, *Campanula garganica* in variety, many *Saxifrages*, *Oenothera speciosa rosea* and others being noted.

Mr. Reginald Prichard, Christchurch, had many interesting and choice plants, the chief of which were *Acantholimon venustum*, *Wahlenbergia vincaeflora*, *Primula suffrutescens*, *Hypericum cuneatum* (golden flowers and reddish buds), *Campanula westmooriensis* (a hybrid from Hooker and Elizabethæ), *C. acutangulare* (a very dwarf, dark blue, dainty flowered kind) and *C. Bowles Hybrid* (a dark-flowered sort).

Mr. G. Reuthe, Keston, Kent, had a fine show of *Orchis foliosa*, *Primula litoniana*, *Acantholimon venustum*, *Polygonum sphaerostachyum*, *Hypericum empetrifolium*, *Campanula punctata*, *C. Raineri*, *C. cespitosa pubescens* (a very dainty pusilla-like form), *C. pulla* and *Hypericum cuneatum*, *Spigella marilandica*, *Edelweiss*, a choice lot of *Saxifrages*, with *Ericas cinerea*, *atrorubens*, *carnea*, *atropurpurea*, *coccinea pygmaea* and others were also noted.

Mr. Clarence Elliott, Stevenage, showed alpinists on rockwork, the Mountain and other Thymes affording pretty sheets of colour. *Geranium argenteum*, *Campanula pulloides* (very fine), *C. carnica*, *Nierembergia rivularis* and *Potentilla Miss Willmott* were among the more showy and distinct. *Campanula linifolia pallida* was very beautiful, and the great mauve bells of *Ostrowskia magnifica* very effective.

Messrs. Piper, Barnes and Bayswater, arranged a prettily conceived alpine and rock garden, using the weathered York limestone to advantage. *Campanulas* of the pusilla class, *C. garganica* in variety, *Hypericum empetrifolium*, *Dianthus deltoides* in variety, *Origanum dictamnus*, *O. hybridum* and others were freely employed. The group was supplemented by *Astilbes*, *Iris Kämpferi*, *Water Lilies* and water-side plants, and constituted a very beautiful whole.

Mr. Herbert Jones, Bath, arranged a formal garden, in which were seen a great variety of garden ornaments, stone seats, vases, sundials and the like. Some of the larger vases were occupied by plants—*Lavender*, *Hydrangea* and others. A paved walk with stone columns for the pergola also formed part of the arrangement, and, planted with climbers, was very suggestive of its use in the garden.

Mr. Ernest Dixon, Putney and Wimbledon, arranged a terrace and wall garden, with lawn for tennis or the like. The wall and terrace borders were well occupied by plant life.

STOVE AND GREENHOUSE PLANTS.

Messrs. R. and G. Cuthbert, Southgate, N., set up a group of a miscellaneous kind, representing a large and varied array of interesting subjects. Very pretty were *Viscaria oculata caerulea*, *V. Brilliant*, *Lilium longifolium giganteum*, *Streptosolen Jamesonii*, *Hydrangeas*, *Spiraeas*, *Ferns*, foliage plants, and a number of

Ivy-leaved *Pelargoniums*, notable examples being *Mme. Crousse*, *Simmons' Scarlet*, *Sabina*, *Resplendent*, *Mrs. W. H. Martin* and *Mrs. Hawley*.

Miscellaneous stove and greenhouse plants were shown in most attractive form and in excellent condition by Mr. L. R. Russell, Richmond, Surrey. Diversity of species, forms and varieties were most noteworthy, and we are unable to do ample justice to the merit of the display. *Nepenthes* Sir W. Thistleton-Dyer, *N. amesiana*, *Anthurium Veitchii*, *Dracena sanderiana*, *D. Victoria*, *Croton Conte*, *C. Juliette Russell*, *C. russelliana*, *Caladium Mrs. L. R. Russell*, *C. Pantia Ralli*, *C. William Rappart*, *C. Thomas Tomlinson*, *Phyllotanium Lindenii*, *Alpinia sanderiana*, a nice batch of *Solanum Wendlandii*, and other plants, such as *Allocaasias*, *Phyllanthus*, *Marantas* and *Pandanus*, all contributed to make a most interesting group.

Colonel the Right Hon. Mark Lockwood, C.V.O., M.P., Bishop's Hall, Romford, Essex, had a very large and comprehensive table group of *Fuchsias* in great variety. The plants, which were mostly in 5-inch and 6-inch pots, were well grown and flowering profusely. Included in the collection were several very beautiful and novel colours and forms. Had the back rows been more elevated, the effect would have been enhanced.

Zonal *Pelargoniums* were shown in large and attractive bunches by Messrs. H. Cannell and Sons, Eynsford, Kent. The flowers had suffered in some measure from the heat experienced of late, but were pleasing, nevertheless. A few good sorts were *Louis Chauvin* (salmon), *Golden Lion* (orange), *Helen Countess of Radnor* (cerise), *Lady Roscoe* (soft pink) and *The Sirdar* (scarlet).

A very bright collection of Zonal *Pelargoniums* in large bunches was shown by Mr. Vincent Slade, Taunton. Good singles were *Golden Lion* (orange), *Lady Warwick* (margined), *Princess D. Singh* (salmon), *Lady Curzon* (soft pink), *A. J. Macself* (rosy red), *Mrs. Stidolph* (soft salmon), *Scarlet King* (rich scarlet) and *Lieutenant-Colonel Lambton* (Jeanne d'Arc type). Doubles and semi-doubles were *Lane* (orange), *Golden Glory* (vermillion), *Chavarri Hermanos* (scarlet), *Fascinator* (salmon) and *Dagata* (rose pink).

Fancy and Regal *Pelargoniums* made a beautiful table group as displayed by Messrs. Godfrey and Son, Exmouth, Devon. The colours were bright and pleasingly varied, and, set up with *Ferns* interspersed, the effect was quite good. Varieties worthy of special note were the following: *Beauty of Exmouth*, *Mrs. F. C. Hunter*, *Glory of Devon*, *Princess Mary*, *Topsy* (very dark), *Hettie*, *Captivation*, and *Bystock Charming*. A few very interesting seedling Cape or sweet-scented *Pelargoniums*, among which were *Godfrey's Pet*, *Mrs. Galsworthy* and *Jonathan Smith*, were also included.

Messrs. Jarman and Co., Chard, staged thirty-three bunches of Zonal *Pelargoniums* in fresh, clean condition. Doubles and semi-doubles were very conspicuous. The better kinds were *F. Poitevine*, *Genitriif Lane*, *Joyful*, *M. A. Roseleur*, *Mme. A. Mahieu*, *Paul Reboux*, *Mme. Dux* and *Le Luton*. A charming thing in this group was the semi-trailing variegated miniature hybrid *Mrs. Newton*, beautiful for decoration, and it has long, wiry stems.

Messrs. John Peed and Son, West Norwood, S.E., had a very large and comprehensive group of *Caladiums*, *Gloxinias* and *Streptocarpi*, the first mentioned being represented by large, well-grown plants of remarkable colour, better than this firm have shown for years. Some very handsome specimens of the *Caladiums* were noticeable, viz., *Lady Stafford Northcote*, *May Archer*, *Silver Queen*, *Rufus*, *John Peed*, *Sir Henry Irving*, *King George V.*, *Sir Julian Goldsmid*, *Argentine*, *Mrs. W. E. Gladstone*, *La Lorraine*, *Marquis Camden* and many dainty miniature forms, including *H. J. Chapman*. The *Gloxinias* and the *Streptocarpi* were very handsome and well grown, and showed remarkable improvement and good culture.

Two groups of *Spiraeas* from Messrs. Walshaw and Son, Scarborough, were a welcome feature in one of the tents. A very charming display they made, and the varieties represented were *Queen Alexandra*, *Superba*, *Ceres*, *Salmon Queen*, *Philadelphia*, *Juno*, *America* and *Queen Alexandra Improved*.

The Yokohama Nursery Company, Limited, Craven House, Kingsway, W.C., made a very interesting exhibit of dwarf trees. This display was set up in much more attractive style than usual with exhibits of this kind, and the specimens were in wonderfully good health and condition.

Messrs. W. Cutbush and Son, Highgate, N., and Barnet, Herts, showed a group of their new Ivy-leaved *Pelargonium* *Radiance*. This is a bright scarlet flower of great promise, and is a welcome addition to the list of these plants.

A table group of miscellaneous plants from Messrs. Stuart Low and Co., Enfield, made an attractive exhibit. The plants included specimens of *Statice imbricata*, *S. profusa imbricata*, hybrid *Streptocarpi* in variety, *Begonia Lucerna*, *Oleander splendens*, *Lotus peltorychnus* and *Solanum Wendlandii*. *Begonia Rex* (in front) and *Adiantum cuneatum* were used as an edging, and *Palms* as a background.

Pigmy Japanese trees in a great diversity of receptacles were shown outside the large tent by Messrs. Liberty and Co., Limited, London and Paris. This was a large collection, and well maintained the reputation of this firm.

ORCHIDS.

A dozen groups of Orchids occupied the central staging of Tent No. 2 this year. Perhaps one never expects at Holland House a repetition of the brilliant groups at Chelsea, which are shown when the Orchid season is at its height, but in quality the plants shown here worthily challenged comparison. Fresh genera had added their

flowers to those of six weeks ago, and such plants as the summer-flowering *Cypripediums* received prominent mention which was not shown then. There were not a large number of novelties entered for certificate, but of the five special mention should be made of Mr. Gurney Fowler's *Odontoglossum Georgius Rex*, which is undoubtedly one of the finest seedling *Odontoglossums* ever raised. The staging of Messrs. Charlesworth's group deserves special attention. After gazing at the roof of the tent, to which exhibitors will climb to get a little of everything in, it was a relief to see every plant placed on the eye-line, and every plant staged a specimen set off by a groundwork of *Maidenhair Fern* or other greenery. It need hardly be admitted that such an arrangement was simpler for the exhibitor, so far as putting the plants up was concerned, but it represented the specimen cultivation which we should like to see more generally imitated, and a wise restraint in the use of only the very best plants in a collection.

Messrs. Sander and Sons, St. Albans, occupied an important position at the entrance to the tent. The central bank of *Cattleya gigas sanderiana*, with its pinky sepals and rich crimson purple lip, dominated and gave character to the group. The summer-flowering *Cypripediums*, which are often so much more beautiful on account of their mottled foliage, were notably represented. *Upton* the very seldom seen hybrid between the *Cypripedium* and *Selenipedium* groups, was flowered well. *C. philippinense* was another good plant well flowered; these attracted by their quaintness. Vivid colouring was given by the brilliant *Odontiodas*, especially *Charlesworthii* and *Bradshawia luminosa*; and among the newer plants *Miltonia Sanderia vivicans* (neat, smallish flowers, finely blotched), *Odontoglossum wylamense* (a lovely piece of colour), *Cattleya R. Prowe* (a fine white), *Laelio-Cattleya Leda* (which is so beautiful for the self-colouring of its unblotched deep crimson lip) and *Stanhopsea tigrinum* were shown well. The *Dove Orchid* (*Peristeria*), *Laelio-Cattleya Endymion lutea* and the *Cordean* variety of *Cypripedium gigas* were other outstanding plants.

Messrs. Stuart Low and Co., Bush Hill Park, always infuse a distinctive charm into their exhibits by something graceful and charming in their scheme of arrangement. There were plenty of specimen plants, *Cattleya gigas* *Majestic*, four beautiful forms of *Laelio-Cattleya Aphrodite*, and a very lovely set of white *Cattleya Mossiae* varieties, to which prominence was given; but the group owed much of its lightness to the feather pieces of *Oncidium pulvinatum* and *O. macranthum*. One never tires, too, of such a combination of red and white as was repeated here, *Renanthera imschootiana* and *Phalenopsis rimestadiana*, although both are such well-known plants and so frequently find place together. Messrs. Low's group was worth studying for its small Orchids, so frequently misnamed botanical Orchids, as if their charm needed a botanist's eye to be appreciated and as if the only appeal to the florist's eye was size. *Brassavola tuberculata*, *Bulbophyllum barbigerrum*, *B. Lobbii Colossus* and *Promeneia citrina* were a few of those which repaid attention.

In the exhibit of Messrs. Armstrong and Brown, Tunbridge Wells, the pleasing use at the back of hybrid *Odontoglossums*, and, perhaps, too, the rich proportion of whites, gave a touch of individuality to a very nice arrangement of good plants. We cannot note down half the good plants of which we made jottings. *Cypripedium Daisy Barclay*, a variety unique in its rich spotting, must suggest a collection of good *Cypripediums*. *Odontoglossum Chanticleer* (a self-coloured chocolate except for its white edge) and *Miltonia lambeauiana* (white, with lemon centre) must stand as representatives for others not less fine. *Odontoglossum luteo-purpureum*, *Oncidium phymatocilium* and some fine plants of *Cattleya gigas* were other deserving of mention in the briefest list.

Mr. Harry Dixon, Spencer Park Nurseries, Wandsworth Common, staged a pleasing little group of good decorative plants; but why cannot the average visitor receive the help of a name card to the individual plants? There were a number of choice *Odontoglossum* hybrids. A plant of *Brasso-Cattleya Marion* carried seven flowers. *Laelio-Cattleya Cowanii* (apricot sepals and crimson lip), *L.-C. blancheyensis* (very lovely deep crimson lip), *Odontoglossum armainvillieriensis xanthotes* and *Cattleya Mossiae Wagneri* (two beautiful whites) were worth places (and labels) in any collection.

Mr. C. F. Waters, Deanland Nurseries, Balcombe, Sussex, also showed a small collection. *Vanda teres*, *Cattleya citrina*, *Renanthera imschootiana* and other good plants found place here alongside a number of newer *Odontoglossum* and *Miltonia* seedlings.

Messrs. Charlesworth, Hayward's Heath, had a quiet group, a pre-eminent group, every plant a specimen and every plant with room enough to be seen as a specimen. This exhibit at once appealed in its simplicity and richness. There was a central plant of the quaint *Epidendrum prismatocarpum*, with eight spikes, each over two feet high. *Odontioda keighleyensis* carried a much-branched spike 4 feet high. *Miltonia Charlesworthii* carried seven of its fine spikes so magnificently butterfly-blotted in deep crimson. *Odontioda Chanticleer*, with smallish orange scarlet flowers in close spikes; *Angraecum cichlerianum*, with its strange-looking white and green flowers jutting from successive leaf-axils; *Cattleya Warszewiczii* Mrs. E. Ashworth, with sepals of the tenderest lilac pink; *Dendrobium infundibulum*, pure white; *Odontoglossum crispum aurantiacum*—but we should have had to make a full catalogue of the group if we wished to mention all the best plants in it. We must not omit, however, the lovely white *Cattleya Mendelii* The Queen and the fine plants of *Epidendrum vitellinum majus*, fifteen spikes in a pan, of which the intense orange colouring lit up the whole exhibit.

THE GARDEN.

No. 2279.—VOL. LXXIX.

JULY 24, 1915.

NOTES OF THE WEEK.

Record Price for Roses.—At the Saltaire Rose Show, an abridged report of which appears on another page, the whole of the proceeds were devoted to the War Fund. A collection of sixty Rose blooms exhibited by Messrs. Frank Cant and Co. realised £25, and a smaller collection was sold for £5.

Trials of Spring Cabbages and Perennial Poppies at Wisley.—A trial of Spring Cabbages will take place at the Royal Horticultural Society's Garden, Wisley, during the coming season. Seeds of all varieties which it is desired should be tried should be sent *immediately* to the Director, Royal Horticultural Society's Gardens, Wisley, Ripley, Surrey, from whom forms of entry may be obtained. A trial of Perennial Poppies will also take place at the Royal Horticultural Society's Garden, Wisley, during 1917. Plants of all varieties which it is desired should be tried should be sent *immediately* to the Director.

Rose Climbing White Pet in a Cottage Garden.—The accompanying illustration, from a photograph taken in the picturesque village of Letcombe, Berkshire, depicts this well-known climbing Rose clothing an archway with its large clusters of double white flowers. The variety appears to be quite a favourite among cottagers, since it is often seen in country districts. One reason for its popularity is owing to the fact that it continues to flower over quite a long season, and this cannot be said of many climbing Roses. Moreover, it is a very strong grower, being quite able to hold its own even in a neglected garden.

A Beautiful Chinese Rose.—*Rosa soulieana* is a vigorous-growing species from Western China, beautiful and distinct in character throughout the year. Growing 8 feet to 10 feet or more in height, it is a delightful wild Rose for the less formal parts of the pleasure grounds, the shrubbery border and the boundary of the woodland. Freely armed with spines, *R. soulieana* could be most effectively planted as an impenetrable hedge of informal outline. Its interest and beauty may be described as four-fold—the winter character, with dense growths and branches copiously armed with grey-green spines; the light grey-green or

silvery green foliage; the creamy white flowers, more than an inch across, abundantly borne in large, branching corymbs; followed by orange red fruits in the autumn.

National Sweet Pea Society's Outing.—Following the splendid exhibition of Sweet Peas held in London on Tuesday of last week, about eighty members of the society visited the official trials at Boyton Hall, Roxwell, Essex, on Wednes-

Peas and other flowers greatly admired. Tea, at which the president, Miss Philbrick, very ably presided, was provided by the two firms named. Returning to London in the evening, the members generally were of the opinion that the outing was one of the most pleasing of the many that have been arranged by the committee. It is good to know that the society, notwithstanding the war, is making good progress.

The Orphans of Gardeners.—In past years the Royal Gardeners' Orphan Fund has relied for its income on the annual festival dinner, held in May. This year the committee felt compelled to abandon this, and a special appeal is now being made to those interested in horticulture. This appeal we endorse with every confidence, knowing as we do the admirable work that the Fund has done and is still doing. Started in 1887, it has for its object the maintaining and starting in life of the orphans of gardeners, an annual income of nearly two thousand pounds being required for this admirable purpose. We appeal to those of our readers who are now enjoying their gardens, and especially those who have children of their own, to send a donation to the hon. treasurer, Mr. Edward Sherwood, and so help to brighten the lives of those whose fathers, in their lifetime, played their part in the great world of horticulture. The address to which to send money is 19, Bedford Chambers, Covent Garden, London.

The Mount Etna Broom.—Among the comparatively few hardy shrubs which flower during July and early August, the Mount Etna Broom, *Genista ætnensis*, is one of the most valuable. Growing to a height of 12 feet to 18 feet or even more, it is a useful subject for the back of a shrubbery border, large beds in the pleasure grounds, and groups in the open woodland and park. In time, should the position in which the plants are

A ROADSIDE SCENE IN A BERKSHIRE VILLAGE. THE ROSE IS CLIMBING WHITE PET.

day. In spite of the dry weather, the trials were in excellent condition, thanks to the untiring efforts of the trials superintendent, Mr. Reginald Christy, and his enthusiastic daughter. After lunch the members proceeded by motor to Mark's Tey, near Colchester, where the seed grounds of Messrs. Alex. Dickson and Sons and Messrs. Dobbie and Co. were inspected, and the magnificent Sweet

growing permit, they assume the habit of small, elegant trees the young, twiggy branches being pendulous. This Broom is sparsely furnished with leaves, but with the rich green of the branchlets this is not very noticeable. The small, Pea-like flowers are rich golden yellow. Young plants can be readily raised from seeds, which mature freely on the plants.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Deferred Query on Goldfish.—Can any reader tell me how long it is before little goldfish get their colour? I have sixteen gold and silver fish in a good-sized pond, and there are several small brown fish which we hope are goldfish. They are about a year old. I shall be so much obliged for any information about goldfish being hardy in this country.—G. M.

Flower Borders at a Cripples' Home.—The accompanying illustration is of particular interest, inasmuch as it represents flower borders, with orchard in the background, at St. Vincent's Cripples' Home, Eastcote, Middlesex. We understand that most, if not all, of the gardening is done by cripple boys, and the effect seen in the illustration does them credit.

FLOWER BORDERS AT ST. VINCENT'S CRIPPLES' HOME, EASTCOTE, MIDDLESEX.
THE GARDENING IS DONE BY CRIPPLE BOYS.

On Drying Herbs.—Take care they are gathered on a dry day, by which means they will have a better colour when dried. Cleanse your herbs well from dirt and dust, cut off the roots, separate the bunches into smaller ones, and dry them by the heat of the stove, or in a Dutch oven, in such quantities at a time that the process may be speedily finished, *i.e.*, "Kill 'em quick," as a great botanist says. By this means their flavour will be preserved. There can be no doubt of the propriety of drying herbs, hastily by the aid of artificial heat rather than by the heat of the sun. When dry remove the leaves, rub through a sieve and bottle at once.—K. T.

How to Make Perfumes.—To anyone inclined for experiment in the direction indicated by Mr. E. T. Ellis in your issue of July 10, page 337, may I give Punch's advice, "Don't." The only possible result will be failure and waste of money and material. Will Mr. Ellis try some small experiments and report? I should much like to witness the operations, having read the communication with great amusement. As an

enthusiastic gardener and an old pharmacist, may I assure "M. H." that she will get no satisfaction whatever by dabbling in laboratory work; the only result will be mess. She certainly cannot produce liquid perfumes from the products of an English garden, and no ointments are now made from "herbs." The last survivor made with Elderflowers is no longer used. The only product of my own garden handed over to the pharmacy is a little Garlic, and this is by no means a favourite perfume.—JOHN WHITFIELD, F.C.S.

The Cutting of Flowers.—Mr. E. T. Ellis, in writing on this subject, page 301, issue June 19, would have done well if he had referred to the varieties and kinds of flowers that will stand the "cut-and-come-again" practice. Inexperienced amateur cultivators may do plants harm, structurally, beyond the mere loss of blossom through indiscriminate cutting; they would, in cutting off flowers, perhaps remove buds that would supply next year's crop of bloom, and then wonder why

ham is very fine indeed, the orange scarlet bloom being superb. Margaret Atlee, deep cream pink is magnificently grown at Castlemilk, and, although some criticise the colour, it is not easily surpassed. Royal Purple, seen in a few blooms only, does not look nearly so well as in a bunch, when the colour shows splendidly. It is by far the best of its colour. Morning Mist is likely to make its way into favour for decorative work. It is a delightful combination of French grey on a cream groundwork. Pathfinder is capital; and R. F. Felton, as grown at Castlemilk, is not surpassed by any of its shade of lavender. King Manoel is the favourite among the maroons. Mr. John Jeffrey, Sir Robert's gardener, gives Maud Holmes the preference among the crimsons, and grows it magnificently. Melba is favoured, and Boadicea is very satisfactory.—Ess.

The Deciduous Cypress.—I was much interested in the note on this grand tree by "H." in the issue for July 10, page 342. In a Hampshire garden there is a fine specimen growing about twenty feet from the edge of a pond, a gravel path and sloping lawn intervening. The "knees" of the roots, since they were not cut, have become very conspicuous. In some cases I have heard of the knees growing to a height of about eighteen inches above the level of the ground. When I first took charge of the garden I found that the scythe had been used in the cutting of the grass, and the exposed roots were cut, too. This mutilation I stopped. When I measured the tree about fifteen years ago it was more than one hundred feet high, and 14 feet round the trunk at 4 feet from the ground. The trunk was branchless to a height of about twelve feet.—G. G.

New Potatoes.—The appeal by the Board of Agriculture, urging the public to refrain from consuming the new crop of Potatoes while so large a stock of old Potatoes remains available and in good condition for the table, deserves the careful attention of everyone at the present moment. May I, however, remind your readers that the old Potatoes on hand can also be put to another use? In response to the advice given last August, considerable quantities of new Potatoes were then planted, which gave excellent returns, and visitors to the Royal Horticultural Society's exhibition in November last saw splendid examples of Potatoes grown from tubers planted in August. But even better results can be assured if old Potatoes are planted during the next four weeks. All that is needed is to choose the soundest tubers, and either plant them at once on any freshly dug ground or set them up on end for a fortnight to encourage "sprouting," and then plant. New Potatoes in November and December are always acceptable, and the addition to the national food supply would be very great if the present planting of old Potatoes were generally adopted. Whether the public buy new Potatoes now or not, it is almost certain that growers who depend upon the early market for the remunerative prices obtained will still lift their crops, as in many cases the land thus cleared is wanted immediately for sowing some "catch crop," which in its turn helps to swell the national food supply. The public cannot be too often reminded that great additions to the food supply can be ensured by sowing in July and August many valuable vegetable crops, such as Cabbage, Carrot, Onion, Lettuce, Dwarf Beans, Globe Beet, Peas, Spinach, &c.—ARTHUR W. SUTTON. [We publish with pleasure Mr. Sutton's letter, which supplements the advice we have been giving readers for several weeks past.—Ed.]

the plants were a failure—did not bloom. There is a vast difference in dealing with flowering shrubs and flowers on annuals such as Sweet Peas. Even in removing faded flowers much injury can be done unless the workman understands the plants he is dealing with. Many persons cut flowers at any hour during the day; but when a time can be chosen, the early hours of the morning are best, as the stems are more charged with moisture.—SHAMROCK.

Sweet Peas at Castlemilk, Scotland.—Sweet Peas are among the specialities in the gardens of Sir R. W. Buchanan Jardine, Bart., at Castlemilk, Lockerbie, Lady Buchanan Jardine being a great admirer of these beautiful flowers. The new varieties are secured for trial, but some of the older ones are too good to discard. This year the Sweet Peas are very fine, the blooms being large and well coloured. Among those noted were, Elsie Herbert, classed as picotee-edged with white ground. The picotee edging is not so marked as to be stiff by any means, and the flowers at Castlemilk are superb. Robert Syden-

The Gooseberry Caterpillars.—In your issue of July 10, page 342, you have an article on Gooseberry caterpillars. For some years the common green caterpillar, which comes in the spring, did great damage here, and we turned on all hands to pick them off. Seeing how easily they fell off if the bushes were shaken, we surrounded the stem of each bush with soot. Every morning a man went round with a forked stick and gave each bush one sudden shake. Within a day or two there were no caterpillars left on the bushes. They sometimes got back on the bushes by passing over the dead bodies of those which had crawled over the soot; but that only needed watching and more soot added. We are now quite free from caterpillars.—THACKERAY TURNER, *Godalming*.

Narcissus Santa Maria in New Zealand.—In *THE GARDEN* of April 17, on page 188, *re* the Rev. Joseph Jacob's notes on Daffodils at Vincent Square on March 29, he wonders whether Santa Maria is known and grown in New Zealand. I may say it is, and in three different lists before me it is for sale; but I have not seen it on any of the exhibition stands for the last four or five years, and about that time I discarded it as not worth growing for exhibition, as it was too small. The colour was all right, but the perianth was no good. So far as I remember, it was a good grower and increaser.—R. GIBSON, *Riverlea, New Zealand*.

—In "Daffodil Notes," in your issue of April 17, the Rev. Joseph Jacob enquires whether *Narcissus Santa Maria* is grown and known in New Zealand or Australia. Yes; this variety has been known here, around Auckland at any rate, for many years; but, unfortunately, it is not a "good doer." In the earlier days it appeared at times on the show tables, and though now altogether out of date in this respect, it is still retained in many gardens and prized for its intense colouring. On page 90 of the Year Book, 1913, mention is made by Mr. Lowe of the flowering of a seedling yellow trumpet at Christchurch on June 4, 1912, which is very early, that part of New Zealand being quite three weeks later than Auckland. I recently saw a yellow trumpet seedling in Mr. H. Bull's garden at Epsom (a suburb), which bloomed on May 24. It reminded me of an old variety grown here under the name of Primrose Dame, and is the earliest bloomer that has so far come under my notice.—A. E. GRINDROD.

Rose Neige d'Avril.—Last year I wrote a note in *THE GARDEN* drawing attention to this climber as one of the finest of early flowering varieties. Another year's trial induces me to send a further note emphasising its value. My plant is growing in a border next a wall, trained up a pole. The uppermost branches were bent over towards the pole, forming a huge weeping head some 10 feet high. The great freedom in which its pure white blooms in clusters are produced the first week in June renders the variety especially valuable. The opening stages of the blooms display deep yellow anthers, which gradually pass away from the semi-double flowers. The growth and foliage, too, are all that could be desired.—E. MOLYNEUX.

Cypripedium Calceolus in Switzerland.—I had the pleasure of finding last spring in its wild state a flourishing colony of *Cypripedium Calceolus*, and the habitat is interesting in view of its rarity. The plants were growing on a steep northern slope, among thick sphagnum and under the

shade of Firs, and an eminent Swiss authority tells me this is their typical habitat. This fact may interest your correspondent "C. Q.," from whom you published a letter on June 13, 1914, as he mentions having been told to look for the plant "in turf in very gritty, fibrous limestone soil in full sun." This beautiful Orchid is, unfortunately, becoming rare in Switzerland, owing to its having been so much sought after, so I am hoping that the site of my colony may long remain a secret.—LUCY JOSHUA, *La Corbière, Estavayer le Lac, Fribourg*.

Railway Botany.—The railway traveller with a taste for natural beauty may often find agreeable occupation in observing the vegetation of the railway banks. A monograph on railway botany would be an entertaining book, and useful, especially to those who travel by the more leisurely lines. The floral display of *Centranthus ruber*, the Red Valerian, on the railway banks near Gravesend, and to a lesser extent on the London, Chatham and Dover Railway, is most impressive, and is much remarked upon. It appears in dense masses, almost clothing the whole bank in places, but is often seen in large patches, contrasting beautifully with Whitethorn, dwarf Elder, grasses and other wild growth. These banks are worth studying as an object-lesson in wild gardening. This Valerian is one of the best subjects for growing under trees, where any covering of the ground is difficult and Ivy objected to. Its ample dark, glossy leaves make it a feature even out of bloom. I have never seen this Valerian on railway-sides in the North. Earlier in the year Wallflowers are a feature on the same railway, though only where the chalk is so exposed as to make rank vegetation impossible. It has been asserted that Wallflowers were first cultivated from plants obtained from the rocks of Edinburgh Castle, but the railway banks prove it indigenous wherever similar conditions are found. [Such examples may be estrays from neighbouring gardens.—ED.] The presence of *Colutea arborescens* on railway banks in the East of London and within City limits is very striking. This Bladder Senna is a handsome shrub of about fifteen feet high when well grown. Its presence on the railway-sides in so unfavourable an atmosphere proves its adaptability to sites where better subjects would fail. Its curious seed-pods, which succeed the yellow flowers and are borne in such profusion as to almost cover the plant, give a quaint appearance. Introduced from the Continent in the sixteenth century, there are six species of *Colutea* in cultivation, though all are somewhat neglected. They can be readily raised from seed. Heaths in several varieties are quite a railway-side feature in the uplands of Surrey and Hants, as well as in the northern regions where Heath is prevalent. On the line near Swanley it is abundant, and associated with Silver Birch the effect is very pleasing. That railway banks are worth scientific planting would have been demonstrated long ago but for the conflict of interests in their proprietorship. As it is, they are pleasing evidence of Nature's tendency to invest with beauty what the hand of man has made unsightly.—HURSTCOT.

FORTHCOMING EVENTS.

August 4.—Royal Horticultural Society's Fortnightly Meeting and Exhibition, Vincent Square, Westminster, 1 p.m. to 6 p.m.

August 7.—Société Française d'Horticulture de Londres, Monthly Meeting.

THOUGHTS AFTER HOLLAND HOUSE SHOW.

BY THE REV. JOSEPH JACOB.

JUST as the ladies of a house-party love to gather together for a good talk after the last guest has gone and before they "turn in" for what is left of the morning, so for the keen gardener the talking over what has been seen and the comparing of notes are the finishing touches to his enjoyment of a big show.

I met a friend who had been to the Holland House Show as I was journeying to my sister's after the second day, and we at once fell to work. The one Paul's Scarlet Climber Rose, and the other Paul's soft pink single Rose Butterfly had taken his fancy; had I seen them? Yes, I had. Had he seen what I thought one of the prettiest and most striking bits in the whole of the five large tents—E. J. Hicks' magnificent set-out of Princess Mary, the rich bright crimson single—the Rose that, if it behaves well, must be one of the greatest of all bush Roses in the future? No, he had not. Had I seen Bunyard and Sons' splendid light blue Delphinium Queen Mary? I had, and I had thought it very fine, and coming to Holland House fresh after a long Delphinium morning at Wisbech, I marvelled when I saw it had received no award. When, later on, I saw the "silver-gilt Flora" given to as fine a lot of hardy Ferns as anyone need wish to see, I came to the conclusion that these Council signs of approbation are very like the wind, for no one can tell whence they come or whither they will go. Enough; I have exercised my Englishman's right of a growl, and I now pass on to what I have to say, much relieved.

One of the great men of ancient history once searched the city in which he lived for an honest man, but in vain. He should have been at Holland House. "What jolly old stone vases you have, Mr. Jones!" I remarked as I saw the extremely pretty pergola, pigeon-cote, vases and seats exhibited from Horsecombe, near Bath. "Fakes, Sir, nothing but fakes. I assure you, Sir, that that hundred year old seat was not half made when we began to pack our truck last Monday evening." Mr. Herbert Jones may not have the secret of perpetual youth, but he undoubtedly knows how to give the impression of age. I thought I recognised an old friend. Readers will do the same when I tell them it was the stone that Messrs. Carter and Wallace use so much in the "formal garden" displays.

Bath, "Beaus" and Begonias.—Blackmore and Langdon's beautiful batch of brilliant Begonias were the "beaus" of the show. The Coronation Cup went home with them. Such a display was only possible because a hanging-on character has been slowly evolved, and we need no longer be afraid to look at a flower. What beauties some of them were! Lord Methuen, scarlet; Mrs. Cuthbertson, pink; Lady Cromer, pink, edged pale blush; Mrs. W. L. Ainslie, yellow; Mrs. R. Caulfield, deep rose; Mrs. James Thornton, white; and Irene Tambling, orange. What a hybrid Lily Amos Perry was! Grove, the Lily king, is reported to be more than satisfied with the new-comer. Roughly speaking, it is a magnified and refined *Hansonii*, quite Jersey butter yellow and much spotted. The daily Press fixed on Mr. Gurney Fowler's *Odontoglossum Georgius Rex* as the flower or plant of the show,

but I am inclined to think they were wrong, and that they should have come here.

I did like Wallace's Eremuri. Twenty years' work was in that small group—Bungei and Olgæ, the old parents, and all their grandchildren and great-grandchildren around them. How proud the parents must have been to see how Shelford, Sir Michael, Primrose Queen and White Queen have got on in the world!

Miss Willmott's garden must be like a conjuror's hat—quite as inexhaustible and as full of surprises. Some lovely vases of the beautiful *Lilium regale* came from there. It is like a shortened *Lilium Harrisii* with delightful broad rose markings down the centre of the exterior of each petal or segment, which in this variety are joined together. Miss Willmott told me it did not like peat, and that it was perfectly hardy and would grow in any good, well-drained garden soil. If only it is a "doer" like *testaceum* or *pardalinum*, we have in *regale* a most useful and ornamental plant.

The most out of the common exhibit was that of Macdonald's fancy Grasses. There is an opening in this direction. Few and far between are the gardens where much attention is paid to them or where any but the most ordinary are to be found. *Glyceria spectabilis*, *Arrhenatherum bulbosum variegatum*, *Aira atropurpurea*, *Elymus glaucus* and the semi-hardy *Eulalia gracillima* were among the more striking. Bees always have a more or less quantity of new or rare flowers. The white *Erigeron Edina* cannot help being very good for cutting. It is a rather small counterpart of the well-known *speciosus*.

Sweet Peas were very much in evidence. The supply of novelties is well-nigh inexhaustible. It is not often that such a distinct colour turns up as that found in last year's Royal Purple. Cream grounds seem to be still the rage, and dainty, fresh-looking flowers like Mrs. A. G. Gentle are overlooked.

But who saw the last new *Primula*, I wonder—*Primula nutans*? It was found by George Forrest in China, and is very, very new indeed. *P. capitata* with the flower-head elongated may give an idea of the looks of the new-comer. *Hemerocallis Golden Bell* is a decided step in the right direction. The individual flowers are like yellow Madonna Lilies and as large as a good-sized coffee cup.

Lakeman's *Carnation Lieutenant Shackleton* (apricot, spotted and flushed with rose) and Dutton's rose and white *Perpetual-flowering* one are both down on my list; so, too, is a short note about the rich crimson *Thyme*, *Thymus Serpyllum coccinea major*. A patch on rockwork shows up well. With *Hedera dentata variegata*, the fine large variegated, heart-shaped leaved Ivy shown by Mr. L. R. Russell, I must conclude, hoping that these few stray thoughts and notes may be found useful and interesting when read in conjunction with the full account in last week's issue.

SEASONABLE NOTES ON CARNATIONS.

Layering.—The propagation by layers of Malmaisons and of border and show kinds of Carnations and Picotees now engages the attention of growers. There is no accepted date when any of these are propagated, some layering at the earliest moment, once the shoots are hard enough to manipulate, and these invariably form roots in a shorter time than those which are deferred. The best cultivator of Malmaisons I know does not layer his plants till well into August, but the general run of growers would hesitate to wait so

which is the usual practice. Each method has its advantages.

The better class of Picotees and show Carnations are usually cultivated in pots, and though these may be propagated in the same manner as Malmaisons, though the protection of a frame is not essential, the old method of layering in the pots in which the plants are growing is as useful as any. It has the one drawback that shoots growing up the stem cannot be layered, whereas, when the balls are plunged, every shoot can be brought close to the rooting medium. There being little space on the surface of the pot plants to introduce a little light compost to promote the production of roots, 1 inch or 2 inches in depth must be

removed from the outer circumference of the ball, and the space filled with compost, into which the layers are pegged. Now, one of the chief means whereby the tyro incurs loss in layering is by breaking the shoots partly or altogether off the parent plant. On the other hand, it is a rare occurrence for an adept to lose any. Each, no doubt, has his own method; but perhaps the simplest and not the least successful is to twist the part of the shoot between the bit to be layered and the stem of the plant, just enough to make it easy to move in any direction on the part twisted, and so obviating breakage anywhere. The operation requires both hands. The fingers and thumb of one hold the shoot immovable while those of the other are making the twist that renders the shoot amenable to disposal. Some are apt to slit the stem to such a length that the tongue is far too long. Half an inch at the most is quite enough. Some kinds root so freely that a mere notch, to be covered with soil, is sufficient.

I have seen a market-grower propagate a large number by notching and merely fastening each layer to the surface of the soil by means of a stone. All he wanted was just a few roots, and his end was gained satisfactorily in the manner described. Though layering is the recognised method of propagating a new stock of plants, cuttings of the right sort root freely if inserted in October, provided a little bottom-heat is allowed and the rooting medium kept so moist that the leaves never droop. This is a rapid way of increasing stock, and in this year, when garden labour is so generally short, it may well be adopted where time cannot be spared to layer the required number.

R. P. BROTHERSTON.

THE MANNA ASH.

(*FRAXINUS ORNUS*.)

The accompanying illustration represents a fine specimen of *Fraxinus Ornus*, a little-known but very beautiful hardy Ash. It is a native of Southern Europe and Asia Minor, and has been cultivated in this country since early in the eighteenth century. Notwithstanding its early introduction, one seldom finds really good specimens in gardens.

A NOBLE SPECIMEN OF THE MANNA ASH, *FRAXINUS ORNUS*, IN AN ESSEX GARDEN.

long. The now accepted method with Malmaisons is to turn the plants out of their pots in order to plunge the balls in a bed of soil in a cold frame, each ball being inclined so that the shoots may with the greatest facility be operated on. It facilitates the work to make the cuts before plunging the plants, and the best, which are not always the largest, shoots should be selected. One way of re-establishing stock which has become unhealthy is to root only the ends of the shoots, preserving no more than enough to provide a piece that will form roots. Once established, these small pieces grow in a much faster ratio than larger pieces, especially if disease is present. My own plan for many years was to layer into small flower-pots instead of into a bed of soil,

As will be seen by the illustration, it makes a noble tree 50 feet or more in height, and during May it is covered with large, creamy white inflorescences. These are particularly graceful, and a tree in full bloom is a very beautiful sight. According to Mr. Bean in his new work on trees and shrubs, Manna sugar is obtained from the stems by incision. The tree illustrated stands in the grounds of Brooklands House, Romford, the residence of Mr. G. Dunball. It is nearly fifty feet high, and the trunk has a diameter of nearly two feet. It will thrive in almost any good, well-drained soil.

A BEAUTIFUL CHILIAN SHRUB.

(EUCRYPHIA PINNATIFOLIA.)

AMONG the many choice shrubs hardy in the favoured West and South-West Counties, few are more beautiful or highly prized than the subject of this note. It was introduced to this country from Chile as long ago as 1859, and until quite recently the original plant stood in the Coombe Wood nursery of Messrs. James Veitch and Sons, thus proving that when well established it is really much hardier in the London district than many suppose. Its flowering season is July-August, when its large, pure white blossoms make a charming feature in the garden. The young plants are rather difficult to establish, and should be given soil composed mainly of peat and leaf-soil. Mr. Bean states that at Kew they have been most successful in establishing young specimens by planting them in beds of Heather, the latter screening the roots from scorching sun. It is such a beautiful shrub that, once established, it will fully repay any trouble entailed in its early stages.

CLARKIAS FOR THE CONSERVATORY.

VARIETIES of *Clarkia elegans*, especially Firefly and Salmon Queen, have now become very popular as conservatory plants. The usual practice is to sow in the autumn, winter the plants in a greenhouse in small pots, and finally shift them into 7-inch or 8-inch pots. By this method very fine specimens can be raised, the only drawback to the system being that the young seedlings are very apt to damp off during the dull days of winter. However, they are so beautiful and fresh-looking during late spring that they are well worth the trouble entailed. Free ventilation on all favourable occasions will do much towards dispelling damp.

A method of obviating damping off is to sow in the spring instead of the autumn. Seed should be sown in a pan or box in early February and germinated in very gentle heat. As soon as the seedlings can be conveniently handled, they should either be pricked off into 5-inch pots, five in a pot, and in due course be shifted into 7-inch pots, or be pricked off into 6-inch pots and flowered in them.

As soon as they have taken to the soil in the pots, they should be transferred to a cool greenhouse and kept near the glass. Treated thus, the plants will begin to flower early in June, at least six weeks before those sown in the ordinary way in the open garden. CALEDONIA.

STREPTOCARPI AND THEIR CULTIVATION.

THE advent of the red-flowered *Streptocarpus Dunnii*, which was discovered in the Transvaal in 1884 and first bloomed in May, 1886, proved to be of very great importance to horticulture in general. It was a happy thought of Mr. Watson of Kew to cross this species with *Streptocarpus Rexii* and *S. parviflorus*. From the *Rexii* cross was obtained *S. kewensis*, and from *parviflorus* was raised *S. Watsonii*. Both of these were given first-class certificates by the Royal Horticultural Society in 1887. Thus was the foundation-stone laid of the *Streptocarpi* of to-day, though some of the several species introduced since that time have been to a certain extent employed by the hybridist; but none has exercised so great an influence as

kinds of *Streptocarpus* is that from seed sown in heat early in the year, plants may be obtained which will flower throughout the summer and, under favourable conditions, well on into the autumn. The flowers last well in a cut state, and for some kinds of decoration are very useful. If cut with stems as long as possible, they are very light and elegant in appearance.

Cultivation.—Seeds should be sown during the first half of February, as then the young plants will have a long growing season before them. Whether sown in pans or pots, the utmost care must be taken in carrying this out, as the seeds are very minute, and the seedlings at first correspondingly delicate. The pans or pots must be quite clean, well drained, and filled to within a third of an inch of the rims with a good light compost. Most gesneraceous plants are very fond of a liberal quantity of leaf-mould in the soil they grow in, and the several forms of *Streptocarpus* form no exception to the rule. A suitable

A FLOWERING BRANCH OF EUCRYPHIA PINNATIFOLIA, A BEAUTIFUL SHRUB FROM CHILE.

S. Dunnii, with its marked break away in colour from what had hitherto been a genus of white or blue flowered plants.

Several raisers have played a part in the production of the present-day race, which now in popularity vies with the *Gloxinia*; indeed, by some the *Streptocarpi* are preferred to the others, though on this point opinions will, of course, differ. In place of a practically unknown and undeveloped race of plants, which was the case a little over a generation ago, we have now an exceedingly useful group where a display of flowers has to be kept up at all seasons.

The best forms now are exceedingly floriferous, with compact masses of large, bold blossoms. The range in colour is very great, varying from pure white through different shades of pink and carmine to deep red or crimson, while in many the blue, violet and purple tints are delightful. Not the least attractive are those of a pure white, pencilled mainly in the throat with carmine or purple. A feature in favour of these hybrid

compost in which to sow the seeds may be made up of one part loam to two of leaf-mould, and about half a part of silver sand. It is a good plan to sterilise the soil before use, after which it should be sifted through a sieve with a quarter of an inch mesh, putting the rougher portions that do not pass through the sieve on one side to place immediately over the crocks. The soil should then be pressed down moderately firm and made quite level.

Before sowing the seed, the soil should be moistened either by watering through a very fine rose or by standing the receptacle nearly to the rim in a vessel of water, which will enter through the hole in the bottom and thus wet the whole of the soil without disturbing the surface. Placed then in a shaded part of a warm structure, that is, where a temperature of 60° to 65° is maintained, the young plants will in due time make their appearance. Until this happens a pane of glass should be laid over the pot, in order to maintain a uniform state of moisture. The seed is so minute that

when it is sown some cultivators do not cover it at all except with the glass, while others sprinkle just a little dry silver sand on the surface. It is most essential to take care that the seed is sown very thinly. It may be noted that it sometimes germinates in a rather irregular manner. When the young plants are large enough to conveniently handle, they may be pricked off into pans or boxes, using much the same kind of compost as that in which the seeds were sown. From the delicate nature of the young plants this must be carefully done. The temperature of a warm house and a shady spot therein are necessary for the young plants. When sufficiently advanced, they may be potted off singly into $2\frac{1}{2}$ -inch pots, from which the strongest-growing plants may in due course be shifted into pots 4 inches to $4\frac{1}{2}$ inches in diameter.

During the winter the plants should be put in a temperature of 50° to 55° and the soil kept moderately dry, though on no account must they be parched up, as, unlike Gloxinias, they do not form a solid tuber. Then, about the end of February or early in March, they may be potted, equal parts of loam and leaf-mould with a little sand being very suitable. Under the influence of additional heat they will soon start into growth,

TOTLEY HALL, DERBYSHIRE.

DOWN the swiftly flown days of bygone years come memories of ancient pleasaunces, where in peaceful fashion the old-world flowers blossomed from year to year ever the same. Here the white Jessamine spread its fragrance on the summer breeze,

and below it the Fuchsia bush drooped graceful boughs perennially over the sweet-scented Musk. Though generations of happy and contented owners passed along the garden paths, well pleased with the display, yet the years in their flight brought little change to the flowers. "Men may come, and men may go," but the garden brought forth its changeless beauties in an abiding peace.

Not so with the garden of to-day! The solitary toiler of old with his scythe in the early hours of the May morning is seen no more. His labours on the lawn are perchance rushed through by a rapid and noisy engine, and his leisurely work among the flower borders is replaced by the efforts of a staff of gardeners skilled in different branches of their profession. In the garden of to-day

with vistas of powdery white stalks, erect as maypoles and crowned with dazzling whorls of blossom. To those who, like William Blake, can see

"The world in a grain of sand,
And heaven in a wild flower,"

this little rock and herbaceous garden is indeed, like all other blessed places where flowers flourish, a Paradise on earth.

M. E. M. W.

SOME INTERESTING ORCHIDS AT KEW.

THE current issue of the *Orchid Review*, published by Frank Leslie and Co., 12, Lawn Crescent, Kew, contains the following article on Orchids at Kew. This, we feel sure, will be read with interest by all Orchid-lovers.

"Several very interesting Orchids are in bloom in the Kew collection. A plant of the rare Central American *Epidendrum porpax* is flowering very freely, its short-scaped, solitary purple flowers recalling to some extent the smaller *E. Matthewsii*, both of them belonging to the section *Nanodes*.

Camarotis obtusa is another rarity, a native of the Himalayan district, and recalling somewhat *C. purpurea*, but bearing drooping spikes of light rosy flowers with a large orange-coloured crest on the lip, which gives it a very distinct appearance. *Oncidium Waluewa* is a charming little thing, bearing a short panicle of flowers barred with purple on a white ground. It was made a distinct genus by Regel, but the flowers are almost identical in shape with those of the *Oncidium pubes* set. *Eulophia paniculata* is a distinct Madagascar plant, bearing rather narrow, somewhat mottled leaves, and a tall panicle, nearly six feet high, of light green flowers, with some white and purple on the lip. *Pleurothallis lilacina* is a Brazilian species having broad, fleshy leaves and a profusion of short spikes of lilac purple flowers, the whole plant only a few inches high. *Listrostachys forcipata* is bearing five spikes of its very pretty semi-pellucid white flowers, and its equitant leaves recall those of *Oncidium iridifolium*, to which it bears some resemblance in habit.

"*Megaclinium minutum* is one of the smallest species in the genus, and is bearing several spikes of its red-purple flowers, situated on either side of a curious flattened rachis of similar colour, making

it quite an attractive little plant. *Nephelaphyllum pulchrum* var. *sikkimense* is the Sikkim form of a Malayan species, from which it differs somewhat in its stouter habit. The leaves are variegated, and the flowers are borne in a short, erect spike. *Schomburgkia thompsoniana*, a species from the Cayman Islands in the West Indies, is producing a panicle of yellowish flowers with the front lobe of the lip blackish purple in colour. Another rare and interesting plant is *Catasetum Bungeorhizii aureum*, one of the handsomest of the *Catasetums*, now bearing several

TOTLEY HALL, DERBYSHIRE: A SMALL PORTION OF THE SPRING GARDEN.

when they may for the summer be removed to the greenhouse. An occasional stimulant will at that time be beneficial, and, in order to prolong the flowering period, all the old blooms should be picked off unless seed is required. After the second year's flowering the plants may be thrown away.

As seedlings are now flowering, this is the best time to select those for growing on another year. This is the reason for giving the present article, at what might otherwise be considered an unseasonable time.

H. P.

we strive after ever new treasures of colour and form, and we realise the truth of the words,

"If little labour, little are our gains,
Man's fortunes are according to his pains."

Then surely the much-loved, much-coaxed garden here depicted should truly "blossom as the Rose"; and, indeed, it does return the watchful care bestowed on it.

Among its treasures are many hybrid bulbs and plants, and this year it produced a stately army of *Primulas*—no warriors in hues of drab, but a flaunting array of vermilion and crimson,

large light yellow flowers. A plant of *Bulbophyllum viridifolium* is bearing a fine umbel of large green flowers, and the way they radiate in a whorl, with the dorsal sepals thrown back and forming a pyramid in the centre, is very striking. The yellow *Trichopilia galeottiana* is one of the rare kinds, and is in bloom near a plant of *T. tortilis*, while hanging up near by are plants of *Stanhopea gibbosa* and *Coryanthes macrantha*, one of the largest and most remarkable species of this quaint genus. Many others could be enumerated, and there is a fine display of the usual showy species of the season."

POLYANTHUSES AND PRIMROSES.

I NOTED with pleasure the most interesting and instructive article on these flowers on page 308 of the issue for June 19. It should be most helpful to all who need assistance in cultivating plants of the greatest value to brighten the open garden in the first five months of the year. During the past thirty-five years I have grown these plants by the thousand every year, both in private gardens and otherwise, and in widely diverse localities and soils. I am convinced there is no other low-growing plant that gives the amount of colour at so small a cost when raised from seed.

In Mr. Jenkins' practical notes he directs attention to their meriting universal popularity, and deplores their being so often seen in such poor health compared with those grown and exhibited by those who grow them on a definite system, whether they are amateurs or otherwise.

Under "Division of the Plants" Mr. Jenkins makes some strong statements. I can fully endorse all he says, and I am convinced for general purposes nothing is more unwise and expensive than dividing old plants. I am aware it can be done, and is to be recommended in cases of new or very choice kinds. Then it pays to keep them on to work up stock by seed; but, as is stated, they are far less vigorous, and are generally in poor health compared with seedlings.

Some thirty-five years ago I took the Polyanthus in hand, and have been working at it ever since. During that time I have tried many things, and I am sure nothing has done so much to bring these into such prominence as raising them from seed. Neither can the seed be considered expensive. From a shilling packet a large number of plants can be obtained, enough for a small garden. I quite endorse all that is stated as to the importance of obtaining the seed from the very best strains. This high standard can only be obtained by continual selection. During my years of growing and selecting I have proved this many times.

Mention is made as to Polyanthuses growing in soils of a varied nature. In the West the soil is of quite an opposite nature to our Camberley soil, which is light and sandy. Still, last spring I saw in two private gardens in this parish from 2,000 to 3,000 plants as vigorous as any I ever grew in the West, and these were sown the March previous. I could name many others equally good.

J. CROOK.

THE HEATH GARDEN IN LATE SUMMER.

THE dry weather experienced during the early part of the summer was very trying for hardy Heaths in many parts of the Southern Counties, but the plants have now recovered, and there are some interesting kinds to be noticed among them. Very prominent is the Irish Heath,

proper, has some botanical differences, the chief being that the small leaves are closely packed together in four lines up the stems, thus giving the latter a four-angled appearance.

There are a great many varieties of the Ling, and these are very useful during August and September. The White Heather of Scotland is a white-flowered form of it. There are several with white flowers, the best being *alba*, *alba rigida* and *alba Serlei*, all of vigorous habit; and *alba pumila*, of dwarf, tufted growth. *Alportii* and

SEA PURSLANE, ARENARIA PEPLOIDES, GROWING ON SHINGLY SEA BEACH.
(From "Plant Life," see page 368.)

Daboecia polifolia, with its comparatively large, balloon-shaped flowers of rosy purple hue. Grouped in a bold mass with the white variety, the plants create a welcome splash of colour at this time. A good variety noticed at Kew the other day is named *erecta atropurpurea*, the growths being more erect than those of the typical Irish Heath, and the flowers of richer rose purple colour. The Cross-leaved Heath, *Erica Tetralix*, in its several forms is also flowering well now. One of its most interesting varieties is named *mackayana flore pleno*, the dainty rose-coloured blossoms being double and of lasting quality. It is a very prostrate plant. *Alba*, as its name implies, has white flowers, and is closely resembled by *mollis*, which has, however, rather softer leaves. The Cornish Heath, *Erica vagans*, is just opening its whitish-coloured flowers on its long, slender shoots. It is a graceful, free-growing Heath that might be more freely planted. *Erica stricta*, which will make a large bush 5 feet high or more, has foliage and growth similar to the Cornish Heath, but its flowers are larger, of a decided rose pink colour, and are borne in rather dense clusters towards the ends of the shoots. It is a good one for the distant parts of the Heath garden. The common Ling, *Calluna vulgaris*, although closely resembling the Heaths

rubra have red flowers; *rosea*, rose coloured; and *rosea flore pleno*, double red blossoms. A rather remarkable variety is known as *cuprea*, the foliage and stems being copper coloured. These forms of the common Ling are amenable to the same treatment as the hardy Heaths proper, and flower at a time when their blossoms are especially welcome.

It does not seem to be generally known that hardy Heaths can be readily increased by means of cuttings, this method having several advantages over the usual system of layering. August is the best time to take the cuttings, which must be made from young, moderately firm, half-ripened shoots about three inches long. If given a sharp, downward pull, these will easily slip off the plant with a small "heel" of the older wood. This "heel" has to be cut smooth with a sharp knife, the lower leaves removed, and the cuttings then planted about one and a-half inches apart in pots of finely sifted peat and sand, two parts of the former to one of the latter. The pots should be half filled with drainage first, then filled up with the sifted material, which must be made very firm. Before planting the cuttings some silver sand should be spread on the surface of the soil. The cuttings need planting about an inch deep and very firmly, and each pot must be subsequently covered with

a bell-glass, plunged in Cocoanut fibre in a cool greenhouse or frame, and be well shaded. By the following spring the cuttings will be well rooted and ready for potting off separately into small pots, whence they can be transferred to the outdoor garden the following autumn.

PRUNING THE JAPANESE ROSES.

NOT the least important work that will demand attention in the Rose garden during the next few weeks is the pruning of the many beautiful forms of the Japanese Rose, which are now so extensively grown, and represented by the pink-flowered Dorothy Perkins and the newer single variety Hiawatha. It is characteristic of these Roses to produce new, straight shoots from the bases of the plants each year, and it is from these shoots that the best blooms will be obtained next summer, always providing that they are well ripened the preceding autumn.

It is with this ripening in view that we must soon attend to the thinning of the mass of growths which have been made during the summer, so that air and sunlight may have free access to those shoots which are retained. Many growers cut away entirely the old stems which have given the current season's display of flowers, and where a sufficient number of new basal branches have been produced to take their place, the practice is a sound one.

It frequently happens, however, that the new shoots are not sufficient, and some of the old growths must of necessity be left. When this is desirable, some old rods will usually be found which have sent out long, young, non-flowering growths, and these are the ones to leave, cutting the old stem back to the point whence the new shoot emanated. After the old wood has been cut out, the shoots retained ought to be loosely tied in position, so that they are fully exposed to wind and sun on all sides.

The above remarks apply with equal force to this class of Roses when grown as weeping standards, except, of course, that instead of the new shoots being produced at the base of the plant, they will emanate from the apex of the main stem where budding was originally done. With those that were only planted last winter it is a good plan to cut away all the old wood immediately the flowers are over, as this will throw all the energy of the Briar into the young growths.

NEW SWEET PEAS OF THE YEAR.

LAST week in London was the Sweet Pea week of the year. On the Tuesday, as our show reports indicate, the National Sweet Pea Society held its annual exhibition, and the following day about eighty members visited the official trials at Boyton Hall, Roxwell, Essex, and subsequently the seed grounds of Messrs. Alex. Dickson and Sons and Messrs. Dobbie and

blooms are very fragrant. Next in our estimation was

Old Rose.—This was on Messrs. Dobbie and Co.'s stand, and we also saw it at their seed grounds. It is a moderately large flower of pleasing, soft, old rose colour. For table decorations it will be very charming indeed.

Tea Rose, a variety that secured an award of merit at the trials, we did not think a great deal of as staged at the show, but growing at the trials it was very good and beautiful. Its colour is similar to that of the delightful old Tea Rose Gloire de Dijon, and we hope on some future occasion to see a table decorated with Old Rose and Tea Rose.

The President.—This is undoubtedly the most striking variety of the orange scarlet Sweet Peas. When Mr. Hugh Dickson of Messrs. Alex. Dickson and Sons, Hawlmark, Belfast, showed us a small bunch at Holland House Show last year, we were much impressed by the intense purity of its colour. This year the firm had a large central group on their stand, where it attracted much attention. At the trials it was good, and the flowers showed but very slight traces of "burning."

Dora (Messrs. Dobbie and Co.).—This was an award of merit variety at the trials. It belongs to the bicolor section, and for decorative purposes should prove very useful. The flower is of medium size only, the deep cream ground being heavily flushed with rather bright red.

Cream Ground Mrs. Cuthbertson.—As shown on Messrs. E. W. King's stand at the exhibition, this was a very pleasing variety. We have always regarded Mrs. Cuthbertson as one of the most beautiful of all Sweet Peas for garden decoration; hence we welcome the cream ground variation of it. Appleblossom red over the cream colour best describes this charming variety.

Constance Acomb.—This is a rather quaint, but to us pleasing Sweet Pea. A large stand of it occupied a rather prominent position in Robert Sydenham's, Limited, group. It is a big, very waved, cream-ground flower, the standard, and

in lesser degree, the wings being heavily suffused with lilac. Though by no means showy, it is interesting, and denotes a decided colour break.

Miss Burnie.—Messrs. Dobbie and Co. have in this variety a pleasing Sweet Pea that in the opinion of many just misses being first class. It appealed to us strongly at the show, and our opinion was strengthened when we saw it growing at the trials. It is a large, waved flower of splendid habit, the pure white segments having just the faintest suspicion of lilac rose bush running through them. With age this tint almost disappears. For decorative purposes it should prove a very charming variety indeed.

THE ENGLISH STONECROP, *SEDUM ANGLICUM*.
(From "Plant Life," see page 368.)

Co. at Mark's Tey, near Colchester. It is to this London exhibition and the society's trials that the enthusiast looks for novelties, and usually he is not disappointed. In giving particulars of what we consider the best, we do not expect that everyone who saw them will agree on this point. The variety that we admired most of all was

Mrs. E. Wright.—Mr. Robert Bolton had a wonderful bunch on his stand, and also a fine vase of it in the special class for fragrance. It is a large, beautifully waved flower with pure white ground. Wings and standard are all very daintily edged deep lavender blue, and this colour is also lightly suffused with the white ground. The

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Early Vines.—If the rods are infested with mealy bug, attention must be given to the pest as soon as all the Grapes have been cut. If this work is persevered in at intervals from now till the Vines are again started into growth, much time will be saved during the busy season of spring. The borders must be well soaked with water as soon as the crop has been cleared, and if in good condition, diluted liquid manure will be of great benefit. Borders which require renovating may be attended to now. If they are both inside and out, the inside borders only should be dealt with this season. The whole of the roots inside may be lifted and replanted in new soil, and if the work is done carefully and expeditiously, there need be no fear for next season's crop.

Strawberries.—The layering of Strawberries will now be finished, and attention must be given to the potting of the most forward plants. These may now be removed from the parent plants and placed on a bed of ashes in a shady position. The soil must be prepared for potting the whole of the plants and placed under cover. Loam mixed with a little old Mushroom-bed manure, wood-ashes, soot and crushed bones make a suitable compost for Strawberries. Let the plants be potted firmly and not too deep.

Plants Under Glass.

Ferns.—Well-grown specimen Ferns are always useful for decorative purposes, either for grouping or as single specimens for vases. The plants which were potted in the spring must be given plenty of room to allow them to develop into shapely plants. The newer varieties of *Nephrolepis* are most desirable subjects for indoor decoration.

Anthurium crystallinum.—This makes a handsome plant when well grown. The plants must be given every encouragement to develop their large leaves. Plenty of heat and moisture are required, and abundance of water must be afforded while growth is active. To prevent damage, the leaves should be carefully secured to stakes.

Browallia speciosa.—Batches of this beautiful greenhouse annual may be had in flower during the whole of the summer and autumn. Another sowing may be made now for flowering in the autumn. Plants which are coming into flower may have their flowering shoots pinched back if they are not wanted to bloom now.

Perpetual-Flowering Carnations.—The earliest plants will now be well established in their flowering pots. These may be given a little Clay's Fertilizer, but stimulants must not be used too freely till the pots are full of roots. An occasional syringing with a rust specific will help to keep them free from this pest.

Coleus thyrsoideus.—A batch of cuttings rooted now will make useful plants for flowering in small pots. The tops of the older plants may be removed for this purpose. Pot them singly into 2½-inch pots, and when well rooted repot them into those of 3 inches.

The Flower Garden.

Sweet Peas.—Plants in tubs must be liberally supplied with stimulants, and dead flowers should be removed daily. The plants which are being grown for supplying cut flowers must have their flowers cut regularly, or they will quickly show signs of exhaustion. Sprinkle soot or artificial manure between the rows before watering, and use the hoe frequently.

Summer Bedding Plants.—It has been necessary to water all bedding plants frequently. The constant watering with clear water quickly impoverishes the soil, therefore it is necessary to sprinkle a little artificial manure or soot between the plants previous to watering.

Lawns.—During long spells of drought it is a good plan to remove the grass-box from the mower when mowing, thus allowing the grass cuttings to remain on the surface. Newly laid turf must be watered, where this is practicable, also lawns which were sown in the spring.

Ivy-Leaved Pelargoniums.—Large specimens which are growing in tubs or large pots require plenty of stimulants all through the summer. They must be gone over regularly for the purpose of regulating and tying the new growths. At the same time dead flowers should be removed.

The Hardy Fruit Garden.

Apricots.—Every precaution must be taken to protect the ripening fruits from the ravages of insects. Wasps can be trapped by placing jars half filled with beer and sugar about the trees. Earwigs are as destructive as wasps. They may be trapped in beanstalks placed among the branches. The traps must be examined every morning and the insects blown into a jar of paraffin.

Peaches and Nectarines.—The early varieties will now be ripening, and will need the same protective measures against insects as advised for Apricots. The fruits must be examined every morning when ripening, and gathered before they become too ripe. Give plenty of stimulants to midseason and late kinds, and regularly remove all superfluous growth.

The Kitchen Garden.

Globe Artichokes.—The heads of these may be cut when ready and placed in water in a cool shed if they are not required for immediate use. The plants must be well supplied with liquid manure, or the heads will be small and of little use.

Asparagus.—Plenty of stimulants must be given till growth is completed. During showery weather some suitable fertiliser sprinkled over the beds will be of considerable benefit. Keep the beds free from weeds, and see that the growths do not get damaged by strong wind or heavy rains.

Turnips.—A good sowing of Turnips may be made now for winter supplies. Ground which has been cleared of Potatoes may be used for this crop. Give the surface a good dusting of soot; then lightly fork and level the ground. Rake the surface fine; then sow the seeds in drills about fifteen inches apart. Green Top Stone and Red Globe are both excellent varieties to grow for winter use.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Flower Garden.

Border Carnations.—The flowers will be approaching their best, and must be kept upright by the use of stakes, as many varieties, particularly the older ones, have very weak stems. Layering should now commence, as the young growths, or grass, is now ready for this work. After stripping sufficient foliage from the growths which are to be layered, small hillocks of new soil containing plenty of sand should be put around each plant. After pegging down the layers, watering when necessary will be the only further attention required until planting-time.

Hedges.—The clipping of Yew and other hedges ought to be proceeded with, as a second growth is not likely to appear after this date and so cause the work to be redone.

Wallflowers.—The pricking out should be done before the plants become overgrown in the seed-beds. Taking out a shallow trench with a spade and line is far better and more expeditious than dibbling them individually. After pricking out, they require to be well watered.

Plants Under Glass.

Ferns.—As most of the plants have now completed the formation of their fronds for this season, care must be taken that there is no overcrowding, as the foliage will stand much better during the short days in winter if the plants are given ample space to harden and mature their new growth. Maidenhair Ferns, if overcrowded, are very subject to damping. Ferns grown in baskets should have their roots submerged in water for a few seconds in preference to applying it with the watering-can.

Bulbs.—Freesias which were grown on after flowering in the spring should now be shaken out of their pots, the best bulbs graded out and repotted, then kept shaded in a shallow frame until growth has recommenced. They must not be covered with ashes, as in the case of most other bulbs. Orders should now be placed for all bulbs, as Roman Hyacinths and Narcissus Paper-White will soon be on the market.

Winter-Flowering Begonias.—If cuttings were rooted during March and April, the resultant plants should be ready for their final shift into flowering pots. The compost must be of an open and light nature, containing a fair percentage of peat and leaf-mould. Do not pot firmly as required by most other plants. Fumigate frequently to check and kill insect pests.

The Hardy Fruit Garden.

Strawberries.—The main crop now being over, the oldest and most exhausted beds should be trenched. If weeds are troublesome—and this is often the case owing to the quantity of hay seeds that are found among the litter used previously for mulching—the plants should first be cut over with a spade and the whole burnt. The ground must then be treated to a liberal dressing of farmyard manure before trenching.

Preparations for Planting.—A good system which should always be practised is to make a new plantation of young Strawberries each year. The experience of the late frost in May has taught me the value of such late sorts as Bountiful. While such varieties as Royal Sovereign and Garibaldi were in full flower, Bountiful was not far enough advanced to be injured by frost, the result being a full crop on this variety. Plants layered in pots are now rooting freely, and must be regularly attended to as regards watering.

Loganberries.—The plants are making vigorous growths, and now require to have the young shoots or canes tied up, but not in such a way as to shade the ripening fruit. Usually the birds do not trouble this fruit, but in dry weather it is safer to protect it with nets.

Fruit Under Glass.

Pot Vines.—Both yearling Vines raised from eyes in February and cut-back canes have completed the bulk of their growth, so that the aim after this date should be to encourage a thorough ripening of the wood. Unless a well-ventilated house can be set apart for them, they will be better removed to some position outdoors where they will get full benefit from the sunshine. Watering should be performed carefully, and some fertilisers or liquid manure must still be given to help the foliage to keep as healthy a colour as possible and also assist in encouraging the formation of good plump buds. The pinching of sublaterals should continue as long as they appear.

Young Vines planted this season should now be encouraged to ripen their wood as much as possible. More ventilation must be given and less moisture, but not restricted in such a way as to encourage red spider.

The Kitchen Garden.

Turnips.—A good breadth should now be sown for autumn and winter use. If the weather is very dry, a better and more regular germination of the seeds will be assured if the drills are watered an hour or two previous to sowing. Ground which has been used for such crops as early Potatoes or Strawberries will be available for this crop if first dug over.

Runner Beans.—To keep the plants in bearing, they must never want for plenty of moisture at the roots, and while this is being given them some quickly assimilated fertiliser should be added to the water. While growing, some shoots become detached from the stakes; these should be tied up to hold them in position until they again support themselves by entwining around the supports.

Broad Beans.—The main crop ought now to have the tops removed to help on the development of the existing pods. Some support is necessary, but a few stout stakes, with strong twine strained between, are generally sufficient. This is more necessary where other crops might be injured if the Bean plants were allowed to overgrow them.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

BOOKS.

Plant Life.*—Excellent photographs, faithful coloured plates, readable print, good paper, accurate and interesting text, and artistic binding combine to make a book which we can recommend to all who desire to gain something more than a passing acquaintance with the outside of that most interesting study, plant life.

Beginning with an account of protoplasm, easy to read and understand, and of the simplest of living things as seen in Amoeba, the author describes the structure and mode of life of organisms successively higher in the scale of life until the highly organised flowering plant is reached. He shows how the protoplasm which is the fundamental basis of all living things has its food requirements, its air supply and so on, maintained in all the different forms which plants assume. Bacteria, fungi, Algæ, Mosses, Liverworts, Ferns and their allies, and fossil plants all claim a share of attention, but more than half the book deals with flowering plants. A general account of the last is given, and then the separate divisions, Gymnosperms, Monocotyledons and Dicotyledons are discussed and their increasing complexity of structure traced.

Such a study of plants in sequence as we have outlined would be but fragmentary if the fossil remains which have been unearthed and investigated during the past century were ignored, and the chapter on "Fossil Plants" fills the gap so far as it can be filled at present. Owing to their delicate texture, plants have left fewer traces of their history in the rocks than have animals; but still, many interesting discoveries have been made and much light has been thrown upon the sequence of plant life on the earth. This aspect of the study of plant life is almost always ignored in botany books, and is, perhaps, to be counted as of little value in understanding how to grow plants. Nevertheless, it is a study well worthy of attention, if only for the aid it is to the earnest student in understanding the significance of various structures in plants, the meaning of which would otherwise be very obscure.

The latter part of the book deals with the plant's relation to its environment, and contains, perhaps, the chapters which are likely to appeal strongest to most readers. The rather difficult question of food supply is admirably dealt with, and the part water plays in furthering it, together with the complex relations of plants to their water supply, are all carefully gone into. This question, naturally, leads up to the relation of the plant to light, and this, again, to climbing plants, leaf mosaics and the like, and, by a consideration of these and similar points, the significance of the green leaf in the life of the plant is made clear.

As with animals, if a plant cannot get precisely what it wants in any ordinary situation, it may have to take what it can get in one less suited to it. Plants do not grow in Nature where they can grow best, but where they are able to compete with others and win water, light and food in the struggle. Some are driven by this struggle out of good situations, and have become so specialised in structure in the new situations which they have colonised that they are now restricted to these curious habitats. Water plants, xerophytic (or

dry country) plants, carnivorous plants, saprophytes (or plants which obtain their nutriment from decaying matter), and parasites are cases in point, and all are dealt with by the author in a masterly manner.

All plants finally settle down to form a more or less constant "formation" or "association" in Nature, based on mutual accommodation, and depending upon a nice balance between the various forces which act upon the plants. These associations come in for their share of consideration, and the author clearly shows how, when the balance between the forces is altered in any degree, the association tends to change. He discusses, too, the means by which plants increase in Nature, and shows how this frequently depends upon a variety of environmental circumstances beyond the control of the individual plant.

Altogether the author has produced a book which cannot but be of value to all students of plant life, among whom gardeners, amateur and professional, are by no means the least—a book which we can commend heartily to all seeking a reliable and intelligible account of plant life in general.

The book is singularly free from orthographical errors; indeed, we have noticed only one or two (e.g., "Hippophæ" for Hippophæ), and one illustration, that of "Rafflesia Arnoldi," on page 295, appears to be inverted. We mention these very slight oversights merely to emphasise the book's freedom from the mistakes that too often disfigure the pages of popular books on plants.

If we were asked to pick out one point in which the book particularly excels, it would not be very easy; but we think our choice would fall upon the photographs of plants in their native habitats, most of which are beyond praise—there is not an indifferent one among them. (See pages 365-6.)

ANSWERS TO CORRESPONDENTS.

MISCELLANEOUS.

TWELVE PILLAR ROSES FOR PROMINENT POSITIONS (Cicero).—Excelsa, Shower of Gold, Miss Helyett, Silver Moon, Aviateur Blériot, Sodenia, American Pillar, Blush Rambler, Grafen Ada Bredow, Tea Rambler, Lady Godiva and Lady Gay.

AZALEAS DISEASED (Mrs. Bond).—The Azaleas are attacked by the Azalea gall fungus, *Exobasidium japonicum*. This fungus causes galls on Azalea indica, and is of comparatively recent introduction. The only remedy is to pick off the galls as soon as they are observed and burn them. The fungus does not usually spread very far.

GREEN GAGE TREE NOT FRUITING (Mrs. F.).—There are many varieties of the Gage Plum. Some of them are shy bearers. Yours may be one of these. Even so, after replanting twice, the tree ought to bear by this time. There is no more effective way to bring about fertility in barren trees than this. Plum blossom is the most tender of all fruit tree blossom. Is your garden subject to spring frosts? These are annual unwelcome visitors, and may be the delinquent in your case. It may be that the flowers are infertile. Would you mind sending us a sample next spring? Were the trees, we would lift and replant again this autumn, cutting back all the strong roots to within 16 inches of the stem and slightly shortening all other roots.

APPLE-GROWING IN NOVA SCOTIA (A. C. Wyatt).—Where the soil and climate appear so excellent and in which Apple Cox's Orange Pippin appears to grow with the same freedom and vigour as does Bramley's Seedling, we should not hesitate to make a sheet-anchor of this variety and plant it largely, especially as the crop is intended for English markets, where the Apple is so well known, so much liked, and where it will always command tip-top prices. On warm soils of fair depth it does well in this country, and the tree lives to be old; but on cold, heavy soils it will canker, and is not profitable to grow for market on such soils. Bramley's Seedling and Lane's Prince Albert are both well known for their heavy and consistent bearing qualities; but the cooking qualities of Lane's Prince Albert, in our opinion, is only second-

rate, the flesh turning to a dark and unpleasant-looking colour after being cooked. However, it sells well and is much grown. A better Apple than this as a cooker is Newton Wonder, a cross between Wellington and Blenheim Orange. It is as large and handsome as the latter in colouring. When cooked, the flesh is snow white, and practically as good as Wellington, than which there is none better. We advise you to try two of our comparatively new dessert Apples (both certificated by the Royal Horticultural Society), viz., Ellison's Orange, ripe a month or six weeks earlier than Cox's Orange Pippin, and William Crump. The former is a cross between Cox's Orange Pippin and Calville Blanche, and the latter a cross between Cox's Orange Pippin and Worcester Pearmain. This is in season at Christmas. It has yellow and sweet flesh like Cox's Orange Pippin, and the high colour of Worcester Pearmain, but is considerably larger. The former is a deliciously flavoured early Apple, and the tree a free and healthy grower and good cropper. As regards the new American varieties you speak of, you must have your "weather eye" open not to miss a real good thing; but it is well to remember that it takes more than two or even three years to determine the value and character of a new Apple. Try a few by all means; but let someone else plant such largely and you benefit, or take warning, as the case may be, from such experience. As regards prices in our markets, they vary so much, according to the supply, sample and variety, that it is impossible to give a trustworthy estimate; but of one thing you may rest assured, namely, that the best samples will always realise satisfactory prices, and Cox's Orange Pippin several shillings a bushel more than any other if we except, perhaps, good samples of American Newtown Pippin. After the war, we fear many of our young fellows will not again settle down to office or sedentary work, but will want to lead a freer outdoor life in our Colonies. From what you say of the climate and soil of Nova Scotia, it would be Paradise for such men. It would be interesting to them to hear from you through THE GARDEN, giving particulars of the industry of fruit-growing, climate, price of land and facilities for obtaining the same, whether there is a market for labour, and the nature of remuneration.

NAMES OF FRUIT.—R. W. C.—We regret we cannot name the Peach from the specimen sent. Can you send a more typical fruit with a leafy shoot?

NAMES OF PLANTS.—Boris.—1, *Polygonum cuspidatum*; 2, *Ulmus* species, too poor to identify; 3, *Sambucus nigra*; 4, *S.* species, probably *S. racemosa*; 5, cannot identify, too scrappy; 6, *Diervilla* species, probably rosea; 7, *Fagus sylvatica*; 8, *Populus tremula*; 9, *P. canescens*; 10, *Sedum album*; 11, *Cotoneaster* species; 12, *Sedum anglicum*.—C. C. F.—1, *Sedum*, cannot identify from scrap sent; 2, *Desmodium canescens*.—L. Blackith.—1, *Helichrysum rosarinifolium*; 2, *Spiraea Menziesii*.—W. C. Amey.—1, *Campanula lactiflora*; 2, *C. Rapunculid*; 3, *Salvia Grahamii* (hardy in sheltered places).—F. B. J.—The Rose is *De la Grifferaie*, one of the Multiflora varieties often used as a stock, especially by Dutch growers.—C. B. A.—1, Climbing Cecile Brunner probably, but flowers had fallen; 2, Psyche; 3, Souvenir de L. Vienne; 4, Goldfinch; 5, Blush Rambler; 6, Duchesse de Morny; 7, Paul Neyron; 7A, François Louvat; 8, General Jacqueminot; shrub, *Spiraea opulifolia lutea*.—R. M. E. Y.—1, *Leopoldine d'Orleans*; 2, Captain Christy; 3, J. B. Clark.—Tobar Mhuire.—The Trumpet Flower, *Tecoma radicans*.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

THE outstanding features of this meeting, held at Vincent Square on July 20, were the excellent groups of herbaceous plants, and of these the Phloxes dominated the whole. In addition, there was a magnificent exhibit of Gooseberries from Langley, and fine collections of culinary Peas and vegetables. Orchids were but sparsely shown, though there was much of interest and beauty in the groups staged.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), and Messrs. E. A. Bowles, F. W. Harvey, J. Green, W. J. Bean, G. Reuthe, G. Harrow, J. W. Moorman, C. R. Fielder, J. F. McLeod, J. Jennings, C. Dixon, H. J. Jones, C. E. Shea, C. E. Pearson, J. T. Bennett-Poë, W. P. Thomson, E. H. Jenkins, G. Paul, R. C. Notcutt and J. Hudson.

Messrs. George Bunyard and Co., Maidstone, filled an entire table with hardy herbaceous plants and Lavender bushes in one or two distinct varieties, the former including the best of the herbaceous Phloxes, with *Gladioli*, *Gaillardias*, *Scabiosa caucasica* in variety, *Pentstemons*, *Eremurus Bungei* and other good things. *Campanula Standsfieldii*, in small pots, was very well flowered; it is an excellent rock plant. Of the *Gladioli*, *Pink Beauty* was conspicuous; it is coloured rose with crimson blotches. *Hypericum empetrifolium* was full of its small golden yellow flowers. Hardy flowering shrubs and Lavenders in variety were also noted, the nana or dwarf-growing sorts being prominent.

Messrs. Waterer, Sons and Crisp, Limited, Bagshot and Twyford, staged an admirable lot of herbaceous Phloxes in the leading varieties, arranging them in imposing groups in a very effective manner. *Helenium striatum*, *Eryngium oliverianum* (rich blue stems and bracts), *Campanula longistyla* (big drooping bells of rich purple), *Catananche cœrulea*, *Campanula White Star*, *Potentilla nitida alba* (silvery leaves and white flowers), *Malvastrum lateritum*

* "Plant Life," by Charles A. Hall, F.R.M.S. With 74 full-page illustrations, 24 being from photographs by the author and 50 in colour from drawings by C. F. Newall. 4to, xi + 380pp. London: A. and C. Black, 1915; price 20s. net.

Daphne arbuscula, *Pelargonium endlicherianum* and *Asclepias tuberosa* (rich orange) were all noted in an excellent group. *Sphaeralcea munroana* (with rose-coloured flowers) and *Santolina pinnata* (white flower-heads) were also noteworthy.

A new *Polyantha* Rose with silvery variegated foliage and rose crimson flowers from Messrs. George Paul and Son, Old Nurseries, Cheshunt, was named Silver Gem. It is pretty and would be effective as a bedding plant.

Messrs. Stuart Low and Co., Enfield, Middlesex, showed some excellent stands of Roses. Such as Louise Catherine Breslau, Rayon d'Or (fine golden, in splendid condition), Chateau de Clos Vougeot (dark crimson), Mme. E. Herriot, George Dickson, Louise Lilla (rich crimson), H. E. Richardson and Ophelia (flesh and cream) were all superbly staged.

The Rev. J. H. Pemberton, Romford, showed new seedling Roses, as Moonlight (white with golden-coloured anthers), Danae (yellow and cream), Queen Alexandra (single cream, rose-tinted very beautifully), Callisto (yellow, very charming), Pemberton's White Rambler, Autumn Glory (dull reddish tone), and Clytemnestra (a pretty double-flowered sort of apricot and buff tone, very effective in the mass).

Messrs. H. B. May and Sons, Edmonton, arranged a table of Rex Begonias, Hydrangeas, Lantanas and Ferns, the latter chiefly varieties of *Osmunda palustris*, *O. regalis* and *O. gracilis*. In addition there were many Fuchsias, hybrids of *F. fulgens* and *F. triphylla*, of which Corallie, Mary, Thalia and Queen of the Belgians were all distinct and good.

Mr. J. Douglas, Great Bookham, staged a superb lot of border Carnations. Such excellent sorts as Elizabeth Shifner, Bookham Clove, Hercules (a magnificent crimson), Annie Laurie (a most charming pink) Kate Nickleby (white, flesh tinted), Mrs. Elliot Douglas (fine yellow), Ziska (cinnabar red), and Dora (richest apricot) are a selection of the best.

Messrs. B. R. Cant and Sons, Colchester, had some very fine Roses in stands and baskets, such as Irish Fireflame, Mrs. Alfred Tate, Lady Hillingdon, A. Hartman (a grand red), British Queen (superb white), Mme. Edouard Herriot, Rayon d'Or and Lyon Rose all being superbly represented.

Mr. W. Wells, jun., Merstham, contributed a collection of herbaceous Phloxes in some dozen or more leading sorts.

Mr. Maurice Prichard, Christchurch, Hants, exhibited many of the showier herbaceous plants, the newer Astilbes, as Juno, Pink Pearl, Opal and Gloria (a fine red), being prominent. *Coriaria terminalis*, *C. japonica* and *Podophyllum Emodii* major (all in fruit) were highly ornamental. *Romneya Coulteri*, *Poterium obtusum* (reddish), *Spigelia marilandica* and *Campanula White Star* were among other noteworthy subjects. *Alstroemeria revoluta* is of an intense rich orange tone.

The Misses Hopkins, Shepperton-on-Thames, showed alpine in boxes with *Polyantha* Roses and other things.

Mr. Clarence Elliott, Stevenage, Herts, had a few charming alpine in pots, the best of which were *Campanula walsteiniana*, *Potentilla nitida*, *P. n. alba*, *Epilobium Dodonaei*, *Sedum leibmannianum*, *S. sexangulare*, *Oenothera mexicana*, *Campanula Hendersonii* and *Pentstemon isophyllus*, the last of brilliant scarlet colour and very elegant habit.

Messrs. T. S. Ware, Limited, Feltham, filled a full-length table with the bolder herbaceous plants, of which Phloxes in great variety, *Campanula grandiflora*, *Helenium* and *Scabiosa caucasica* were the chief. *Eryngium oliverianum* was also very fine, and *Sparaxis pulcherrima* delightful in the extreme.

Mr. Amos Perry, Enfield, displayed an interesting group of Lilies, Astilbes, Water Lilies, Phloxes and the bolder herbaceous plants, associated with Ferns. *Lilium dalmaticum*, *L. Humboldtii*, *L. superbum*, *L. Roelzii* and *L. pardalinum* were all good. Phloxes Mrs. E. H. Jenkins (snow white) and General von Heutz (scarlet) were very fine.

Mr. G. W. Miller, Wisbech, showed a mixed collection of hardy plants, which included many seasonal things.

Mr. G. Reuthe, Keston, Kent, had an extensive exhibit of alpine and other plants, such as *Dianthus microlepis*, *Hypericum laeve rubrum* (rich red), *Saxifraga mandschurica* (very distinct), *Primula littoniana*, *Campanula Raineri* and *C. acutangula* being very beautiful. *Desfontainea spinosa*, *Berberidopsis corallina* and *Tricuspidaria lanceolata* were all noted.

Mr. James Box, Hayward's Heath, staged a glorious bank of Phloxes in the leading varieties, arranging them in bold, imposing masses. *Rijnstroom* (rose pink), *Colonel Mangin* (scarlet), *Jules Sandeau* (salmon), Mrs. E. H. Jenkins (snow white), *America* (white, cherry red eye), *Albert Vandel* (the finest blue), *Le Mahdi* (violet purple), *Tapis Blanc* (dwarf white) and *Elizabeth Campbell* (pink) were among the best. *Sparaxis pulcherrima alba* and *Tropeolum speciosum* (scarlet) were very finely shown among many others.

Messrs. H. J. Jones, Limited, Lewisham, arranged an avenue of Phloxes in imposing masses in stands and in the best varieties. *G. A. Strohelein* (scarlet), *Elizabeth Campbell* (pink and white), *Rijnstroom* (rosy scarlet), *Le Mahdi* (violet), *Météore* (rosy scarlet), *Frau A. Buchner* (white), *Mme. Paul Dutrie* (pinkish white) and *Boule de Feu* were some of the best in a magnificent lot.

Messrs. J. Cheal and Sons, Crawley, arranged a collection of Phloxes and other seasonal herbaceous flowers, together with cut shrubs in variety. Among these latter the *Ceanothus* were very interesting.

Messrs. Allwood Brothers, Hayward's Heath, staged a capital lot of Carnations, such as *Wivelsfield White*, *Fairmount*, *Gorgeous*, *Salmon Enchantress*, *Benora* (white-ground fancy), *Princess Dagmar* (crimson) and *Champion* being noted.

Colonel the Hon. Mark Lockwood, C.V.O., M.P., Bishop's Hall, Romford, Essex (gardener, Mr. G. Craddock), arranged a table of single and double Fuchsias grown as bush plants in some fifty or more varieties, the plants being well grown and abundantly flowered. In another group *Trachelium caeruleum* and its white variety were well shown, the 3-feet high examples carrying handsome heads of flowers.

Messrs. Thomas Grove and Son, Sutton Coldfield, near Birmingham, showed a group of *Campanula Norman Grove*, a pretty hybrid between *White Star* and *tomassiana*, with blue horizontal bells. The plant was about six inches high and full of flower.

FRUIT AND VEGETABLE COMMITTEE.

Present: Owen Thomas, Esq. (chairman), and Messrs. W. Bates, E. Beckett, W. Pope, H. Markham, H. J. Wright, A. Bullock, P. D. Tuckett, E. A. Bunyard, A. Grubb and A. R. Allan.

Mr. J. C. Allgrove, Langley, near Slough, exhibited about a hundred dishes and plants of Gooseberries, with Currants in variety. Of the former there were double and triple cordons and standards, all bearing handsome crops of fruits. *Keepsake*, *May Duke* and *Whitesmith* (all standard grown) carried amazing crops, while *Langley Beauty*, *Surprise*, *Langley Gage* and *Lancashire Lad* were among notable dishes. *Champagne Red Currant* is a very distinct sort and a great bearer. A gold medal was deservedly awarded this magnificent exhibit.

Mr. S. Mortimer, Farnham, exhibited boxes and fruiting sprays of his new *Tomato Tip-top*. It is of a rich scarlet colour and a big cropper. The fruits are of medium size.

Messrs. Dobbie and Co., Edinburgh, staged forty varieties of culinary Peas in early, midseason and late sorts. *William I.*, *Laxtonian*, *Quite Content*, *Duke of Albany*, *Gladstone*, *Veitch's Perfection*, *Ne Plus Ultra*, *Alderman*, *Gradus* and *Senator* were noted in a large lot.

The Misses Tate and Tanner, Caldecote Towers, Bushey Heath, Herts (gardener, Mr. F. Streeter), staged an admirable collection of vegetables, which included fine Cucumbers, Mushrooms, Carrots, Cauliflowers, Peas, Lettuce, Potatoes, Beet, Onions, Marrows, Tomatoes (both yellow and red) and excellent Cabbage. A really superb gathering of the finest produce. Silver-gilt Knightian medal.

ORCHID COMMITTEE.

Present: Sir Harry J. Veitch (chairman), and Messrs. J. O'Brien, W. Bolton, W. H. White, A. Dye, W. H. Hatcher, C. H. Curtis, J. Charlesworth, Pania Ralli, J. Wilson Potter, R. A. Rolfe and S. W. Flory.

Messrs. Stuart Low and Co., Enfield, showed *Vanda caerulea*, *Aerides odoratum album*, *Epidendrum vitellinum majus*, *Cattleya o'brieniana alba*, with *Miltonias* and *Dendrobium clavatum*.

Messrs. J. and A. McBean, Cooksbridge, showed the brilliant *Odontodia Charlesworthii*, *O. lambeaiana*, *O. Thwaitesii* (of rosy red colour), *O. Diana* (very brilliant red), and the yellow and crimson *Odontoglossum Hye de Crom*.

Messrs. Sander and Sons, St. Albans, showed *Bulbophyllum balfourianum*, *Anguloa Cliftonii* (golden), *Coleogyne dayana* (with yard-long trails of buff yellow and crimson flowers), *Odontodas*, *Cattleya gigas sanderiana* and others.

SOUTHAMPTON ROYAL HORTICULTURAL SOCIETY.

SUMMER SHOW.

CARNATIONS, Sweet Peas, Roses, hardy herbaceous flowers, fruits and vegetables were exhibited in splendid condition on Tuesday and Wednesday, July 13 and 14, in a large tent on the pier and in the pier pavilion at Southampton. The general arrangements for the convenience of the exhibitors and the public are always as near perfection as it is possible to have them, under the able management of the courteous secretary, Mr. C. S. Fudge. Not only are the exhibits placed in good order, but with a view to securing a good general effect. Roses and other herbaceous flowers were well shown by Messrs. W. H. Rogers and Son, Limited, Southampton. A charming display of hardy border flowers and Water Lilies was made by Messrs. B. Ladham, Limited, of Shirley; also by Mr. M. Prichard, Christchurch. Roses were splendidly shown by Mr. Harry Richards, Warsash, Hampshire. Stove and greenhouse plants by Mr. Wills, Southampton, filled a large stage in front of the orchestra; and Perpetual-flowering Carnations staged by Messrs. Allwood Brothers, Hayward's Heath, and Messrs. Wills and Hesketh, Warsash, looked charming, the colours being very noticeable on account of their richness. Mr. James Douglas, Great Bookham; Messrs. A. R. Brown, Limited, Birmingham; and Mr. R. Morton, Woodside Park, London, were very prominent exhibitors in the classes for border Carnations. Mr. A. E. Usher, gardener to Sir Randolph Baker, Bart., M.P., Blandford, won all the principal prizes in the open Sweet Pea classes; and Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, led with high-class produce in the fruit and vegetable classes.

COMPETITIVE CLASSES.

Carnations.—Mr. J. Douglas won in Class 1 for twelve vases of selfs, fancies and yellow-ground Picotees; he had *Pasquin*, *Togo*, *Daffodil*, *The King*, *Santa Claus*, *Queen Eleanor*, *Elizabeth Shifner*, *A. B. Stewart*, *Lord Steyne*, *Rose de Mai*, *Onward* and *Mrs. J. J. Keen*. Second honours went to Messrs. A. R. Brown, Limited, King's Norton, who staged fine blooms, *Mandarin*, *Rosy Morn* and *Cardinal* being the best. Third, Mr. R. Morton, Woodside Park, London.

In Class 2, for four vases of Carnations, selfs, Mr. J. Douglas again led. The best blooms were *The King*,

Pink Clove (grand), *Elizabeth Shifner* and *Bookham Scarlet* (fine). Second, Mr. R. Morton, who had *Gordon Douglas* (good); third, Messrs. A. R. Brown, Limited.

For four vases of Carnations, fancies, Mr. J. Douglas won, *John Ridd*, *Queen Eleanor*, *Lord Steyne* and *Skirmisher* being staged. Messrs. A. R. Brown was placed second. In this stand *Queen Eleanor* and *Skirmisher* were beautiful.

In Class 4 Mr. Douglas once more led with *Millie*, Mrs. J. W. Owen, *Daisy Walker* and *Lord Kitchener*; second, Messrs. A. R. Brown, Limited.

Mr. R. Morton had the best four vases of Picotees, yellow ground, with *John Ruskin*, *Eclipse*, *Santa Claus* and *Onward*; second, Mr. Douglas, *Her Majesty* being a fine bloom in this collection; third, Messrs. A. R. Brown, Limited.

In the classes for dressed blooms, shown on cards, for twelve blooms on each stand of flakes and bizarres (distinct), Carnations and fancies, Carnations (selfs), yellow-ground Picotees and white-ground Picotees, Messrs. A. R. Brown, Limited, were the only exhibitors, but the flowers staged were very fine ones. This firm had also as a result the monopoly of premier blooms. Those selected were *Gordon Lewis*, *Robert Hargrave*, *Prairie Belle*, *Professor Burston*, *Queenie* and *Margaret*. The handsome challenge cup, presented by the president, Lord Swaythling, to the exhibitor securing the most points in Division I, was also won by Messrs. A. R. Brown, Limited.

For six vases of selfs, fancies and yellow-ground Picotees Mr. H. W. Frostick, Woodville Road, Thornton Heath, London, S.E., was first. *Lord Steyne*, *Onward* and *Blue Gem* were fine flowers. Mr. Frostick had also the best four vases of Carnations (selfs), *Basuto* being very good. Mr. G. Cousins, gardener to J. A. Fort, Esq., The College, Winchester, was second.

Mr. Frostick won in the class for one vase, fancy, other than white ground, with *Lord Steyne*; second, Mr. G. Cousins; third, Mr. A. F. Tofield, *Chandler's Ford*, Hampshire.

Mr. Cousins had the best single vase, one variety, showing *Bookham White*; second, Mr. Frostick.

Rosy Morn won for Mr. Cousins in the class for one vase, blush or pink.

Messrs. Frostick and G. Cousins won in the order named for one vase of crimson or scarlet self; and for a vase of buff or terra-cotta self the same exhibitors won in the reverse order of their names.

The variety *Eclipse* won first prize for Mr. Cousins in the class for one vase, yellow ground, Mr. Frostick being second here and again first in the class for one vase, white ground, followed by Mr. Cousins.

For dressed blooms shown on cards, Mr. Cousins won in the class for six blooms of Carnations, fancies. *My Fancy* and *Rhea* were good specimens. This exhibitor had the winning six blooms of Carnations, selfs, Mrs. R. Percy Smith and *Bookham White* being good. He again won in the class for six blooms of yellow-ground Picotees. Mr. J. J. Keen, Southampton, was a close second. In the latter exhibitor's stand the variety *Clytie* was selected as premier bloom. Mr. Keen also had the winning stand of six blooms of white-ground Picotees.

Some lovely blooms were staged in the classes for vases of Perpetual-flowering Carnations. For five vases, three blooms of a distinct variety in a vase, Mr. A. E. Usher, gardener to Sir Randolph Baker, Bart., M.P., was first. He staged *Carola*, *Benora*, *Enchantress*, *Mrs. C. W. Ward* and *White Wonder*. Second, Mr. T. Hall, gardener to Ellen Lady Swaythling, South Stoneham House; third, Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham.

Mr. T. Hall was the winner in the class for a vase of Carnations, Tree or border varieties, arranged for effect with any kind of light foliage. Second honours went to Mr. E. F. Hart, gardener to H. Trimmer, Esq., Twyford, Hampshire; third, Mr. G. Cousins.

Sweet Peas.—The first prize, presented by the hon. treasurer, for six vases of Sweet Peas, distinct varieties, was won by Mr. S. T. White, Eastleigh. *Margaret Atlee*, *Tennant Spencer* and *Sunproof Crimson* were the best. Second, Mr. A. F. Tofield. The last-named exhibitor won in another class for six vases.

Messrs. Toogood and Sons, Southampton, offered prizes for nine distinct varieties. Here Mr. A. E. Usher won with a grand collection, namely, *King Manoel*, *Minnie Toogood*, *Elsie Herbert*, *W. P. Wright*, *Mark's Tey* and *Edrom Beauty* (very fine). Mr. W. Hodson, gardener to Mrs. Clemson, Milford-on-Sea, was a good second. *Helen Lewis*, *Etta Dyke* and *Countess Spencer* were the best blooms. Third, Mr. H. E. Wallis, gardener to Eustace Palmer, Esq., Basingstoke.

In another class for six distinct varieties, Mr. O. Nicklen, gardener to Mrs. Alan Searle, Bassett, Hants, was first. *Margaret Atlee*, *Maud Holmes*, *Mrs. Cuthbertson* and *R. F. Felton* were the best. Second, Mr. A. Maple; third, Mr. E. F. Hart.

Mr. Usher won the first prize offered by Messrs. Sutton and Sons for six bunches of Sweet Peas. He staged a very fine collection, consisting of *Thomas Stevenson*, *Anglian White*, *King Manoel*, *Clara Curtis*, *Don Alvar* and *Edith Taylor*. Second, Mr. W. Hodson, the class being well filled.

Mr. Usher also won in the class for eight bunches, the prizes being offered by Messrs. Webb and Sons, Sincerity (a good crimson), *Mark's Tey*, *Anglian White*, *Nubian*, *Audrey Crier*, *King Manoel*, *Elfrida Pearson* (extra good) and *Lavender George Herbert* being staged. Mr. Hodson was again second.

Mr. Usher also won the first prize offered by Robert Sydenham, Limited, Birmingham, for six varieties, distinct. He had *Helen Lewis* and *Robert Sydenham* very fine.

Miscellaneous Section.—Mr. C. Hosey, gardener to J. C. E. D'Esterre, Esq., Southampton, had the best single specimen stove plant and the six best Zonal Pelargoniums. Mr. T. Hall was second in each class.

Mr. E. Wills, Southampton, staged the best Palms, and Mr. T. Hall the six best Caladiums.

Mr. G. Ellwood won in the class for a bowl of hardy flowers, one variety, and also for a bowl of border flowers, mixed.

Messrs. B. Ladhams, Limited, Shirley, won in the class for twelve bunches of border flowers. Mr. F. M. Vokes, Sholing, Hants, was second.

Decorative Classes.—Mrs. E. Ladhams, Shirley, had the best table decoration, Carnation or Picotee blooms only to be used; second, Mrs. A. Maple; third, Miss Taylor, Bemerton Rectory, Salisbury.

Miss Maple, Shirley, was the winner in the class for a dinner-table decoration, Sweet Peas only to be used; second, Mrs. E. Ladhams; third, Miss Taylor.

Mrs. E. Ladhams had the best spray of Carnations, and also won in the class for an epergne of Carnations. Miss Maple had the first-prize button-holes of Carnations.

Fruit Section.—Mr. Ellwood had the winning collection of fruit, four dishes, staging grand bunches of Black Hamburgh Grapes, a splendid Melon, and fine dishes of Figs and Peaches. Mr. T. Hall was second.

Mr. Ellwood had even finer bunches of Black Hamburgh Grapes in the class for two bunches. Mr. T. Hall was second with well-finished Madresfield Court Grapes.

Mr. Ellwood staged the best-flavoured Melon.

Vegetable Section.—Mr. Ellwood won all the first prizes in the classes for collections of vegetables, six kinds in each case.

Prizes were offered by Messrs. Toogood and Sons, Messrs. Sutton and Sons, Messrs. James Carter and Co. and Messrs. Webb and Sons. The silver challenge cup offered by Messrs. James Carter and Co., Raynes Park, S.W., was won by Mr. Ellwood, who staged produce of high quality throughout. Mr. W. Hodson was second in each class referred to, and put up very fine dishes.

Mr. Ellwood had the winning brace of Cucumbers, and Mr. Usher the best dish of Tomatoes.

NON-COMPETITIVE EXHIBITS.

Gold Medals.—Messrs. Allwood Brothers for Carnations; Mr. Maurice Pichard for hardy herbaceous flowers; Messrs. B. Ladhams, Limited, for hardy herbaceous flowers, Lilies and Roses; and Messrs. W. H. Rogers and Son, Limited, for Roses and herbaceous flowers.

Silver-gilt Medals.—Mr. E. Wills for stove and greenhouse plants; and Mr. Harry Richards for Roses.

Messrs. Wills and Hesketh received an award of merit for a lovely collection of Tree Carnation blooms.

SALTAIRE ROSE SHOW.

Of the thirteenth annual show of the Saltaire Rose Society, held recently in Saltaire Park, no more appropriate description probably could be given than that applied to it by the president of the society, Mr. Oswald Partington, M.P. Speaking at the luncheon table, he said that he had attended many similar exhibitions, but he did not think he had ever seen a more gorgeous display of colour. In extent the show was below the high-water mark attained on some previous occasions, but there was still such a richness and delicacy and wealth of colour as should satisfy the most fastidious or the most cosmopolitan of rosarians.

Perhaps the highest testimony that could be given of the solidity and progress in importance of the society's exhibitions is to say that this show was of little less excellence than its forerunners, in spite of the fact that Messrs. Alex. Dickson and Sons, Limited, of Newtownards, who have in the previous twelve years consistently carried off all the premier awards, found it inconvenient to send more than a few specimens on this occasion.

A request had been made to Rose growers throughout the district to make gifts of flowers in order that these might be sold in the streets of Bradford, as well as in Saltaire Park, to swell the receipts, which are to be given, after payment of expenses, to the war relief funds. So generous was the response that some ten thousand blooms were given for this purpose. In addition an auction sale of flowers was conducted at Saltaire by Mr. H. Abbott of London. No less a sum than £50 was raised by this means in the large marquee immediately after luncheon. The class for sixty cut Roses, for which the 100-guinea challenge bowl is offered, was dropped on this occasion, but Messrs. Frank Cant and Co. of Colchester had sent a fine exhibit of sixty blooms, and the flowers were greatly admired. This collection was the first to be put under the hammer, in the language of the auction-room, and the first and only bid for it was £25, at which figure Mr. Partington became the owner. Later the Member for Shipley requested the secretary, Mr. E. Wright, to have the Roses sent to Sir Titus Salt's Hospital. To Mr. G. C. Waud was knocked down for £5 the collection of Roses shown by Messrs. Harkness and Co., Hitchin, in the class for twenty-four blooms, and these he handed back to be sold again. A single bloom was sold to Mrs. F. Foster for £1, while other purchases were made by Mr. J. J. Oddy and Mr. H. Sutcliffe Smith at £3 each. During the afternoon and evening the auction sale was continued briskly out of doors, and the various means adopted of collecting money should result in a considerable balance being available for the war funds.

SOME OF THE PRIZE-WINNERS.

In all open classes the entries were much fewer than has been usual in recent years. For this various reasons may be assigned, an unfavourable season, limited transport facilities and the absence of many gentlemen's gardeners, on military duty being the chief. Violent hailstorms have greatly damaged many of Messrs. Dickson's blooms.

In the absence practically of their unbeatable competition the principal awards went to Messrs. D. Prior and Sons, Colchester; Messrs. Chaplin Brothers, Waltham Cross; and Messrs. Frank Cant and Co., Colchester. The arrangement of distinct varieties of Roses in round baskets is found an excellent one, all the beautiful features of the flowers being well displayed.

For seven baskets the first prize fell to Messrs. Prior and Sons, who showed beautiful groups of Duchess of Wellington, Mme. Soupert, General Macarthur, Leslie Holland, William Allen Richardson, Chateau de Clos Vougeot and that perennial favourite the Lyon Rose. The group placed second, that of Messrs. Chaplin Brothers, was little inferior, some of their prettiest groups being composed of the fine deep red Lieutenant Chauré, Lyon Rose, the velvety scarlet General Macarthur and the chaste ivory white Ethel Malcolm.

In Messrs. Dickson's set were included the well-named Irish Fireflame (which arrests the attention of everyone), and the almost equally charming Red Letter Day.

Mr. A. H. Rigg showed some good examples of Lady Pirrie (of a red almost indefinable), Lady Ashtown, Hugh Dickson and Caroline Testout.

Messrs. Frank Cant and Co. secured the first award for sixteen varieties of Roses, showing some wonderfully fine blooms of Mildred Grant, Dean Hole, Mrs. Andrew Carnegie, George Dickson and Mrs. Joseph H. Welch. These blooms were so large that visitors were to be heard declaring "they are too huge!" Space would not allow of mention being made of a tithe of the finest blooms shown, but among some of the most impressive were Rayon d'Or (a lovely shade of gold), Irish Elegance (a bronzy orange in the bud, opening to single flowers of various charming shades), Mrs. Rosalie Winch and Mme. Edouard Herriot.

The display of Sweet Peas was excellent throughout in quantity and beauty of shading. Mr. Robert Bolton had a grand exhibit, including Rowena (an apple blossom pink), Surprise (shrimp pink) and Mrs. E. Wright (white, edged with blue).

The most successful amateur exhibitor was Lord North of Wroton Abbey, Banbury.

Among successful local amateurs exhibiting Roses were Mr. A. W. Hoffmann, Mr. F. Holmes, Mr. H. H. Spencer, Mr. W. A. Whitehead, Mr. J. W. Dracup and Mrs. G. Nicholson.

Carnations formed a very pleasing feature in the exhibition. Here Mr. G. C. Waud scored in two classes.

The trade exhibits were, as usual, of a high class and charming character.

NATIONAL SWEET PEA SOCIETY.

If the fifteenth exhibition of this society, held on the 13th inst., does not establish a record for numbers of entries, it will still rank high for flower quality and general excellence, while it is to the great credit of exhibitors and society alike that so representative a gathering was brought together at this time of national stress. That enthusiasm prevailed was manifested by exhibits from Wales, Glasgow, Ireland, Liverpool and other distant places, both amateurs and professional gardeners acquitting themselves well. The trade also gave both of its strongest and best. Novelties of outstanding excellence were not observed, though four received awards of merit. Following is a detailed report of the show.

Henry Eckford Memorial Class.—For twelve bunches of Sweet Peas, distinct, to consist of named varieties in commerce, the first prize—the Henry Eckford Memorial Challenge Cup, the gold medal of the society and 40s. in cash—was awarded to Lord North, Wroton Abbey, Banbury (gardener, Mr. E. R. James) for a superb lot of flowers, consisting of Rosabelle, Dobbie's Cream, Constance Hinton (white), Mark's Tey, Maud Holmes, May Unwin, E. Cowdy (scarlet), Agricola (pink), King Manoel, R. F. Felton (mauve, very fine), Audrey Crier and Orange Perfection; a really telling lot. Second, Mr. W. H. Holloway, Post Hill, Shrewsbury, whose very fine lot contained Agricola, Dobbie's Cream, Lavender George Herbert, Edna May, Edrom Beauty, Hercules, Elfrida Pearson, Mark's Tey, Sunproof Crimson, Mrs. C. W. Breamore, Mrs. Cuthbertson and May Campbell; third, Sir Randolph Baker, Bart., M.P., Blandford (gardener, Mr. A. E. Usher), who staged Barbara, Princess Victoria, R. F. Felton, Mark's Tey, Agricola and Prince George, among others. Nine competitors staged collections in this fine class.

Sutton Cup Class.—For eighteen bunches of Sweet Peas, distinct varieties, to be selected from the Classification List, the first prize—the Sutton Silver Challenge Cup, the gold medal of the society and 15s. in cash—was awarded to Lord North, Wroton Abbey, Banbury (gardener, Mr. E. R. James), who again staged flowers of fine quality. His varieties were as follows: Hercules, Rosabelle, White Queen, Robert Sydenham, Royal Purple, Princess Victoria, Barbara (good in colour), May Unwin, Dorothy (fine rosy mauve), Margaret Atlee, Helen Williams (cream and pink), King Manoel, Maud Holmes, Agricola, Mrs. Jessop (light scarlet), Dobbie's Cream and Edrom Beauty. Second, Sir Randolph Baker, Bart., Blandford, whose best vases were R. F. Felton, White Queen, King Manoel, Barbara, Mark's Tey, Mrs. Breamore, Hercules, Mrs. Cuthbertson, Maud Holmes, Elsie Herbert, Royal Purple, New Marquis, May Unwin, Dobbie's Cream and Edrom Beauty; third, Mrs. L. Cookson, Wem, Shropshire. Three only competed in this important class.

For six bunches of new Sweet Peas, distinct, four collections were staged, the premier prize going to Sir Randolph Baker, Bart. (gardener, Mr. E. A. Usher), for Mrs. Damerum (cream), Alfred Watkins (lavender), Royal Purple, Path-finder, Norvic (white) and Austin Frederick (mauve); second, Mr. T. Jones, Ruabon, who had Dobbie's Orange, Mrs. J. Palmer (rose and cream), E. Cowdy

(scarlet), Don Alvar (mauve) and Duchess of Portland (pink and cream); third, Mr. L. Webb, Lower Terrace, Welshpool.

Classification Class.—Eighteen bunches, distinct: First, Mr. J. Smellie, Busby, near Glasgow, who staged very finely Rosabelle, Duchess of Portland, King Manoel, Lady Evelyn Eyre (pink), King Alfred (scarlet), Elsie Herbert, Margaret Atlee, King White, John Ingman, Mrs. C. W. Breamore (creamy buff), May Unwin, R. F. Felton, Mrs. Cuthbertson, Royal Purple, Agricola, Hercules, Dobbie's Cream and Maud Holmes (reddish scarlet); second, Mr. William Bond, Formby, near Liverpool, whose T. Stevenson, Lady Evelyn Eyre, Margaret Atlee, Dobbie's Cream, Lady Miller (salmon), King Manoel, R. F. Felton, King White and Elfrida Pearson were very good. Mr. H. Tyson, The Lodge, Bedford, was third. Five competed in this important class, the quality being excellent throughout.

Twelve bunches of Sweet Peas, distinct, limited to growers of not more than 1,000 plants: First, Mr. F. W. Franks, Loampits, Tunbridge, Wells (gardener, Mr. W. Humphrey), whose fine lot contained Barbara, Hercules, King Manoel, J. Ingman, Lavender George Herbert, Mrs. Breamore, New Marquis, Elsie Herbert, Thomas Stevenson, Elfrida Pearson, Sunproof Crimson and Doris Usher. The flowers were of superb quality. Second, Mr. Arnold Hitchcock, Brook House, Tiptree, whose best were Dobbie's Scarlet, Illuminator, Royal Purple, Barbara, Hercules, Thomas Stevenson, Dobbie's Cream, Agricola, Duplex, R. F. Felton, Edrom Beauty and King White. This also was a strong and good lot. Third, Major Molson, Goring Hall, Goring-by-Sea, Sussex. Nine competitors staged, the majority showing flowers of high quality.

For one bunch of a seedling Sweet Pea not in commerce, fifteen competitors entered novelties, the prize, a silver-gilt medal, being awarded to Dr. Hammond T. Hinton, Heytesbury, Wilts, for J. B. Lowe, a handsome variety with scarlet standards and pink-coloured wings.

E. W. King Challenge Cup.—For twelve bunches of Sweet Peas, distinct varieties in commerce, the first prize, a challenge cup and gold medal, was awarded to Mr. Robert Stanford, Barton Mills, Mildenhall, Suffolk, who staged R. F. Felton, Mrs. C. W. Breamore, Hercules, Juliet, New Marquis, King Manoel, Orange Perfection, Maud Holmes, Elsie Herbert, Mark's Tey and Lavender George Herbert; a most beautiful and refined lot of flowers. Second, Mr. E. Broad, Trezenger, Fowey, who had Mrs. Cuthbertson, Elsie Herbert, Lady Miller, Royal Purple, Illuminator, Rosina, King White, King Manoel, Dobbie's Cream, Melba and Hercules. These were much too grossly grown, the tall, gaunt stems without grace or beauty. Third, Major Geoffrey Lubbock, Greenhill, Warminster, Wilts, who showed smaller flowers, yet full of refinement and charm. Nine collections were staged in this important class.

Burpee Cup.—For a display of waved Sweet Peas, space permitted 8 feet by 3 feet, only one competitor, Miss Baird, St. James, West Malvern, entered, her exhibit being awarded first prize. Lavender George Herbert, Mrs. Cuthbertson, Lady Miller, Scarlet Emperor, Mark's Tey, Clara Curtis (cream), Rosabelle, King White and Elsie Herbert were good kinds.

London Class.—Six bunches, distinct: First, Mr. W. Raven, 30, Berkshire Gardens, Wood Green, who had Dobbie's Cream, Princess Victoria, Sunproof Crimson, Thomas Stevenson, Hercules and Royal Purple; second, Mr. Robert J. Baker, Muswell Hill, who staged Mrs. Cuthbertson, Nora Unwin, Rosabelle, Loyalty (white, flaked royal blue) and King Manoel; third, Mr. G. M. Morewood, Brentford. Six groups were staged.

Scottish Class.—Six bunches, distinct: First, Mr. James Kew, Westmount, Stewarton, Ayrshire, whose excellent lot contained Rowena, Dobbie's Cream, R. F. Felton, J. Loader (crimson), Edna May Improved and May Unwin. These were of very fine quality. No second prize was awarded, the third prize going to the Rev. J. C. Gillies Colvin, Manse of Hoddam, Ecclefechan.

Irish Class.—For nine bunches of Sweet Peas, distinct, Mr. Edward Cowdy, Greenhall, Loughgall, County Armagh, was the only competitor, being awarded first prize. Audrey Crier, Mrs. C. W. Breamore, Rosina, King White, Lavender George Herbert, Hercules, Marvel, Elsie Herbert and May Campbell comprised his lot.

Welsh Class.—For nine bunches, distinct, there were two entrants, the premier award going to Mr. T. Jones, Ruabon, for excellent vases of Agricola, Duchess of Portland, Mark's Tey, Lavender George Herbert, Dobbie's Orange, Mrs. C. W. Breamore, Prince George, May Campbell and Edrom Beauty; a particularly good and refined lot. Second, Mr. L. Webb, Lower Terrace, Welshpool, who had New Marquis, Agricola, R. F. Felton, Princess Mary and Duchess of Portland, among others.

Northern Counties Class.—For nine bunches of Sweet Peas again only two collections were staged, the premier award going to Dr. Roy Appleton, Beverley, East Yorks (gardener, Mr. H. Walmsley), who had a superb lot of flowers. May Unwin, Mark's Tey, Elsie Herbert, Mrs. Cuthbertson, Pathfinder (salmon scarlet), R. F. Felton, R. Sydenham, Royal Purple and Hercules comprised his set. Second, Mr. W. Bond, White Cottage, Formby, near Liverpool, who had Pathfinder, Royal Purple, E. Cowdy and Rosabelle as his best.

Western Counties Class.—Nine bunches, distinct: First, Mr. W. Phillips, Astley House, near Shrewsbury (gardener, Mr. R. Goliath), whose May Campbell, Mrs. Damerum (cream), Duchess of Portland, Mark's Tey, Edna May Improved and Elfrida Pearson were excellent; second, Sir Randolph Baker, Bart., who staged Queen Mary, Constance Hinton (white), Marvel (salmon and cream), Hilda and E. Cowdy, among others; third, Mr. E. Broad Trezenger, Fowey.

THE GARDEN.

No. 2280.—VOL. LXXIX.

JULY 31, 1915.

NOTES OF THE WEEK.

Roses Minnehaha and Hiawatha.—We were agreeably surprised, when visiting a friend's garden a few days ago, to find these two well-known Rambler Roses growing together. The growths of one were intermingling with those of the other, and the flowers of both made quite a charming picture. The combination of these two colours was rather a daring one, Minnehaha having pink blooms similar to those of Dorothy Perkins, while the single blooms of Hiawatha are bright crimson, with a small white centre to each.

A Good Bush Honeysuckle.—The Lonicera or Honeysuckle family consists of a varied class of plants, many of which are very decorative. One of the best is Lonicera grata, a free-flowering shrub bearing at the present time masses of fragrant reddish flowers, which are borne in the axils of the upper leaves or leaf-like bracts. It somewhat resembles the common Honeysuckle of our woods, except that, instead of being of a rambling nature, it forms compact bushes, and is therefore valuable where space is limited. Although introduced from North America in 1720, it is a plant not very well known.

An Interesting New Zealand Shrub. Notospartium Carmichaeliæ is a dainty leguminous shrub, a native of New Zealand. On the borderland of hardiness, the plants pass unharmed through an ordinary winter, yet as they invariably succumb in the open during hard winters, it is desirable to have them in sheltered positions, where also, if necessary, a little additional protection may be afforded. The green, twiggy branches suggest those of Broom or Carex. The small purplish pink flowers are closely arranged in racemes an inch or more in length. This note is suggested by several plants, 2 feet to 2½ feet in height, flowering at Kew in the Leguminosæ collection near the Rose Dell.

A Beautiful St. John's Wort.—One of the most attractive shrubs of recent introduction is Hypericum patulum Henryi. It is larger and more robust in flower, leaf and stem than the type, and is better in every way, bearing its large golden flowers in great profusion for a long period. A native of China, whence it was introduced in 1898 by Professor Henry, after whom it was named, it somewhat resembles the beautiful H. hookeriana, but has the two-edged branchlets

of H. patulum. It is an excellent subject for the front of the shrubbery, or for a bed which is filled with spring-flowering bulbs.

Correction in the Royal Horticultural Society's Diary.—The Rev. W. Wilks writes us as follows: "In the Royal Horticultural Society's Diary for the present year a fortnightly show and meeting has been entered for Wednesday, August 18; this should be Tuesday,

garden in the Cotswolds, and have been in their present position for eighteen years. When the photograph was taken a week or two ago the flower-heads were not quite fully developed, but by this time they will be ready for cutting and drying.

Coreopsis grandiflora and Madonna Lilies.—

Few herbaceous plants can surpass Coreopsis grandiflora for decorating the garden or for cutting, and even when many other flowers are suffering from drought, this plant remains quite fresh. The beautiful, large golden yellow blossoms are produced very abundantly on long, slender stalks, making them extremely valuable for cutting. We recently saw a large vase filled with Madonna Lilies and this Coreopsis, and the effect was very beautiful, while it is equally as effective in small vases with Gypsophila. C. grandiflora is a true perennial, but much better flowers are obtained when it is treated as a biennial, sowing the seed in the spring.

The Californian Mock Orange.—

One of the latest species to flower, Philadelphus californicus is among the most beautiful of the vigorous-growing Mock Oranges cultivated in our gardens. Ultimately some ten feet or twelve feet high, and even more in diameter, lawn bushes may become a conspicuous feature of the pleasure grounds during July, while for the back of the shrubbery border and on the edge of the woodland this species is deserving of attention. The pure white flowers are fragrant, fully an inch across, and borne in panicles up to a dozen or more in each.

Clematis Hendersonii.—This is probably one of the first hybrid Clematises raised in our gardens, 1830 being given as the date of raising by a Mr. Henderson, who lived at St. John's Wood. The reputed parents are C. viticella and C. integrifolia. Free in growth and profuse flowering, for the

flower garden and pleasure grounds it is one of the most beautiful Clematises. The evidence of C. integrifolia is seen from the fact that the plants die down to the ground in winter, pushing up young growths freely in spring, which reach a height of 6 feet or 7 feet, requiring the support of rough poles or Pea-sticks. The dark bluish purple flowers are some two and a half inches across, produced in quantity from early July until September.

EIGHTEEN YEAR OLD LAVENDER BUSHES IN A COTSWOLD GARDEN.

August 17. Would Fellows and exhibitors please make the correction."

Sweet Lavender in the Garden.—Although Lavender is highly appreciated by everyone for the sake of its perfume, it is sometimes rather difficult to grow successfully. In some gardens, however, and especially those where the soil is of a rather sandy character, and therefore well drained, the plants live to a considerable age. Those shown in the illustration are growing in a

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Bottle-Brush Tree Flowering in Surrey.

Perhaps it may be interesting to some of your readers to know that the Australian Bottle-brush Tree, *Metrosideros* (*Callistemon speciosus*), which is not very common out of Cornwall, is flowering well against a south wall on the gravelly sand of West Surrey. It is about four feet high, and has nearly thirty spikes of rich red flowers. It has been some years in the garden, but has never flowered so freely as this season. *Mandevilla suaveolens* and *Plumbago capensis* are also flowering well, and *Exogonium* (*Ipomœa*) *Purga* will soon be a sheet of flowers.—WILLIAM TIDY, *Clare Lodge, Rowledge, Farnham.*

Gardening in South Australia.—I have pleasure in forwarding you two photographs which may be of interest to your readers. One is of *Furcraea longæva*, which, after twenty-two years, has this summer thrown up a flower-spike 20 feet

this case *Papaver umbrosum* (or *commutatum*) was employed, and with a very fine result indeed. Until I was quite near the bed I did not realise they were Poppies, but thought they were scarlet Tulips. Of course, the bright colour was observable a considerable distance from the bed, thus intensifying one's curiosity. I do not remember reading a comment on this arrangement anywhere.—C. TURNER. [Our correspondent does not read his *GARDEN* closely. The Poppies were referred to on page 287 of our issue for June 12.—ED.]

Plagianthus Lyallii Flowering at Kew.

This beautiful New Zealand shrub is now in flower in the *Berberis Dell* at Kew, and the two large bushes of it are well worthy a visit, as it is not every year that it can be seen to perfection. The white Malva-like flowers—*Plagianthus* is a genus of *Malvaceæ*—are about one and a-half inches across, borne on stems about one and a-half inches long, and are produced in threes on the previous year's wood, so that a fine autumn with plenty of sunshine to ripen the wood is essential to the production of flowers the following season.

one of a combination of Violets and Primroses, I think it well worth knowing by residents on our South Coast, so that they may try it, and so increase the many sweet-scented outdoor subjects which for so many years have been starved in pots. The colour, of course, is yellow, and the habit of the plant is similar to our *Jessamine*. The fact of it being a native of South America shows that it would thrive only in our Southern Counties and in sheltered positions.—GEORGE BURROWS.

Antirrhinum Asarina.—This interesting trailing Snapdragon has large, cream-coloured flowers in pairs. It thrives in light soils, and generally seeds itself abundantly. It is useful for covering rocks and bare ground. Seedlings grow rapidly, and soon make a pretty carpet. The old plants, if they survive the winter (which they rarely do in heavy soils), are not nearly so attractive as young ones. Planted in a hanging basket in a cool conservatory, the stems hang down and are very pretty. Twenty-five years ago *A. Asarina* was hardly known in this country. In the year 1892 I brought some plants from the Eastern Pyrenees, and in the following year gave plants and seeds to many botanists and gardeners, including the late Mr. Wolley-Dod. None of them had ever seen or heard of the plant. It is now cultivated pretty generally. The Director of the Royal Botanic Gardens, Kew, has favoured me with the following particulars of its history: "The statement that *Antirrhinum Asarina* was introduced in 1699 appears to have been based on information given in Aiton's '*Hortus Kewensis*,' 1789, where 'cult. 1699 by Mr. Jacob Bobart' occurs. Bobart, who was Superintendent of the Oxford Botanic Garden, edited the third part of Morison's '*Historia Plantarum Oxoniensis*,' published in 1699, in which a description of the plant is given, with the statement that seeds were sent by Sherard. Mrs. Loudon, in 1844, said that it appeared to have been a popular plant for some time about the middle of the eighteenth century, but was afterwards lost to cultivation. However, it was cultivated again at the end of the eighteenth century, and was figured in the *Botanical Magazine* early in the nineteenth century (1806), but it was considered rare then and apparently remained so."—G. R. JEBB.

FOLIAGE PLANTS EFFECTIVELY GROUPED IN AN AUSTRALIAN GARDEN.

high, the stem 10 feet high, the plant dying in the effort. The other photograph is of a clump of Grasses, Japanese and Chinese Bamboos, *Yuccas* and *Dracæna*, the combination of which is very effective.—FRANCIS H. SWAIN, *Aldgate, South Australia*. [The photograph of *Furcraea* showed a magnificent plant, but, unfortunately, was not suitable for reproduction.—ED.]

Annals Between Shrubs.—Early in the season there appeared in *THE GARDEN* an article and illustration of annals (*Godetias*) among shrubs. Just recently I came across an excellent example of *Marigolds* so placed in the public grounds of Primrose Hill, N.W. They looked so well and the plan is so practical that other public shrubberies might be so treated, were the idea more generally known. In addition, too, there are many rough borders and shrubberies in private places which would be much improved by scattering among them some such dwarf annual. I might add that a still better effect was to be seen towards the end of May in a very large bed of shrubs at Kew situated near the Tea House. In

The leaves are 2 inches to 3 inches long, broadly cordate in shape, dull green above and paler beneath. The plant is one of the few New Zealand shrubs that can be grown outdoors in the London district, and even there requires a sheltered position and full exposure to sunshine to ensure the best results.—J. C.

Cassia corymbosa at Eastbourne.—The note on the Mount Etna Broom in *THE GARDEN* for July 24, page 359, was interesting, as we have numerous plants growing in the public gardens in Eastbourne. Following the many spring-flowering shrubs, they flower at a most welcome time, and contrast well with the many varieties of *Veronicas* which are at home in this seaside resort. I was attracted the other day, when in the neighbourhood of Carlisle Road, by the scent of *Cassia corymbosa*, which is growing in the gardens of Mrs. Morrison. The plants, which have attained large dimensions, are quite at home here, although I do not know of any other instance where they are grown successfully outdoors. As the scent of this shrub is so sweet, and reminds

The Toad in the Garden.—Certain people have a great aversion to the presence of toads in their gardens. They think that toads are "horrid things," that they do great harm in the garden, and, in consequence, make every effort to banish them. Now, this state of things results from ignorance and lack of observation; hence my reason for sending this plea on behalf of the toad. True, it is somewhat of a surprise, not to say a shock, to suddenly discover one of these benevolent creatures close to your hand when you are weeding your annuals, if you were not expecting to discover one; but the shock is quickly got over. Of course, the assertion that toads are "horrid things" is true when made by some people, for these say they feel unwell, or, to put it in their own words, are "tarned sick" at the sight of a toad. However, such excuse ought not to be the reason for banishing toads from the garden. The assertion that they do great harm in the garden is not true. At any rate, they are perfectly harmless; and experience shows me that they are not merely harmless, but capital friends of the gardener. Nearly every summer we have one or two here (sometimes several), and only a few days ago I

found one enjoying a cool and damp retreat under some foliage up in the top garden. Toads are benevolent because they eat many of the gardener's foes, which are with us quite plentiful enough even in the summer. Some people say that they work destruction because they "eat up the young growths of annuals and other plants." I cannot, of course, be certain that they do not, but I can say very definitely that I have never found nor traced them doing any such thing. I have found them to be the gardener's friends, so readers should think long before they banish them from their gardens.—E. T. ELLIS, *Weetwood, Ecclesall, Sheffield.*

Single Rose Miss Rosalie Wrinch.—This Rose, sent out in 1914 by Messrs. Brown of Peterborough, bids fair to become one of the most popular early flowering varieties we have. My plant was, on June 5, in full flower and making a conspicuous object in the garden, rambling over an old tree stem. The blooms are 5 inches in diameter, ranging from six to nine petals, with generally a crinkled edge and deep yellow stamens. The colour is the pleasing feature; the buds are a deep rosy red, gradually fading to a rich pink when fully developed. The blooms are freely produced.—E. MOLYNEUX.

Pæonia officinalis lobata.—I was pleased to see a note in your issue of the 17th inst., page 351, anent this plant. I have visited many well-known gardens, but I have never yet seen a specimen of it. Moreover, it is seldom mentioned in modern horticultural works; in fact, the only mention of it I have come across is in the "Cottage Gardeners' Dictionary." Kew is not the only place where one would expect to find this plant and where it is missing, as there is not one in the Royal Horticultural Society's Gardens at Wisley. It is a kindly subject to grow, and different from *Pæonia sinensis*, which generally takes some years to thoroughly establish. *P. lobata* flowers the first season after planting. At least, that is my experience. Your correspondent very accurately describes the colour of the flowers and the attractiveness of this plant. So far as I know, there is no other colour in the garden quite like it. Noble as the varieties of *P. sinensis* are, the subject of this note is far more refined and elegant, while it does not occupy the great space required for the stronger-growing plant.—ALPINIST, *Weybridge.*

Three Useful Recipes.—The following old recipes may perhaps be of some use and interest to other readers: *Syrup of Gilliflowers* (Yorkshire, 1769).—Take 5 pints of clift Clove Gilliflowers, and put to them 2 pints of boiling water; then put them in an earthen pot to infuse a night and a day. Take a strainer and strain them out; to a quart of your liquor put 1½ lb. of loaf sugar, boil it over a slow fire, and skim it while any scum rises. When it is cold, bottle it for use. *Elder Rob* (eighteenth century, about 1750).—Gather your Elderberries full ripe, pick them clean from the stalks, put them in large stew-jars and tie paper over them. Let them stand two hours in a moderate oven. Then put them in a thin, coarse cloth and squeeze out all the juice you can get. Put 8 quarts into a preserving pan, set it over a slow fire, let it boil till it be reduced to 1 quart. When it is near done, keep stirring it to prevent it burning. Then put it into pots, let it stand two or three days in the sun; then dip a paper, the size of your pot, in sweet oil, lay it on, tie it down with a bladder, and keep it in a very dry place.

Balm Wine (Yorkshire, 1769).—Put a peck of Balm leaves in a tub or large jar, heat 4 gallons of water scalding hot, ready to boil, then pour it upon the leaves. Let it stand all night, then strain it off through a hair sieve. To every gallon of liquid put 2 lb. of fine sugar and stir up very well. Take the whites of four or five eggs, beat them very well, put them into a pan with the liquor. Whisk it well before it be overhot. When the scum begins to rise, take it off, and keep it skimmed all the time it is boiling. Let it boil three-quarters of an hour; then put it into the tub. When it is cold, put a little new yeast upon it, and beat it in every two hours, that it may head the better. So work it for two days; then put it into a sweet keg, bung it up close, and when it is clear, bottle.—BORIS.

Dianthus Spencer Bickham.—I was pleased to observe the illustration of *Dianthus Spencer Bickham*, together with the paragraph regarding it, on page 324 of *THE GARDEN*. It is a delightful little Pink, of which I happen to possess the true form mentioned by you. The flowers, as you remark, "are of a brilliant rose red," and are freely borne a little above a close mat of small foliage. I grow it best here in a moraine of crushed road chips and lime, and it is increasing well and evidently thriving. It is universally admired by those who see it, and is one of the choicest of such hybrid Pinks.—S. A.

Gentiana acaulis.—I can quite corroborate what Mr. Jenkins says on page 336, issue July 10, regarding *Gentiana acaulis* on a sandy soil. It is a little difficult to forecast whether it will succeed in any particular place or not, but I know that I have been successful with it in sandy soil, and that I have frequently seen it flourishing and flowering freely in such a medium. I find that my best results in my present garden are obtained in a border of poor soil with gravel in it, and in full sun. The position is fully exposed, and the plants are hard and firm. It is always unsafe to offer any theory regarding *G. acaulis*, and to say that this will be found to work out well in any particular garden. Long experience and observation have convinced me of this. When I say that I have seen *G. acaulis* flowering and spreading well on a fairly good loam, with 2 inches of animal (cow or horse) manure almost immediately underneath, it will be seen that this remark is not without foundation. Another example of its success was in a garden where it grew in good loam immediately in front of a border occupied in the summer by Dahlias and other gross-feeding subjects, for whose benefit the border was heavily manured annually. The border sloped well to the front, and the *Gentianella* must have received a considerable amount of nourishment in consequence. It formed a long line about two feet across, and was a picture of beauty in its flowering season. In another garden where *G. acaulis* is a success it is planted in a broad line at the front of a border of herbaceous plants, again in good loam. It was shy of flowering for some time, and was subjected to the apparently harsh treatment of running the garden roller over it, with the happiest results in the shape of plenty of flowers. This operation is performed annually, and the brilliance of the blue flowers of the *Gentianella*, borne in abundance, is considered a justification for this severe treatment. "Sweet are the uses of adversity!" Yet, on the whole, my conclusion is that a light, dry soil is the most conducive to blooming and gives the best plants.—S. ARNOTT, *Dumfries.*

RECIPES FOR HOME-MADE SOAP AND PERFUMES.

NOTICE in your issue for June 19, page 300, "M. H." asks for recipes for home-made soap, ointments and perfumes. I hope the following will be of some use:

A Fine Scented Wash-Ball (Perfumed Soap).—Take of the best white soap ½ lb., shave it into thin slices with a knife; then take 2½ oz. of Florentine Orris, ½ oz. Calamus aromaticus, ½ oz. Elderflowers, ½ oz. Cloves and dried Rose leaves, 1 dr. Coriander seeds, Lavender and Bay leaves, and 3 dr. storax. Reduce the whole in a mortar to a fine powder, sift finely through muslin, knead into the paste of soap, softening the paste with oil of Almonds. Make into round balls and set to dry. The above recipe ends: "Too much cannot be said in favour of this wash-ball with regard to its cleansing and cosmetic property."

Cold Cream.—Take white wax and spermaceti, 1 dr.; oil of Sweet Almonds, 2 oz.; spring water, 1½ oz. Melt the wax, spermaceti and oil of Almonds in a glazed pipkin, put in a pan of hot water. When melted, pour into a mortar and stir it about with the pestle till it gets cold and quite smooth; then add the water gradually and keep stirring until the whole is incorporated. This pomatum resembles cream. Use rose-water instead of spring water to give it a Rose scent.

Cucumber Cream.—Three small Cucumbers, 1 oz. of white wax, 6 oz. of Sweet Almond oil, 1 oz. of Cocoa butter, and two teaspoonfuls of tincture of benzoin. Cut the Cucumbers (rind as well) into inch blocks and put in a saucepan with the Almond oil. Let it simmer four or five hours; strain and press as much of the juice of Cucumber as you can get; then add the wax and Cocoa butter. Put in a pan and heat until thoroughly melted and mixed. Take off the fire, heat it gently, adding the benzoin till it is well mixed. Add a few drops of Spinach juice to give it a delicate green colour, pour into jars and tie down.

Lavender Cream.—Six ounces of Almond oil, 1 oz. of white wax, ½ lb. of Lavender flowers (Rose leaves or Jasmine can be used instead). Put the oil, wax and Lavender into a pipkin, put a lid on the pipkin, and stand it in a cool oven for three or four hours. Remove and let it cool. Next day strain, remove the flowers, add fresh ones, and again warm in the oven. Second day strain and pour into jars.

Hungary Water.—Take 4 oz. of Rosemary flowers, 1 pint of spirits of wine; infuse twelve days, shaking the bottle well. Draw off and cork close.

Rosemary Hair Wash.—Steep Rosemary leaves in a bottle of bay rum ten days. Strain and add fresh Rosemary. Keep for another ten days, strain and use.

Absinthe.—Infuse for a fortnight 3 oz. of the flowers and tops of Wormwood, three Cloves, ½ oz. stick of Cinnamon (which break) in a quart of rectified spirits. Strain, add a pint or less of syrup (using cane sugar and distilled water). To give it the proper green colour, add drop by drop Spinach juice.

A Cordial.—Put a handful of Rosemary and Balm, ½ oz. of Cloves, ½ oz. of Nutmeg and ½ oz. of Cinnamon in a quart of brandy. Let it infuse three weeks. Add a syrup sufficient to sweeten to taste, strain and bottle.

Peppermint Cordial.—Put a few drops of oil of Peppermint on a lump of sugar, put it into a

bottle of gin, add syrup. The amount of Peppermint depends on the individual taste.

"Rummel" Cordial.—Infuse 10z. of fresh gathered Caraway seeds in a quart of unsweetened gin. Let it stand two months, strain and sweeten.

Herb Vinegar (for Salads).—Lemon Thyme, Savory, Marjoram, Sweet Basil, 3oz. of each; Lemon peel and Eschalot, grated, 1dr. of each; Celery seed, 1dr. Infuse for ten days in the sun in Orleans vinegar. Strain and use. K. T.

BOTTLING FRUITS AND VEGETABLES.

THE value of bottled fruits and vegetables to every household during the winter, even in normal times, is generally understood, but how much more important it is in these strenuous times that every effort should be made to preserve as far as

of sugar to a quart of water. Take care that the fruits chosen are perfectly sound and not overripe. Pack the fruits closely in the bottles to within an inch of the top, cover with the syrup, adjust the rubber ring and glass disc, and screw down the metal collar tightly; then stand the bottles in the steriliser, place over a steady heat, and allow the water to come to the boil gradually. Remove from the fire and screw the bottles down firmly.

Plums, Damsons and Green Gages may be bottled by covering with water only; but these fruits are improved by the addition of a small quantity of sugar. From 4oz. to 5oz. to a quart of water will be sufficient.

Strawberries and Raspberries require very little or no water, the best method being to sprinkle sugar between the fruits and proceed as for those above mentioned.

Of Tomatoes, choose some of a good medium size, not overripe, taking care they are quite

America. We are told that its beauty, both at the flowering season and in autumn when the foliage turns bright orange and scarlet, is so impressive that the tree is spared 'even by the settlers.' The tree illustrated is by no means of exceptional size. Sargent gives the height as 40 feet to 60 feet, occasionally 100 feet. Under cultivation in this country it is much more promising than its fellow American species—*C. florida*. At Kew some plants 6 feet to 10 feet high have flowered well for two or three years past. The inflorescence is formed in early autumn and remains exposed throughout the winter, the bracts developing and the flowers expanding the following May. The bracts usually number six, but vary from four to eight; they are 3 inches long and up to 2½ inches wide, often partially overlapping. The whole involucre (or 'flower' as it is popularly termed) is thus 6 inches wide and creamy white, often tinged with pink later. The true flowers are small, greenish, and gathered in a dense head three-quarters of an inch wide. The species is native of the coast region, from British Columbia and Vancouver Island to South Carolina. We are indebted to Mr. F. W. Godsall of Cowley, Alberta, Canada, for the photograph of a tree of *Cornus Nuttallii* growing in British Columbia which is here reproduced."

SNAPDRAGONS FOR PRESENT SOWING.

THOSE who wish to raise Snapdragons or Antirrhinums for flowering early next summer should sow the seed at once. These charming flowers are so easily grown, and continue to blossom over such a long period, that one has no hesitation in putting forward a plea for their extended cultivation.

Flowering as they do in any reasonably good garden soil that is well drained, they impose no difficulties on the grower, excessive wet during the winter months being the greatest trouble to contend with. Seed of separate coloured varieties, such as deep crimson, yellow, pure white, pink and flame red, is obtainable, and either dwarf, intermediate or tall forms can be had. For most purposes the intermediate section, with flower-stems from 18 inches to 2 feet high, is the most useful, the dwarf varieties being too stunted to be pleasing, and the tall ones rather too lusty for positions that are at all exposed. The seed may be sown now in the open ground, but the surface must be of fine tilth, as the seed is small and needs but a quarter-inch covering of soil. We prefer to sow thinly in rows a foot apart, and then to transplant the seedlings, when about two inches high, into beds of deeply dug but rather firm soil. They should go about nine inches asunder in rows at least a foot apart, and remain there until the end of March, when they can be transferred to their flowering positions. In very wet and cold localities it would be advisable to transplant the seedlings to a bed made up in a cold frame, so that excessive rain could be guarded against.

Any pretence at "coddling" must not, however, be allowed, as the plants are perfectly hardy so long as they are kept reasonably dry. Where Snapdragons are grown on rockwork or old walls, it would be best to scatter the seeds at once where the plants are to grow and flower, thinning them as may be necessary when the seedlings are a few inches high.

A SPRAY OF CORNUS NUTTALLII SHOWING THE CHARACTER OF THE FLOWERS.

possible those kinds and varieties which answer so well to this treatment.

Fortunately, there is every prospect of a heavy crop of Plums and Damsons, two of the most valuable fruits for this purpose, as nothing retains its flavour and reminds one of freshly gathered fruit more than these. Any kind of Damson is suitable, but some of the best varieties of Plums are Rivers' Early Prolific, The Czar and Victoria, and wherever these are grown, either in large or small quantities, one can generally spare sufficient, if only for a few bottles.

As I have for some years taken a great interest in the preserving of all kinds of fruit, I will, for the benefit of those who have had little or no experience, relate in as brief and concise a form as possible the methods I have adopted with success.

Gooseberries, Cherries and all kinds of Currants may be bottled in syrup, allowing 6oz. to 8oz.

clean and not bruised. Pack closely into the bottles, cover with clean cold water, adding a little salt, and proceed as for sterilising fruit. Beans may be bottled in the same way; also small young Carrots are useful and good. The latter must be parboiled before bottling. (Mrs.) E. BECKETT.

A BEAUTIFUL AMERICAN TREE.

(*CORNUS NUTTALLII*.)

Writing in the *Kew Bulletin* No. 4 on *Cornus Nuttallii* and its allies, Mr. W. J. Bean gives the following particulars of the species. We are indebted to H.M. Stationery Office for permission to use the illustration of the magnificent tree which accompanies Mr. Bean's notes in the bulletin.

"The illustration we give of this, the noblest of Cornels, enables us to appreciate the enthusiastic terms in which this tree is invariably commented on by writers and by travellers in Western North

SEASONABLE NOTES ON AURICULAS.

IF the plants were duly potted as suggested in May and carefully watered, they will now be rooting freely. Top growth will be scarcely perceptible, but, as stated, the roots will be active, and thus preparing for the second period of growth. At this stage every encouragement must be given by admitting plenty of air, giving just sufficient water to keep the roots on the move, and by holding in check insect pests, of which green fly is the most persistent.

Where the grower cannot provide the shade of a north wall or hedge, it will be necessary to use artificial shading for a few hours during the middle of the day when the sun is bright and hot.

Seed-Sowing.—In these days seed-sowing has become a favourite hobby with many amateurs, and such work should be commended and encouraged, as by this means new kinds are secured and real progress made.

When to Sow Seed.—In a previous article I suggested the intercrossing of different varieties, and where such work was carried out the seed will reach maturity during the present month. Auricula seed may be sown at any time, but I prefer to sow it directly it is gathered, because it germinates more evenly. Even then it is somewhat irregular, and the beginner should not be discouraged if only a few seedlings appear during the first three or four weeks. The seed will continue to germinate for some months; in fact, I have known it to lay dormant for over a year.

Seed-Pans.—The ordinary flower-pot, box or seed-pan may be chosen in which to sow the seed, and one-half of their depth should be filled with drainage, over which is placed a thin layer of moss or rough material to ensure a free outlet for water. A mixture of loam, leaf-mould and sand should be prepared, and then made fairly firm in the pans. The surface should be made even, when it will be ready for sowing the seed. This is sprinkled rather thinly and then covered with a little fine soil.

After-Treatment.—An ideal position for the seed pots or pans is in a hand-light or small frame, which should be placed at the base of a north wall, or wherever it is shady. For a few weeks the pans may be covered with a thin layer of damp moss to conserve moisture, as the soil must never be allowed to become dry. To maintain a close, moist atmosphere, very little air ought to be admitted, and then only during damp weather. When the seedlings have made two or three tiny leaves, they may be pricked off into pans of light soil an inch or so apart. With ordinary care and attention they will grow freely, providing they are kept cool and the soil is not allowed to become sour through overwatering. T. W. B.

A BEAUTIFUL HARDY ANNUAL.

ONE of the most interesting and charming annuals flowering in the outdoor garden just now is *Collomia coccinea*, a native of Chile and a plant that is evidently but little known. Very few seedsmen offer seeds in their catalogues, though doubtless they could supply them if ordered. The plants flowering now were self-sown seedlings last autumn, and have stood the winter through without any protection; hence one may fairly claim that this *Collomia* is perfectly hardy, a

rather interesting fact when we remember its habitat. It forms a neat, rather dense, branching bush from 12 inches to 15 inches high, and each growth is terminated by a cluster of small vermilion flowers, the reverse of which is bright golden yellow. In general appearance the flower-heads resemble those of the smaller *Bouvardias*. This annual is not fastidious as to soil or position,

and would be quite a good temporary plant for the rock garden where a reasonable depth of soil is available. As already indicated, it seeds and sows itself freely, and although by no means weedy, is not likely to be lost when once it has been allowed to seed. Seeds could be sown either in August or September, or in April. The plant continues to flower for some weeks.

A MAGNIFICENT TREE OF *CORNUS NUTTALLII* GROWING IN BRITISH COLUMBIA.
(From the Kew Bulletin. See page 374.)

SOME SIMPLE PLANTS FOR EDGINGS.

WITH so many beautiful new plants before us that have been collected from temperate regions, and especially the western and northern parts of China, I am afraid that we do not always appreciate, or give so much attention to, the old favourites as their merits deserve. No one with

aggressive, old plant, London Pride or Saxifraga umbrosa, making a broad yet neat and beautiful margin to the pathway; while, in the other, garden Pinks are used for the purpose. The last-named picture has its fault, inasmuch as the pathway, being narrow, has become too much overhung by the plants. The primary object of a pathway is for walking upon, and anything that hinders this, or renders progress uncomfortable, is not good gardening. Properly placed, these garden Pinks make one of the best permanent edgings that I know, though one would prefer

the smaller-flowered varieties to the large ones seen in the illustration. At all seasons the neat, glaucous-tinted foliage of Pinks is pleasing, and during the flowering period, which, unfortunately, is rather a short one, the deliciously fragrant blossoms are appreciated by everyone. The present is an opportune time to write of these Pinks, because there is no better season for propagation. The young shoots that are to be found in abundance on the old plants just now, if pulled off with or without a "heel" and dibbled in rather thickly in a bed of sandy soil and leaf-mould, and then covered with a cold frame, will root almost as freely as weeds, and make neat little tufts for planting as edgings during October or early November. These Pinks will thrive in very poor soil, hence they are particularly useful for those whose gardens are mainly composed of sand.

In similarly poor soil there are few better plants than the Thrift or Sea Pink, *Armeria vulgaris*. All the year through this has neat, bright green, grass-like foliage, and during June, July and

August it never fails to produce its quaint, globular heads of rosy pink flowers in abundance. A variety of it named *lancheana* has blossoms of a deeper hue and is equally useful for edgings. To increase the plants, one has only to lift and divide them early in the autumn. London Pride, already referred to, is one of the best natured plants that we have, and is only despised by those who regard it as "common." Although its specific name indicates that it is shade-loving, it will grow practically anywhere—in deep shade or full sun—and gives no trouble at all except to occasionally, during autumn, lift the old plants, when they are extending too far, or becoming thin in the centres, and replant some of the young, outer rosettes.

Of a more dainty character, but equally as easily grown, are the Aubrietias. Where a pathway has a rough edging of stone, there is nothing

better for scrambling over it, and during spring and frequently well into the summer, the plant will provide sheets of lavender, blue or rose coloured flowers, according to the variety that is selected. The plants are easily increased by division during wet weather as soon after flowering as possible selecting the young, rooted growths for replanting. Equally useful is *Arabis albida* or *alpina*, which gives its white flowers in such profusion during the spring. In recent years the double-flowered variety has been extensively used for edgings, but I prefer the older single-blossomed plant, which is neater and more pleasing, at least as an edging. It is readily increased in the same way as the Aubrietia, and is a plant that will give but very little trouble.

Harking back to gardens composed mainly of sandy soil, one would like to see the Sun Roses or *Helianthemums* more extensively used for edgings. Of a semi-shrubby nature, these plants revel in sunshine, and although, if left to their own resources, they become rather ragged-looking in a few years, this can, to a large extent, be obviated by cutting back some of the growths immediately after flowering. There are very beautiful colours among them, and some of the plants have foliage of a pretty glaucous tint. Their propagation, which is not exactly easy, is best effected by means of cuttings made from young growths during the next few weeks. These should be planted in pots of very sandy soil, each receptacle plunged in Cocoanut fibre in a cold frame, and then covered with a bell-glass.

Where the soil is naturally peaty, or contains a large percentage of humus, and is free from lime, no better edging could be found than one of the dwarf *Ericas* or hardy *Heaths*. *Erica carnea* is ideal for the purpose, and it flowers profusely from January to April. A little taller, but quite suitable for a broad edging, is *E. mediterranea hybrida*, or *E. darleyensis* as it is now to be known. It flowers in December and continues until May, its rose pink blossoms being highly appreciated for cutting. It is not at all an old plant, but is included here as a beautiful representative of an old family. Those who prefer a summer-flowering Heath as a margin to the pathway should select the Scotch or Grey Heath, *E. cinerea*. Its bright purple flowers are very charming, and it always keeps dwarf. The garden varieties of this Heath, beautiful though they are, ought not to be selected for the purpose now under consideration, as, generally speaking, they do not possess the vigour of the type. For a flagged pathway there is no better margin than Lavender—one of the dwarf varieties obtainable from any really good nurseryman. The maximum height of these is about fifteen inches, and at all seasons they are pleasing. If Catmint, *Nepeta Mussinii*, can be sandwiched between, the effect will be particularly good, the soft blue flowers and grey foliage harmonising splendidly with the Lavender.

There are, of course, a great many other simple plants that could be used as permanent edgings to pathways, according to the desire of the owner of the garden, and the locality, but enough has been said to draw attention to a phase of gardening that is too often neglected. In planting these edgings it should be remembered that a fairly broad belt gives a much better effect than a very narrow one. Its actual width will, of course, be determined very largely by the width and length of the pathway. A comparatively narrow walk, if of considerable length, would need quite a broad edging—one at least a foot wide—while a wider

PINKS AS EDGINGS TO A PATHWAY. THE WALK IS TOO NARROW FOR THE PLANTS.

a broad outlook on gardening would say that a plant, simply because it is old-fashioned, should be retained in prominent positions in our gardens if a newer one better adapted for the purpose is available in quantity. But there are a good many old, or comparatively old, flowers that for certain positions have yet to be surpassed. Take edgings to pathways for an example. In many gardens one finds these occupied by plants quite unsuited for the purpose, and in others the pathway is devoid of edgings at all. Yet these features, if planned with a little forethought and sound judgment, add considerably to the charm of the garden, and yield not a little pleasure to the owner.

The illustrations that accompany this article, reproduced from photographs taken in the garden of Mrs. Dill at Londonderry, will serve to show what I mean. In the one we have that useful, if somewhat

pathway that is short would be best furnished by one 9 inches in diameter. It must also be remembered that the tendency of all the plants named is to increase in width, and some little allowance must be made for this, though in most cases judicious cutting back will keep them within a few inches of their original sphere. F. W. H., in *Country Life*.

SEASONABLE NOTES ON VEGETABLES.

Broccoli.—The plants are now growing freely. The ground between the plants should be kept quite clean by hoeing, or, where the soil has become soddened by trampling upon it during wet weather or other causes, it should be forked over, thus admitting air to the roots.

French Beans sown in frames during the early part of July should be thinned if too crowded, staked, and mulched with leaf-mould or spent Mushroom-bed manure, which will feed the surface roots. Gather the Beans directly they are ready, thus removing any undue strain on the plants. Do not use the lights on the frames until the end of August, and then only at night, giving abundance of air at the same time.

Runner Beans are now podding freely. Pick the Beans early, and disbud to two on a bunch if specially long pods are required. Mulch freely with long litter and water copiously, occasionally with weak liquid manure if available.

Brussels Sprouts should receive supports if of the Exhibition type, which are likely to grow 4 feet high. One stout stake to each plant, thrust into the ground on the south-western side, will support the plant if loosely tied. When plants are blown about by strong winds at the end of August, they cannot right themselves, and for the purpose of exhibition as a whole plant they would be unsuitable if crooked. Slightly earth them up to protect the lower part of the stems.

Carrots.—Now is a good time to make a sowing in a frame that has been used for French Beans, Turnips or early Potatoes, choosing one of the Short Horn varieties. In prepared soil on a south border a sowing of the same type should be made. The small roots are always appreciated during the winter or early spring.

Endive.—Plants should be put out as fast as they are ready in drills 15 inches wide, allowing a foot between the plants. Make a final sowing on a warm border, or, what is better, in a temporary frame. Assurance of good plants is then certain.

Autumn Onions.—Preparation should be made for sowing this crop the first or second week in August. Well manure and deeply dig a plot that has been occupied by Potatoes, Peas or Broad Beans, for example. If prepared at once, the soil will settle down firmly by the time it is required. The present season's crop is now ready for harvesting. Pull up the bulbs, clean off any soil, and lay them in a sunny spot to dry and mature thoroughly, turning them over occasionally.

Spinach.—Prepare a piece of ground by digging it deeply to ensure good drainage for a batch to stand the winter. Ground previously trenched and cropped with Potatoes or last season's Celery should suffice. As a rule, the end of July or early in August is a good time to sow. Early rather than late is the best, as the plants get a good start before the autumn and stand the winter better than those sown late, which have not time to become strong. One variety is sufficient, and that is Long Standing Prickly, although the ordinary round kind answers very well in the majority of seasons.

Turnips.—Continue the fortnightly sowings of Snowball, All the Year Round, Green Top White and Red Globe to ensure a regular supply of succulent roots. Sow in watered drills if the weather is dry at the time, to ensure quick germination of the seed. Cover the drills with short grass to guard against the attacks of Turnip fly. Directly the plants are above the ground, dust with soot and wood-ashes.

Potatoes.—The early and second-early varieties should be lifted as they become ripe, selected, dried and stored for seed. Pick out tubers about 2oz. in weight, as these are the best for planting. The old-fashioned plan of greening seed Potatoes is quite unnecessary. Thoroughly dry them and store thinly in a shed or cellar.

Cabbage.—Sow seed of such early varieties as Harbinger, Ellam's, Springtide and Flower of Spring in well-dug soil in an open site, well watering the soil first if it is dry. Cover the seed thinly and apply some shade until the plants show through the soil, when full exposure should be given to ensure stocky growth. A cold frame is the best place in which to ensure quick growth and freedom from fly attack, as the seed is more under control. The advantage of the glass covering is valuable until the seedlings appear through the soil, when full exposure should be given to ensure sturdy growth.

Swanmore Park, Hants.

E. MOLYNEUX.

LONDON PRIDE AS AN EDGING TO A GARDEN PATH.

THE ROSE SEASON IN SCOTLAND.

OWING to the long continuance of almost tropical heat, followed, providentially, by an abundance of rain, the Rose season in Southern Scotland has been much finer than usual this year. Among Roses of quite recent origin and introduction, some of the most florally effective have been Lady Clanwilliam, Majestic, Mrs. Wemyss Quin, Edgar M. Burnett, Florence Forrester (an immense, pure white Rose), Josephine (with "Gloire" attributes, but more replete with central petals), Mrs. Archie Gray (of exquisite apricot yellow complexion), Mrs. James Lynas (rivalling in beauty Lady Clanwilliam, and shell-like in its lustrous petals) and Lady

firm has hitherto produced. Majestic is unquestionably one of the finest garden Roses hitherto sent out by Messrs. William Paul and Sons of Waltham Cross, and I am sincerely glad that, like Lady Clanwilliam and Augustus Hartmann, it has had the distinction of being awarded the gold medal of the National Rose Society.

I have George Dickson and H. V. Machin, two glorious crimsons from far-famed Newtownards, flowering in the new garden at Kirk House, Kirkmaiden, where I now reside. The former is somewhat sparing of its flowers, which, however, are large, and grandly impressive alike in colour and formation. As both of these varieties were only planted in the beginning of March, they are not yet entirely established, and will probably be more florally effusive—if that is a possibility—during the early autumn months. Where they can be grown by the hundred, as they

Gray, Mrs. Cooper (already characterised) and the luminous Brilliant are also at present superbly effective, and their value for garden decoration—as I already know from experience—can hardly be over-estimated.

Mr. S. McGredy is one of the most eminently successful of British rosarians; he rivals M. Pernet-Ducher, and his most recent creations amply sustain his great reputation. Pre-eminent among these is Iona Herdmann (a greater acquisition than Mrs. Charles E. Pearson), Florence Forrester (which, being a splendid pure white Rose of abnormal dimensions, is certain to become a valuable variety for exhibition), Colleen (expressively described as "a glorified Killarney") and Edgar M. Burnett (which may be described, not inexpressively, as an advance, especially in bright colour, on the hitherto almost incomparable La France). DAVID R. WILLIAMSON.

CAMPANULA ARVATICA (ACUTANGULA). THIS RECEIVED AN AWARD OF MERIT LAST WEEK.

Plymouth (almost equally endowed, and a splendid representative of the Maman Cochet family).

In addition to these, in the recently made garden here I have William Cooper (intensely bright in colour and richly fragrant), H. V. Machin and George Dickson (rivals in renown), Colleen, Mrs. Ambrose Ricardo, Iona Herdmann, Irish Fire-flame, Mme. Edouard Herriot and the picturesquely coloured Queen Mary (worthy of such an exalted name). I am gratified to learn from previous issues of THE GARDEN that Mr. Herbert Molyneux, whom I cannot but regard as an authority on Rose culture in all its aspects, has such a very high opinion of this Rose. Augustus Hartmann I have not yet acquired, but from what I have heard of its characteristics and achievements, I have no hesitation in regarding it as the grandest variety the distinguished Colchester

are in the great rosariums, they must be of inestimable value for exhibition. One of the greatest acquisitions from Newtownards is Mrs. Wemyss Quin, which here is a very brilliant apricot in hue, extremely floriferous, and with fascinating, Maréchal Niel-like fragrance, which outrivals, particularly in exquisite complexion and artistic form, its gracious predecessor, Miss Alice de Rothschild.

Unquestionable acquisitions are also the latest introductions or creations of that renowned rosarian, Mr. Hugh Dickson of Belmont Nurseries, Belfast. Among these, in my estimation, supremely shines Lady Clanwilliam, which—to myself at least—is somewhat reminiscent of Mme. Melanie Soupert, the favourite Rose of Queen Alexandra, though I cannot but think that the Irish Rose is a notable advance on that splendid variety. Mrs. James Lynas, Mrs. Archie

NEW AND RARE PLANTS.

AWARDS OF MERIT.

Campanula Meteor.—From the garden standpoint we consider this a much inferior plant to C. White Star, to which it is in some measure related. A year ago C. Norman Grove received an award of merit, it having been raised from crossing C. White Star and C. tommasiniana, C. Meteor being one of several seedlings resulting from the selfing of the hybrid above named. It is white-flowered with a suffusion of blue, virtually a modified White Star. From Messrs. Grove and Son, Sutton Coldfield.

Campanula arvatika (acutangula).—In flower effect this is an enlarged C. waldsteiniana of the same, or slightly deeper, violaceous blue, with violet purple base. Dainty as a whole, the erect, solitary flowers are freely produced on 3-inch high peduncles from a spreading carpet of miniature, almost Ivy-like leafage. Quite one of the choicest of the alpine set, it promises well for the rock garden or moraine. Although shown under the name of acutangula, we believe the Kew authorities name it arvatika. (See illustration.) Shown by Mr. M. Prichard, Christchurch, and Mr. G. Reuthe, Keston, Kent.

Pelargonium Kathleen Bunyard.—An Ivy-leaved sort of rich scarlet colour and a great bloomer. Plants 15 inches high were full of bloom. From Mr. M. Billingham, West Croydon.

Bulbophyllum balfourianum.—An interesting Orchid flowering for the first time. The hooded flowers have a groundwork of greenish yellow, copiously spotted with brownish crimson, the lip being of richer crimson. The example had two flowers, these appearing from the pseudobulbs on a level with the soil. The Phalaenopsis-like leaves are large, green, and out of all proportion to the other parts of the plant. A most curious and interesting species. Exhibited by Messrs. Sander and Sons, St. Albans.

Cherry Waterloo.—A very old variety, and still one of the best for any purpose. The colour is dark reddish purple, almost black.

Gooseberry Roseberry.—The fruits are small, green, and of excellent flavour.

Gooseberry Whinham's Industry.—This well-known and popular red sort needs no description. These were exhibited by Messrs. G. Bunyard and Co., Maidstone.

The foregoing plants and fruits were exhibited before the Royal Horticultural Society on July 20, when the awards were made.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Early Peaches and Nectarines.—As soon as all the fruits have been gathered, attention must be given to the ripening of the young growths. All old fruiting wood must be removed unless it is necessary to leave it for extension. Old branches which are becoming bare at the base may be cut out if there are sufficient young growths to take their place. All young growths may be loosened from the trellis to expose them as much as possible to light and air. The roots must not suffer for lack of moisture. Old-established trees will benefit by occasional applications of liquid manure.

Early Pot Trees.—The trees which were forced early in the year may now be repotted. They will then have time to make plenty of fresh roots before they are again started into growth. In many cases the trees may be repotted into the same pots, but young trees may be given a slightly larger shift. In all cases the roots must be carefully shaken out, thus reducing the ball of soil so that there will be plenty of room to ram the new material firmly about the roots. A good compost consists of loam, lime rubble, crushed bones, wood-ashes and soot. Place the trees in a shady position for a few days after potting, and water with care till the roots are again active.

Midseason Trees.—Lose no time in soaking the roots with water as soon as all the fruits have been gathered. Drench the foliage with an insecticide to destroy all insect life. Prune them as advised above, and carefully examine the ties on young trees to see that they are not too tight.

Plants Under Glass.

Humea elegans.—Pot on the young plants as they become sufficiently well rooted. Use a light compost, and see that the pots are efficiently drained. Do not attempt to hasten the growth of the plants, or many may be lost through the winter. Keep them close to the light and shade from bright sun.

Cinerarias.—Keep these growing in a cold frame in a shady position. They are liable to attacks of green fly at any time. To keep them free from this pest, a light fumigating with a nicotine compound should be given them about once a fortnight.

Calceolarias.—These may be grown in a cool house on a gravel or ash bottom. Late-sown plants may be potted up singly into small pots when large enough. Keep them shaded from bright sun, and admit plenty of air to the house at all times.

Abutilon Savitzi.—This makes excellent plants for grouping when well grown. Quite large specimens may be grown by potting on into 7-inch pots. Cuttings may be struck at almost any time when available.

The Flower Garden.

Pentstemons.—The flowering season of Pentstemons may be somewhat extended by affording the plants plenty of water, which may be supplemented occasionally with diluted liquid manure. If the flowers are not already supported with stakes, no time must be lost in doing so.

Begonias.—The beds must be gone over regularly to remove dead flowers and seed-vessels. The varieties Hampton Court and Major Hope are two of the best bedding Begonias I know. The flowers need a little support to keep them clear of the ground.

Spiræas (Astilbes).—The plants which have flowered in the conservatory or cool greenhouse may be made use of by the margin of pools or streams. The pink varieties are most useful for this purpose.

Lavender.—Hedges of Lavender require to be cut back occasionally to keep them within bounds. This may be done when they have flowered. If flowers are required for use indoors, they must be cut before they are too far advanced and placed on a sheet in a dry place. A stage in a vinery which has been cleared of the fruit is suitable for this purpose.

The Hardy Fruit Garden.

Morello Cherries.—The fruits will soon be ripening, and will need protection from birds. The nets applied to protect Strawberries may be used for Cherries. Supports must be given to carry the nets clear of the young growths.

Sweet Cherries.—When the fruits are all gathered, the trees should be given a good drenching with an insecticide to clear them of insect pests. Trees on walls will need plenty of water.

Strawberries.—The ground for the planting of Strawberries should be prepared at once, so that there shall be no delay when the plants are ready to put out. For late supplies a border at the foot of a north wall is most suitable. Royal Sovereign is still largely grown for the early and main crop. For late supplies, Waterloo, Givon's Late Prolific and Laxton's Latest are all excellent.

The Kitchen Garden.

Autumn-Sown Onions.—Prepare a piece of ground for this crop. A good dressing of soot should be dug into it, and if of a heavy character, wood-ashes also may be added. Last year we made a good sowing of Cranston's Excelsior on August 10, which gave a splendid return long before the ordinary winter varieties were ready.

Celery.—Earth up the early plants as they become ready. It is better to do this work a little at a time than to put large quantities of soil round the plants at one time. The planting of late Celery should be completed now.

Endive.—Make a sowing for use during the winter months. Water the drills previous to sowing if the ground is dry; and to assist germination the ground must be damped with a rosed can occasionally.

Herbs.—Small sowings of Chervil may be made in rows about nine inches apart. Basil often fails to grow outdoors, and it is necessary to grow it under glass. A sowing may be made now in pans. When large enough, the seedlings may be pricked into 6-inch pots, putting about three or four plants in a pot. Marjoram, Mint, Sage and Thyme may be cut now and hung in an airy shed to dry for winter use.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

Fruit Under Glass.

Pot Fruit.—The earlier fruits of Apples, Pears and Plums having now been gathered, the trees should be partly plunged and a fair amount of food given when applying water. Where insect pests exist, they ought to be promptly dealt with. Trees bearing fruit, having been removed outdoors to colour, must be shaded from very bright sunshine, and the syringe used freely in dry and bright weather.

Strawberries.—Preparations should be made for potting the Strawberry runners into their fruiting pots as soon as they are sufficiently rooted. For the earliest batch to be forced, use 5-inch pots; but for the general lot, 6-inch is the best size. The potting compost should not be made too fine, but must contain plenty of lime refuse, bone-meal and other artificial manures of a lasting nature. When potted, stand them on an ash-bed with full exposure to the sun and keep well syringed.

Early Figs in pots, and which have now ripened two crops of fruit, should not be allowed to mature any more fruit this season, or it will weaken the trees and possibly cripple the first crop for next year. Any requiring potting on should have attention before they finish their growth for the season. Figs growing in borders must also have an application of manure when watering.

The Hardy Fruit Garden.

Insect Pests.—Trees growing against walls, and especially Plums, are likely to be infested with insects, which disfigure and injure the young growths. A dull day should be chosen for applying insecticides to cleanse the trees.

Suckers arising from the stocks or roots of fruit trees must be pulled or twisted off as soon

as they appear. Old trees which are showing signs of exhaustion are most likely to produce suckers, although some young trees, even in good health, give trouble in this respect.

Plants Under Glass.

Zonal Pelargoniums.—Plants which are growing in frames for flowering during the winter should have the lights kept constantly off, except when there is a prolonged spell of wet weather. Flower-buds must be kept picked off, and a little manure should be added to the water when applying it.

Violets.—As the dew gets more plentiful during the night-time, these plants appear to grow more rapidly. If the weather is dry, they should still be freely syringed to keep the foliage clear of insect life. Either soot or Clay's Fertilizer should now be applied to get good, vigorous plants; but, at the same time, overlarge plants are not desirable, as they are apt to encourage the damping of flower-buds after removal to the frames. The runners will now be appearing faster than ever, and will need to be kept picked off to centre the energy in the crowns of the plants.

Tree Carnations.—The plants now establishing in flowering pots should be staked. Green-painted wooden stakes 3 feet in length are best. The young growths should be looped up separately, as it avoids breakages when cutting the blooms. Fine hemp twine is more durable and has a more tidy appearance than raffia used on these plants. Continue to damp among the pots and on the floors and paths of the houses on all fine days.

Heating Apparatus.—This is a good time of the year to have any repairs or changes made to the heating system. In any case, the pipes and boilers should have the water drained from them to get rid of any accumulation of sediment. Where much mineral or chalk is in the water, this should not be done too often, especially where sectional boilers are in use.

The Kitchen Garden.

Mushrooms.—Where a supply has to be kept up from the autumn and on through the winter months, a start should now be made to prepare beds for the Mushroom-house. Beds made up now will commence bearing in early October.

Watercress.—If one has not got the natural conditions for growing this subject—that is, in a stream of running water—a quantity of seed might be sown in cold frames or boxes and kept well shaded from sunshine. If protected from severe frost later on, excellent Watercress may be had all the winter from plants grown in this manner.

Cardoons, like Celery, must never be allowed to suffer from lack of moisture. When large enough, they should be tied and earthed up by gradual stages.

Lettuce.—After this date sowings need not be so frequent, but larger in quantity. In wet weather slugs devour the young seedlings as soon as they appear through the surface. To prevent this, scatter soot or wood-ashes where they are sown.

Tomatoes for late autumn fruiting should be got into their fruiting pots. Sufficient space must be left for applying top-dressings. If white fly is troublesome, fumigate on two successive nights. They quickly become exhausted.

Peas.—If the weather is dry, late Peas should be watered, to extend the season of supply as long as possible. If allowed to suffer from drought,

The Flower Garden.

Myosotis.—The plants raised from seed sown in June are ready for transplanting to their flowering quarters. As mildew is often a great trouble with this plant, a site should be chosen which will not encourage the disease. If attacked very badly, use a reliable mildew specific.

Roses.—The first and best display of the Hybrid Tea Roses being now over, encouragement should be given to the bushes now making their second growth, which will produce blooms through the autumn. Where one has a good supply of liquid manure from a farmyard, there is nothing to equal it if used at the proper strength during showery weather. In dry weather the beds should be watered first before applying the manure.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

THE USE OF VARIEGATED TREES AND SHRUBS.

IN no class of ornamental planting is more judgment and discrimination required than in the use of variegated and coloured trees and shrubs, as these plants can easily be overdone and a patchwork landscape be evolved that is never entirely satisfactory. The first thing to remember when planting is that Nature's colour is green, and, in every class of plant, green of some shade or other is the predominating colour. More than half the beauty of flowers or coloured foliage would be lost if there were no green to act as a foil to what without it would be harsh and glaring. In looking at a garden gay with flowers in the summer-time, it is pleasant after a while to rest the eye on a cool stretch of grass or the rustling leaves of trees. The colours of the flowers are not dimmed, but enhanced by the contrast. The eye, however, is rested by the change from the dazzle of reds, blues, pinks, &c., to the cool green of Nature.

A certain proportion of coloured foliage, however, is necessary in the garden, especially during the winter months, when the green of Nature is practically one uniformly deep tint, and a certain number of coloured evergreens is necessary to brighten the landscape. The following list comprises only the best and most easily grown variegated and coloured trees and shrubs. The heights given are only approximate, but will be found useful to the planter. Deciduous and evergreen subjects are treated separately as being more convenient for reference.

DECIDUOUS TREES AND SHRUBS.

Name.	Height in Feet.	Colour and English Name.
<i>Acanthopanax spinosum</i> var. <i>variegatum</i>	4	White variegated
<i>Acer Negundo</i> var. <i>variegatum</i>	12	"
" <i>aureum</i>	12	Golden yellow
" <i>palmatum</i> vars. <i>atropurpureum</i> , <i>purpureum</i> and <i>sanguineum</i>	6-8	Shades of deep purple and red
" <i>platanoides</i> var. <i>Schwedleri</i>	25	Bronzy red
" <i>Pseudo-platanus</i> var. <i>brilliantissima</i>	6-10	Terra-cotta, red in spring
<i>Cornus alba</i> var. <i>sibirica</i> variegata	4	White variegated
" " <i>Spæthii aurea</i>	4	Yellow "
" <i>Mas</i> var. <i>variegata</i>	8	White "
<i>Corylus maxima</i> var. <i>atropurpurea</i>	6	Purple Hazel
<i>Fagus sylvatica</i> var. <i>purpurea</i>	60	Purple Beech
" <i>Zlatia</i>	20	Golden Beech
<i>Populus deltoides</i> var. <i>aurea</i>	12	Golden Poplar
<i>Prunus pissardii</i>	20	Purple Plum
<i>Quercus Concordia</i>	12	Golden Oak
<i>Sambucus racemosa</i> var. <i>plumosa aurea</i>	6	Golden plumose Elder
<i>Ulmus Dampieri aurea</i>	6-8	Dwarf Golden Elm
" <i>Louis van Houtte</i>	25	Large Golden Elm
<i>Weigela amabilis</i> var. <i>Looymansii</i>	5	Golden yellow
" " variegata	5	White variegated

EVERGREEN TREES AND SHRUBS.

Name.	Height in Feet.	Colour and English Name.
<i>Arundinaria auricoma</i> (pretty dwarf Bamboo)	3	Yellow variegated
" <i>Fortunei</i> (pretty dwarf Bamboo)	2	White
<i>Atriplex Halimus</i>	3	Silvery grey "
<i>Buxus sempervirens</i> var. <i>aurea</i>	4	Golden Box
" <i>elegantissima</i>	3	Silver Box
<i>Cassinia fulvida</i>	3	Feathery golden foliage
<i>Cedrus atlantica</i> var. <i>aurea</i>	20	Golden Cedar
" <i>glauca</i>	30	Blue Cedar
<i>Cupressus lawsoniana</i> var. <i>lutea</i>	15	Golden yellow
" <i>Triomphe de Boskoop</i>	20	Bright glaucous blue
" <i>macrocarpa</i> var. <i>lutea</i>	40	Golden
" <i>obtusa</i> var. <i>filifera aurea</i>	10	Feathery yellow
" <i>nana aurea</i>	6	Bright
" <i>pisifera</i> var. <i>plumosa aurea</i>	20	Feathery golden foliage
" <i>squarrosa</i>	20	Feathery blue
<i>Elæagnus pungens</i> var. <i>Simoni aurea</i>	8	Yellow variegated
<i>Euonymus japonicus</i> var. <i>ovatus aureus</i>	5	"
<i>Hedera arborescens</i> (Tree Ivy)	4	Gold and silver variegated
<i>Ilex Aquifolium</i> (Holly) vars. <i>Golden Queen</i> , <i>Golden King</i> , <i>Silver King</i> , <i>Silver Variegated</i> and <i>watereriana</i>	10-20	All specially bright in winter
<i>Juniperus chinensis</i> var. <i>albo-variegata</i>	20	Irregularly marked white
" <i>aurea</i>	10	Golden foliage
<i>Ligustrum ovalifolium</i> var. <i>aureum</i>	6	Golden Privet
<i>Picea pungens</i> var. <i>glauca</i>	12	Blue Spruce
<i>Pinus sylvestris</i> var. <i>aurea</i>	8	Golden Scotch Pine
<i>Santolina Chamæcyparissus</i>	2-3	Silvery grey
<i>Taxus baccata</i> var. <i>aurea</i>	12	Golden English Yew
" <i>fastigiata aurea</i>	12	Golden Irish Yew
<i>Thuja Lobbi</i> var. <i>zebrina</i>	30	Yellow variegated and striped

J. C.

NATIONAL DIPLOMA OF HORTICULTURE EXAMINATIONS.

THE 1915 Examinations for the National Diploma in Horticulture—established by the Royal Horticultural Society in conjunction with, and by the approval of, H.M. Government—were held at the Society's Gardens at Wisley in June. At their meeting on the 6th inst. the Council approved the recommendations of the examiners that the diploma should be bestowed upon the following, who have satisfactorily passed the Final Examination:

Section 1.—W. Chislett, Oakleigh, Bishopsworth, near Bristol; Gertrude Cope, Manor House Gardens, Northfield, Birmingham; Sylvia E. Cornelius-Wheeler, Elmwood School of Gardening, Cosham; F. W. Costin, Clemsford, Shinfield, Reading; William C. Crisp, Woodcote Grove Cottage, Coulsdon, Surrey; John James Green, Higher King Street, Hurst, Ashton-under-Lyne; H. L. Jones, The Gardens, Clerk Hill, Whalley, near Blackburn; Alfred B. Melles, 39, Bushwood Road, Kew, Surrey; William Stewart, Oakleigh, Bishopsworth, near Bristol; C. C. Titchmarsh, Royal Horticultural Society's Gardens, Wisley, Ripley; and William C. White, 46, Frederick's Road, Beccles, East Suffolk.

Section 1c (Fruit-growing Under Glass and in the Open).—Frank A. Griffiths, South View, Alverstone, Brading, Isle of Wight; and George Stuart, 13, George Square, Edinburgh.

Section 2 (Hardy Fruit-growing for Market).—Charles W. B. Wright, 7, St. Vincent Street, Edinburgh; and Henry Goude, Elvin Road, East Dereham, Norfolk.

Section 3 (Market Gardening, Outdoor).—

Florence M. Verrall, Letheringsett, Holt, Norfolk.

Section 7 (Horticultural Inspection).—Thomas Richardson, 106, Fairholm Road, Benwell Grove, Newcastle-on-Tyne.

Further, the following candidates satisfied the examiners' requirements in the Preliminary Examination:

Division A.—A. D. Turner, Madryn Castle Farm School, Pwllheli, North Wales.

Division B.—Robert Gibson, The Spital Gardens, near Hexham; Edna M. Gunnell, Horticultural College, Swanley, Kent; and Thomas Payne, 223, Bramford Road, Ipswich.

Division C.—David G. Henry, 3, Meadowbank Crescent, Edinburgh; Archibald Macey, Rufford Abbey Gardens, Ollerton; Alfred B. Moody, 28, Drake Street, Enfield; Joseph E. Simms, 44, New Road, Grays, Essex; Henry A. Smith, The Castle Gardens, Bothwell, Lanarkshire; and Hilda M. B. Thrupp, 24, Woroxzow Road, St. John's Wood, N.W.

These candidates are accordingly eligible to take the Final Examination in 1916 if they have then spent six years in regular garden work, or as soon thereafter as they can satisfy this requirement.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR of THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

LILY BULB FOR INSPECTION (L. W. S.).—The bulb of *Lilium auratum* platyphyllum which you send is too far gone to enable us to say definitely what is the cause of the decay. The grubs in it include the small Narcissus fly, *Eumerus strigatus*, which is thought to be the cause of the decay of Narcissus bulbs, &c., and also some larvae of a fungus fly belonging to the genus *Sciara*. We think it quite probable that the former may have been the source of the trouble, which has certainly been increased by the entry of bacteria and the like, leading to the complete decay of the bulb.

HOLLYHOCK LEAVES FOR INSPECTION (H. D.).—Your Hollyhocks are attacked by the insidious Hollyhock disease (*Puccinia malvacearum*). We advise you to cut off and burn all badly attacked leaves, and then adopt the following treatment recommended by Messrs. Webb and Brand, the well-known Hollyhock specialists: Slake a bushel of lime and, when cool, add a bushel of soot, 4lb. of flowers of sulphur and 2oz. of sulphate of copper, finely powdered. Pass the mixture through a fine-meshed sieve and dust the plants well over with it, when the leaves are damp, three or four times during the growing season. You can, of course, make up a smaller quantity, so long as you observe the correct proportions of each constituent.

BULBS FAILING (B. L.).—We imagine that the soil conditions to which you refer are a great factor in the case, to an even greater extent, probably, than those of the atmosphere by which you are surrounded. Usually, quite a variety of bulbous plants will succeed fairly well in smoky districts if the soil is generously cultivated;

but if, in addition to the drawbacks of the locality, the soil cultivation is neglected or inadequately done, the crops referred to are doubly handicapped. Try what trenching of the soil, with thorough manuring and adding lime at the rate of two bushels per rod of ground, will do, with, if possible, an abundant supply of grit. This should greatly improve the heavy soil and render it more fit. In such soil you should be able to grow the following Daffodils: Emperor, Sir Watkin, Barri conspicuus (double yellow), double Poeticus, and others. Liliun croceum, L. umbellatum and, if sunny, L. candidum might be tried also. Muscari, Lily of the Valley, Crown Imperials and Fritillaria Meleagris also usually succeed in such a soil. The whole of these may remain permanently planted; there is no real need to lift them.

LILIUM CANDIDUM (*W. F. Glydon*).—This unique Lily thrives best in rather poor soil, and in such and in a warm position may remain in good condition for years. The soil best suited to it, perhaps, is one of light or moderately holding loam to which sand, burnt clay and old mortar to the extent of one-third have been added. A trench of this a foot wide and deep should answer well. If available, we should for preference select old mortar—old ceiling plaster would answer just as well. The plant is not of a gross-feeding nature, and manure should not be added, or, if added, not in greater proportion than that of one-sixth of the soil if the latter be very poor. Any manure must be well incorporated with the soil, and should be thoroughly decomposed. The hottest position you can command should be selected, and the bulbs buried not more than 3 inches deep. The end of July or quite early in August is the best time to replant. The position should be well drained.

ORANGE, SCARLET, AND YELLOW BORDER FLOWERS (*Edward Swales*).—Trollius asiaticus, T. Fortunei flore pleno, T. Orange Globe, Liliun croceum, Asclepias tuberosa, Erigeron aurantiacus, Geum Heldreichii, G. H. splendens, Heliopsis laevis superbus, Hemerocallis aurantiaca major, H. aureole and Inula glandulosa are all of orange shade, and could be supplemented by border Chrysanthemums if more were required. Of scarlet, you might have Lychnis chalcedonica, L. Viscaria rubra plena, Zauschneria californica, Armeria Cephalotes rubra, Anemone fulgens, Aquilegia Skinneri (scarlet and yellow), Geum Mrs. Bradshaw (a glorious plant), Dianthus barbatus magnificus, Gaillardias of crimson and scarlet, Oriental Poppies (crimson and scarlet), Monarda didyma, M. d. Cambridge (scarlet), Lobelia cardinalis (intense scarlet), L. firefly (rich scarlet), Heuchera sanguinea, H. s. splendens, H. Flambeau, H. Walkeri and others, double crimson Peony (Paeonia tenuifolia flore pleno), Pentstemon barbatus Torreyi, Phloxes Flambeau, Coquelicot, coccinea and others, with much besides. Of deep yellow, Coreopsis lanceolata, Gaillardia Lady Rolleston, Alyssum saxatile compactum, Hemerocallis Dumortieri, H. flava, Helenium Hoopesii, H. pumilum magnificum, Iris aurea, I. Monnierii, Senecio Doronicum, Solidago Virgaurea aurea, S. Golden Wings, Helianthus multiflorus, H. m. major, H. m. grandiflorus, H. m. anemone-florus plenus and many more. Border Chrysanthemums in this colour could also be added if desired; hence you will see there is no scarcity of the colours you require.

TREES AND SHRUBS.

TRANSPLANTING BAMBOOS (*Trehawke H. Kekewich*).—In the event of the weather being moderately wet, the Bamboos mentioned can be transplanted in August or September, providing the roots are not unduly pulled about. That time, however, is not so good as May for the purpose, for in the event of their not becoming established quickly in their new quarters, many of the leaves are likely to turn brown, and will continue so throughout the winter, whereas the leaves are falling naturally in May, and new leaves are soon produced. Should the weather be dry and hot during August and September, it would be inadvisable to start the work. October is rather late for transplanting Bamboos.

FLOWERS FOR EDITOR'S TABLE (*J. M. N.*).—The specimens kindly sent for the Editor's table are Callistemon salignus, Metrosideros florida, or, correctly, M. robusta, is an allied plant, but it has much larger leaves, and is easily distinguished. All the pruning required is to cut the branches back a little after flowering and thin out some of the weak wood. We are interested to know that it is flowering so well with you out of doors at Tunbridge Wells. Fabiana imbricata does not require much pruning. Simply remove the points of the shoots to keep the plant bushy. We do not know of any book that deals specially with the semi-tender plants you mention. Many of them are, however, included in "Trees and Shrubs for English Gardens," by E. T. Cook, obtainable from this office, price 12s. net.

ROSE GARDEN.

MAKING A SMALL ROSE GARDEN (*Quantock*).—In the plot of ground wherein you propose to form a Rose garden the Apple trees will preclude you making a really good, effective design. Perhaps you could remove the tree that stands in the centre of the plot, and this would allow you to have a series of circular and parallel beds. The circular beds may be from 5 feet to 6 feet in diameter, and the parallel-gram beds any length, but about four feet over. The stems of the fruit trees could have a Rambler Rose planted against each, and would produce a fine effect. One or two weeping Roses interspersed here and there would add considerably to the beauty of the whole. A few arches placed over the path leading to the stables would make a pleasing picture when well

covered with ramblers, and you could possibly arrange for one leading from this path on to the proposed Rose garden. Some climbing Roses upon the wall, especially the Hybrid Teas and Teas, would give you an almost perpetual supply of flowers in your beautiful country.

TWELVE GOOD EXHIBITION ROSES (*Constant Reader*).—William Shean, Mrs. A. E. Coxhead, Lady Ashtown, Frau Karl Druschki, Florence Pemberton, J. B. Clark, Mrs. W. J. Grant, Mildred Grant, Mrs. A. Hammond, Melanie Soupert, George Dickson and Mrs. Foley Hobbs.

THE GREENHOUSE.

SMALL UNHEATED GREENHOUSE (*Lancashire*).—A great deal will depend upon the situation of your small structure, as, if in the open, the plants will suffer nearly as much as in the open ground in the event of a severe frost. Probably, however, you could make arrangements to cover it if needed. Cuttings of Pentstemons may be put in whenever young, sturdy shoots at the base are available, so that they will be well rooted before the winter. They will strike better in a frame or hand-light kept close and shaded till roots are produced, when they may be taken into your greenhouse, giving them plenty of air whenever the weather is mild. They can be wintered in pots 3 inches or 4 inches in diameter, giving them a shift into larger ones with the return of spring. The same remarks will apply to Antirrhinums if you intend to strike them from cuttings. If you wish to raise them from seeds, they may be sown now, and the young plants wintered in small pots. In the case of Clarkias and annual Larkspurs, your best plan will be to wait till the end of February, and, considering the small size of your structure, Antirrhinum seeds would probably be most satisfactory if sown then. You must be careful not to overcrowd, or to give an excess of water during the winter.

FRUIT GARDEN.

RUST ON VINE LEAVES AND BERRIES (*M. M. P.*).—The Vines are attacked by thrips, for which the best remedy will be fumigation. More ventilation of the vinery is also called for, as the foliage is showing signs of scorching.

GRAPES FOR INSPECTION (*A. H.*).—The Grapes appear to us to be suffering from water having lodged upon them, and from the atmosphere being too moist. It would be well to ventilate a little more. No fungus is visible at present, but, if they become worse, send us some more berries.

RASPBERRIES FAILING (*S. A. W.*).—We can find no fungus or insects about the Raspberries to account for the failure of the fruiting, and think that they are probably suffering from the late spring frosts, which play strange pranks at times, damaging one plant here and another there in the rows, and letting the others between go scot free.

PEAR LEAVES EATEN (*A. E. F.*).—The Pears are attacked by the Pear slugworm, the larva of a sawfly. The best treatment is to throw freshly slaked lime over the tree, and two days later repeat the dose. This induces the grub to try to cast its skin twice rapidly and kills it. Or the tree may be sprayed with lead arsenate, 1lb. to 15 gallons of water.

RASPBERRY CANES FOR INSPECTION (*Milton*).—You will find pale grey blotches on the Raspberry canes, and on these small black spots, the fruits of the fungus Hendersonia rubi. This fungus appears to be spreading, and the best method of dealing with it is to cut out all the diseased canes, or diseased parts of them, and spray the remainder with Bordeaux mixture.

VINE LEAVES FOR INSPECTION (*A Constant Reader*).—Some Vines are subject to the leaf-scorch, which yours show, especially when the atmospheric conditions are not quite all they should be. Careful examination of the leaves sent shows the presence of minute warts on their lower surface, and these indicate that at some time during their development the air has been too moist. The leaves, naturally, suffer when ventilation is given freely when in this condition, for they have been formed for moister conditions.

PEARS DISEASED (*Oxon*).—The Pears are attacked by the fungus Fusicladium pyrinum, causing Pear scab. It is too late to do anything this season except to spray now with Bordeaux mixture. In the winter remove all the branches and spurs which appear to have cracks in the bark, and spray the rest of the tree with a solution of 1lb. of copper sulphate in 25 gallons of water. Do this while the trees are dormant. Spray with Bordeaux mixture just before the buds burst, again just after the petals fall, and once more about the first week in June. This treatment may appear troublesome, but if carried out will result in the harvesting of clean and healthy fruit.

KITCHEN GARDEN.

CUCUMBERS BITTER (*J. McB.*).—The bitterness is due to seed variation, and is incurable, as it does not depend upon any cultural conditions. Such variations occur even when the greatest care is taken in saving seed, and no one is to blame for them, for, as far as we can see, they are purely accidental.

MISCELLANEOUS.

PLANTING WALL TREE AND LILIES (*Grace Gardener*).—The Apricot is somewhat less liable to silver-leaf disease

than the Plum, and may be planted in the position, though in all probability another Plum may for some time remain immune from attack. If possible, you should discard the soil where the old trees have grown, replacing it with sound chalky loam to a depth of 2½ feet, with good drainage below. Should this prove impracticable, thoroughly dress the positions now with freshly slaked lime, forking over the soil once or twice before replanting. Lilies of the stem-rooting class should always be planted 6 inches to 8 inches deep. The non-reappearance of the plants is not due to the depth of planting, but to basal decay setting up in the bulbs, and in all probability it was chiefly the stem-roots of the plants that contributed to your last year's success. Had you examined the positions, you would doubtless have found a decaying mass of scales only existing. You do not say what the Lilies were. The Snake's-head or Widow Iris, I. tuberosa, is not difficult to grow and flower in light, dry, perfectly drained soils and positions. In such we flower it annually. Wet and cold soils it dislikes. If the soil is not dry and warm, you should make it so by the addition of light loam and sand, and lift and give the tubers a three months' rest in sand after flowering.

NAMES OF PLANTS.—*E. S. Martin*.—Probably Liliun Martagon, but flowers were quite gone when received.—*E. M. D.*—Syringa Emodi.—*N. Strickland*.—Deutzia crenata flore pleno purpurea (quite hardy).—*C.C.F.*—Orobancha minor; Linaria arenaria.—*Miss Butler*.—Common Thyme, Thymus Serpyllum.—*J. Smith*.—Alstroemeria hemantha.

SOCIETIES.

MIDLAND CARNATION AND PICOTEE SOCIETY.

THE elements were decidedly unfavourable to the twenty-fifth annual show of this society, which was held in the Edgbaston Botanic Gardens on July 23 and 24. A late season prevented many of the usual exhibitors from competing, and heavy thunderstorms during the opening day adversely affected the attendance. But although the show was smaller than usual, there were many beautiful flowers, especially among the selfs and yellow-ground fancies, to admire. Mr. T. Humphreys, the well-known Curator of the Gardens, who is also hon. secretary of the Midland Carnation Society, made excellent arrangements, and the judges are also to be congratulated on their work.

OPEN CLASSES.

Flowers on Cards.—Messrs. A. R. Brown, Limited, King's Norton, won the first prizes for twelve selfs, for twelve fancy Carnations and for twelve yellow-ground Picotees with very even sets of good blooms. Their selfs were admirable, and of these Furthest North, Mrs. Elliott Douglas, Rosy Morn, Bob Acres and Ann Hathaway were the very best. The fancies were really excellent, and each bloom deserved mention; but we must content ourselves with naming Becky Sharp, Bombardier, Charles Chappell, Butterfly, Sir Olaf and Mandarin. Of their yellow-ground Picotees such light-edged sorts as Onward, Mrs. C. F. Bundenberg and Queenie were admirable, as also were the heavy-edged varieties Margaret Lennox and Pure Gem. Mr. C. H. Herbert, Acock's Green, was second in his class, and he included many desirable flowers, of which Mrs. George Marshall, Daffodil, Bookham White (selfs), Alice B. Stewart, Queen Eleanor, Edenside (fancy), Princess, Gloria and Exquisite (Picotees) are a representative selection. Mr. Bruce Waite, Harborne, won the third prizes in these classes.

Mr. Herbert won the first prizes for twelve white-ground Picotees and twelve bizarre or flake Carnations with quite good Picotees, but only moderate quality Carnations. The best Picotees were Ganymede, Mrs. Twist (heavy edged), Fortrose and Fair Maiden (light edged). Of his Carnations the bizarres were better than the flakes. Mr. Waite was second in the Picotee class, showing in Silas Osbaldeston, Margaret and E. Shorthouse three good heavy-edged varieties. Mr. Waite won the second prize for Carnations, and Messrs. Brown were third in both classes.

Flowers in Vases.—In these classes three blooms of six distinct varieties were required. Messrs. Brown won easily for selfs and fancies with splendid exhibits. The fancies were excellent, and of these we selected Becky Sharp, Alice Byron Stewart, Queen Eleanor and Linkman, and of the selfs Rosy Morn, Britannia and Mrs. George Marshall as being especially worthy of mention. In the self class there was a close fight for second place, which fell to Mr. R. G. Rudd, King's Heath, who had Furthest North and Solfaterre particularly good. Mr. Waite won the second prize for fancies, of which he showed fine blooms of Becky Sharp and Skirmisher. Mr. J. Bayliss, Walsall, won both third prizes.

In the two Picotee classes Mr. Waite was the chief winner. The heavy-edged sorts were the best among his yellow grounds, such as Corona, Mrs. J. J. Keen and Nell Kenyon being admirable. Mrs. Hammond, Maud Brown and Mrs. Openshaw were the pick of the white-ground varieties. Messrs. Brown were awarded the second prize for yellow-ground varieties, and a similar honour fell to Mr. Herbert for white-ground Picotees.

AMATEURS' CLASSES.

Flowers on Cards.—The competition in these classes, which required six blooms of distinct varieties, was poor. There were only two exhibits in the first three, and one each in the last two classes. There was little to choose

between the Rev. C. A. Gottwaltz, Droitswich, and Mr. J. W. Tranter, Solihull, in the class for self; but the former's exhibit was slightly the better. His best blooms were of Albion, Wyatt and John Pope; while Mr. Tranter showed good examples of Fujiyama and Furthest North.

Mr. Tranter was awarded the first prizes for fancy and for flake or bizarre Carnations, and for yellow-ground Picotees. He had especially good blooms of Linkman, Skirmisher (fancy), Meteor and Black Diamond (bizarre Carnations), John Ruskin, Onward and Mrs. J. J. Keen (yellow-ground Picotees). Mr. Gottwaltz's second-prize fancy Carnations were large, but a trifle coarse, though Bombardier was very good. Of his yellow-ground Picotees, Exquisite and Corona were quite good. With such sorts as Pride of Leyton, Lucy and Georgina he was awarded the first prize for white-ground Picotees.

Flowers in Vases.—Mr. A. H. Birchley, Selly Oak, swept the board in the four classes, which each required three blooms of three distinct varieties, with excellent sets. Of his selfs Daffodil, Gordon Douglas and Bob Acres were delightful. John Kidd and Linkman (fancies) Togo and Neil Kenyon (yellow-ground Picotees), Fair Maiden and Lavinia (white-ground Picotees) were also admirable. Mr. Tranter won the second prizes for selfs and fancies, and Mr. Gottwaltz was similarly successful in the Picotee classes.

DIVISION III.

In the classes for smaller growers the competition was much better, and many of the flowers were highly creditable. Mr. E. Kenwright, Smethwick, was the most successful exhibitor of flowers on cards.

Mr. P. J. Brookes, Bearwood, won first prizes for self and fancy Carnations and yellow-ground Picotees in vases.

Mr. F. Woodward, Bournville, took firsts for fancy Carnations on cards, for fancies, and white-ground Picotees in vases.

Mr. A. Hall, Harborne, won chief honours for self Carnations in vases.

In the novice classes Mr. A. J. Hill, Handsworth, won all four classes with admirable exhibits. His six Carnations on cards were among the best in the show, and if he continues he will be a competitor to reckon with.

Robert Sydenham, Limited, Birmingham, provided a special class for nine varieties of Sweet Peas, in which Mr. A. Duncombe, Oswestry, won the first prize with a splendid exhibit of such sorts as Mrs. C. W. Bredmore, Prince George, Constance Oliver, Etta Dyke and Hercules. Mr. J. Secaney, Harborne, was second with smaller spikes arranged very attractively.

PREMIER BLOOMS.

Carnations on Cards.—Bizarre: Master Fred, shown by Mr. C. H. Herbert. Flake: J. J. Keen, by Mr. Herbert. Self: Jean Douglas, by Messrs. A. R. Brown, Limited.

Picotees on Cards.—Heavy edged white ground: Edmund Shorthouse, by Mr. R. B. Waite. Light edged white ground: Fair Maiden, by Mr. Herbert. Heavy edged yellow ground: Togo, by Messrs. Brown. Light edged white ground: Eclipse, by Mr. Herbert.

MEDAL AWARDS.

In Divisions I. and II. medals were offered by the Birmingham Botanical and Horticultural Society for the highest and second highest aggregates of points. The silver medal in Division I. was won by Messrs. A. R. Brown, and the bronze by Mr. R. B. Waite. The silver medal in Division II. was won by the Rev. C. A. Gottwaltz, and the bronze by Mr. Tranter.

The W. Walters Butler silver medal for the highest aggregate in Division III. was won by Mr. F. Woodward. The Midland Carnation Society awarded a silver-gilt medal to Messrs. W. H. Simpson and Sons, Birmingham, for a collection of hardy border flowers and culinary Peas.

A silver medal was awarded to Mr. C. H. Herbert, Acoc's Green, for border flowers.

A bronze medal was awarded to Mr. R. G. Rudd, King's Norton, for Carnations and Picotees.

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).

This society held its thirty-ninth exhibition in the Royal Horticultural Society's Hall on July 22, a much smaller show than usual being got together. Generally, however, the quality of the flowers was high. As usual, Mr. Douglas was a chief prize-winner, his exhibits taking the lead in the first ten classes. Following are particulars of the more important classes.

DIVISION I.—OPEN.

Flowers Shown on Cards.—For a stand of twelve blooms each of bizarres and flakes, selfs, fancies, white-ground and yellow-ground Picotees, Mr. J. Douglas, Great Bookham, was first in each case, his stronger lot being the fancies, in which he was the only exhibitor. Pasquin, Linkman, Sam Weller, Queen Eleanor and A. B. Stewart were among the best.

Flowers in Vases.—Four selfs: First, Mr. J. Douglas, who staged Daffodil (yellow), Pink Clove, Cardinal and Furthest North (white); a particularly good set. Second, Mr. H. Lakeman, Thornton Heath, who had Bookham White, Rosy Morn and Mrs. G. Marshall (crimson).

Four Carnations (fancies): First, Mr. Douglas, his set comprising Pasquin, Edenside, Liberty and A. B. Stewart; second, Mr. Lakeman. These two exhibitors occupied similar positions in the classes for white-ground and yellow-ground Picotees, and were the only exhibitors.

For nine distinct varieties, selfs, fancies and yellow-ground Picotees, three blooms of each, Mr. Douglas and Mr. Lakeman were again the only competitors, taking first and second prizes respectively. The former had Pasquin, J. Ruskin, Edenside, Daffodil, Elizabeth Shifner,

Bookham White and Exquisite. Mr. Lakeman's best were Pasquin, Daffodil, Lord Steyne and Thomas à Becket. The flowers were very fine throughout.

AMATEURS.

Flowers on Cards.—Six blooms, flakes and bizarres: First, Mr. J. Fairlee, Acton, who staged J. S. Hedderly, Robert Houlgrave, Mestor and others; second, Mr. J. J. Keen, Southampton.

Six selfs, distinct: First, Mr. H. R. Taylor, Cheam, whose Tubal (crimson) was awarded a premier prize. Ambition, Mrs. R. T. Smith (pink) and Daffodil were also good. Second, Mr. J. A. Fort, Winchester.

For six fancies Mr. H. R. Taylor was again first, having Pasquin, Mrs. Leo Hunter, Hidalgo, Linkman, Lord Steyne and Queen Eleanor; second, Mr. J. A. Fort, Winchester.

Six white-ground Picotees: First, Mr. J. J. Keen, Southampton, who showed Favourite, John Smith, Clytre, Lady Louisa, Lottie and Fair Maiden; second, Mr. H. R. Taylor, Cheam. Four competed.

For six yellow-ground Picotees Mr. H. R. Taylor was first with Gloria, Corona, J. Ruskin, Eclipse and others.

Flowers in Vases Without Cards.—Three blooms, one variety, pink or rose self: First, Miss Shifner, Lewes, with Rosy Morn. White self: First, Mr. H. W. Frostick, Thornton Heath. Five exhibited, all showing Bookham White. Dark red or maroon self: Five again competed, Mr. J. E. Gray, Leyton, being first; Mr. R. Morton, Woodside Park, second, both having Mrs. George Marshall (maroon). Yellow self: The last two exhibitors named were in the same order, both showing Daffodil in capital form. Scarlet self: Mr. R. Morton was first with Fujiyama. Mr. Morton was also first for three yellow-ground Picotees, having Onward (light edge). Buff or terra-cotta self: First, Mr. J. A. Fort; second, Miss Shifner, both showing Elizabeth Shifner; third, Mr. J. E. Gray with Dora Blick.

Six distinct varieties, three of each, selfs, fancies and yellow-ground Picotees: First, Miss Shifner, Lewes, who had Cardinal, J. Rudd, Togo, Margaret Lennox, Rosy Morn and Rony Buchanan; second, Mr. J. A. Fort, Winchester, who had Dora Blick, Lord Steyne and Hercules (very good). Four good collections were staged.

Six selfs (Division III.): First, Mr. E. W. Painter, Brentford, with Bookham White, Rosy Morn, Daffodil, Tubal, Etna and Hildegard. This exhibitor was also first for six fancies, staging Lord Steyne, Queen Eleanor, Skirmisher, Rhea, Sam Weller and Father O'Flynn. Six competed in each class.

OPEN TO ALL.

Flowers in Vases Without Cards. Nine blooms, one variety only in each, of the following classes: Pink or rose self: First, Mr. Douglas; second, Mr. H. Lakeman, both showing Innocence (soft pink). White self: Mr. Lakeman was first, having a magnificent vase of Bookham White; second, Mr. Douglas, with the refined Mrs. Henwood. Dark red or maroon self (four competed): First, Mr. Lakeman; second, Mr. Douglas, with Mrs. George Marshall and The King respectively. Yellow self (four again staged, all showing Daffodil), Mr. Lakeman having a superb vase in the first place; Mr. Douglas was a good second. Scarlet self: Mr. Douglas first with a grand vase of Fujiyama. Buff or terra-cotta self: Mr. Lakeman and Mr. Douglas scored in the order named, both showing Elizabeth Shifner well. The class for yellow or buff ground fancies was splendidly contested, Mr. Lakeman first, having a superb vase of Pasquin; Mr. Douglas second with very fine Lord Steyne; Mr. R. Morton having Edenside in the third place. Five competitors staged, all showing well. Nine blooms, fancies, other than yellow or buff ground: First, Mr. Douglas with a handsome vase of Daisy Walker (white ground); second, Mr. Lakeman, who staged The Bride.

Cup Winners.—Division I, Mr. J. Douglas; Division II, Miss Shifner. Cartwright Cup: Mr. Lakeman. Martin Smith Cup: Mr. E. W. Painter, Brentford.

Premier Blooms.—Dressed: Master Fred (bizarre), Mr. J. J. Lea; Gordon Lennox (flaked), Mr. J. Fairlee; Tubal (self), Mr. H. R. Taylor; Edenside (fancy), Mr. Douglas; J. Smith (H.E.W.G.), Mr. J. J. Keen; Mrs. Hammond (L.E.W.G.), Mr. C. Blick; Her Majesty (H.E.Y.P.), Mr. C. Blick; Eclipse (L.E.Y.P.), Mr. J. J. Keen. Undressed: Bookham White (self), Mr. Lakeman; Lord Steyne (fancy), Mr. Douglas; Onward (L.E. Picotee), Mr. Fort; Togo (H.E. Picotee), Mr. R. Morton; Othello (W.G. fancy), Mr. Douglas.

THE SUMMER EXHIBITION OF THE ROSE SOCIETY OF ONTARIO, CANADA.

THE third summer exhibition of Roses was held by the Rose Society of Ontario on Friday, June 25, at the Margaret Eaton Hall, Toronto. It may be said that in every way the show was a marked improvement upon those of the two preceding years of the society's life, and a very satisfactory feature was the presence in larger numbers of exhibitors in the amateur class, whose encouragement is one of the main objects of the society. There were in all seventy-five exhibits and thirty exhibitors, of whom twenty were in the amateur class. The early part of June was cool, with an abundance of rain, and sunshine, the weather was unusually favourable for the Roses, causing an exceptional brilliance in colour, with in the flower than can usually be obtained here.

The names of the professional exhibitors were as follows: Mr. J. T. Moore, Moore Park; Mr. Lawrence, Mr. Thomas Manton and Mr. Muston of the Toronto Horticultural Company.

Mr. J. T. Moore is the owner of large Rose plantations in North Toronto. His Roses are under the practical

care of his able superintendent, Mr. James Bryson, and his exhibit of Perpetuals and Hybrid Teas was especially fine. Among many hundreds of others, the later favourites, such as Juliet, Betty, Bessie Brown, Lyon Rose, Mrs. Wallace Rowe, General Janssen, Miss Alice de Rothschild and Lady Alice Stanley, found places upon his benches.

Mr. J. T. Moore was sole exhibitor in the novelty class. This always popular exhibit included beautiful buds of Old Gold, Willowmere, Mrs. Ambrose Ricardo, Florence Forrester, Mrs. F. W. Vanderbilt, Mrs. Charles Pearson, Mrs. James Lynas, Colleen and Mme. Edouard Herriot.

Mr. Thomas Manton, who is one of Toronto's oldest established and most beautiful decorators, has always at all shows added to the cultivator's skill the talent of the artist, and his representation, by means of single Roses and foliage fastened to the wall, of a climbing and fully blooming Rose was a great attraction.

Mr. Lawrence showed a fine exhibit of that magnificent crimson Hybrid Tea Hadley, for whose popularity he is responsible in Toronto.

Mr. Muston showed a very dainty arrangement of Roses in vases, in a space permitted for such an exhibition.

The semi-professional exhibitors were Sir Edmund Osler, M.P., and Mr. Alexander McPherson, Superintendent of Alexandra Park Gardens.

The semi-amateurs were Mrs. A. Patterson, the president (Mrs. Allen Baines) and Mr. L. McCarthy.

The amateurs were Mrs. W. H. Aikens, Dr. Boddington, Mrs. Barr, Mrs. Stayner, Mr. Reginald Northcote, Mrs. Herbert Mason, Mrs. Ruddy (Brantford, Ontario), Mrs. Watt (Brantford), Mrs. E. P. Smith, Mr. McMichael, Mr. Raymond, Dr. Temple, Mrs. Charles Temple, Dr. Rolph, Miss Ridout, Miss Armour (hon. secretary), Mrs. Ward and Mrs. George Wilson.

It would be impossible to give detailed lists of all the exhibits. The collections of Mrs. Ruddy and of Mrs. Watt of Brantford included Sunburst, Lady Alice Stanley, Florence Pemberton, Evelyn Dauntsey, Mrs. Theodore Roosevelt, Dean Hole and Mabel Drew, and everywhere there were signs of a desire to make and to keep acquaintance with the new-comers among the Hybrid Teas. For the rest, it may be said that they formed a collection of very fine, well-chosen and well-cared-for Hybrid Perpetuals, Hybrid Teas, Teas and Bourbons, and among them old friends' faces, such as La France, Caroline Testout and Souvenir de la Malmaison, lost nothing by comparison with the newer shades and newer kinds of Hybrid Tea Roses. The general effect was very brilliant.

The Rose Society of Ontario tries with respect and affection to follow in the footsteps of its great leader, the National Rose Society of the homeland. Therefore its stands are of the same pattern, and its method of exhibition is in tubes let into the stands and surrounded by leaf moss. These long lines of dazzling colour were thrown into relief against the table decorations at the end of the hall; while beyond these again, upon a raised platform, were the beautifully decorated tea-tables, with the Red Cross as their sign and symbol, which were organised and arranged by Mrs. Reginald Northcote, assisted by a very willing band of young workers; for amid these days of dreadful war in which our dear land is battling for freedom and for honour, the Rose Society did not forget its part. How would this be possible, seeing that its very purpose is to spread throughout the length and breadth of Canada the love of England's emblematic flower, whose attractions of exquisite form, colour and perfume find deepest response in every British heart? Therefore it was agreed that all the proceeds of the tea-tables and half the door money should be given to the Canadian Red Cross Fund, while in the evening the Roses were most successfully sold by auction by Mr. Bryon in aid of a fund to provide comforts for the Canadian Grenadiers.

The exhibition was opened at half-past two by Sir Edmund Osler, M.P., and both in the afternoon and evening there was a crowded attendance. The growing enthusiasm of the amateurs found practical expression in the generous gift of two extra amateur prizes for next year's schedule by Mr. McMichael, himself an amateur, whose exhibit, especially of magnificent specimens of Captain Hayward, proved his skill.

CHURCH ARMY "CITY GARDENS."

THE annual distribution of prizes to successful plottolders of the Church Army "City Gardens" took place on Saturday, the 17th inst., at 4 p.m. One of the actual gardens in Elverton Street, Westminster (at the rear of the Royal Horticultural Society's Hall), was chosen for the ceremony; but the rain necessitated holding it at the Church Army Labour Yard in Artillery Row. Mr. W. Paynter, chairman of the City Gardens Department, presided, and briefly reviewed the successful progress of this venture, started in 1909, mentioning that the society intended to open up another garden at Hammersmith. The hon. secretary, Mr. H. T. Bennett, then read a letter from a plottolder now in the trenches, and afterwards the report on the gardens, which Mr. Basil Holmes of the Public Gardens Association had drawn up. This contained an account of the best plots at the eight gardens—three in Westminster, two in Walworth, and one each in the Brixton, Kensington and Regent's Park districts, having a total of eighty-five plots. Many showed considerable improvement on last year, while the championship plot, in Elverton Street, was particularly good. Victoria Lady Templemore presented certificates to the winners or their relations—for eighteen of the men were at the Front—and received a basket of various vegetables, together with a bunch of Dahlias, grown on the best plot, from the holder himself. The proceedings closed with short speeches from Bishop Thornton, Miss Burn and others.

THE GARDEN.

No. 2281.—VOL. LXXIX.

AUGUST 7, 1915.

NOTES OF THE WEEK.

Pathological Laboratory at Kew.—We understand that a laboratory for the exclusive investigation of problems in plant pathology has recently been equipped at Kew. The attention of the staff will be devoted primarily to the investigation of diseases of plants caused by fungi, both at home and in our Colonies.

Queries from Anonymous Correspondents.—During the last few months we have received a number of requests for information from anonymous correspondents. As stated in our rules, we cannot undertake to name plants or answer questions unless the full name and address of the sender are enclosed. This name is not necessarily for publication, any pseudonym that a reader desires being used for that purpose.

Rose Reve d'Or on a Stable Wall.—Rose Rêve d'Or might appropriately be called a double-event variety, for its pretty, deep yellow blooms are gorgeous in June, and it flowers again freely in the autumn. For growing on walls, pergolas and arches it is splendid, and can hardly be surpassed. It is such a fast-growing variety, very free and perfectly hardy. The illustration on this page shows a gable end, about twenty-four feet in height, clothed with this delightful Rose. The photograph was taken in Mr. George Prince's famous Rose garden at Longworth, near Oxford. The gable is facing east, and the Rose, which gives a double display of bloom every year, is about seven years old.

A Monograph on Sansevieria.—The *Kew Bulletin* No. 5, just published by H.M. Stationery Office, and obtainable through Messrs. Wyman and Sons, contains an extensive monograph by Mr. N. E. Brown on the genus *Sansevieria*. All the known species are included, a number being illustrated by drawings, and S. Dawei by two half-tone blocks.

A Hardy Veronica.—One of our most beautiful July flowering shrubs is *Veronica Traversii*, which appears to be about the most hardy species in cultivation. A native of New Zealand, it forms a dense, compact bush of rounded habit some 5 feet or rather more in height and fully as much in diameter. Travers' Speedwell is a useful specimen bush for the lawn of the suburban and villa garden, for beds in the pleasure grounds, and groups in the shrubbery border. During the winter as an evergreen bush it is attractive. The racemes of

flowers produce a picture of snowy white in July, the shade on closer examination being perhaps best described as starchy white.

Rose Queen.—This is one of the best of all Roses for bedding. It only asks for good cultivation, and it will bring forth its large, semi-double deep pink blooms in great profusion for a long period. It is a Hybrid Tea raised in America by Mr. E. G. Hill. We have seen it used

is generally called, is bound to have a great future when its claims are better known. It was first sent out by Lemoine of Nancy a year or two before the beginning of the war, so it has hardly had sufficient time to have made itself a name. It is quite as easy to grow as the old variety, and has much the same habit. Instead of single blooms, the branches are covered with little bunches of double flowers, which look like pure white glorified Scotch Roses. It is very sweet-scented.

Phacelia campanularia.—The dry spell between Chelsea and Holland House Shows has suited this magnificent annual exceedingly well. When all else was at a standstill or going back, this little plant grew and grew, and, from seed sown in the last week in April, flowers were produced in mid-June, and the plants increased in their rich, quiet beauty until a rough, wet, cold spell in the third week of July sent them home. The marbled grey-green, soft pale claret-edged foliage and the deep gentian blue, bell-shaped flowers give this small Chilean plant a distinctness all its own among half-hardy annuals. It revels in a hot, dry time if seed is sown in a well-prepared bed.

A Good Herbaceous Flower for Cutting.—One of the most useful perennial plants that we know for providing cut flowers is *Helenium pumilum magnificum*. It forms a neat, bushy plant about eighteen inches high, and from mid-July until the end of August produces its large yellow blossoms in profusion. As these are in branching sprays, with stout, erect stems, they are particularly easy to arrange in vases or bowls. It is also a splendid border plant, thriving in almost any reasonably good soil. Plants can be bought cheaply from any good firm that makes a speciality of herbaceous plants.

Rose Excelsa.—This beautiful Rambler Rose is doing splendidly again this year, the large trusses of bright crimson flowers providing a welcome splash of colour during the rainy days of July. Raised in America by Mr. M. H. Walsh, it

was first put into commerce in 1909, yet it is only now coming into general cultivation in this country. It is a wichuraiana hybrid, and, unlike Dorothy Perkins and Hiawatha, does not appear to be subject to mildew. The flowers also retain their colour until they drop; hence it is a far better variety than Crimson Rambler, the blooms of which turn an objectionable magenta hue with age.

ROSE REVE D'OR GROWING OVER THE END OF A STABLE IN BERKSHIRE.

in the orthodox way for ordinary bedding, and also as an edging to a kitchen garden walk, in which position it was most attractive and somewhat of a novelty. The variety has very pretty buds. In the National Rose Society's Official Catalogue it is said to be good under glass.

Philadelphus coronarius Virginal.—This beautiful double variety of the popular "Syringa," as this family of sweet-scented garden shrubs

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

How to Make Perfumes.—It is somewhat of a pleasure to me to know of the "great amusement" my letter on the above subject has furnished Mr. John Whitfield, F.C.S., according to his letter in *THE GARDEN* of July 24. He, regarding my recipe, gives Punch's advice to "M. H.": "Don't." But I think he will agree with me that Punch would express no such opinion unless he possessed very definite information. I will thus ask Mr. Whitfield to spare a few minutes to read my letter again, and if you will allow me, Mr. Editor, I will add a few remarks. Mr. Whitfield will notice on page 300, issue for June 19, that the Editor said that if any readers possessed recipes on the subjects enquired for by "M. H.," he would be very glad to publish them, and I, having the recipe for perfumes, sent it. As I said in my letter, "I have not actually tried it myself," but it was given me years ago by a Scotch friend who was no mean authority on the subject, and I fancy, thus, there must be more in it than Mr. Whitfield is willing to admit. Beeswax is, according to another friend, largely used in Italy for the purpose, and the perfume extracted with spirit. As I said in the letter, the recipe I offered was vague, but I am looking with interest for other readers to send on some definite data. Mr. Whitfield asks me to try some small experiments and report. These things, I regret, are impossible at present, as I am exceedingly busy. Other more leisured readers may perhaps try, but it is quite possible that failure may result, for the art of making perfumes is not learnt in a day. I sent the letter in case "M. H." should like to try it, not guaranteeing success in any way, for all I did was to pass on the information given to me. Mr. Whitfield goes on to advise "M. H." not to dabble in laboratory work. Very good advice indeed; but I think she will be able to carry out the few simple directions I gave without "dabbling in it." No mess will result if care is taken. The writer goes on to say that liquid perfumes cannot be made from the products of an English garden. To this I must confess I cannot agree. Of course, a South country garden is desirable, for then flowers will grow and bloom freely. Sweet-smelling plants should alone be cultivated, and some, of course, grow practically wild. Lists of plants with sweet-smelling leaves and flowers most people possess, so it is unnecessary to write a lot of names down here. But I may inform Mr. Whitfield that liquid perfumes can be, and have been, produced from the products of English gardens. Turning to my letter again, I may say that I intended to mention the question of expense. Spirit is expensive, and so makes the perfume expensive, and, of course, a great number of flowers have to be dealt with to get a little perfume. I do not possess any books containing very old recipes myself, but several have been referred to in *THE GARDEN*, and for my own part I cannot see why they should not act, with slight modifications. In the twentieth century we do not possess the old apparatus used by housewives long ago for the making

of perfumes, so, of course, we have to do the best we can with apparatus that we have. "M. H." will, of course, realise that home-made perfumes are never so good as those bought, for obvious reasons; but it is perfectly possible to make them if care be taken. — E. T. ELLIS, *Weetwood, Ecclesall, Sheffield.*

— I have read with interest the correspondence in *THE GARDEN* dealing with the making of per-

A TWO YEAR OLD PLANT OF VIBURNUM PLICATUM IN A HAMPSHIRE GARDEN.

fumes, &c. In reading the article on the subject by Mr. Whitfield in the issue for July 24, I see he says a liquid perfume cannot be made from the products of an English garden. I venture to say he is wrong, although I have no knowledge of pharmacy. I remember as a boy at school we were shown how to make scent by distilling it from the petals of flowers by means of glass flasks and tubing. The water was boiled in one flask, and the steam conducted by means of a tube to the bottom of another containing the petals. From this flask the scented steam was led through a condenser, which was a small tube inside a large one, with the space between filled with cold water, or, better still, fixed to a tap, and the water allowed to flow through. A vessel was put to catch the scent as it came from the condenser. — W. J. W.

Viburnum plicatum in Hampshire.—Mr. E. Beckett's note on this hardy shrub, page 336, issue July 10, is not too flattering. I quite agree that it is one of the very best of the whole family. It is good to "look on" at all periods of the year; it retains its foliage until the new leaves push off the old ones. The photograph enclosed shows how beautiful the foliage is, apart from its flowers, which are produced in a kind of double row the whole length of the branch; and in the autumn the rich colour tints the leaves take on render it equally effective. It is well worth a place in any garden; but this should not be found in an already possibly crowded shrubbery, but in an isolated position where it can be seen. The plant photographed is only two years old, and carried over seventy trusses of its creamy white flowers. — HERBERT E. MOLYNEUX.

The Extermination of Rare Native Plants.—

An important county association—to give it its full title, The Devonshire Association for the Advancement of Science, Literature and Art—has recently been holding its fifty-fourth annual meeting in Exeter, and among the variety of subjects discussed was that relating to the extermination of rare native plants, chiefly by children attending the County Council Schools. The

matter was referred to in the Report of the Botany Committee presented by Mr. W. P. Hiern, F.R.S., F.L.S., who is not only a well-known botanist resident in the county, but is also chairman of the Education Committee of the County Council. To promote an interest in the children in the products of Nature, which so closely surrounds them in the fertile fields and hedgerows of Devon, is one thing that should be encouraged, but the annihilation of rare species is another, and one that should be carefully watched. The Devon County Council has been, and is still, doing an excellent work in promoting by lectures and practical demonstrations the encouragement of an interest in practical gardening in the minds of the young boys of the villages, and the school staffs are inculcating a love for, and admiration of, the numberless beauties and usefulness of the vegetable kingdom; but a warning should be given to gather freely from our hedgerows and fields only such plants as are abundantly produced. — JOHN R. JACKSON.

A Beautiful Hardy Annual.—Under this heading on page 375 of last week's issue, I was pleased to see an appreciative note on *Collomia coccinea*. I have grown it

for years and advise other readers to sow some seed towards the end of September. — A. B. ESSEX.

The Norway Spruce as a Hedge Plant.—

Over thirty years ago it fell to my lot to convert a portion of a field into a pleasure ground, and the question of shelter had to be faced, especially from the west winds. Our plan was as follows: With a quantity of available subsoil, covered by the soil taken from the line of the intended walks, we formed a ridge with a moderate slope to a height of about three feet above the ground-level, and this border we planted with shrubs. These do not form a perfect shelter in a day, however, so from a neighbouring plantation requiring thinning we lifted young trees of Norway Spruce of a height of from 5 feet to 7 feet, and with these we formed a hedge round the outside of the shrubbery border. The trees succeeded admirably, and fulfilled their purpose for the time being. Since the time indicated I have not seen the Spruce thus utilised till, passing through the village of Echt, Aberdeenshire, recently, I came upon a series of pretty cottages having their gardens separated by hedges of Norway Spruce. The plants had been put in about a dozen years ago, while in a small state, at 6 inches or 8 inches apart, and have been clipped annually since, and they now form a bright evergreen hedge about four feet high. In favoured localities, where you may safely plant "a hedge of sorts," a Spruce hedge may seem a tame affair, but there are other localities where even the Beech hedge is not immune from the ravages of Jack Frost, and to those living under these conditions a Spruce hedge might make some appeal. — CHARLES COMFORT.

Lilium candidum.—It is impossible to dogmatise on the question of the treatment of *Lilium candidum*. The finest group of this lovely Lily I have ever seen was in a cottage garden, which was under my observation for upwards of twenty years. The soil was light and sandy, with a subsoil of pure sand and gravel. Here *L. candidum* flowered splendidly, and was absolutely free from disease. There was no lime in the soil, and I could only attribute its success to the weekly soaking of soapsuds and water from the tubs at the family washings. This soaking was regularly applied.—S. A.

Information about Goldfish.—In reply to "G. M.," goldfish are perfectly hardy, in the southern parts of this country at least. When once established, they will breed so fast that it will be found necessary to reduce them. They are not particular as to the pureness of the water, provided there is enough of it. I must, however, say that the better the water the more lively the fish. Feeding is not necessary, for they live upon the green algæ always present in the water. If one wants to feed them, there is nothing that I know of equal to bread. With regard to colour, I have handled hundreds, have had others under personal observation, and have no hesitation in saying they never change their colour. From a dozen fish (all gold, by the way) in the course of time some thousands were bred, some silver, some black, and every colour from gold to black; in fact, one might say no two could be found precisely alike.—S. G. S., *Newbury*.

The Kilmarnock Orchis.—I saw a handsome plant of this fine Orchis in the garden of Mr. James Davidson, Summerville, Maxwelltown, the other day. It was not only full of flower, but the many spikes were of great length, densely flowered, and of fine colour. This noble variety of *O. maculata* is to be met with under different names, *O. maculata superba* being, I suppose, its correct Latin title. I believe it is the same plant known sometimes as the Glasnevin variety, probably having been distributed from that home of all kinds of good things so carefully fostered by Sir F. W. Moore. Mr. A. D. Webster tells us that he was informed by the Rev. C. Wolley-Dod that it was found, or rather detected, by Miss Hope in a cottage garden at Kilmarnock. It was originally, I believe, discovered wild near there, and probably transferred to the cottage garden in question. It received the name of Miss Hope's Orchid, but is not much known by that name in Scotland, so far as I know. It is really considered to be a hybrid between *O. maculata* and *O. latifolia*. It is exceedingly handsome, of sturdy, erect habit, with stiff, thickly spotted leaves, spikes often more than a foot high, and fine purple flowers. It makes an excellent border plant, and at Summerville is grown in ordinary loam in the border. At Kirkconnel, Newabbey, it is also exceedingly well grown, and handsome spikes are to be seen there every year.—S. ARNOTT, *Dumfries*.

BULBS THAT OUGHT TO BE POTTED IN AUGUST.

BY THE REV. JOSEPH JACOB.

WHEN August is well in, the time has arrived when certain bulbs should be "potted up" with as little delay as possible. The longer I live the more impressed do I become with the value of early planting for anything that is to be forced by artificial means into a premature bloom. To plant late and then to try to get early January flowers is like burning the candle at both ends, and the inevitable result is disaster. The only exception that might be urged against this dictum is that of Roman Hyacinths, which are the most accommodating of bulbs in this respect, even November potting being less harmful for them than it would be for others. As, however, they are not gifted with the flowering property of the Monarch of the East (*Arum cornutum* or

scarlet-crimson umbels, which in sunlight look as if they were powdered with diamond dust, are the admiration of all who see them. *Sarniensis*, which is the original Guernsey Lily, is a vivid carmine, and, together with *coruscans major* and the before-mentioned *Fothergilli* and *F. elegans*, should be included in every first attempt with this fascinating genus. With this reminder about *Nerines*, which are so essentially August-to-be-bought plants, I pass on to say a little about those bulbs which are more usually associated with very early planting. Roman Hyacinths, if potted in August, may easily be had in bloom from November onwards. These may be followed by "prepared" Hyacinths, which with ordinary treatment can be had in flower about a week or ten days before the same varieties not so treated. *Albertine* (white), *L'Innocence* (white), *Garibaldi* (crimson), *Schotel* (light blue), *Lady Derby* (pink), *Oranje Boven* (ruddy apricot) and *Grand Matre* (medium blue) are among those that have been found to be the most responsive. If, however, these are heavily shaded and kept in a temperature of from 55°

to 60° until the flower-spike is well up, they may be had in full bloom in the middle of December. It should be noted that every year these prepared bulbs are becoming more reliable, as their preparation is becoming better understood. These should be obtained and potted as soon as possible.

Freesias are bulbs which suffer very considerably unless they can be started early. I try to get all mine in pots between August 10 and August 20; the earlier the better. We can rely upon the three old stock varieties, *Leichtlini*, *refracta* and *refracta alba*. The first is a pale primrose, the second white with a yellow blotch, and the third pure white. A new variety named *Purity* (pure white) has lately been introduced, for which great things are claimed; but I cannot speak of it as yet from personal experience. I hope it will be found to be more satisfactory than *Excelsior*, which is too dwarf for my liking and too weak in the stem. The new coloured varieties like *Conquest*, *Le Phare* and *Dainty* are all the more satisfactory if potted in August, but at present they are too expensive to grow on a large scale.

This leads up to the all-important question of what the garden-loving public are likely to buy this autumn in the way of bulbs. The day before these words were written, a partner in one of our large firms asked me how many bulbs they should order—a half? a third of what they usually order? or how many? No

one can tell. One would like, however, to express the hope that although everyone will want to save for something more important than the bulb order, yet that this will not be entirely withheld, but that some bulbs will be bought, either of cheaper varieties or a smaller quantity. There are a greater or a less number of employés in every firm who must live, war or no war. Now, if ever, a purchase will benefit both those who buy and those who sell. Everyone

CORNUS MACROPHYLLA AT COMBE WOOD. THIS IS OVER SEVENTEEN FEET HIGH.

Sauromatum guttatum), even they must be potted before they flower, and if late November or early December bloom is required, August potting is essential.

I am uncertain if the Editor intended me to mention *Nerines* or *Guernsey Lilies*. Their normal time of flowering in English greenhouses is September and October; hence we should get our supply in at once. *Nerine Fothergilli* and *Fothergilli elegans* are the most reliable. Their brilliant

realises that it is impossible to "carry on" as usual, and that "somehow" will be about as much as very many will be able to manage.

Beginning with Daffodils, no one can do better than stick to the old favourites Golden Spur, obvallaris and princeps. The last two mentioned are too often passed over; but good princeps are very charming, and obvallaris is as early as, or earlier than, Golden Spur and, if smaller, of exquisite shape. Henry Irving, potted or boxed in August, can comfortably be had in bloom by January 1, and with a like treatment the others will not be far behind. Queen Bess is the best of the short cups for early work, and it is one of the cheapest. Of the Polyanthus type there are the Paper-White, the double Roman and the rich yellow Soleil d'Or. Lastly, a few Jonquils might well be started as soon as the bulbs are procurable. They will come in about early February.

With regard to Tulips, unless bottom-heat and very deep shade or darkness can be given, my advice is, "Wait a little." They are not to be recommended for very early planting and forcing, except every convenience is at hand for providing these two necessities. Scarlet Duc van Thols are much the earliest. Far better, but later, is Vermilion Brilliant. Then, for a succession, Prince de Ligny and Prince of Austria. Of late years the last named grand Tulip has become so much lower in price that it is now within everybody's reach who can afford to buy at all.

A reminder may usefully be given about Lachenalias. A great factor in their successful cultivation is August potting. I know of no bulbs which are more benefited by very early planting

than these. True, they are, comparatively speaking, of much higher price than any I have mentioned, but there should be no difficulty in everyone growing their own from year to year if care is given after flowering. Pendula (red) may be had in bloom about Christmas; Nelsonii, Cawston Gem and luteola maculata in early February. I must not omit altogether the ordinary Hyacinths. Some few first or second sized bulbs might be bought, but as the miniature ones are much less money, I would advise giving them a trial. They are really young bulbs of ordinary varieties that if grown on for another year or two would then become first sized. Put three miniatures in a 5-inch pot or five in a 6-inch. Possibly this year, on account of diminished sales in Holland, they will be larger than usual. L'Innocence (white), Schotel (light blue), Grand Maître (pretty medium blue), General de Wet (pale pink), Lady Derby (pale rose) and Oranje Boven (ruddy apricot) are all excellent in their respective shades.

JAPANESE TREES AT COOMBE WOOD.

FEW deciduous trees have a greater value for ornamental planting than that elegant group of plants popularly known to gardeners as "Japanese Maples." These are foliage varieties of two species, *Acer palmatum* and

A. japonicum, introduced from the Far East by Messrs. Veitch in the early sixties, although

the type of *A. palmatum* found a place in English gardens as long ago as 1820. During the last fifty years many new and pretty forms have been introduced, distinguished by their elegantly dissected, richly coloured foliage and graceful habit. The finest specimen I have seen is at Coombe Wood, where many rare and interesting Maples from the East have been in cultivation. It was sent home from Japan in 1861 by John Gould Veitch, and in 1904 had attained a height of 25 feet with a diameter of 26 feet. In summer, when its dense crown of delicate greenery is fully developed, it is a very handsome tree. Mr. Wallis' excellent photograph brings out well the characteristic habit of the species.

Growing in close proximity to this Maple is a fine example of one of the Evergreen Oaks of Japan, *Quercus acuta*. It was planted in its present position shortly after its introduction by the Veitchian collector, Maries, in 1877. Although growing in an exposed situation on a cold clay soil, it has made vigorous growth and has attained a height of over twenty feet, and appears to be in perfect health. This species, which is perfectly hardy in cultivation, is now becoming more frequent in collections, being valued on account of its evergreen habit; but it is usually bushy in this country, and I do not know of any other specimens so large as the one here illustrated. The thick, leathery leaves resemble a Holly in general appearance, but they are duller in colour and entire in margin. The specimen of *Cornus macrophylla* is also an unusually fine one, being over seventeen feet high and twelve feet through. This species, which is the largest of all the hardy Cornels, is a very ornamental shrub when in flower, which was, unfortunately, not the case when the photograph was taken. Messrs. Veitch state that the Coombe Wood specimen flowers very freely in alternate seasons, the flower-heads being from 2½ inches to 5 inches across. In its native state *Cornus macrophylla* has a wide distribution, occurring from the North-west Himalayas eastward to China and Japan, and is usually 15 feet to 30 feet in height, but examples up to 50 feet high are on record. It is to be hoped that steps will be taken to preserve these interesting trees from destruction. A. BRUCE JACKSON.

THE ECONOMY OF ROCKWORK.

MY Villa Garden," reviewed in THE GARDEN for July 17 (page 356), and three other articles referring to rockwork, show that department of gardening very much to the front just now, despite war and the preoccupation of its many issues. But few publications give the rockery its economic place and value. The rockery appeals, and should appeal, because it is the method of culture giving the maximum result in plant cultivation on any given area of ground, especially an area incapable of ordinary

A LITTLE-KNOWN EVERGREEN OAK: QUERCUS ACUTA.

cultivation. Too much is usually made of the rockery itself and too little of the growth it accommodates. Any garden in this respect is on the same footing as a library. It is desirable to have the library well fitted in all respects, but the one essential is books. The essential of the garden is plants, and the place of greatest concentration the rockery. In this respect the great rockery at Kew always disappoints. It has been constructed as if stones were the essential of a rockery, not plants, though the collection of these there is far from despicable. At Edinburgh Botanic Gardens a rockery admirably constructed for the growth and display of plants has been removed in favour of one in which, as at Kew, stones appear an essential, instead of plants.

In the garden, as in the library, the pleasure is very much in collecting. By eliminating the inferior and preserving only the choice, both the library and garden may accrue enormous value in very limited space. It is here that the rockery scores and enables the villa garden to vie with the many-acred domain, where plants are few in variety but immense in number and display. But to give the small garden its superiority through the rockery, the Kew model of rockwork must not be accepted. Whatever the material, it must be adapted to a numerous colony of plants and as secondary to the growth. It must also be accessible both for working and observation. This may be secured in various ways, but the most essential is flights of steps at an easy gradient intersecting the rockery in various directions. These should be of the same material as the rockery, and built simply with soil. Numerous plants will then naturalise themselves on such steps and give a pleasing, natural effect. The objection that such steps are insecure only applies to bad construction. Stones, brick burrs or other material should always be carefully ledged one on another from the bottom upwards.

I have just constructed a rockery in a garden similar to that described in "My Villa Garden." The garden slopes steeply to the west, and this rockery is made at the upper end on what was a grass bank. Though only an area of about twenty feet each way, it has a winding flight of stone steps intersecting it, and will contain, when fully planted, about two hundred and fifty varieties of alpine. Of course, to concentrate that number, many minute species will be selected and rampant growth excluded. Method as to this must be observed, just as there must be method in the library. A genus should be represented by all suitable varieties, as nearly as possible. Campanulas thus could only find a place in the *recherché* rockery by dwarf varieties such as *carpatica*. Even such charming subjects as *Aubrietias* would require to be very limited as to space if the rockery is to be of the best. The rockery should always provide for plants requiring a dry wall-like surface, and those of more generous habits as well. I saw a rockery constructed lately at considerable expense

A FINE SPECIMEN OF JAPANESE MAPLE, *ACER PALMATUM*, AT COOMBE WOOD.

which could only be termed such by courtesy. A long bank some 15 feet deep was covered with stones showing perfect uniformity from end to end. Such is neither pleasing nor economical. KURSTCOT.

[While we agree with "Kurstcot" as to the economy of the rock garden, we do not think his criticism of the newly-constructed portions of the rockery at Kew justified. The plants there are scarcely established yet.—ED.]

CROCUSES OF AUTUMN.

UNLIKE most of the other bulbous plants that gladden our hearts in the early months of the year, the genus *Crocus* contains a number of species that give us their curious, balloon-shaped blossoms during the shortening and oft-times dull days of autumn. How far the general association of the *Crocus* with the spring months is responsible for the autumn-flowering kinds receiving such scant consideration as they do from the average gardener is difficult to say; but I think it is to some extent responsible. Or can it be that our artistic tastes have been dulled by the floral pageant of summer and that these little gems of autumn possess no charms for the multitude of garden-lovers? Although not suitable for every locality and position, some at least of them could, with a little trouble, be induced to flower well, if not very freely, in the majority of gardens. There is no doubt they appreciate soil of rather light yet rich texture, and perfect

drainage is essential. For this reason they are charming little plants for forming colonies in nooks in the rock garden, or for planting in sunny spots towards the front of the shrubbery where the corms can be left undisturbed year after year.

These autumn-flowering *Crocuses* are, I find, so often confused with the *Colchicums* and *Sternbergias*—similar plants in appearance, but with a botanical difference—that it is necessary to state here that true *Crocuses* are meant.

As early in August as the corms can be obtained they ought to be planted, and it is best, for most purposes, to form irregular colonies of one kind, the size of these depending largely on the surroundings and the space available. Six inches apart is a good distance for the corms, and shallow planting only must be adopted. Much of the non-flowering of spring as well as of autumn *Crocuses* is due to too deep planting, a disappointment for which the nurseryman is too often wrongly blamed. An inch thickness of soil over the corms of autumn *Crocuses* is ample, though in very sandy or loose soil an extra half an inch is allowable.

Probably the best known of the autumn kinds, although by no means the easiest to establish, is the Saffron *Crocus* (*Crocus sativus*), a plant that was at one time grown largely in the Saffron Walden district of Essex for the dye it yielded. This was secured from the dried orange-scarlet stigmata of the flower, and the growing of this species for the purpose named is, I believe, still an industry, though probably a dying one, in some parts of the Continent. The blossoms are of rather large

size, purplish lilac in colour and feathered with violet. It does not flower at all well until thoroughly established. The prettiest and easiest of all to grow is, I think, the one known as *speciosus*. This is a strong, comparatively tall-growing plant, and never looks so charming as when planted in grass, or in the rock garden, or bordering an old pathway, where its large blue flowers make a welcome change from the yellow that predominates in our gardens in autumn. *Zonatus* is a rather delicate-looking flower of rose lilac hue, with an orange yellow zone of spots on the inner surface of the segments. It is essentially a flower for a sunny, sheltered nook in the rock garden, where

AN EAST COAST GARDEN

"Mine are the wild sea-swallows, the sparrowhawk that towers,
The Mallow and the Poppy, and all cliff-loving flowers."

THE other day, when staying in a small village on the East Coast, I was taken by friends to see one of the most fascinating gardens on a small scale that I have ever come across. I could not help thinking how satisfactory it was that the charm of a garden depends so

brilliant as a rainbow. Each flower seems to glow with a special depth and vividness of colouring, owing, no doubt, to the sea-salt in the air. Nowhere else can such bright crimson Poppies be seen as on the sea-washed cliffs of Poppyland.

Passing round the house, against which Honey-suckle, Roses and Rosemary climb, each vying which shall smell the sweetest, the rock garden is reached, and a small gate in the thicket of trees leads through a sunk path in the meadow to the sea. This sunk path, bordered by Grasses and wild flowers, is regarded with a certain amount of awe by the village children, as here, tradition says, walks the spirit of the brave young nurse

who long ago lost her life on the beach below in rescuing her young charges from the waves.

The long strip of kitchen garden is adorned with a patch of Shirley Poppies at one end, and bluest of blue Cornflowers at the other, and this opens upon a particularly sheltered nook, protected on three sides by banks and hedges; this is the herb garden. On a hot summer's day it is here the bees and butterflies love to fly about in the sun, the blue sky above them, glimpses of sea, no less blue, shining through the hedge. The air is full of an aromatic fragrance, drawn by the heat from each dainty plant.

"Excellent Herbs had our fathers
of old,
Excellent Herbs to heal their
pain."

What a joy to find them in a modern garden! In colour the herb garden is chiefly a harmony of soft greens and mauves, though the Bergamot has a handsome crimson flower, and the blooms of the Valerian (the Spikenard of Scripture) are white or red. Some of the plants grow low, the Golden, Lemon and Creeping Thymes, which some say should always be planted round a sundial, the moss-like Camomile, and the Pennyroyal, once used

to purify stagnant water. Other herbs, like Horehound, Angelica and Catmint, are fine, effective plants. There must be few housewives nowadays who are able to enjoy the old-time pleasure of candying their own Angelica! For this herb garden is grown for use as well as beauty, and the cook enjoys a run into the fresh air to gather a sprig of Sweet Marjoram, Savory, Thyme, or Chives which will give a piquancy to her soups and salads. But the two herbs most attractive to me were the Hyssop, growing in Broom-like shape (no wonder it was at one time used to sweep the altars in Holy Church), and the Vervain, which clergymen always linger over. It is the most sacred herb that grows.

"Hallowed be thou Vervain
As thou growest on the ground,
For in the Mount of Calvary
There thou wast first found."

Even now some of the French peasants breathe a prayer as they pick the spiky purple blooms.

The "look out," raised high above the herb garden, offers a wide view over meadow and North Sea. Our hostess told us of strange warlike scenes being witnessed from here at the close of last summer. One Sunday evening especially

FLOWER BORDERS IN AN EAST COAST GARDEN.

boisterous winds cannot so easily sully its refined beauty, although the plant itself is hardy enough in the open. Once established, it is not likely to be lost, as it increases rapidly. Of somewhat similar colour, but having rather larger flowers, is *longiflorus* (or *odoratus*, as it is sometimes known). Like *zonatus*, it is a *Crocus* for the sheltered rock garden nook, although I have seen it flowering moderately well in more exposed situations. *Asturicus* is a charming *Crocus*, and one that does well in many gardens, its delightful, though somewhat variable flowers providing a delicate mist-like patch of pale or purplish mauve in the autumn garden. In *pulchellus* we have a *Crocus* of quiet yet, in some ways, distinct beauty, the white anthers imparting a striking note to the pale lavender of the petaloid segments. *Iridiflorus* or *byzantinus* has a unique appearance, inasmuch as the flowers resemble those of a small *Iris*, the three inner segments being small, pale lilac in colour and pointed, while the large outer segments are of deeper hues. In addition to the above there are a number of species and varieties, many of them very beautiful indeed, that flower in the autumn; but at present they are expensive. Those mentioned are reasonable in price.

H.

little on its extent. All that could be desired in the way of variety and beauty was to be found on this windswept two acres.

Perched high on a hill, just out of the village, almost under the shadow of a fine old perpendicular church, this delightful garden has every advantage that surroundings can give. Walking along the road, visitors notice a circle of trees in striking contrast to the rest of the bare open cliff. Black Poplars, Sycamores and Wych Elms, just the trees that can best stand the wind and salt sea breezes, were planted as a living screen many years ago. A glance through the white, seven-barred gate shows a glimpse of the old gabled, lattice-windowed house, standing like some beneficent spider within its leafy web.

The peculiarity of this garden is the number of hedges and banks, which have been put up from time to time to give still more protection from the searching north-east winds. In early spring these banks are yellow with Daffodils and Primroses, and the little copse under the trees is carpeted first with Crocuses, and then with delicate wild Hyacinths, blue and pink. A smooth green lawn stretches along the south-east frontage of the house; then come the herbaceous borders,

lingered in her memory. It was so calm and peaceful in the garden, yet overhead an aeroplane was rapidly patrolling the coast, and, looking out to sea, three destroyers could be seen hovering round a good-sized trading vessel, which was eventually towed off to Yarmouth, a prize of war, the crew being taken prisoners. Such sights must have seemed to bring the enemy very close. and I was glad, but almost surprised, not to find a carefully hollowed-out cave in some secluded corner, a "dug-out" in which to shelter, if necessary, being a somewhat disturbing feature this year of many an East Coast garden.

There are other gardens along the cliff, large and famous, and full of beauty; but I am sure that many would agree with me in thinking that this quaint demesne, with its trees and its herbs, comes second to none in individuality and charm.

DORA BARDSWELL.

VEGETABLES FOR SOWING DURING AUGUST.

UNDER normal conditions the end of the third week in August marks the finish of the sowing season for vegetables. In a great many gardens this work is brought to a conclusion much earlier, partly through lack of knowledge and partly indifference on the part of owner and gardener. At ordinary times this is not very serious, but now that we are rightly being urged to grow as much wholesome food as possible, and to economise with existing supplies, it is the duty of everyone to adopt unusual or little-known measures with those ends in view. The amount of success attained with the late sowings that I will advocate will depend to a large extent on the season and, in lesser degree, the kind of soil one has to contend with and the amount of care that can be given to the crops. Even with highly unfavourable circumstances partial and useful crops will be obtained, and it is impossible to place too strongly before those who have ground and seed available the desirability of attempting something at least on the lines indicated.

Potatoes.—These, our most important root crop, have received considerable attention from the Board of Agriculture during the last few weeks. It is far more profitable to plant them late than to throw them away or feed them to pigs. Even at this date, if the tubers are sound, they should be planted, with every likelihood of yielding good crops for use at the end of October or early November. Where old tubers are not available I would not hesitate to plant new ones, selecting these from the most matured plants.

Carrots.—Next to Potatoes these are the most useful vegetable to sow now for winter use. A well-drained plot of moderately rich and thoroughly tilled ground should form the seed-bed, and a stump-rooted Carrot ought to be chosen, as this type matures more quickly than the longer ones. Young roots from this sowing will be available for use from the end of October onwards.

Turnips.—After the outbreak of war last year I made a sowing of Early Snowball, and the result was an excellent crop for use during the winter. Thin sowing, in rows a foot apart, and early thinning, so that the plants stand 9 inches asunder, are essential.

Beetroot.—This is a rather risky crop to sow now, yet if seed of a Turnip-rooted variety is available, and a warm, well-drained piece of ground is vacant, it is worth trying.

Radishes.—Seed of French Breakfast variety, scattered thinly and lightly covered with soil, will yield some useful salad in a very short time.

Lettuces.—These used to be sown between the newly planted Strawberries, or else in a separate bed, and the seedlings transplanted there later on. They were cleared in May, just when the Strawberries were commencing to flower. Hardy Hammersmith for a Cabbage variety and Black-seeded Bath Cos for an erect sort were the varieties chosen. Sow end of August.

Onions.—The present is a good time to sow seeds of winter or spring Onions. These have to stand through the winter, and are either pulled and used green at the end of March or during April, or transplanted at the end of October for growing on into large bulbs for use in July of

depend on the variety. Harbinger, which, I think, is the best and earliest of all, is a rather small Cabbage, and needs but 18 inches between the rows and a foot between the plants.

F. W. H.

A BEAUTIFUL ROCK GARDEN PLANT: *SILENE HOOKERI*.

THIS handsome species is a native of California, and was first flowered in this country by the late Mr. Thompson of Ipswich. For some reason the plant was soon lost, but a few years ago it was reintroduced by Mr. Carl Purdy, and now is fairly plentiful in gardens.

S. Hookeri is one of a small group, all natives of California and the Western United States, remarkable for their brilliantly coloured flowers. Others of this group are the scarlet *S. laciniata*, of which the best form is *Purpusii*, and *S. californica*, also with scarlet flowers. The plant illustrated is usually found growing on wooded hillsides, and is described as having both white and rose-coloured flowers. It is of tufted habit, with lax stems only a few inches long, each bearing a single large flower. The leaves are about two inches long, and the whole plant is softly pubescent or almost woolly. The rose-coloured or pink

SILENE HOOKERI, [A DWARF SPECIES WITH ROSE-PINK FLOWERS.]

next year. As a catch crop the growing of these Onions for salad is one of the most profitable for market gardeners. A system that I used to adopt largely was to sow a row between every two rows of newly planted Strawberries. The Onions were cleared in April, and did not do the slightest harm to the Strawberries.

Spring Cabbages.—From August 1 to August 12 is the period for sowing seeds of this important crop. They are scattered thinly in rows a foot apart, and when a few inches high transplanted to their permanent positions. The distance apart will

flowers are over two inches across, each petal being four cleft, while the under side of the flower is of a light buff shade. In a sheltered position, planted in peaty soil, it survived the last mild winter, and during June it flowered very freely. As it sets seeds freely, these afford a ready means of increase. These may be sown as soon as ripe, in which case plants may be obtained ready for planting out in the following spring, or the seeds may be kept till the spring before sowing. Light, sandy, well drained soil is essential.

W. I.

LATE TRANSPLANTING.

ITS EFFECTS ON PERENNIALS.

IT may be of interest to readers of THE GARDEN to hear about some of the effects observed up to the moment of writing concerning certain perennials which were unavoidably planted in very late March and well on in April, and not weeks earlier as they should have been. From the planting-time onwards there has been much to observe about them, and careful notes have been kept.

The perennials planted were *Alyssum saxatile*, *Anchusas*, *Achillea*, *Ptarmica*, *Doronicums*, *Erigeron speciosum superbum*, *Campanula persicifolia*, *Polemonium caruleum*, *Inulas*, *Lupinus polyphyllus*, *Pyrethrums*, *Chrysanthemum maximum*, *Trollius*, *Verbascums*, *Valerians*, *Aconitum bicolor*, and one or two others. They were put into a couple of borders, one of which I expected we should fill with annuals; but as the family did not want so many annuals this year, we filled it with perennials pretty well as late on as we dared.

In April and May we had to water generously, for the plants felt the heat and their removal, which was only natural, seeing how late we had to put them in. They soon, however, took hold of their new quarters, and we have watched and tended them anxiously enough.

I have taken various notes from April to the present time (mid-July), and the first thing which we could not help observing was the fact that the flowering period altered and became much earlier. I have not calculated how much, because, of course, to do such a thing would be difficult, seeing that the seasons vary each year to some extent. But there was a really big difference—that no one could deny—and we got flowers in consequence much earlier. As a matter of fact, we are continuing to get earlier flowers up to the time of writing.

Of course, we think nothing of early *Doronicums*, for sometimes they are in bloom in late March—just starting—if the season is very mild. In our border, planted late, many of them shot up and flowered at once. These are now over. But certain of them which were planted late, showing merely leaf only, did not begin to flower till late June—I think it was somewhere about June 24—and are now over.

In an extensive nursery near here I was able to observe the effects of late transplanting and division of *Pyrethrums* (single and double), as well as the effects of merely late transplanting in the garden here. In both cases the plants came into bloom *much* earlier, the flower-spikes were not so tall, there were fewer of them, and the flowers themselves were small and not of excellent quality. Here we do not expect *Pyrethrums* before mid-June, but we got them very early in the month.

Lupines also began much earlier than usual, and in consequence were too much "over" to take to a flower service which is always held every year on the second Sunday in July. Last year many fine spikes were cut for this purpose. This year, also, there is only prospect of a very small second crop from the plants planted late.

The *Polemonium* forms another interesting case. Planted late, this subject gave a few stray flowers in early May. Then there was a gap of several weeks, and in late June and from then to the present time it has thrown up freely some fine flowers.

With *Anchusas*, again, we noted earlier flowering; and the same may be said of *Erigerons*, only in

The *Achillea* and the *Campanula* did *not* flower earlier. They are only just out now. The *Achillea* felt the very hot spell we had here the last week in April, in spite of careful watering.

With regard to *Chrysanthemum maximum*, I had an experience last year when we planted a few roots very late to fill in a gap, and this bids fair to be repeated this year also, for the plants have been showing buds for some time. Instead of flowering in late August and throughout September, as they normally should, they started to flower in late July, and were over by the end of August. (I think they will not begin till August 1 this year, however.)

I think now I have put down jottings on most of the plants grown in our late-planted border, I will sum up before closing. The greatest point is that here late transplanting has meant the earlier flowering of all the plants tried, except one or two. Next to this comes the question of quality and quantity. The *Anchusas* and *Valerians* have been, and are still, covered with bloom, though the first is getting over. The late-planted *Lupines* have not been remarkably prolific, and some have dropped their buds badly. *Chrysanthemum maximum* will be covered with bloom later. But with these exceptions we must admit that late transplanting has greatly impaired both the quality and quantity of the bloom so far obtained, and has in many of the cases kept the plants much dwarfer in stature, which means it has weakened them. Succession of bloom we shall, of course, have on many of them; but we shall cut the flowers off as soon as they are open from our late border to avoid weakening the plants further. Of course, the experiment has been interesting, but it is not worth repeating. Now that the effects of late transplanting are known, I hope others may be warned not to plant late, for it does not pay, and this is my reason for writing so lengthy a contribution on the subject.

E. T. ELLIS.

Weetwood, Ecclesall, Sheffield.

THE TRUE IRIS FILIFOLIA SHOWN IN LONDON A FEW WEEKS AGO BY MR. W. R. DYKES.

this case the plants did not reach the expected height. The *Inulas*, planted later, were very dwarf, and showed buds very soon after they were planted; they are now over. The *Verbascums* behaved similarly to the *Erigerons*, only, of course, in the case of plants (necessarily small) of *Verbascums*, only a single main spike was given, supplemented with one or two very small ones. This main spike on each plant did not reach the height usual for *Verbascums*.

The *Trollius* in our late-planted border came out very early, and so did the *Aconitum*. This last, however, is extremely strong and healthy, and is throwing up several spikes of no mean size, which will open shortly.

in cultivation, nor is it widely distributed in Nature, being only found in a few scattered localities in Southern Spain and on the north coast of Africa. It has long been confused with an early flowering form of *Iris Xiphium*, which still appears in some catalogues under the name of *filifolia*. But it is easy to distinguish the true plant, for it has a linear perianth tube half an inch or more in length between the ovary and the base of the segments of the flower, while no form of *I. Xiphium* has any such tube. The colour is a rich red purple, with a broad central patch of yellow, surrounded by a more or less conspicuous halo of blue where the yellow is merged in the purple.

A RARE AND BEAUTIFUL IRIS

The true *Iris filifolia*, as described by Boissier, is still rarely seen

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Early Muscat Grapes.—When only a few bunches are left in the house, it is wise to cut them and place them in bottles in the fruit-room. The Vines may then be syringed with an insecticide to destroy any pests which may be present. Give the border a thorough soaking of clear water, which can be followed with diluted liquid manure.

Late Muscat Grapes.—The bunches must be exposed to the light in order to ripen them perfectly. Keep lateral growths regularly removed before they become too large. Use fire-heat sparingly at all times. When the weather is quite warm, fire-heat may be dispensed with; but during these periods the damping of the floors must not be done to excess.

Other Late Grapes.—Lady Downe's Seedling, Gros Colmar and Lady Hutt require a long season to ripen their bunches perfectly, and should be grown, if possible, in a house by themselves. The latter variety is inferior to Muscat of Alexandria in every way, and should not be grown extensively. During the process of ripening, late Grapes require plenty of air, and the ventilators must be open day and night, more or less, according to outside conditions.

Plants Under Glass.

Retarded Bulbs for Autumn and Winter Flowering.—*Lilium speciosum rubrum*, *L. s. album* and *L. longiflorum* are most useful subjects for decorative purposes during the autumn and winter. The bulbs may be potted at intervals of a fortnight or three weeks to keep up a continuous display. An occasional light fumigation with a nicotine compound will keep them free from aphids.

Roman Hyacinths.—These may now be procured and potted, or planted in boxes for cutting. Early Narcissi may also be potted now. When potted, plunge them in ashes in a cold frame.

Mignonette.—For flowering in the spring months a sowing may be made now in 3-inch pots. The plants will require to be potted into 5-inch pots to flower. Further sowings may be made at intervals to keep up a successional supply of this delightfully fragrant flower.

The Heating Apparatus.—All boilers and hot-water pipes should be thoroughly overhauled before the cold nights set in, as it is now possible for fire-heat to be dispensed with for a week or two.

The Flower Garden.

Gladioli.—The flower-spikes will require the support of a neat stake. Plenty of water must be afforded during long spells of drought, and, where possible, a mulch of some suitable material will be appreciated by the plants.

Narcissi.—Where these are grown in large clumps, it is necessary to lift them when they show signs of weakening. This work may be done now, as the foliage has naturally decayed. When lifted, select the large bulbs for replanting again in their flowering quarters; but before this is done, the ground must be thoroughly prepared by deep cultivation and manuring. If necessary, the smaller bulbs may be planted in the reserve garden, where they will eventually attain sufficient strength for flowering.

The Rock Garden.—The propagation of various plants must be attended to after flowering. Campanulas are easily propagated either from cuttings or seed. There are many beautiful varieties flowering at the present time which are suitable for small rock gardens and probably the most beautiful of all is the variety Warley. Dianthus may be increased by cuttings inserted in sandy soil in a frame or hand-light. Geums may be propagated from seed sown now in boxes and placed in a cold frame. Bulbs planted in rockeries require to be overhauled, replanting those which are becoming too thick. Special attention must be paid to the watering of rock gardens during long periods of dry weather, or many valuable plants may be lost.

The Hardy Fruit Garden.

Outdoor Vines.—Now that the berries are swelling, the roots must be well supplied with water.

Stimulants, such as liquid manure and some approved fertiliser, must also be given till the Grapes are nearly ripe. Keep all lateral growth removed as it appears, thus diverting all the energy of the Vines to the maturing of the fruit. Mildew is almost certain to appear on the berries, but this may be kept in check by dusting flowers of sulphur about them.

Black Currants.—When the fruits have all been cleared, attention must be given to the ripening of the young growths. First cut away all the old fruiting wood; then thin out the young growths so that light and air can penetrate right through the bushes.

The Kitchen Garden.

French Beans.—If a heated pit is available, a good sowing of these should be made towards the end of the month. A little fire-heat is necessary during the dull, damp days of late autumn to dispel moisture. If the ground is prepared now, it will be in proper condition when the time for sowing arrives.

Cucumbers.—A batch of plants may be raised now for fruiting in the late autumn and winter. For this purpose the young plants must be grown as sturdily as possible, therefore keep them near the glass in a temperature of 65° or 70°. The plants growing in cold frames must be gone over once a week for the removal of surplus growths.

Mushrooms.—The materials for a bed for producing Mushrooms in the autumn may be prepared. The horse-manure must be put in a dry place as it is collected, and turned every two or three days. If a proper Mushroom-house is not available, a bed may be made in a shed and covered with straw when spawned. I have grown Mushrooms successfully in a barn right to the end of the year.

Runner Beans.—Plenty of water must be given the plants now that they are fruiting. Liquid manure from the farmyard is an excellent stimulant, as also is soot, which must be dusted between the plants previous to watering. When the plants have reached the tops of the stakes, the points of the growths may be pinched out.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

Plants Under Glass.

Violets.—Many growers get their stock by splitting up the plants which have finished flowering during May. This is certainly an easy method, but far better results are obtained by propagating from runners put in this month. If a few old plants were retained in the reserve garden, sufficient stock can be got from these without having to take any from the young plants. The frame to receive them should be made up to within 8 inches of the glass with a good mixture of turf and leaf-soil, and covered with quite an inch of sand. If kept air-tight and shaded for three weeks, the runners will be found to root freely. After they are rooted, the syringe must be used freely to prevent red spider from attacking them.

Chrysanthemums.—Buds can now be taken where flowers are needed in October and onwards. Laterals must be kept pinched off to divert all the energy to the growths with buds forming. Top-dressings should be slight, but rich in composition, and applied as soon as it can be seen that the previous application has been assimilated and taken possession of by the roots. Weeds must not be allowed to grow in the pots.

Bulbs.—Pot up all bulbs as soon as they are received, so as to get them well rooted before attempting to force them. With the exception of Freesias, they should all be covered by a depth of 4 inches of ashes after potting. Roman Hyacinths, Freesias and Paper-white Narcissi should all be on the market by this date.

The Kitchen Garden.

Carrots.—If small Carrots are desired for late use, a sowing can still be made of a short-rooted variety. Unlike the earlier sowings, there

is more chance of this late crop escaping the dreaded fly.

Celery.—The early plants should be earthed up as far as the state of growth will permit. An occasional dusting of soot will keep the Celery fly in check; and if earthworms are very troublesome, a slight dusting of Vaporite in the bottom of the trench will help to remove them.

Endive.—A good sowing should now be made for use in the late autumn or early winter. The Round-leaved Batavian is the most reliable and hardy variety to grow.

Corn Salad is another subject which should be grown largely by those who have not much frame accommodation for other salads. Sow in shallow drills a foot apart.

Vegetable Marrows should be cut regularly to encourage the formation of more young fruits. If the Marrows are permitted to mature, the plants will not continue to produce any great number of young fruits.

Tomatoes growing outdoors must now be stopped, to try to encourage the fruit already formed to swell and ripen. Expose them to all sunshine by tying the foliage aside.

Winter Onions.—The ground should be prepared in advance for these, as it is better for the soil to be in a firm, settled condition before sowing.

The Flower Garden.

The Herbaceous Border.—Frequent attention must be directed to this portion of the garden to keep it as attractive as possible by removing dead and withered flowers. Seed-pods of such plants as Delphiniums must be cut off and the flowered stems of Papavers and *Spiraea Aruncus* taken away, as they give the border an untidy appearance while they remain. Michaelmas Daisies and other autumn-flowering subjects will require additional ties to stakes as they develop.

Phlox decussata.—To obtain free-flowering, vigorous plants, herbaceous Phloxes should be propagated from cuttings during this month. If young growths are selected from the base of the plants or from the flowering stems and dibbled closely in some sandy soil in an air-tight and shaded frame, they will root within a month and make useful plants for next season.

Propagation Preparations.—Frames, boxes and soil must be got ready for cuttings of several of the very tender bedding plants, which will soon have to be taken.

Fruit Under Glass.

Early Vinery.—Unless red spider is still in existence, slightly less humid conditions should now prevail to assist in the maturing of the wood and foliage. This, however, must not be unduly hastened by excessively dry treatment. If any extension of the border is to be made either outside or inside, this is an ideal time to do it, as the roots will get nicely started in the new soil before the Vines go to rest for the winter.

Other Vineries are likely to be troubled by wasps from now until the first severe autumn frost. These, however, are not difficult to exclude if there is plenty of material available for the purpose. Tiffany or gauze may be used, but the special wasp netting is best for the purpose, as it permits a free circulation of air through the ventilators. The system of ventilation must decide whether the netting should be fixed outdoors or inside the vineries.

Late Grapes.—Fruit which is to be kept late in the winter should be looked over to see if there is any crowding of the berries. To keep late Grapes successfully, it is important that each berry has ample room for development.

The Hardy Fruit Garden.

Fruit Nets should not be allowed to remain on bushes or trees after the fruit has been gathered. Apart from injuring the nets, many good growths are sometimes spoilt by this neglect.

Late Gooseberries, also Morello Cherries growing on north walls, which are required to supply fruit as late as possible, should have all the growths required for extension neatly tied into position before putting on the nets.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

SEASONABLE NOTES ON CHRYSANTHEMUMS.

"Taking" Buds.—From the first week in August till the middle of September cultivators who require large blooms for exhibition or for grouping in greenhouses and conservatories will be very busy "taking" or securing the best buds for the purpose. Complaints have reached me of persistent bud formation in the case of certain varieties in various parts of the country, and where this occurs it is often rather difficult to get the right bud at the right time. In the case of those varieties showing buds persistently, I find it best to take the buds that appear about the middle of August. A few days earlier or later does not matter. Usually, if a bud forms late in July, it would be useless if taken. The next bud forms about a fortnight later, rather sooner than a terminal bud does, following the removal of a crown bud. It is a fact that the buds taken between August 10 and August 25 generally develop into very clean, well formed and highly coloured blooms, but the latter are rather smaller.

"Taking" Crown Buds.—A crown bud is one which forms and causes a number of young shoots to grow below it. If left untouched, these young shoots would grow apace and soon overcome the bud, and while the latter dwindled in size, the shoots would grow rapidly and, in due course, bear clusters of buds, termed "terminal buds." The removal of the shoots results in the rapid swelling of the crown bud and, in proportion, of the top main leaves and stem.

It is unwise, however, to pinch off all the surrounding shoots at one operation. We will presume that, after the cultivator has pinched off shoots in the axils of the leaves from time to time, there will now remain from three to seven small shoots to be removed. The bud is taken by pinching off these small shoots at the rate of one every day until all are removed.

Robbing the Crown Buds.—Some cultivators leave one shoot to grow on for a time, so as to retard a forward bud. The shoot selected is generally the one next to the bud. I do not favour such a course, as the bud is seriously crippled, being checked too much and robbed unduly by the shoot. The best plan is to gradually pinch off all the buds as they become large enough to handle and to be removed without in any way damaging the main stem. If the latter is peeled, punctured, or any other kind of incised wound is made in it, probably the bud will develop unevenly, one side or one half possessing shorter flower petals than the other half.

When the buds are taken and it is found that some are too forward, remove the plants to a cooler position, but not one that is shaded, as all the light possible must reach both leaves and buds. Others that may not be forward enough should be hastened by a somewhat fuller exposure of the plants to the sunshine and air. This can be done by spacing out the plants a little more, and also by giving them the following dose of nitrate of soda: One teaspoonful dissolved in two gallons of rain-water, or, if the rain-water cannot be obtained, in tank or pump water in which ordinary washing soda has been dissolved at the rate of 10z. to three gallons, and then allowed to stand for twenty-four hours before being used.

I would here warn inexperienced cultivators not to be tempted to use, at this stage, more

nitrate of soda than is specified. I remember one cultivator who, to hasten on some backward buds, gave the plants several rather strong doses of nitrate, with the result that the flower-stems were nearly two feet long and the blooms useless. Judiciously used, the nitrate has a beneficial effect, especially in the case of buds with rather hard stems, as then the latter swell freely as well as the flower-bud.

Feeding.—Having removed the shoots and taken the bud, watch the latter closely, and as soon as it can be seen that the bud has begun to swell, recommence the feeding of the plant. To be successful, it is well to go to the trouble of picking out the plants and not to treat all alike.

If soot-water is used, it must be very clear, else the pores of the soil will get clogged. Liquid manure from tanks or from tubs of water in which manure in bags has been placed should also be used in a clear state after an initial soaking of at least two days and several violent movements of the manure bag to and fro in the water. When using artificial manures, it is advisable to give water in a clear state for two days previously. Do not exceed the strength recommended by the vendors of the chemical manures.

The rich top-dressing material should be put on as usual while the liquid food is being applied. As the time is short between the taking of the bud and the full development of the bloom, clear water should only be given in the intervals between applying liquid and concentrated manures as referred to above.

Syringing.—On fine days syringing the leaves and buds will be beneficial if done about four o'clock in the afternoon. But it is not wise to syringe on dull days or in cool weather. Keep the foliage and buds free from insects, and especially guard against earwigs, as they eat the buds, also the stems of the buds.

AVON.

SUMMER PRUNING OF HARDY FRUIT.

LONG since recognised as an operation of prime importance in the case of wall or similarly trained fruit, there is yet some want of appreciation of the usefulness of such work as summer pruning where fruit in the open ground is concerned. Many growers of small areas of fruit, though they do essay to summer prune, are often at fault in their method of putting the operation into effect. Some prune too early, and cause the trees to waste their vigour in secondary growth of a comparatively weak and useless character; others defeat their object in a similar way by pruning too severely, even going so far as to cut off a good part of every shoot; while others fail to discriminate in their treatment of growths of varying vigour. Such errors as these have in no small degree contributed to the disheartening appearances many small plots of bush Apples, and other fruits, present at this time.

Summer pruning will not in itself cause an unfruitful tree to become fruitful, but it will contribute to symmetrical development and the economical use of space and plant vigour.

Apples and Other Tree Fruit.—Where these are grown as standards in the garden or orchard, summer pruning is not practicable nor necessary. The following remarks apply to specimens trained on wall or trellis, or grown in bush or pyramid form in the cultivated open ground. From the

first fortnight in August in the South to the last fortnight of the same month in the North of England is the best time in normal seasons for the work. The chief objects in view are the economical and profitable use of space and the maturation and full development of fruit-buds. Most varieties of tree fruit grown in a trained or a bush form are very wasteful in the matter of space. Examining an average extension or a main lateral growth in the autumn, one invariably finds the plump fruit-buds occupying the central portion, and separated from the old wood from which the shoot sprang by several inches of young wood bearing small, flat buds. With these latter buds we are mainly concerned. If we neglect to prune the shoot in the summer and winter, these wood-buds will in all probability remain dormant, thus conducing to a loose and rampant, even if fairly fruitful, bush.

Again, should summer pruning be neglected and the grower, under the impression that winter pruning is essential, prunes back to the normal 4 inches or 5 inches, these basal wood-buds will almost all produce strong shoots, which renders the tree a veritable thicket the following summer. It is far better, where summer pruning of open-ground fruit is not attempted, to merely remove to the base two-thirds of these growths at winter pruning, leaving the rest to bear fruit. Some varieties do, indeed, bear best when treated in this manner, such, for instance, as Lord Derby, Domino, Irish Peach and Cornish Gilliflower. Coupled with the removal of weak, useless shoots in the summer, the method of merely thinning in winter may be commended to market growers, with whom shape and space are of less importance than the saving of labour and early production of fruit.

With the exception of those varieties mentioned, there are very few others which will not respond successfully to summer pruning as it is generally understood and practised. At the time mentioned, all new growth except the main extension growths must be cut or pinched back to an average of six buds (generally approximating to 4 inches to 6 inches from the base). In the case of Plums on walls, &c., this may be slightly severer, and where much breast-wood is made, preceded at an earlier date by judicious wholesale thinning. In clay soils and damp autumns the bud immediately below the cut may "push" 1 inch or 2 inches. This does not matter, however, since all summer-pruned growths are cut back one, two or three buds further at winter pruning, according to the strength or need of the growth.

The effect of this method of pruning is to cause the basal wood-buds to develop the following summer. One or two will produce wood growths, while from one to three will produce short fruiting spurs. The reader must bear in mind that this severe method of pruning applies only to lateral and other subsidiary growth. The extension shoots are pruned only in winter, and then only slightly, if there is ample room for development.

Bush Fruit.—Under the influence of good cultivation, bush fruit is prone to grow luxuriantly and densely, such growth being in consequence drawn and imperfectly ripened. The pruning needed is more in the nature of thinning, and can most advantageously be carried out from now onwards as occasion requires, rather than be performed at any special period.

Red Currants are generally the first to need attention, producing abundance of breast-wood when grown on walls, or laterals vying in strength with the leaders when grown in the open ground.

This superabundance must be removed by the shortening of all but the extension shoots back to within 1 inch or 2 inches of the old wood. This cutting back must be modified in those instances where serious leaf reduction appears possible under the full treatment.

Black Currants, when growing strongly, need a slight thinning of the young shoots to admit of short-jointed, well-ripened wood for fruiting next year. A percentage of the old wood can also often be advantageously removed as soon as the fruit is gathered.

Gooseberries are prodigious shoot producers, and even moderate pruning aggravates the evil. The judicious thinning of entire shoots will, however, do much good and help to prevent or repress American Gooseberry mildew.

Raspberries are pruned when fruiting is finished by the entire removal of old canes. Sometimes, however, where the young growth arises thickly, much benefit will accrue to the elimination of the weakest canes. C. W. MAYHEW.

MULTIFLORA AND WICHURAIANA ROSES IN POTS.

[In Answer to a Correspondent.]

If these are desired for exhibiting next spring, it would be advisable to procure pot-grown plants this autumn and pot them on into larger pots. But I presume that your correspondent is desirous of potting up plants from the open ground, which is the most economical plan, although they would not give much bloom the first year.

Procure in October good strong, field-grown plants with well-ripened growths. Pot these into 8-inch or 9-inch pots. Cut back the roots considerably and pot firmly, using a compost of two parts good loam, one part well-rotted manure, and add a 6-inch potful of bone-flour to two bushels of compost. Shorten the growths of the plants to about five feet and stake them; then plunge the pots outdoors in a bed of ashes or other plunging material. Keep them there until February, when, if a warm greenhouse is available, they can be placed therein. The soft growths should be pruned back to within 3 inches or 4 inches of their base, retaining merely one or two well-ripened shoots about five feet high. Start the plants in a temperature of about 45° by night and 50° by day, and increase gradually to 55° by night and 60° by day.

The syringe should be applied freely on fine days, the object being to encourage new growths from the base as early as possible, as it is from these the next season that the best trusses of bloom will be obtained. These ramblers need abundance of water when growing freely, also well syringing; but they do best in rather small pots, so that 8-inch or 9-inch will be ample. By September, or even August, the plants may be hardened off and placed outdoors, tying their growths to the front of the greenhouse in order to induce a thorough ripening of the wood. Should a greenhouse not be available, the plants can be grown outdoors, but in this case they must not be pruned quite so severely. The plants can be set out in full sun at the end of May and kept well watered, when they will furnish themselves with good growths during the summer. A dozen splendid varieties are: Multiflora.—Mrs. Flight, Tausendschön, Crimson Rambler, Blush Rambler and Goldfinch. Wichuraiana.—Dorothy Perkins, Lady Gay, Lady Godiva, Excelsa, Sodenia, Sander's White and Hiawatha. DANECROFT.

BOOKS.

The Book of Hardy Flowers.*—This is a bulky volume, running into nearly five hundred pages; one, moreover, whose contents are not to be gauged by the name on the cover, though in this connection, if the purchaser gets more than he bargained for, he at least should be satisfied. Under the above-named title, indeed, are to be found all sorts of plants, from the wealth of hardy plants now in vogue to half-hardy annuals, Acers, conifers, Pines, Juglans, and such well-known stove and greenhouse plants as Abutilon, Alternanthera, Ageratum, Ardisia, Acalypha and others which have not the least claim to hardiness. It is in these circumstances that we are surprised a more suitable title was not found for a book which certainly teems with sound practical matter. Assisted by several writers of repute, the author has produced a really excellent volume, which will be valuable because of its comprehensive character. The many genera embraced are treated in alphabetical order and brief information given, though in the case of an important family like Liliaceae we could have wished for much more of a practical nature. *Lilium chalcedonicum*, for example, is not likely to give of its best "in ordinary ground in a sunny border." Nor is the reader told that *L. longiflorum* is of little good for the open garden permanently. Such discrimination is of the greatest help to those whose knowledge of a subject is little more than elementary. No reference is made, so far as we observed, to the swamp-loving Lilies, and moisture-lovers are indiscriminately associated with others that do well in ordinary borders. So unique a genus merited special treatment. For transplanting the Christmas Rose, "July" is a most unhappy choice, and though we are told that most agree that that time is "most suitable," we candidly confess we have never seen it recommended before. "March" for Flag Irises is far happier, and, moreover, correct. Generally, however, the information given, though very brief, is reliable. The book is well got up and nicely illustrated, and, for so considerable a volume of matter, exceptionally free from errors.

The Hobby Gardener.†—Of a hundred or so pages this is one of a type of books whose title-page belies its contents. Judged by the former, one would expect to find it dealing with a few specialities from which the "hobby gardener" might take his choice. As a matter of fact, no single "hobby" of the gardening profession is touched upon, and instead, a smattering of this and that of a more or less indefinite kind. Diagrams and illustrations abound, but of a type which we see daily, and which become wearisome by repetition. The year's work is divided into months, a sample of that given for January being "The Feeding of the Lawn," "Planting Shallots"—without a qualifying word—and "Seed Catalogues." In this latter connection the "hobbyist" is seriously assured that "it is the customer who orders first who invariably secures the pick of the seed." We have heard of the "early bird getting the worm," but not till now did we know that it was the first customer who stood the only chance of getting the "pick" out of, say, a few tons of grass seeds or Sweet Peas. It is statements of this kind which bring such books into well-

* "The Book of Hardy Flowers," by H. H. Thomas. London: Cassell and Co., Limited; price 12s. 6d.

† "The Hobby Gardener," by A. C. Marshall. London: C. A. Pearson, Limited; price 1s.

merited ridicule. Moreover, they are as absurd as they are untrue. Occasionally, as in "August," the illustrations possess some teaching value, though the extravagant idea of "How to Make a Potato Clamp" (page 85), and in which even the gardener of a millionaire would hardly indulge, will scarcely appeal to a suburban dweller whose garden, often enough, is not much larger than the sitting-room of his dwelling.

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish expert advice.

The Editor welcomes photographs, articles and notes, but he will not be responsible for their safe return. All reasonable care, however, will be taken, and where stamps are enclosed, he will endeavour to return non-accepted contributions.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

The Editor will not be responsible for the return of artistic or literary contributions which he may not be able to use, and the receipt of a proof must not be taken as evidence that an article is accepted. Publication in THE GARDEN will alone be recognised as acceptance.

Offices: 20, Tavistock Street, Covent Garden, W.C.

ANSWERS

TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR of THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

SWEET PEAS DISEASED (Miss S. R. F.).—There is some trace of root rot, due to the attack of *Thielavia basicola*, and this is no doubt the cause of the trouble with the Sweet Peas. It would be well to give the soil where it is intended to grow the Sweet Peas next year a good dressing of wood-ashes or potash salts if they can be obtained.

INFORMATION ABOUT VERBASCUMS (J. R.).—The only safe way would be to treat V. Miss Willmott and Harkness Hybrid as biennials, and by sowing seeds each year keep up a succession. Even the other kinds should be tried on the biennial plan, as, thus grown, the plants are much finer at flowering-time. To get the best results from this, the seeds should be sown in January or February in the greenhouse, growing the seedlings on singly in pots and planting them out in May. In this way you get a good leaf development in the first year, which results in a proportionately good flowering the next. There are only two ways to account for the failure of the seed—either it is infertile or has perished in the soil. Try sowing under glass as suggested above, or even late in autumn, soon after the seed is harvested, in a cold frame. Few plants generally are less fastidious than these.

CUTTING DOWN LILIES (N. M. R.).—It is better in all cases to allow the stems to mature before cutting them down, though in no instance should seed-pods be allowed to form. With plants of weakly growth, bulb development may be assisted by the early removal of the flower-buds. In this way the whole energies of the plant are directed to growth and bulb development. Conversely, the bulb may be weakened by the immediate removal at ground-level of the stem after flowering, its fullest development being in no small measure due to the vital forces of the plant remaining unimpaired to the end. For example, a plant early suffering from disease is bereft of the functions of leaf and stem—small bulb growth the inevitable result. Much the same thing, though in lesser degree, perhaps, would ensue by the wholesale removal of the plant's growth at the moment of its highest development.

PELARGONIUMS AND SWEET PEAS (*Miss H. B. M.*).

—Part of the trouble with the Pelargoniums is that they are attacked by green fly, but some mistake has also been made with the watering, and this is mostly accountable for the discoloration of the leaves. It is quite true that Sweet Peas are fertilised before the flowers open, generally about three days before, and it is essential in hybridising them that they should be pollinated before this. To do it, one must open the buds while yet four days too young to open naturally, remove the unopened anthers, pollinate the stigma, and cover with a bag to exclude foreign pollen.

TREES AND SHRUBS.**LEAVES OF BIRD CHERRY EATEN** (*Reckank*).—

The Bird Cherry is very badly attacked by the lesser ermine moth (*Hyponomeuta padicella*). The webs are made by the caterpillars in order to afford protection for them in wet weather and at night, and this habit of hiding in webs gives the opportunity of dealing with them which ought not to be missed, viz., cutting out the webs while the caterpillars are resting in them, and dropping them into a pail of water with a little paraffin on the top. The only other mode of dealing with the pest is to spray the trees with lead arsenate at the rate of 1lb. to 15 gallons of water; but it will be difficult to wet the whole of the tree with the material, since the webs are so numerous and so copious.

REPLANTING A SHRUBBERY (*A. H. R.*).—When

replanting your shrubbery, it would be advisable to confine your background of conifers to kinds that do not spread widely. The Deodar, although a very beautiful tree, is better fitted for an isolated specimen on a lawn or in a park, or for grouping in a park, than for planting at the back of a shrubbery, on account of the wide spread of its branches. There are, however, many desirable coniferous plants, such as Pines in variety, *Thuja plicata*, *T. orientalis*, *Cupressus lawsoniana* and varieties, *C. pisifera*, *C. obtusa*, *C. nootkatensis*, *C. macrocarpa*, *Prumnopitys elegans*, *Tsuga Sieboldii*, *Libocedrus decurrens*, &c., which may be used. The flowering trees, such as you suggest, should not be used as a distinct line in front of the conifers. Rather let the two kinds of trees intermingle, and allow the small ones to stand well forward here and there. A few good flowering trees are *Prunus serrulata*, *James H. Veitch*, *P. s. watereriana*, *P. Avium flore pleno*, *P. Padus flore pleno*, *P. subhirtella*, *P. Amygdalus*, *Pyrus spectabilis flore pleno*, *P. floribunda atrosanguinea*, *Magnolia conspicua*, *Laburnum alpinum*, *L. Watereri*, *Robinia Kelseyi* and double-flowered Thorns. The decision as to large or small groups of shrubs must depend largely upon whether you prefer broad displays of a few subjects or a larger collection of shrubs. A shrubbery composed of a large number of small groups of shrubs is infinitely more interesting than one composed of a small number of kinds of plants arranged in large groups. Very often three plants are sufficient for a group, but in the case of very small-growing ones it may be necessary to use ten or twelve. By using a large number of kinds of plants it is possible to have some in flower over about nine months of the year, commencing with *Hamamelis mollis* and *Erica mediterranea hybrida* in January, and ending with *Arbutus Unedo* in the autumn. Pretty combinations can be made by using coloured foliage shrubs in distinct groups, such as *Prunus Pissardii*, purple and golden leaved Nuts, Japanese Maples, variegated-leaved *Euonymus japonicus*, *Acer Negundo variegata*, *Santolina Chamaecyparissus*, *Cornus Späthii*, &c. Then *Magnolia stellata* may be planted near *Forsythia suspensa*. *Spiraea arguta* is a good companion for *Prunus triloba flore pleno*. *Cytisus albus* and *C. scoparius andreaeanus* may be planted together. *Laburnums* or *Pyrus spectabilis flore pleno* may be grown above any of the spring-flowering *Spiraeas*. A good summer group can be formed by planting *Spiraea japonica* Anthony Waterer with dot plants of *S. salicifolia*, and so on. The *Cotoneasters* should be included on account of their berries, particularly *C. frigida* (a tall-growing species) and *C. rotundifolia* (which grows about four feet high).

ROCK GARDEN.**PLANTS FOR RETAINING WALL** (*A. T.*).—We are

afraid few plants will thrive under the Pine tree shade, though Wallflowers and Antirrhinums will endure drought as well as most plants. We know of no "copper coloured leaved" plant suitable for the top of the wall, though *Ajuga reptans purpurea* is a good dark-leaved subject. Mauve colour would be best represented by *Aubrietia Lavender*, which is of a very charming shade. Orange you would get in *Helianthemum cupreum* and *Potentilla Tongol*, the first being the best for the wall. For the rest you might specialise in *Aubrietias*, as Dr. Mules, Fire King, Lloyd Edwards, *tauricola*, *Souvenir de W. Ingram* and others, all of which are good, easily grown and free flowering. *Campanula pusilla*, *C. p. alba*, *C. p. Miss Willmott* (silvery sky blue), *C. garganica* in three shades and *C. isophylla alba* would be also valuable. White-flowered plants are *Achillea rupestris*, *A. serbica*, *A. Clavennae*, *A. argentea*, *A. leucophylla* and *A. umbellata*, all but the first also having silvery foliage. These plants are usually good in dry, sunny walls. The Cobweb Houseleek (*Sempervivum arachnoides*) would be excellent if freely planted, and many of the silvery Rockfoils (*Saxifragas*) would do quite well. We are pleased to know that THE GARDEN has been so helpful to you.

THE GREENHOUSE.**CULTURE OF STEPHANOTIS FLORIBUNDA** (*F. O. B.*).

—If the minimum temperature during the winter is a

no time below 55°, *Stephanotis floribunda* can be successfully wintered. You do not say under what conditions you intend to grow the plant, whether in a pot or planted out, or the size of the structure available. For a large house the most satisfactory way is to plant the specimen in a prepared bed, in which provision is made for ample drainage. The soil should be taken out to a depth of 2 feet, in the bottom of which 6 inches or so of broken brick rubble, broken crocks, &c., should be placed in order to allow the water to run away freely. A suitable soil may be made up of three parts turfy loam to one part of peat and one of good leaf-mould, with nearly one part of silver sand. If grown in a pot, the same kind of soil will be suitable. With regard to watering, it requires a liberal amount of moisture during the growing season; but in winter especially, where subjected to a minimum temperature of 55°, it needs at that season to be kept moderately dry. Concerning pruning, it will depend to a great extent upon the roof space that is available, for, until it is covered, very little pruning will be needed. When it has furnished the whole of the available space, any old and exhausted shoots may be cut out early in the year, thus making way for young and vigorous ones. When the plants are growing freely, care must be taken to keep the shoots regularly trained, as, if allowed to become entangled it is very difficult to straighten them again. This *Stephanotis* is very liable to be attacked by mealy bug, so that especial care must be taken to keep the pest in check. An occasional sponging with soft soap and warm water will do much towards this end.

FRUIT GARDEN.

MELONS FAILING (*R. J.*).—Something has been amiss with the cultivation of your Melon plants. The leaves plainly show that atmospheric conditions have not been suitable, and ask for greater attention to moisture requirements and ventilation. "Scorching," as often as not, results from inattention to ventilation.

RASPBERRIES UNSATISFACTORY (*E. M. N.*).—There is nothing on the pieces of cane sent to enable us to say what is amiss with the Raspberries. It is possible that the flowers have been damaged by the Raspberry beetle (*Byturus tomentosus*), but it may be that the canes are attacked lower down by a fungus, which is very prevalent in certain places, called *Hendersonia Rubi*, which forms grey, black-spotted patches on the stems. There is not much that you can do with the Gooseberry bushes while the leaves are on. Write us again about them at the end of October.

KITCHEN GARDEN.

PEA PODS DISCOLOURED (*J. Smith*).—The Peas are attacked by the Pea thrip, a very destructive pest when it is abundant. It would be well to spray the affected plants with paraffin emulsion when the yellow or black insects are seen on the pods. Old sticks probably harbour them, and should be burned.

PEAS FOR INSPECTION (*Sir B. F.*).—We think that your plants must have received a check during the past dry weather, for watering can never take the place of rain, as it does not alter the conditions of the atmosphere to anything like the extent to which rain alters it. The farmyard manure would be likely to encourage the growth of the root-rot fungus, which is able to seize upon the roots of Peas weakened by any cause. Potash manures are the most likely to counteract any conditions tending to the attack.

CARROTS UNHEALTHY (*Cliffe*).—The Carrots are badly attacked by the Carrot fly, *Psila rosae*. This, which is a small black fly with two wings, lays its eggs near the roots of the Carrots or on them, and sprinkling sand moistened with paraffin along the rows is an aid to checking the egg-laying. Another important thing is to take care in thinning the Carrots that the earth is not disturbed too much, and that all thinnings are removed from near the plants as completely as possible, as they are apt to attract the flies.

HINTS ON GROWING POTATOES (*H. Batten*).—The Potato will succeed in any well-cultivated and fairly manured soil, but it succeeds best in deep loam of a light sandy texture. The best way to manure the soil for Potatoes is to lay a moderate amount of farmyard manure in the furrows before planting. It is now late to plant Potatoes; but later sorts may still be planted with fair prospect of success, so long as the tubers planted are sound and fertile. Plant in rows 2 feet apart and the sets a foot apart in the rows, covering them with soil 6 inches deep. The best varieties to plant are *Up to Date* and *Factor*. The tubers of the former are the cheapest. Do not plant near the Oak. The shade from the tree and its roots robbing the soil will effectively prevent the crop being satisfactory.

MISCELLANEOUS.

CLOVER ON LAWN (*E. H. P.*).—You may dress your lawn with sulphate of ammonia at the rate of a pound to the square rod, not more. This will discourage Clover if done year after year, and encourage grass. The Anti-Clover Manure sold by Messrs. Pearson of Lowdham, Notts, we have found very useful for ridding lawns of Clover.

NAMES OF PLANTS.—*Dundag*.—We cannot name plants for anonymous correspondents: see rules. If you will send fresh specimens, with your full name and address, not necessarily for publication, we shall be pleased to assist you.—*R. M. E. Y.*—White Dorothy Perkins.—*M. G. R.*—Hiawatha. We are glad to know that you appreciate THE GARDEN.—*Nature Lover*.—1,

Juniperus recurva; 2, *Salix*, probably *triandra*; 3, *Podocarpus drupacea*; 4, *Abies nobilis*; 5, *Pseudotsuga Douglasii*; 6, *P. albertiana*; 7, *Fagus sylvatica quercoides*; 8, *Taxodium distichum*.—*Boris*.—*Rhus Cotinus*.

SOCIETIES.**DUNFERMLINE ROSE SHOW.**

THE annual Rose show, under the auspices of the Carnegie Dunfermline Trust, was held in Dunfermline on July 22. It was a marked success, despite the dislocation of horticultural affairs caused by the war—a success which was a tribute to the management and the enterprise of trade and other exhibitors. It was surprising to find that the entries, which numbered 630, staged by over one hundred and twenty exhibitors, exceeded those of last year. The quality, too, was of remarkable merit. Roses were superb, so were Sweet Peas, and the herbaceous flowers were of magnificent quality. The whole show merited the description given as "the finest ever held in the district."

The leading prize for Roses, the Carnegie Championship for seventy-two blooms in thirty-six varieties, was won by Messrs. R. Harkness and Co., Hitchin, Herts, with flowers which were generally of superb quality and embraced the leading varieties of the day. In the classes for thirty-six and twenty-four cut blooms, Mr. W. H. Frettingham was the winner. The National Rose Society's medal for the best Hybrid Perpetual or Hybrid Tea Rose was won by Messrs. D. and W. Croll, Dundee, with *Snow Queen*. Mr. J. Pigg, Royston, won a similar award for a Tea with Mrs. E. Mawley.

In the amateur classes Florence Pemberton was the best Hybrid Tea or Hybrid Perpetual, and Mrs. E. Mawley the best Tea, Mr. J. Ireland being the exhibitor. The other Rose classes were excellent.

The principal class for herbaceous plants was the open one for a display, for which a prize of £10 was offered. Here Messrs. J. Cocker and Sons, Aberdeen, again carried off the leading honour, thus making the record win of this class for twelve years in succession. The exhibit was of specially noteworthy merit.

The Sweet Pea classes were well contested. First-class certificates were given to Messrs. Dobbie and Co., Edinburgh, for *Jean Ireland*, *Tea Rose* and *Old Rose*.

Seedsmen in the Army.—Messrs. Kelway and Son of Langport, Somerset, send us a list of their employes who have enlisted in the Army or Navy since the commencement of the war. The total is thirty-three, or about 23 per cent. of men, women and boys employed by the firm on August 1, 1914.

Visit to the Kinver Trial Grounds.—On the 28th ult. the foremen of the various parks of the City of Birmingham, accompanied by the Chief Officer, Mr. William H. Morter, journeyed by motorbus to the trial grounds of Messrs. Edward Webb and Sons (Stourbridge), Limited. After a tour of the grounds, in which the keenest interest was evinced, the party adjourned for luncheon provided by Messrs. Webb, and later a visit was paid to the famous Kinver Edge, also the property of the firm, from which a magnificent view of the surrounding country is obtained. Favoured with delightful weather, the outing proved a great success.

Wargrave and District Gardeners' Association.—By the kind invitation of Messrs. Sutton and Sons the members of this association visited their seed stores and trial grounds on July 22. The party was met at the head office by Messrs. Albury, Blaxell and Taylor, who conducted them through the various offices, seed stores and order rooms, explaining the uses of the many machines for winnowing, cleaning and grading the seeds received from the growers. On visiting the seed-testing and germinating house the members were much impressed by the careful and systematic way in which this work was carried out. The range of greenhouses at the trial grounds was next visited, where fine batches of Begonias, Cyclamen, &c., were giving promise of an excellent display of bloom. The party was kindly entertained to tea by Messrs. Sutton, and a vote of thanks was unanimously passed to them and suitably acknowledged by Mr. Albury on behalf of Messrs. Sutton and Sons.

* * The Yearly Subscription to THE GARDEN is: Inland, 6s. 6d.; Foreign, 8s. 9d.

THE GARDEN.

No. 2282.—Vol. LXXIX.

AUGUST 14, 1915.

NOTES OF THE WEEK.

Carlisle and Cumberland Horticultural Association.—The show arranged in connection with this association, which was to be held on August 25 and 26, has been abandoned.

Shirley Poppies as Cut Flowers.—Full-blown flowers of Shirley Poppies are of little use as cut blooms, owing to their fleeting beauty; but when cut in the bud state, before the hairy green sepals have fallen, the petals eventually unfold and the flowers remain in their fresh, full beauty for several days. If full buds are cut in the evening and placed in water, they will unfold by the following morning, and there is every reason why this method should be practised when Poppies are required for home decoration.

Mr. A. Garnett Leaves for Tasmania.—On August 6 Mr. Arthur Garnett left England on the Arawa for Tasmania, where he will join a friend on a fruit farm near Hobart. Mr. Garnett had been employed at the Royal Gardens, Kew, as a technical assistant for about ten years. In his new venture he takes with him the best wishes of a very wide circle of literary and botanical friends.

The Giant Sea Holly.—One of the most attractive hardy plants at this season is the Giant Sea Holly, *Eryngium giganteum*. As will be seen in the accompanying illustration, it makes a sturdy, branching plant some 3 feet to 4 feet high, its heads of Teasel-like flowers, as well as the stems, being coloured a brilliant shade of steel blue. It is this unique colour that renders it so valuable a plant at this season. A native of the Caucasus, it was introduced to this country in 1820. Like other members of the family, including our native Sea Holly, *E. maritimum*, it appreciates soil that is of a porous or sandy character.

Planting Strawberries.—We would remind readers that the present is the best time of the whole year for making new Strawberry-beds. Owing to the wet weather, runners are exceptionally good this year, and the earlier they are planted the better. If put in during the next week or two, they will be well established before the winter, and will give good crops of fruit next

year. Several nurserymen issue special lists of plants, and most varieties are inexpensive to buy. Vicomtesse Héricart de Thury, Royal Sovereign, Bedford Champion, The Bedford and Givon's Late Prolific, ripening in the order named, are all excellent.

Death of Mr. T. A. H. Rivers.—Just as this issue was going to press we received news of the death of Mr. T. A. H. Rivers, of the well-known firm of Messrs. Rivers, Sawbridgeworth. The deceased was only taken ill on Wednesday of last week, and passed away on Friday, the 6th inst.

large enough planted in full sun in light, sandy soil.

The Evening Primrose.—Now that we have so many other beautiful flowers, the common Evening Primrose gets somewhat neglected. This is undoubtedly partly due to it closing up during the day, and also it is thought too common; but there are many spots in most gardens where it could be an object of beauty. A group of the large-flowered form known as *Oenothera lamarckiana* that we recently saw growing on the shady side of a large shrubbery looked very beautiful during the early morning and evening, the spikes of large yellow flowers standing out boldly against the dark green background.

In the Primula Dell at Clandon.—It is hardly to be expected that hardy Primulas should flower so late in the year as August, yet there is one Primula still making bright splashes of colour with its whorls of reddish purple flowers. The Primula in question is *P. Poissonii*, which annually produces flowers right through the summer until the autumn. Tall spikes of the beautiful Blue Poppy, *Meconopsis Wallichii* enhance the beauty of the dell. The gardens are much enjoyed by wounded soldiers who are in hospital in the Earl of Onslow's mansion at Clandon Park.

The Herb Lily.—Beautiful and attractive as are the *Alstroemerias*, they are a class of plants that seem very much neglected. Although perhaps some of them are of doubtful hardiness, such is not the case with *A. aurantiaca*, which is one of the freest and most beautiful plants

flowering at the present time. They are no trouble when once established. Plant the roots deeply and leave them alone, for if we would have its full beauty it must remain undisturbed, and each year it will increase. Although growing a yard high, this plant needs no support, its shoots being stiff and strong and well clothed with ample foliage. Each growth terminates in an umbel of from twelve to fifteen flowers of a deep orange colour, and continues to bloom for the greater part of the summer. It is highly effective, both upon the plant and in a cut state, remaining fresh for a long time.

A NOBLE STEEL BLUE, HARDY PLANT: *ERYNGIUM GIGANTEUM*.

All who were privileged to know him will learn of his sudden demise with the deepest regret. The funeral took place at Sawbridgeworth Church at 3 p.m. on Monday last.

An Attractive Annual for the Rock Garden.—At the present time, when the rock garden is not looking so bright as it was a few weeks ago, a nice patch of *Grammanthes gentianoides* is very welcome. This bright little annual, with its orange-red shaded flowers 3 inches high, is now looking very bright. It is allied to the *Sedums*. It should be raised in pots in March, and when

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Myosoidium nobile in Scotland.—The Chatham Island Forget-me-not is seldom met with doing well in Scotland. It is, however, successfully cultivated in the exquisite and interesting gardens of Mr. Kenneth McDouall of Logan, Wigtownshire. There it received a slight protection with straw in the winter—a precaution well repaid by the handsome leaves and flowers which are obtained in due course.—S. ARNOTT.

A Beautiful Plant.—*Lythrum virgatum* presents a beautiful sight on the banks of the River Avon at Keynsham, growing in a wild state, with its elegant branching, fairy-like spikes massed between the wild *Achilleas* and *Lythrums*, and as one walks along the towing path towards Bath the plants are still growing freely on the banks.—JOSEPH ETTLE.

Rose Minnehaha.—This *Wichuraiana* Rose, raised by Walsh in 1905, is not grown nearly as much as its merits deserve, which cover a wide sphere of commendation—vigorous growth, freedom of flower, panicle-like sprays of bloom 18 inches in length, double, dark rose in colour, very conspicuous among other Roses, as its colour is quite distinct from all other sorts, and, above all, the foliage is immune from any insect or mildew attack. Grown as a pillar is the most effective method of displaying its virtues. Those who see it for the first time are delighted with its appearance.—E. M.

Snapdragons for Present Sowing.—The note on these beautiful and extremely useful flower garden plants, page 374, issue July 31, is timely and very encouraging to those cultivators who wish to have early flowering plants next year. The reference to the very dwarf and tall growing sections, respectively, is quite a correct one, as they would be rather disappointing except in special circumstances. The intermediate section, if transplanted twice before their final shift to the flowering quarters, grow very bushy and make a splendid display in due course. These plants thrive well in soil in which some old mortar rubble has been mixed—about a spadeful to a bushel of soil when transplanting in the seedling stage.—AVON.

Pæonia officinalis lobata.—This, which has recently been mentioned in two previous numbers of THE GARDEN, is certainly one of the most beautiful of the whole genus, the colour being very pleasing and quite distinct, while the plant is elegant and compact, and far superior to many others that are often grown in gardens. It was first received in this country from the Royal Gardens in Paris by a Mr. Alexander Macleay, in whose garden it flowered in 1821. It was considered, according to Mr. Sabina, who had probably the largest collection of Pæonies at that time, a distinct species, under the name of *P. lobata*; but it has since been classed as a variety

of *P. officinalis*, its origin being unknown.—F. G. PRESTON.

Small Bedding Dahlias.—The Mignon Dahlias sent out by Messrs. Cheal of Crawley are charming little plants for bedding. They are being tried here this year for the first time, and are a great success. They may be had in assorted shades, and all come quite true to colour. As the season advances, provided dead blooms are picked off, they are covered with a profusion of small, single, well-displayed flowers, and the plants are dwarf and of ideal bedding habit. As they become

LILIAM GIGANTEUM FLOWERING IN THE GARDENS AT CASTLEFORD, CHEPSTOW, GLOUCESTERSHIRE.

better known I am certain they will be made extensive use of.—F. HERBERT CHAPMAN, Rye.

An Autumn Rockery Note.—The summer and later flowering occupants of the rockery never seem to get that public notice which their early flowering relatives do, yet there are many good plants to be had by those who so desire. On July 31 the modest collection here contained the following in flower: *Anomatheca cruenta*, *Asperula hirta*, *Arabis alba* flore pleno (second flowering), *Berberis Wilsonii*, *Campanula pulla*, *C. Miss Willmott*, *Convolvulus mauritanicus*, *Dianthus graniticus*, *D. superbus* and *D. del-*

toides (seedlings), *Erigeron mucronatus*, *Erodium cicutarium*, *Erythraea Massonii*, *Chrysogonum virginicum*, *Fuchsia Tom Thumb*, *Mentha Requienii*, *Oxalis rosea*, *Oenothera eximia*, *O. Arendsii*, *Parochetus communis* (in bud), *Pratia angulata*, *repens*, *Scabiosa graminiflora*, *Sedum kamtschaticum*, *Statice incana nana*, *Tunica Saxifraga*, *T. S. flore pleno*, *Verbena chamædrifolia*, *Wahlenbergia gentianoides*, *Viola Papilio* and several annuals.—C. TURNER, Highgate.

Lilium giganteum in Gloucestershire.—The flowering of this remarkable Lily always creates a certain amount of interest, and the conditions under which the plant has been illustrated bloomed may not only be interesting, but perhaps helpful to not a few readers of THE GARDEN. It was planted a year ago, being removed from another position, and this season produced a spike 5 feet high with seven flowers, which were pure white, the tinge of green associated with this species being conspicuous by its absence. The foliage was healthy down to the base. The plant was grown practically in dense shade, about eight feet from the grass verge, and surrounded by shrubs except for an opening between 3 feet and 4 feet wide and 9 feet high. It was top-dressed with rotten manure and leaf-soil, and occasionally watered whenever the weather was dry and hot. The photograph was taken by Mrs. Lysaght in the fine gardens of W. R. Lysaght, Esq., Castleford, Chepstow, Gloucestershire, where many choice and rare plants find a home. *L. giganteum* is a native of the Himalayas, and is said to be hardy only in favoured localities; but if it will succeed in other gardens under the conditions stated above, there appears to be no reason why its cultivation should not be extended to other parts of the country which are often referred to as unsuitable.—B.

Watering Melons.—When one reads instructions as to the treatment of Melons, they generally include something similar to the following: "Keep the soil quite dry (or perfectly dry) near the stem"; or "Place a collar round the stem to keep the soil dry there." Those instructions also refer to atmospheric moisture: "Syringe the plants and damp the floors of the houses thoroughly"; often, "several times each day." Now, I am firmly convinced that Melon plants are coddled too much and unduly forced. Throughout a long gardening career I have never hesitated to water the soil right up to the stems of the plants, and have never lost a single plant through doing so. After gaining certain experience I refrained from maintaining so much atmospheric moisture, and have given the plants more air than is usual, with the result that my plants would grow on and bear second crops of fruits if needed. This is proof enough of their healthy condition throughout. The soil I prefer is a good stiff loam, without any leaf-soil, sand or manure, made quite firm. The feeding is done after the fruits are set. Fruits cut from healthy, not collapsed, plants always possess the best flavour,

according to variety. Early in the season less water and less air are needed; later, more water and more air; but the prevailing weather conditions must always be duly considered. I have seen many plants in large pots freely watered, without regard to the water touching the stems, mature splendid crops.—G. G.

How to Grow *Gentiana acaulis*.—I was very interested in reading, on page 373, issue July 31, experiences on growing *Gentiana acaulis* on sandy soil. My trouble has been to get it to flower on my light, sandy soil here, and I have tried various recipes, most of them consisting of a nourishing diet, but I still fail. Now I believe your correspondent has solved the difficulty for me. It does not require coddling and feeding up, but rather starvation. Two days ago I spent an interesting and instructive afternoon in a lady's rock garden. There she told me she could flower *Gentiana acaulis* anywhere, although it is in a part of the country where Pine trees and Heather abound. Her secret was, on the level to dig a trench about nine inches deep and fill it with small pieces of stone, sifting a little soil among them, and planting the roots between the stones and surfacing with ordinary soil, the whole being made very firm and the plants trodden in. They must be in full sun. In one part of her rock garden was a slope at an angle of 45°, having the appearance of a conglomerate mass of sand rock; but from every crevice the plants were growing, and from their heads of seed one could see what a fine display of colour there must have been.—ENTHUSIAST, *Dorking*.

The Cutting of Flowers.—“Shamrock,” writing on the above subject on page 360, issue July 24 says I should have given a list in my letter in your issue for June 19, page 301, of plants which will stand the “cut-and-come-again” practice. I am very glad to do so, as he asks for a list; but my reason for withholding one was because I thought gardeners would realise that most plants stand this practice—in moderation, of course. However, here is a list of plants which grow and blow more freely the more they are cut: *Calendula grandiflora*, *Centranthus ruber* (Valerian), *Aconitum bicolor*, *Dimorphotheca aurantiaca hybrida*, *Eschscholtzia californica*, Sweet Peas, Everlasting Peas, *Galega officinalis*, *Coreopsis*, and Shirley Poppies. The following is a list of plants which do not stand so much of the practice, but which can, nevertheless, be cut from remarkably freely, and will either bloom again later or continue to bloom for some time: *Erigeron speciosus superbus*, *Chrysanthemum maximum*, *Lupinus arboreus* (white and yellow), *L. polyphyllus*, *Clarkia elegans* and others, *Godetia* The Bride and others, *Antirrhinum majus* and others, Stocks, Dahlias, *Nigella*, Foxgloves, *Potentillas*, *Geums*, *Heleniums*, *Polemoniums*, Sunflowers, *Pyrethrums*, *Doronicum austriacum*, *Anchusa italica* Dropmore variety, *Inulas*, *Gaillardias*, *Verbascums*, *Campanula glomerata* and others, *Acroclinium roseum*, and Asters. Many of these throw up first one or more main shoots or flower-spikes; but after these are removed, others of smaller size are given. Very many other plants might be named, but these must suffice. In my letter I was not thinking of flowering shrubs at all, but only border plants; hence it is not possible, if any care be taken, “to remove buds that would supply next year's bloom” On border plants these “buds” are seldom formed as early as June 19.—E. T. ELLIS, *Weetwood, Ecclesall, Sheffield*.

The Toad in the Garden.—As far as my experience goes, very few people, I find, regard the toad as a harmful creature in the garden; quite the reverse. The natural aversion felt by many persons cannot be well overcome, and, where it exists, there should be no hesitation on the part of the owner of a garden in having the toad removed from the glass structure or garden, as repeated shocks do more harm to people than the toad does good in the case of plants by eating insects, &c. Personally, I have a great aversion to the toad at close quarters, and have just taken one out of my vinery owing to the many shocks it has given me. To those who like the toad, or are indifferent to its presence, I say, “Retain it by all means.” There are so many efficacious insecticides advertised in our gardening journals now that, if rightly used, there will be little need for a toad or toads to be kept at close quarters in our gardens. The toad seems to be a somewhat intelligent creature, too. When my brother was in Messrs. Dickson's nurseries at Chester many years ago, he said there was a veteran toad kept in one of the propagating-houses. It had lost the use of one eye. Every evening it went for a constitutional walk, hop, skip or jump, but always returned to the propagating-house. If by chance it had not returned early enough to be admitted the same evening, it was there at the door the following morning, and came in directly the door was opened. This toad was a general favourite with the workmen. Rarely does anyone see a toad actually eat insects, because of the rapidity with which it darts out its tongue and the insect disappears. I have never heard of toads eating seedlings of any kind, as referred to by Mr. E. T. Ellis, page 373, issue July 31.—GEORGE GARNER.

—Everything that your correspondent, Mr. E. T. Ellis, page 373, states in favour of the toad I can fully endorse: indeed, I will go even further. In the first place, toads do not eat any plants, however tender they may be, for the toad is in no ways a vegetable feeder, and, what is more, it will only eat living insects, and even then not until they move. It is very interesting to watch it feed, for should an insect sham death, as so many of them do, the toad will watch its prey for some time, and at the least sign of movement the long, glutinous tongue of the toad is protruded with a snap and the insect disappears. All this is done so quickly that the eye can scarcely follow the action. I had a large toad in my garden for a couple of years which lived in a cool retreat made of a few bricks. It would come when I whistled, and gobble up any moving insect I gave it. Some of the ways of my toad were very interesting to visitors, especially the manner in which it would dispose of wasps. Being a cold-blooded reptile, their stings did not affect it in any way. To illustrate this, I would confine some wasps under a bell-glass and slip the toad underneath. One by one they were quickly disposed of. I grant that at a superficial glance the toad does not score much on the point of beauty; but close inspection will reveal the fact that the eyes are really beautiful.—H. P.

FORTHCOMING EVENT.

August 17.—Royal Horticultural Society's Fortnightly Exhibition and Meeting, Vincent Square, Westminster, 1 p.m. to 6 p.m. Lecture at 3 p.m.

NOTES ON SOME OF THE NEWER SWEET PEAS.

BY THE REV. JOSEPH JACOB.

SOME lucky person, who was able to go to the trials and accept the kind hospitality of Messrs. Dobbie and Co. and Messrs. Alex. Dickson and Sons at Mark's Tey, sent a very interesting list to THE GARDEN for July 24 of the new Sweet Peas that struck him. As I also made some notes of what he saw at Holland House and the “National,” although he was unable to join in the outing, a comparison may be of interest. To the remarks of the “unknown one” with regard to Mrs. E. Wright, I thoroughly agree. Its dainty heliotrope wire edge with its delicate flushing of palest purple gave it a most pleasing refinement. No one can fail to be charmed with it.

Here we part company for a time, for no mention is made in THE GARDEN list of Sir R. Baker's intense deep blue-purple which was staged in the class for three home-raised seedlings. Since it appeared in public for the first time on the same day as the announcement of the result of the War Loan; since, to compare small things to great, it is of a colour badly wanted; and since several keen judges, like my friend Mr. Mackereth of Ulverston, voted it a great success (is not this the last word?), would the worthy baronet and his gardener, Mr. Usher, be offended if War Loan were suggested as a not inappropriate name? Again, no mention is made of Mrs. Gentle, a singularly clean and taking flower with its pretty rosy pink standard and more light-toned wings.

Cream ground Mrs. Cuthbertson does not seem to have caught my eye. Neither the “unknown” nor myself has Jean Ireland down—because he probably thought it too well known to mention, I for the same reason that cream-ground Mrs. C. was unnoticed. Personally, I am fed up with cream grounds. Once I could look at nothing else, but our eyes, like our “little Marys,” relish a change of diet. Old Rose. Yes; very nice. So, too, is Tea Rose, which I see is likely to become Sylvia [?—ED.]. Both are good, and would make delightful companions in a vase. Trial visitors speak highly of the latter as they saw it growing. It is, in my humble opinion, far and away the best of the four picked out for prospective awards: the only one, in fact, that, in popular language, I would give a sixpence for.

Dora, another of the four, I remember as a poor bicolor, with nothing at all wonderful about it; while Margaret Fife and Victory are only useful to swell the lists of the too-much-alikes.

Possibly someone will say, “How about Mrs. Gentle and Eric Harvey?” Yes; but *where* is poor Eric now? Constance Acomb; why, certainly. But how came it that the most striking—and to me the most fascinating—characteristic of the big bunch on Sydenham's stand was missed? Like Aldersey's Dragon Fly, the young blooms are quite a different colour to the older ones. In this variety they are a soft grey primrose, while those more fully developed are a pretty lilac. Possibly the two colours were taboo. They are with some people. When I ventured to say to Mr. Ireland that his rosy pink and cerise vase of Illuminator was as near perfection as anything one need wish to see, the look that came over his face was like that which comes over Mr. James

Bentley's when some poor uninitiated one expresses a liking for a Tulip with a dirty base. He quietly said such diversity of tone ought not to be. Well, we each have our opinion.

Miss Burnie—um! possibly yes. *But* I do like a little more substantiality in the charms of a beauty. "Too delicate to live" was my comment. I read "the colour soon goes, and the flower becomes practically a white," or something to this effect in the "unknown's" note of what he saw at the outing. Dickson's President no

AN ARTISTIC LITTLE GARDEN.

IT is a great art in gardening to know how to make the best use of a small space and plan it out to the best advantage. We doubt if there can be seen a more artistic little garden than that we have lately visited on the edge of our Berkshire downs. In the fresh, pure air, from the corner of a fertile

DELPHINIUMS AND PINKS IN A LITTLE GARDEN.

one could pass over. It is a truly glorious bit of colour. Mrs. Kate Hammond (Hobbies) is quite high up on my list as pink—unqualified pink. Honor Bright as a pale cerise looked very pretty. One remembered it so well from Chelsea Show, and the good impression then left behind was now renewed.

Morning Mist (a curious pale grey slate colour) and Mrs. Hugh Wormald (pale yellow wings with a buff pink standard) are noted as two out-of-the-common varieties. Until I looked at my "ejaculations" in the last Sweet Pea Annual, in the course of writing these reflections, I had no idea I had "spotted" them last year. Although of a certain age, I must put in a word for Wenvoe Castle, the exquisite shot blue and ruddy mauve; and Princess Mary, which is generally very safely described as a medium blue.

Said the Norfolk Justice to the countryman witness: "Now, tell me what sized stone was thrown?" After failing, after several tries, to get more than that it was a middling-sized stone, his Honour had a brilliant inspiration. "Tell me, my man, something it was like." After much thought the words slowly came out: "It was the same size as a middling-sized lump of chalk." Having read my little tale, what, Mr. Catalogue Maker, is a medium blue?

field, less than a quarter of an acre has been made beautiful to garnish the environment of a picturesque cottage designed by Messrs. Boulton and Paul. The gabled dwelling stands on a slight eminence, and is approached by a sloping path of brick tiles, edged by rockwork planted, and a delight at all seasons. On one side the tiny lawn is deeply sunk, and flowers shelter snugly in sunny nooks upon the narrow beds and banks. A trellis, well covered with climbing Roses envelops the whole area, which is bounded by an ancient wall bearing a succession of the charming plants which love a crannied resting-place. Wallflowers, House-leeks, Valerians, Arabis and many another make the outer boundary of this tiny pleasure a joy to passers-by. To add to their pleasure, where the flowering wall extends along the uncultivated field, a strip of ground has been fenced off for flowering trees and shrubs of various kinds, so this hospitable little garden is a beauty spot to all the hillside.

Nor have we yet exhausted its charms, for we have still to notice Rose Blush Rambler, recently in perfection, arching the brick steps at the head of the slope; and we have not explored the tiled path continued all round the house, with beds of blossom on every side, producing a delicious effect from every low window. Not a corner has been neglected, yet none is overstocked. We could

not but admire the good taste that knew how to plant profusely and never overcrowd.

Add to all this the advantage of a fine peep at the distant downs and a background of grand old Elms, and we shall be agreed that the dwellers in this little home have cause to love it greatly. And perhaps the secret of it is: Do not try to do too much; do not make your tiny space look still tinier by cutting it up into many little beds and then crowding into it as many as possible of the plants in your nurseryman's catalogue. But let your flower-beds be real borders, *i.e.*, follow the lines of house and paths and wall, and fill up with a lawn to set it all off and give one room to sit down and look at it.

GOOD YELLOW-TINTED ROSES.

WHERE I asked to-day which I consider the best yellow-tinted Rose, I should undoubtedly say Hybrid Tea Reine Mère d'Italie. Grown in bush form, it is difficult to describe its real beauty. The colour somewhat reminds me of Soleil d'Or, but has many improvements.

The first two years we grew it in Hertfordshire I was disappointed with its behaviour, so much so that I determined to lift it and replant; and, bearing in mind its distinct colouring, decided to mix a little peat, Cocoanut fibre and leaf-soil with the natural soil, which is heavy, retentive clay on chalk. The effects of the iron in the peat and the assistance to the root action by the other constituents were quite pronounced last season, both by the high tones in the colouring of the flowers and the growth of the plants. It has beautiful ovoid buds, carried on erect and rigid stems, lovely on opening, of a seductive apricot yellow ochre. The flowers when open are of good size, likewise apricot yellow ochre, washed in the centre with a mixture of yellow and Nilson rose.

Marquise de Sinety is disappointing in its growth. Some plants have done better than others, but the bed has an untidy look and is anything but even. The flowers when open are large and full; colour, Roman ochre, shaded with fiery red; the buds are carmine ochre. Being a somewhat heavy rooter, it suggests a friable soil and fairly heavy mulch.

Mrs. Aaron Ward is an excellent variety, a good grower, and carries two good crops of flowers which are beautiful in the bud and when expanded, but require shade to maintain their pleasing tints of Indian yellow and salmon pink.

Paul Lédé has a distinct yellow tint and, grown side by side with Harry Kirk and Mrs. Peter Blair, is very effective. All three varieties respond well to a little encouragement in the way of Cocoanut fibre when planting.

Mrs. Joseph Hill occupies a bed to itself, and proves itself worthy of its position every year. It is a rampant grower, and requires fairly hard pruning in late March and when the first flowers are over. The second crop is far and away the better of the two, some of the strong stalks carrying as many as nine good-sized flowers, shapely and of fine substance. Its colour is really salmon pink, shaded with yellow, the outside of the petals being tinged with coppery pink.

Mme. Mélanie Soupert is admired by everyone and possesses many charms. I had it growing among pale pink and flesh coloured varieties; but, however much the others flower, this charming variety always stands out prominent and seems to demand admiration. Its colour is saffron yellow on a carmine pink ground. Its growth is made easier in heavy soil with the help of a little leaf-soil or any thoroughly decayed vegetable matter.

Rayon d'Or I have not had sufficiently long to be able to recommend or condemn. It certainly has a colour somewhat stronger than any other we have, which makes it difficult to place. I can imagine that a small bed of it between two crimson varieties would be very effective.

Mme. Ravary is too well known to need any comment here. We have it and love it, both for its behaviour and the charming flowers it produces.

Among the many yellow-tinted Teas which are good doers, I am in favour of Mme. Chedane Guinoisseau, having grown it now for twenty years or more with marked success. It makes a splendid bush when not pruned too heavily, and is a constant flowerer from June till November. The blooms are beautiful in shape and of a sulphur canary yellow. G. B.

THE NATIVE LADY'S SLIPPER ORCHID.

(CYPRIPEDIUM CALCEOLUS.)

I HAVE been interested by the letters of your correspondents "C. Q." and "Lucy Joshua" on page 361, issue July 24, describing the habitat of *C. Calceolus* in Switzerland. It is clear from these letters that the plant will grow in the wild state under very different conditions. I have for some half-dozen years known of several patches of the plant growing in an open wood of Spruce, Birch, Aspen and Hazel, on the floor of a valley only a few feet above the river, at an altitude of about 3,500 feet. I have referred to my notes, and find that the plants were rooted in 4 inches or 5 inches of loose leaf-soil, which was filled with the fibrous-growing rootlets of Ferns, coarse grasses, and of adjacent shrubs. Below the whole were slabs and cobbles of limestone (evidently the old river bed). The roots of the *Cypripedium* barely entered the stratum of sand, and were spread horizontally through the leaf-soil. Overhead was a thicket of Hazel. I have visited this patch and two others since discovered in the same wood three times in the last six years. I have never found a single seed-pod on all those plants, so no wonder that the plant is rare, also that it is easily exterminated in any particular locality.

After losing many plants purchased and planted as recommended in the text-books "in clayey loam, wedged in fissures of limestone," &c., I and a friend, who studied carefully the conditions under which these Swiss plants above mentioned were growing, have had no difficulty in cultivating the plant in our gardens in perfection.

Select a pocket well up off the ground, facing east or north-west, and remove the soil to a depth of 18 inches. At the bottom of the pocket lay rough 4-inch cubes of stone or brick, and on the top of these lay inverted turf, say, 3 inches thick. Mix a compost of a third coarse river sand, a

third sifted, well-decayed leaf soil, and a third fibrous loam torn into small fragments. Add enough half-inch limestone chippings to keep the compost open. Lay 8 inches of the latter on the turves, and then take the plants and carefully spread out the rootlets horizontally, finally covering up with the same soil.

Before and after winter it may be necessary to top-dress; but both at that time and when first planting take care to avoid burying the dormant growths too deeply, which is a common cause of "damping off." Lightly cover up with Fir or Yew branches for the winter, removing them before the young growths are at all drawn by them, which in the North of England will probably be necessary about the end of April.

To show how such methods suit this Orchid, I may mention that I moved a plant in the late summer of 1913, as its position seemed insufficiently drained and it was not doing well. It only carried two flowers that season, and consisted of seven or eight growths. I replanted it in the manner before described, and last year it greatly improved and made many strong growths, though the flowers were killed by a late May frost. This season it pushed up nineteen growths, and they carried twenty-one fine flowers. I have never seen *C. Calceolus* growing so freely as this when planted as so often recommended.

As regards the best position, whether in sun or shade, I can only say that such plants as I have seen growing in the wild state have been in open, airy woods, but with a canopy of shade overhead. I find by a note written in July, 1910,

HYBRID LILIES.

THE appearance of a good hybrid Lily (Amos Perry) at the recent Holland House Show is sufficiently rare to call for a few general remarks on hybrid Lilies. Some very fine and interesting crosses have been obtained, but the bulbs, in a few cases at least, have been wanting in constitution, so that instead of becoming permanent occupants of our gardens, they have in time died out.

A case in point is furnished by *Lilium Parkmannii*, a hybrid Lily, which in its day aroused a great amount of interest. It was raised in the United States of America by a Mr. Parkman, and is said to have resulted from the crossing of *L. auratum* and a deep-coloured variety of *L. speciosum*, the latter being the seed parent. Some fifty seedlings were obtained, but only one proved to be distinct from *L. speciosum*. This one, which first flowered in 1869, partook greatly of the character of *L. auratum*, with a good deal of the colour of the best form of *rubro-vittatum* or *cruentum*. To this fine Lily the name of *Parkmannii* was given, in honour of the raiser thereof. Working up a stock was, of course, a slow process, so that it did not cross the Atlantic for some years. When it did so, however, the entire stock passed into the hands of Mr. Anthony Waterer of the Knap Hill Nurseries, whence it was several times exhibited, and on August 24, 1880, was given a first-class certificate by the

A VIEW IN A SMALL GARDEN IN BERKSHIRE.

that the only growths which had flowered that season on those patches referred to in the beginning of this article were well under a Hazel bush. The plants more exposed to the sun had not flowered that year. W. H. ST. QUINTIN.

Scampston Hall, Rillington, York.

Royal Horticultural Society. It would, however, appear to have inherited some of the erratic character of *L. auratum* itself, for it gradually weakened, and in time died out altogether. I have a note of seeing it at one of the meetings of the Royal Horticultural Society in 1890, but

do not remember seeing it since. Some years ago, on application to the firm, I was courteously informed that, as far as they knew, it was quite lost to cultivation.

L. kewense is another hybrid Lily that must, I think, be now spoken of in the past tense. This was an exceedingly interesting Lily, though not particularly showy, at least in the same sense as *L. Parkmannii*. The parents of *L. kewense* were *L. Henryii* and *L. Brownii* Chloraster, this last being the seed bearer. Strange to say, the flowers were a good deal like those of a small *L. auratum*, being of a creamy white, becoming paler with age, and having a suspicion of yellow down the centre of each petal. This was raised from seed, the result of a cross made in 1897, and the first flower opened three years later.

Of hybrid Lilies that have come to stay, and which are now well distributed in gardens, may be mentioned *L. Marhan* and its improved form

It is a vigorous-growing yet exceedingly graceful species, whose colour is well expressed by its popular name of the Nankeen Lily. The bright red anthers afford a marked contrast to the rest of the flower.

L. Beerensii is a very pretty hybrid Lily that I saw in flower at Messrs. Ware's just twenty years ago. It was the result of a cross between *L. chalcidonicum* and *L. testaceum*. The flowers were about the size of the last named, but of a brighter tone of colour. I have not seen *L. Beerensii* since, but a friend tells me he flowered the same cross last year, and that it quite agreed with my description of two decades since.

There is but little doubt that the members of the Isolirion, or upright-flowered, group cross with each other. At all events, some of the garden forms appear to me to be of mixed parentage.

L. Golden Gleam, which came to us from across the Atlantic, is said to be the result of a cross

The foregoing does not profess to be a complete account of the different hybrid Lilies, but simply a few disconnected notes on some of the most important of those that have at one time or another come under my notice. H. P.

SAXIFRAGA LANTOSCANA SUPERBA.

BOTANICALLY, this is placed under *S. lingulata*, from which it differs in its shorter, blunter leaves, which are also less conspicuously encrusted, the size of the flowers, and the handsome, arching racemes.

S. lingulata (type) is characterised by exceptionally long, linear-acute, somewhat ascending leaves with conspicuously encrusted margin, that above named having shorter leaves, less encrusted; while the rosettes incline to reflex slightly. Taken all in all, it is one of the best of the June-flowering kinds, a good free-flowering sort, and generally one of the most desirable and tractable. The flowers are pure white, produced in dense, arching racemes from 6 inches to 12 inches in length, the latter rare rather than general. By reason of this arching character the plant is especially well suited to ornament highly placed ledges of rock, where, if colonised, it would show to advantage. It is also excellent for a rocky slope if placed near the line of vision. Without fastidiousness, it should be grown in very gritty loam, or this associated with broken limestone or sandstone, a good depth of which, with perfect drainage, suits the plant. About two months ago Mr. J. C. Allgrove, Langley, near Slough, exhibited the plant at one of the meetings of the Royal Horticultural Society, and from this plant the accompanying illustration was prepared. E. H. JENKINS.

A MAGNIFICENT PLANT OF SAXIFRAGA LANTOSCANA SUPERBA.

Ellen Willmott. *L. Marhan* is the result of crossing *L. Martagon album* with the Japanese *L. Hansonii*, both of which are among the most desirable of our garden Lilies. In *L. Marhan* the flowers are of a clear orange yellow, with reddish brown spots and streaks. An older hybrid, in the production of which *L. Hansonii* played a part, is *L. Da'hansonii*, the other parent being the dark-coloured form of *Martagon* known as *dalmaticum*. In this the main characters of the parents are blended in a curious way, the colour being yellow, heavily clouded with reddish brown. This has certainly become scarcer of late years. Though the early history of one of the finest of all outdoor Lilies, *L. testaceum*, known also as *L. excelsum*, is unknown, it is commonly regarded as a hybrid between *L. candidum* (Madonna Lily) and *L. chalcidonicum* (Scarlet Turk's-cap). It appears to have made its way to this country from Erfurt in the forties of the last century, since when it has become a permanent occupant of our gardens.

between *L. tenuifolium* and one of the *Martagons*. Though showing a considerable leaning to *L. tenuifolium*, it is more floriferous and robust, while the elegantly reflexed flowers are of a pure apricot yellow colour.

Under the name of *L. Burbankii* a mixed lot of Lilies was sent here from America about fifteen years ago. Traces of *L. pardalinum*, *L. Parryii*, *L. superbum* and *L. washingtonianum* may be found among them. Some are really good, but they should have been selected before they were put into commerce.

The last to refer to is that mentioned at the head of this article, namely, *Amos Perry*, which was raised from *L. Parryii* and *L. Humboldtii* magnifica. It shows, perhaps, more of the influence of the last-named parent, but the part played by *L. Parryii* is also markedly evident. The flowers are of a rich golden yellow colour, spotted inside with crimson. In the whorl-like arrangement of the leaves this hybrid resembles *L. Humboldtii*.

of a charming late-flowering perennial. To botanists it is now known as *Ceratostigma plumbaginoides*, but in gardens it is still familiar as *Plumbago Larpentæ*. It is a native of China, and was first introduced from the neighbourhood of Shanghai. It is so late in flowering, generally blooming in the colder districts in September and October, that it ought to have a warm and sunny situation. In these cold districts it is best on a sunny rockery or wall, and there, especially if between stones on rockwork, it should do better than anywhere else. The flowers are of a most delightful shade of blue, and as they come just before the plant assumes the most beautiful autumn tints in its foliage, the combination of the two attractions at the end of the season is exceedingly charming. In some places it does not prove hardy, and occasionally disappears through the effects of a cold spring. Sandy loam and peat, or, failing the latter, some well-decayed leaf-soil, will form a capital compost.

S. ARNOTT.

LADY LARPENT'S LEAD-WORT.

This is the attractive alliterative title

SOME NATIVE PLANTS FOR THE WATERSIDE.

DURING the scorching days of summer and early autumn, when our lawns are seared and almost devoid of foliage, and plants in beds and borders are showing obvious signs of distress, there are few more restful and interesting garden features than a stream or pool. Just how much quiet pleasure the owner of such a garden feature will derive from it will depend very largely on the vegetation that clothes its banks and runs down even into the water itself. During recent years considerable attention has been given to water-side gardening, but I am disposed to think that it has not all been in the right direction. The introduction of so many hardy plants that are obviously more at home in moist places than the herbaceous border has led to their extended use in places of wild or semi-wild character, quite irrespective of their natural habit of growth or the colour of their flowers, the result too often being garish patches of colour, and awkward stems and leafage, that cannot, by any stretch of imagination, be said to harmonise with their surroundings. This criticism must not be taken as an indication that I do not consider exotic plants suitable for the waterside—many are admirably adapted for such positions—but there are signs that sufficient restraint and care are not being exercised in their selection and planting.

A ramble through some marshy countryside a week or two ago, and the accompanying illustration, served to remind me that among our native plants we have a goodly host that are capable of creating beautiful pictures on the damp margins of our garden pools and streams, especially where these are of a natural and informal character. It may be urged by some that these wildings are weedy and difficult to keep within bounds, but practical experience does not bear this out. The painstaking gardener will see to it that one does not encroach too much on its neighbours, and will also be careful not to plant such kinds as the Willow-herb, which are certainly very hard to keep within prescribed areas. The plants shown in flower in the illustration are those of the Purple Loosestrife, *Lythrum Salicaria*, a beautiful native of our marshlands and damp hedgerows. Like a number of other simple hardy plants, it is most effective when planted in fairly large colonies, and, once a few roots are obtained, it is quite an easy matter to increase them by division at practically any time during the winter. A better garden plant than the wilding is named *L. S. rosea*. Instead of the purplish hue, we get in the flowers a pleasing shade of deep rose, while the sturdy, yet graceful, habit is fully maintained.

A curious fact about quite a number of waterside plants is that they will adapt themselves to ordinary border cultivation. The Loosestrifes mentioned are a case in point. Both will grow and flower quite well far away from water, though there is no gainsaying the fact that they are more at home by the margins of ditches, pools, or

sluggish streams. For several years I have watched with interest some plants of the common Water Flag, *Iris Pseudacorus*, that are growing in a suburban front garden. There, planted close up to a brick burr wall, where the soil must be more often dry than wet, these plants have flowered each year for the last three years, and possibly longer. It is, however, better by the waterside, where its stately, sword-like foliage and yellow flowers fit in so well with other vegetation.

Another beautiful native plant for the purpose now under consideration is the Loosestrife known as *Lysimachia thyrsiflora*. It grows about two feet or rather more high, and during July is always

beautiful with its dense clusters of yellow blossoms. It is a true sub-aquatic, and far better suited for the water edge than many of the exotics used for the purpose. The common yellow Loosestrife, *L. vulgaris*, though often grown in borders and comparatively dry parts of the wild garden, also thrives well by the waterside. In general appearance it is very much like *thyrsiflora*, but grows a foot taller. A dwarf member of this family, and one that will grow either in moisture or drought, is the Moneywort, *L. Nummularia*. It spreads rapidly over the soil, and from spring until well into the autumn is seldom without its large, bright yellow blossoms.

THE PURPLE LOOSESTRIFE EFFECTIVELY GROUPED BY THE WATERSIDE.

For the spring months there is not a more beautiful and pleasing plant than our native Forget-me-not, *Myosotis palustris*. It loves the moist soil by the water's edge, and once established will seed freely and perpetuate itself without further trouble, except to see that ranker vegetation does not, during late summer and autumn, smother the seedlings. Its blue flowers, peeping shyly through a loosely tangled mass of green stems and foliage, never fail to attract attention, and surely so lovely a wilding deserves a place in our water gardens. Flowering at much the same season, but in a more brazen manner, is the Marsh Marigold or Kingcup, *Caltha palustris*. Both its brilliant yellow flowers and large, glistening green foliage are handsome, and it is too well known to need any detailed description. The double-flowered variety should, however, be left well alone. It is not nearly so pleasing as

foliage, surmounted during July and August by large, plume-like heads of creamy white and deliciously fragrant flowers, creates such a picture of quiet beauty as few other plants, even the most expensive, are capable of.

Then what shall we say of the Bulrush, *Typha latifolia*? In a few good gardens one does see it thriving with its roots well into the water, but too often it is missing. Its tall, sword-like foliage is very handsome, and the dark brown inflorescences, produced so freely in autumn, are a source of attraction for a long period.

The Flowering Rush, *Butomus umbellatus*, with its umbellate heads of rose-coloured flowers, is another good native for the waterside; while everyone would surely wish to include the Sweet Flag, *Acorus Calamus*, the roots and leaves of which are deliciously fragrant. The Arrowheads, or *Sagittarias*, and the wild Campion are other

crimson, lined and reticulated with golden in the throat.

Cattleya Harold Fowler's Variety.—This is a very beautiful variety, sepals and petals being of the purest white, the bold, fringed lip broadly margined white, with conspicuous rosy purple blotch and yellow-touched throat. The whole of the foregoing were from Mr. J. Gurney Fowler's fine collection at Pembury, Tunbridge Wells.

Campanula Abundance.—The general effect of this is an enlarged Norman Grove, to which probably it has affinity. The plant is 6 inches high, the blue flowers, which are produced with considerable freedom, horizontally disposed above a modified *C. carpatica* habit of growth. From Messrs. J. B. Grove and Son, Sutton Coldfield.

The foregoing were exhibited before the Royal Horticultural Society on August 4, when the awards were made.

THE NEW CAMPANULA ABUNDANCE SHOWN IN LONDON LAST WEEK.

the wild plant, and provides an excellent example of a good flower spoiled.

Cowslips also ought to have a place by the margin of our pond or stream. Plant them rather high up on the sloping bank, so that they do not get flooded during the winter, and they will yield flowers nearly twice the size and with much longer stems than those growing wild by the wayside. Nature teaches us this when she encourages Cowslips in damp pastures, where they are always finer than in similar situations where the soil is dry. Our native Primrose also might well be associated with the Cowslips, and would in many cases be more appropriate to the surroundings than the vivid purple and orange exotic species now so largely used as semi-aquatics. In the Meadowsweet, *Spiraea Ulmaria*, we have a native that is quite at home with its roots touching the water. Its beautiful pinnate

native plants that occur to me as being eminently suited for positions such as are now under consideration.

F. W. H.

NEW AND RARE PLANTS.

FIRST-CLASS CERTIFICATE.

Cattleya Sybil Scintillant (*C. iridescens* × *C. aurea*).—The sepals and petals of this handsome hybrid are coloured old rose, the front lobe of the lip rich purplish maroon, which, ending abruptly, is continued in deep orange. A very beautiful and striking variety.

AWARDS OF MERIT.

Laelio-Cattleya Thyone Fowler's Variety (*L. C. Ophir* × *C. aurea*).—In this the sepals and petals are of golden hue, the heavily fringed lip reddish

DURING the last year or two the value of the Loganberry for preserving purposes has been fully realised, and it is by no means unusual to find the fruits offered for sale in shops as "Giant" and "Egyptian Raspberries." The plant is a rampant grower and will thrive in almost any soil, yet the majority of those who attempt to cultivate it do not get anything like the crop that a properly tended plant is capable of producing. This is due more to ignorance than to any wilful lack of attention. It should be fully realised that the fruit next year will be borne on the lusty young growths or rods that are being pushed up from the base this summer. The better these are ripened before the winter the better will be the crop next year, hence anything that can be done to bring that about ought not to be neglected. The growths that are fruiting this year have completed their work when the berries have all been gathered, and the sooner they are cut right out the better it will be for the young ones that remain. Too often they are allowed to remain until the winter, all the time deriving a certain amount of nourishment from the roots, and impeding the progress of light and air to the new shoots. After cutting away the old rods, the cultivator will probably find that there are more new ones than can be accommodated. If this is so the weakest ought to be cut away, retaining only sufficient of the sturdiest to furnish whatever support is available.

With Raspberries the same methods apply with even greater force. Too often I receive complaints of Raspberries being small and hard, the flowers in some instances refusing to set, and in others collapse of the canes after the flowering stage has been reached. In nearly every case this can be traced to immature rods or, in other words, only partial ripening the previous autumn. For many years now I have made a practice of going over the Raspberries early in June, cutting away the obviously weak and unwanted new shoots, leaving only the strongest and best. Then, immediately all the fruit has been gathered, the old canes are cut out and the new ones loosely tied in their places. The result by the winter is short, hard canes of a beautiful brown colour, and a heavy crop of luscious fruit the following year. H.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Figs.—With careful attention there should be no difficulty in keeping up a supply of fruit till late autumn. If the wood is kept well thinned out and the fruits thinned where they are too thick, the second crop will be of excellent quality, though smaller in size than the first crop. Keep the roots well supplied with moisture, but the atmosphere in the house must be kept dry when the fruits are ripening.

Pot Fig Trees.—The trees which are required for very early forcing must now be overhauled. In some cases repotting will be necessary, but overpotting must be avoided. Where the trees are in very large pots or tubs, they will go for several years without being disturbed, except removing as much of the surface soil as possible to make room for a top-dressing. A compost of loam, lime rubble, wood-ashes and crushed bones will be suitable. Ample drainage and firm potting are two important points to remember when carrying out this work.

Pot Vines.—The Vines which have been grown for fruiting next year will have made considerable progress, and attention must now be given to the ripening of the canes. Plenty of air, both top and bottom, must be given them during warm, congenial weather. Should a long spell of wet, sunless weather set in, it is advisable to use a little fire-heat to assist the ripening. When the Vines have made satisfactory progress, they may be placed outdoors in a sunny situation, plunging the pots in ashes. It is important to keep the foliage clean, therefore syringe with an insecticide occasionally.

Plants Under Glass.

Violets.—The soil may now be prepared for the planting of Violets in their winter quarters. Chopped loam and leaf-soil which has decayed naturally makes an excellent compost for the Violet. Oak or Beech leaves make the best leaf-soil. Keep all runners and weeds removed, and hoe between the plants frequently.

Pelargoniums.—The plants required for flowering during the late autumn and winter will now be well rooted, and a little stimulant may be given, but this must not be applied too freely till the flowering season arrives. Keep the flower-buds removed, and stop extra strong shoots.

Schizanthuses.—A small sowing may be made for raising plants for flowering in the early spring. Schizanthuses require cool treatment throughout, and, if possible, the pots should be stood on a base of ashes. There are now several types of this beautiful annual, and each has its claims for recognition.

The Flower Garden.

Hollyhocks.—The disease which is more or less always present on these stately plants may be prevented to some extent by raising plants annually from seed. The seed may either be sown in the spring or at the present time. If sown now, the seedlings may be wintered in cold frames and planted out in the spring.

Violas.—To keep the plants flowering all through the season, the dead blooms must be regularly removed. A sprinkling of well-seasoned soot or artificial manure during showery weather or previous to watering will assist them to flower. Cuttings may be inserted now in sandy soil in a cold frame. Keep the frame close and shaded till the cuttings are rooted; then gradually inure them to light and air.

Pelargoniums.—Cuttings of these must now be taken for next season's stock. If care is exercised in removing the growths, the beds need not be unduly robbed of their beauty. The cuttings may be inserted in boxes of sandy soil and placed outdoors in a position which is sheltered from the midday sun.

The Water Garden.—Dead flowers and leaves must be regularly removed. Weeds usually grow rampant in and around ponds containing choice water plants, and if not rooted out early they will quickly smother the plants. Seeds of *Primula*

japonica and *P. pulverulenta* may be sown when ripe. In suitable soils and situations these *Primulas* will become naturalised.

The Hardy Fruit Garden.

Raspberries.—When all the fruits have been cleared, cut out all the old fruiting canes so that the young growths may become thoroughly ripe. The young growths will also require thinning where they are too thick. The autumn-fruiting varieties must be well supplied with water, and if not already done, a mulch of rich manure should be placed over the roots.

The Kitchen Garden.

Late Peas.—Plenty of water must be given to Peas at this season, or the pods will fail to fill. If late Peas are not mulched, an effort should be made to do this now, as then there will not be so much water needed. After a hot day it is a good practice to sprinkle the plants with rain-water late in the afternoon.

Spinach.—Make sowings of this valuable vegetable at intervals till the end of the month. This crop needs a deeply tilled and well manured piece of ground. The surface must be well broken up and thoroughly raked over before sowing the seed.

Cabbage.—The last sowing of Cabbage may now be made. An open situation should be chosen for this purpose. It is sometimes necessary to place netting over the seed-bed to keep off birds.

Lettuce.—Small sowings of Lettuce must be made till the end of the month. Brown Cos and Hardy Hammersmith are two of the most reliable varieties for late sowing.

Endive.—If rough frames are available, a sowing of Endive may be made now for the winter. Shallow frames are the best for this purpose.

Parsley.—A sowing of Parsley may be made now for pricking into cold frames.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Flower Garden.

Pinks.—If fresh stock is required, cuttings should be got in now. If a close frame is available, they are not difficult to root. Fill the frame with soil to within 6 inches or 8 inches of the top and cover with sand. After dibbling in the cuttings closely together, keep them shaded and fairly moist. Some growers layer Pinks, but as they are so easily propagated from cuttings, this system would mean endless time spent on a very tedious operation.

Climbing Roses.—Any which have finished flowering should now be pruned, cutting out any old growths which can be replaced by young shoots. Do not tie in too many, but leave sufficient space for each to ripen and where it may have room to show off its flowers another season. Tarred twine of medium thickness should be used; it will then remain in good condition for two years and will not quickly rot or decay.

Zonal Pelargoniums.—A start should be made by taking cuttings for next season. Where large numbers are required, they are best put in boxes, as these are more easily handled if, during the winter, circumstances necessitate their removal. The soil used ought to contain plenty of sand. Place in frames if the weather is wet, but do not shade. If the weather is fine, simply place them out of doors in full sun.

Plants Under Glass.

Mignonette.—Seed should now be sown if Mignonette is to be had in flower during March and April, a time when this fragrant flower is usually appreciated. If cultivated with ordinary care, it is not difficult to manage if one has got a cool and frost-proof greenhouse where it can be well ventilated during mild weather. It resents much artificial heat, and is, therefore, best kept in a cold frame until November. Much time will be saved by sowing the seed thinly in 3-inch pots and thinning out when the seeds

have germinated. Matchet is the most suitable variety for cultivation in pots.

Cinerarias must not be allowed to starve in the 3-inch pots, but be moved on as soon as ready into their flowering pots, either 6-inch or 7-inch being the size generally used. If insect life is present, either spray with insecticides or fumigate.

Fruit Under Glass.

Peaches and Nectarines.—Trees which were cleared of their fruit in June and are to be restarted in December for another season must now be well looked after if next year's crops are to be a success. The growths should be allowed ample space to ripen and develop the buds, which can only take place where the foliage is not crowded. Water must be given frequently, as these trees require a copious supply until the leaves show signs of ripening. Insect pests must be kept in check, so that the trees may start with a clean growth in the spring.

Houses Containing Ripe Fruit should be kept somewhat drier, and water only applied to the roots if necessary. Too free a use of water at this stage ruins the flavour of the fruit. Picking the fruits daily as they ripen is much better than erecting nets to catch the dropping fruits, which more often than not become marked and, therefore, ruined for dessert.

Early Vinery.—To assist in the ripening of the wood, the laterals can be shortened back to about half their length. This, of course, is not necessary when the wood is already well ripened.

The Hardy Fruit Garden.

Strawberries.—The planting of young Strawberries should be proceeded with as soon as they are ready to be detached from the parent plants. If the runners were pegged down in pots early, fruit may be expected from this plantation in the first season. Be careful not to cover the crowns of the plants, as this is harmful. Unless the weather is moist, the plants require water frequently until they become established in their permanent quarters.

The Kitchen Garden.

Potatoes.—A good number of varieties are ready for lifting. As it is important that every available piece of ground should be planted or sown with winter vegetables this year, there should be no delay in lifting the crop as soon as it is ready. A dry day should be chosen if possible, so that the tubers can be collected as free of the soil as possible. If the weather is unsettled, no more should be unearthed on any one day than can be got under cover. Diseased tubers must be carefully picked out and taken away from the garden, when there will be no danger of contamination.

Onions.—The feeding should now cease, in order to allow the bulbs to mature in readiness for lifting later on. Any not showing signs of maturity should have the foliage bent over carefully to help in the checking of further growth. The hoe should still be used freely and all weeds removed, as this will be a useful piece of ground on which spring Cabbages may be planted next month.

Cauliflowers.—Sow some seed to produce plants for wintering in frames for early spring planting. Choose a piece of ground which is not very rich, as small plants invariably survive the winter best. This must be followed up by another sowing ten or fourteen days later.

Spinach.—A large breadth must now be sown with Winter Spinach. It is very important that the plants should not suffer for want of moisture. If the ground is dry at the time of sowing, water the drills before putting in the seed. The ground should be fairly rich, and must be well dug over in advance.

Lettuces.—Good sowings must now be made to obtain plants to stand the winter. Brown Dutch, Bath Cos and Stanstead Park are all varieties which are both hardy and reliable. As slugs get very troublesome at this season, means of prevention must be adopted.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

HOW TO SUCCEED WITH PERSIAN CYCLAMEN.

THIS is not an easy plant to manage, but the pleasure of having a really fine display more than compensates for the trouble entailed in its culture. For quite a number of years I have enjoyed very fair success, and perhaps a few details regarding my cultural methods may be helpful to some of the readers of *THE GARDEN*. I am fully convinced that in a great number of cases the seeds are sown at the wrong time, and this seriously handicaps the grower from the start.

When to Sow.—After many experiments I am certain that about the middle of August is the ideal time for this. Select clean 9-inch pans, crock with extra care, and use fairly light soil. Personally, I favour a mixture made up of three parts of fresh loam, two parts of brown peat, one part of sweet leaf-mould, and one and a-half parts of clean sharp sand. Some small pieces of charcoal should also be added, which help materially in keeping all sweet. Pass through a quarter-inch riddle and place a good layer of the rough portion over the crocks. Make the compost only moderately firm.

Sowing the Seeds.—Make the surface quite level; then scatter the seeds very thinly and evenly. Indeed, it is as well to plant the seeds singly about an inch apart, as this ensures the seedlings having abundance of room from the first. Cover to a depth of about a quarter of an inch, and press down gently but evenly, leaving the surface smooth and level. Give a good watering through a fine rose, or else dip the pans to the brim in a bucket of water for a few minutes. Cover each pan with a sheet of glass and a piece of paper, and set in a moist pit with a temperature of 65° to 70°. As soon as germination takes place, remove the paper and tilt the glass a little. In a short time the glass can be removed entirely and the pans set on a shelf near the glass, but shade from bright sunshine for a time. The pans should be wintered in the same, or a trifle lower, temperature; but by the middle of January it is advisable to remove to a house having a night temperature of about 55°.

Pricking Off.—This must not be attempted too early. As a rule, it is best to postpone the operation until the little plants have each produced four leaves. Very similar soil should be used and clean 2-inch pots. A slight sprinkling of Ichthemic Guano may be added to the soil. Pot very lightly, and see that the little bulb is half out of the soil. The little pots should be stood in shallow boxes, with a layer of sifted leaf-mould in the bottoms to ensure a cool and moist base. Give a good watering through a fine rose to settle the soil, and afterwards sprinkle lightly overhead morning and evening with tepid clean water.

Repotting.—As soon as the little pots are well filled with roots, but before they are actually pot-bound, a shift should be given, the strongest plants into the 4-inch size and the others into 3-inch pots. Similar compost, but used in a slightly rougher state, and with the addition of some bone-meal and a little of Thomson's Plant Manure, will be excellent. Continue to sprinkle overhead twice daily, and shade carefully from all direct sunshine.

The Final Potting.—After the roots are running freely round the sides of the pots, the final shift

must be given, as it is unwise to allow anything like a check, which might ensue if the plants become pot-bound. Use very fibrous loam and brown peat in nearly equal proportions, with a little sweet leaf-mould and sharp coarse sand. The addition of a small quantity of dry cow-manure is an improvement; while a 6-inch potful of bone-meal and a 5-inch potful of Thomson's Plant Manure should not be omitted. The idea is to produce a nice light, springy compost and the avoidance of too much sand, as the latter has a tendency to encourage the attacks of the Begonia mite. Pot lightly and keep the tops of the bulbs well above the soil. Water thoroughly and return to the same house for a few weeks, sprinkling overhead twice a day as before. Personally, I prefer to keep the plants in a pit or greenhouse, where they are constantly under the eye; but a cold frame is an excellent place for them during June, July and August. Shading is of the greatest importance, but it must not be too dense, and it is not advisable to have it of a permanent nature. While overwatering must be carefully avoided, at no time should the soil be allowed to become dry.

Subsequent Treatment.—After the flowering pots are well filled with roots, very gentle feeding should be systematically given. Weak liquid manure made from sheep-manure is excellent, and nothing is better for the Cyclamen than liquid made from Ichthemic Guano. A tablespoonful well stirred into a gallon of water is the proper quantity, and may be given twice a week. The Cyclamen, although it resents cold draughts, must have abundance of fresh air on every favourable occasion.

If the cultural details here given be scrupulously carried out, there is but small chance of vermin attacking the plants. The most to be feared are the Begonia mite and thrip. Green fly, too, is sometimes troublesome. An occasional vaporising with XL All will keep all these at bay, and as it is always easier to keep plants clean than to make them clean after the enemy has secured a footing, this periodical vaporising is a very economical proceeding. Plants treated as advised will come into bloom in November or December and continue in beauty until March or April.

C. BLAIR.

Preston House Gardens, Linlithgow.

NEW PERPETUAL-FLOWERING CARNATIONS.

THE following varieties have been registered with the Perpetual-flowering Carnation Society during the past half year:

General Joffre.—A scarlet sport from Lady Northcliffe. Raised by Mr. G. Clarke, Leighton Buzzard.

Chelsea.—A seedling, white, pencilled pink. Raised by Mr. A. F. Dutton, Iver.

King Albert.—A seedling, deep satin pink. Raised by Mr. A. F. Dutton.

Lord Kitchener.—A seedling, purple, striped crimson. Raised by Mr. E. H. Coleman, Bognor.

King of the Belgians.—A seedling, deep crimson. Raised by Mr. E. H. Coleman.

Peace.—A pure white sport from Lady Meyer. Raised by The Newport Nurseries, Essex.

Louvain.—A seedling, bright rosy salmon. Raised by Mr. A. F. Dutton.

Mrs. W. L. Ainslie.—A seedling, salmon pink. Raised by Mr. W. Hemus, Hanworth.

Flaming June.—A sport from Mikado, geranium cerise. Raised by Messrs. Young and Co., Cheltenham.

Souvenir.—A seedling, pale rose 'sa'mon. Raised by Messrs. Young and Co.

Shepherdess.—A seedling, rich salmon. Raised by Messrs. Young and Co.

Golden Flag.—A seedling, yellow, pencilled red. Raised by Messrs. Young and Co.

Mrs. J. L. Cross.—A sport from R. F. Felton, pink, flaked deeper pink. Raised by Mr. W. J. Dance, Calthorpe Tower Gardens, Rugby.

Provisional registration:

Averill Furness.—A sport of R. F. Felton, blush, suffused and flaked rosy cerise. Raised by Mr. R. Barnett, Grantley Hall Gardens, Ripon.

Arrangements for the show on December 8 are now in hand, and the schedules will be published as soon as possible. By joining at this date, new members are entitled to all privileges until November, 1916. Subscriptions from unpaid members are urgently needed.

Orpington. T. A. WESTON, Hon. Secretary.

HORTICULTURAL RELIEF FOR SERBIA.

IN accordance with the recommendation of Mr. Henman, the society's Special Commissioner to Serbia, the Council of the Royal Horticultural Society decided at its last meeting to send out to Serbia seeds to the value of £500. The order for the seeds was placed with Messrs. Hurst and Son, and, thanks to the personal interest which Mr. Edward Sherwood has taken in the scheme for relief, the total of seeds sent, as will be seen from the following list, is a very considerable one. The seeds were sent out by a boat belonging to the Johnstone Line on August 8, and are consigned to the President of the Co-operative Union in Serbia. This gentleman has given a strict undertaking to see that the ship is met by a trustworthy agent at Salonika, and to use the resources of the Co-operative Union for the impartial and thorough distribution among the small Serbian farmers. It is largely owing to the energetic action of Mr. Arthur Sutton, the Rev. W. Wilks, and other members of the sub-committee appointed to deal with the immediate needs of Serbia, that the task of discovering exactly what the needs were and of contributing towards their satisfaction has been discharged so promptly. When it is remembered that the needs of other of our Allies—for example, Belgium—are even greater, there is good hope that the appeal of the Royal Horticultural Society for contributions to the Allies War Relief Fund will continue to meet with an increasing measure of support. Subscriptions, large or small, to this Fund may be sent to the Treasurer, Royal Horticultural Society, Vincent Square, S.W.

List of seeds sent to Serbia: 20cwt. of Mangel Long Red, and 10cwt. each of Mangel Yellow Intermediate and Mangel Yellow Globe; 10 bushels each of the following Peas—Bountiful, Pilot, Essex Star, Fillbasket, Senator, Alderman and Ne Plus Ultra; 60lb. of Broccoli Purple Sprouting, 25lb. of Broccoli Self-Protecting, and 15lb. of Broccoli Late Queen; 50lb. of Brussels Sprouts Covent

Garden; 25lb. each of the following Cabbage—Offenham, Rainham, Leeds Market and Enfield Market; 50lb. each of Cabbage Small Drumhead and Cabbage Large Drumhead; 25lb. each of Cauliflower Walcheren and Cauliflower Autumn Giant; 50lb. each of Carrot Nantes and Carrot St. Valery; 50lb. of Kohl Rabi Fine Top Green, 2cwt. of Spinach Long-Standing Prickly, 2cwt. of Onion White Spanish and 1cwt. of Onion Flat White Tripoli, 1cwt. of Leek Flag, 2cwt. of Kale Thousand-headed, 1cwt. of Beet Turnip-rooted, 2cwt. of Turnip Green Globe, 1cwt. of Turnip Fosterton Hybrid, ½cwt. of Onion Giant Rocca, 13qr. of Wheat, 6qr. of Barley, 10qr. of Oats, 6cwt. of Red Clover, 4cwt. of Lucerne, 5cwt. of Italian Rye-grass, 6cwt. of Winter Tares, 1cwt. of Spinach Beet, and 6cwt. of Perennial Rye-grass.

ANSWERS

TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

CARNATIONS FAILING (E. T.).—The Carnations are attacked by the spotted snake mite, which is feeding inside the stems and completely destroying their tissues. No doubt it has gained an entrance from the new soil, and it would be unwise to propagate them from the stock which is infested. Liming the soil is an important aid in keeping it free from the pest.

PROPAGATING ECHEVERIA METALICA (F. W. H.).—If you have two or three old plants of *Echeveria metallica* and grow them on in a sunny part of the greenhouse, they will probably flower. Then, if care is taken to pollinate the blossoms, seeds will in time be produced, from which young plants can be readily raised. By this means large quantities can be obtained, but in order to get a limited number there is another course which can be followed. If the plant is tall, the top may be taken off, potted into some sandy soil, and stood on the greenhouse shelf till rooted. The soil must be kept slightly moist, but care should be taken not to give too much water. From the old stem young shoots will be pushed out, which, when large enough, may be taken off as cuttings. Furthermore, single leaves will in time form plants if they are stripped off from the stem with a side pull. They must then be dibbled into pots of sandy soil exactly as cuttings are treated, and stood on a shelf in the greenhouse, being very careful as regards watering. In time a young plant will be produced from the base of the leaf, and it may then be grown on in the usual way.

TREES AND SHRUBS.

FORSYTHIA NOT FLOWERING (L. Couper).—It is probable that the flower-buds of your *Forsythia suspensa* are picked out by birds during the winter, or the plants may have been pruned at the wrong time. Pruning should be done about the end of April, as soon as the flowers fade, and when plants are growing against walls or trellises it is usual to cut the flowering branches back to within two or three buds of the base. The new shoots should be left full length. Pipings of Pinks may be taken at any time between the death of the flowers and the end of August, the earlier the better. Dibble them into sandy soil in a close frame, or cover them with a hand-light.

RHUS NOT FLOWERING (T. Q.).—The specimen sent for examination is the Venetian Sumach (*Rhus Cotinus*). The inflorescence is quite normal for the present time of the year. The flowers are really over. They are very small, and have doubtless passed unnoticed. After the fall of the flowers the hair-like stalks, together with numerous flowerless fibres, develop into a large feathery

head, among the fibres of which the small seeds are borne. In many respects these feathery heads of old flower-stalks are the most decorative feature of the plant. As a rule, male and female flowers are borne on the same specimen in this species, but not in all kinds of *Rhus*. By reason of the large heads of fibrous flower-stalks the plant has been known as the Wig Tree.

ROSE GARDEN.

PERNETIANA ROSES (Cicero).—We presume you mean this group, as you mention Juliet. You will find the following first-rate: Mme. Edouard Herriot, Cissie Easlea, Louise Catherine Breslau, Arthur R. Goodwin, J. F. Barry and Willowmere.

GROWTH ON DOG ROSE (Miss N. H.).—The Rose has the curious gall called the Bedeguar gall upon it, sometimes also called Robin's Pincushion. It is due to the laying of eggs by a gall fly in the Rose shoot, which not only causes a swelling in which the larvae which hatch from the eggs live and feed, but the growth of numerous hairs over the surface of the swelling, which, turning red in autumn, form a very pretty object in the hedgerows, quite common in many districts.

THE GREENHOUSE.

OPINION ON HYDRANGEA (W. S. P.).—The *Hydrangea* of which a flowering spray was sent is not the ordinary kind, but the variety *japonica*. In this last the large sterile blossoms, which form the most conspicuous feature of the inflorescence, are limited to a scattered few, whereas in the case of the common *Hydrangea* (*H. Hortensia*) they form a compact head or cluster. If you desire this last, it will be useless to take cuttings from your plant of *japonica*, as this variety will simply be reproduced. There is no malformation in the specimen sent, it being characteristic of the variety *japonica*.

INSECTS ON ROOTS OF CACTI (F. W. Hull).—If your Cacti are firmly potted, it is very probable that the woolly aphid is limited to the roots that are on the outside of the ball of earth. So situated, they congregate in the spaces that are sure to occur between the soil and the side of the pot. If so, they may be destroyed by turning the plant out of its pot without disturbing the ball of earth, and applying a little methylated spirit by means of a soft brush. As the eggs are often deposited in the irregularities within the pots, they should be scalded out before the roots are again replaced. Should the roots in the centre of the ball of earth be affected, the plants must be shaken clear of the old soil, the roots cleaned with methylated spirit, and the plants repotted in fresh compost. There are different soil fumigants that may be safely used in the open ground, but we should hesitate before recommending their employment in a case like this.

KITCHEN GARDEN.

CUCUMBERS GOING YELLOW (A. P.).—We suspect something wrong at the roots of the plants, preventing the free absorption of water, or insufficient or improper ventilation, to be the cause of the yellowing of the Cucumbers.

TOMATOES A BAD COLOUR (Dorothy, Edge Hill).—The Tomatoes are ripening irregularly owing to lack of potash in the soil. Potash is essential to the proper ripening of fruits of all kinds, and it would be well to water the soil in which your plants are growing with a solution of potassium sulphate at the rate of half an ounce to the gallon of water once a week. In making up your compost another time, the addition of wood-ashes would be an advantage.

MISCELLANEOUS.

WEED ON LAWN (Dr. G. Hales Parry).—The weed sent for identification is the common Yarrow or Milfoil (*Achillea Millefolium*). It cannot be easily destroyed, and the best method to adopt is to remove turves in the worst areas and make up with clean new turves. Elsewhere, weed out as much as possible and remove young plants as they appear. Three tons of marl will make a good dressing for your lawn. It ought to be applied during early autumn, or as soon as play is ended for the year.

GARLIC IN WOODS (Woodland).—The best way to kill the Garlic in your woods is to chop the leaves down with a hoe as soon as they appear above the ground. By doing this several times during the spring and early summer the plants will be weakened and gradually killed. To be effective, however, the leaves must never be allowed to grow to full size. As you evidently wish to prune your Hollies fairly severely, it would be advisable to do the work in spring. April is a good time, for young shoots will then be formed quickly. If pruning were done in the autumn, the bushes would look ugly all the winter.

NAME OF FRUIT.—R. M. E. Y.—The Gooseberry is *Roseberry*, a variety that ought to be better known.

NAMES OF PLANTS.—William Grant.—1, *Cimicifuga racemosa*; 2, *Verbascum Thapsus*; 3, *Stachys grandiflora*; 4, *Campanula rapunculoides*; 5, *Geranium sanguineum*; 6, *Rose*, probably Duke of Edinburgh. *Arbutus*.—1, *Pyrus terminalis*; 2, *Tilia tomentosa*; 3, *Abies nobilis*.—C. C. F.—1, *Juncus maritimus*; 2, *J. glaucus*; 3, *Scirpus lacustris*; 4, *S. maritimus*.—C. W. D.—*Statice sinuata*.—E. F. Chawner.—*Mitraria coccinea*, quite hardy in sheltered positions. —M. P.—Tulip Tree (*Liriodendron tulipifera*). —*Saturnia*. —*Hedera Helix* var. *conglomerata*.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

IN no sense was the fortnightly meeting of the 4th inst. of an overflow character, though there was much to interest and admire. Most interesting, perhaps, was the almost unique collection of scented *Pelargoniums* from Elstree, while the *Gladioli* from Langport constituted a feature alone. Apart from these were great banks of herbaceous *Phloxes*, and in all probability these showy summer flowers have never been better staged. Fruit (Apples) was represented by collections from New Zealand and Hounslow. There were three collections of *Orchids* and several good novelties on view.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), and Messrs. C. T. Drury, E. A. Bowles, J. Green, F. W. Harvey, G. Reuthe, G. Harrow, J. W. Moorman, W. Howe, J. F. McLeod, T. Stevenson, J. Jennings, C. Dixon, J. Dickson, H. J. Jones, A. Turner, C. E. Shea, C. E. Pearson, W. P. Thomson, E. H. Jenkins, J. T. Bennett-Poë, W. Cuthbertson, G. Paul, W. G. Baker, J. Hudson, C. R. Fielder and W. J. Bean.

Quite a unique exhibit of the scented *Pelargoniums* came from the Hon. Vicary Gibbs, Elstree, Herts (gardener, Mr. E. Beckett). Arranged on the floor opposite the entrance, it attracted attention by its variety, completeness and extent, the latter running into some 400 superficial feet. Practically every known kind in cultivation was to be found in the group in either standard or bush form, and, margined by the well-known and popular silver-leaved variety *Lady Plymouth*, constituted an interesting feature of the meeting. Prized for their leaf fragrance rather than for flower beauty, many find pleasure in cultivating the more select kinds for the purpose named, and they are certainly among the oldest of greenhouse favourites. A large collection was staged, and we have no desire to publish a long list of the many varieties shown; hence a few names of the more distinct must suffice. Of these we take at once the very interesting, though almost leafless, *P. tetragonum*, whose curious stem growth renders it striking and distinct, though not beautiful; *P. betulinum*, *P. echinatum*, *P. artemisiifolia*, *P. Shottii* (with woolly leaves and crimson flowers), *P. saxifragoides* (a trailing species with pink flowers, for which the specific name of "*hederifolia*" would, we think, be far more appropriate), *P. glaucum* (almost *Corydalis*-like in leaf and with greenish yellow flowers) and *P. terebintha* as the more conspicuous examples. *P. tomentosum*, *P. Clorinda*, *P. Rollinson's Unique* (an old, much-esteemed sort), *P. denticulata*, *P. citriodorum*, *P. crispum* in variety, *P. pinnatum* and the "Pheasant's Foot" were others of beauty and interest. A silver-gilt Flora medal was awarded.

Messrs. James Kelway and Son, Langport, displayed a superb avenue of *Gladioli*, the extent of the exhibit, in conjunction with almost endless variety, constituting quite a feature. We were particularly struck by the beauty and grace of the new *primulinus* hybrids, to which the group name of "*Lang-prim*"—of rather doubtful euphony—has been given. Some of the best of these were *Ella Kelway*, *Wrath*, *Sylph*, *Friendship*, *T. W. Sanders*, *Mrs. Crane*, *Josephine Kelway* and *Banshee*. Of the large-flowered set (hybrids of *nanceianus*, *Childsii* and *Lemoinei*) *Mrs. F. Field* (cream, blotched crimson), *Blotch* (white and crimson), *Queen Mary* (ivory white with dark blotch) and *Mrs. Asquith* (a very distinct blotched variety) were among the best. Others of merit and distinction included *Dido* (of intense crimson hue), *Cecilia Kelway* (salmon, rose, crimson and yellow, very distinct), *Crown Jewel*, *Indomitable*, *Indiana* (deep maroon); *Dick* (mauve, violet and purple), *Happy Match*, *Golden Ray*, and *Favour* (scarlet, freckled with white). Silver-gilt Banksian medal.

The Misses Hopkins, Shepperton-on-Thames, showed a small collection of alpine and herbaceous plants with *Violas*.

Messrs. H. B. May and Son, Edmonton, contributed an excellent table of Ferns and flowering plants, the former largely in the majority. Of these the varied forms of *Nephrolepis* were much in evidence, such well-marked sorts as *N. elegantissima compacta* and *N. Wredii* appearing in prominent groups. *N. Willmottii*, the most mossy and diminutive of all, was particularly well shown, with *Adiantums* and many others. White and red *Lapagerias* were very finely displayed. Silver Banksian medal.

Messrs. Stuart Low and Co., Enfield, staged an excellent exhibit of *Streptocarpus* and *Gloxinias*, together with a fine grouping of *Nerine Fothergillii* major. *Solanum Wendlandii* was also good, and *Clethra arborea* variegata pleasing in flower.

Mr. James Douglas, Great Bookham, again staged a superb lot of Carnations. Bookham White, *Mrs. Griffith Jones* (buff), *Mrs. George Marshall* (crimson), *Passquin* (fancy), *Daffodil* (the best yellow), *Elizabeth Shiffner*, *Solfaterra* (yellow), *Linkman* (good yellow-ground fancy) and *Edenside* were among the best. Silver Flora medal.

Mr. Reginald R. Cory, Duffryn, sent a collection of *Peony*-flowered *Dablias*. *Myrtus Luna* (syn. *Eugenia apiculata*) came from the same source. It forms a handsome bush, covered with white-cupped flowers. A cultural commendation was awarded.

Campanula R. B. Loder is a pretty semi-double flowered hybrid of very dwarf habit and great freedom. It was sent by Mr. Reginald Prichard, West Moors, Dorset, and is full of promise.

Some charming flowering examples of *Tecoma grandiflora* were sent by H. R. H. the Duchess of Albany, Claremont (gardener, Mr. J. S. Kelly). They were greatly admired. A cultural commendation was awarded.

Messrs. Rich and Co., Bath, displayed a liberal collection of Phloxes, of which Meteor, Le Mahdi, Frau A. Buchner and Europa were among the best.

Messrs. W. Cutbush and Son, Highgate, N., had an excellent exhibit of the new Ivy-leaved Pelargonium Radiance. It is very brilliant in colour and profusely flowered.

Mr. G. Reutho, Keston, Kent, had an interesting lot of plants, both alpine and shrub. Of the former, Campanula Tymosii, C. Raineri and C. Stansfieldii were very beautiful. Astilbe simplicifolia was most charming. Desfontainea spinosa (in scarlet and gold), Bravoa geminiflora, Sparaxis pulcherrima and Veratrum nigrum were other notable plants. Bronze Banksian medal.

Messrs. H. J. Jones, Limited, Lewisham, brought an excellent exhibit of herbaceous Phloxes, for which a silver-gilt Banksian medal was awarded. The trusses were particularly clean and fresh-looking. Among new varieties, Mrs. A. W. Alder (shell pink) and Violet Guest (rich salmon, dark eye) were the best. Widar (Parma Violet blue), Rijnsdroom (salmon scarlet), The Queen (white, purple eye), Mme. Paul Dutrie (soft pink), Goliath (carmine, immense size) and General van Heutsz (very brilliant) were all excellent.

Mr. J. C. Allgrove, Middle Green, Langley, had an extensive exhibit of Roses—quite a remarkable grouping, considering the wet that had been experienced. Lyon Rose, Mme. Ravary, General Macarthur, Mrs. A. Ward, Rayon d'Or (quite a glorious display), Mme. Edouard Herriot, Lady Hillingdon and Mme. Abel Chateau were among the finer sorts. A feature of the group was a delightful lot of the violet-coloured Thalictrum dipterocarpum, without doubt one of the finest hardy plants extant. Silver Flora medal.

Mr. James Box, Lindfield Nurseries, Hayward's Heath, had a superb grouping of herbaceous Phloxes, probably one of the finest seen this year. Arranged in formidable groups, the whole constituted a bank of colour such as is rarely seen. Albert Vandel (violet blue), Arthur Rane (salmon), Dr. Königshofer (brilliant orange scarlet), Sofie Cordes (soft lilac), Jules Sandeau (cerise), Le Mahdi (which variety formed a huge centre-piece), Mrs. E. H. Jenkins, Frau Antonin Buchner, Fraulein von Lassberg (the finest whites) and Dr. Charcot (dark violet) were some of the finer in a very imposing display.

Mr. W. Wells, jun., Mersham, also had a capital exhibit of Phloxes, such as Dr. Königshofer, Le Mahdi, Europa, Selma, Meteor, G. A. Strohlein, Frau Antonin Buchner, Elizabeth Campbell and other excellent sorts being well staged.

FRUIT AND VEGETABLE COMMITTEE.

Present: A. H. Pearson, Esq. (chairman), and Messrs. J. Cheal, George Woodward, G. Kelf, A. Bullock, P. D. Tuckett, J. Jacques, Owen Thomas, E. A. Bunyard, Edwin Beckett, J. Harrison, A. R. Allan and H. H. Williams.

Messrs. S. Spooner and Sons, Hounslow, showed a select lot of Apples, such as Early Victoria, Red Quarrenden, Early Red Margaret, Beauty of Bath, Lady Sudeley, Gladstone, Ruddy (a fine-looking sort), Irish Peach, Worcester Pearmain, White Transparent and many others. A dish of fruits of the Strawberry-Raspberry was also on view.

The Tonkins Trustees, Treliske Orchard, Ettrick, Otago, New Zealand, also staged an exhibit of Apples, remarkable for size and good colouring. Scarlet Nonpareil, Cleopatra (yellow-skinned variety), Esopus Spitzenberg (very richly coloured), Jonathan, Delicious, Munroe's Favourite and Rome Beauty were among the more conspicuous in a very telling lot.

ORCHID COMMITTEE.

Present: J. Gurney Fowler, Esq. (chairman), and Messrs. J. O'Brien, Gurney Wilson, W. Bolton, R. Brooman White, Pantia Ralli, R. Thwaites, J. Charlesworth, Arthur Dye, S. W. Flory and F. Sander.

Messrs. Sander and Sons, St. Albans, had many interesting Orchids, among which the rarely seen trio of Anguloas—A. Cliftonii (golden), A. uniflora (pink) and A. eburnea (white)—were conspicuous. Others of note included an unknown species of Maxillaria with yellow flowers, the pure white Coelogyne mooreana, a superb Lælio-Cattleya wistoniensis, Epidendrum radiatum (vanilla-scented) and the remarkable Brassia lawrenceana longissima, whose nearly foot-long, tapering, orange-coloured sepals and deep cream coloured lip rendered it very striking amid the rest. Silver Banksian medal.

Messrs. Stuart Low and Co., Enfield, had some nice examples of Vanda cœrulea, Aerides maculosum Schröderæ, Cattleya dowiana, Miltonia Queen Alexandra, Phalaenopsis rimestadiana, with Odontiodas and others. Silver Banksian medal.

Messrs. Charlesworth and Co., Hayward's Heath, staged some excellent Cattleya dowiana, C. gaskelliana alba (very fine), the intensely coloured Odontioda Brewii and O. Wilsonii (pink), together with Odontoglossum Ossulstonii (heavily pink spotted), O. Doris (rich chocolate markings) and O. crispum harryanum, among others. Silver Banksian medal.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE usual monthly meeting of this association was held in the Goid Hall, St. Andrew Square, Edinburgh, on the evening of August 3. The chair was occupied by the president, Mr. W. G. Pirie, Dalhousie Castle Gardens. The evening was principally devoted to the reading of papers sent in by junior members in connection with the association's annual prize competition for these. On account of the war and the absence of several junior members with the Forces, the number of papers was smaller than usual, but those submitted were generally excellent. The adjudicators were Mr. J. S. Chisholm of the Edinburgh and East of Scotland College of Agri-

culture, and Mr. J. Highgate, gardener to the Marquis of Linlithgow, Hopetoun House Gardens. The first prize, a gold medal, was awarded to Mr. Walter Fleming, Mount Melville Gardens, St. Andrews, who had a capital paper on "The Cultivation of the Potato." Miss May White, Edinburgh, won the second prize with an excellent paper on "Insect Pests on the Apple." The third prize was awarded to Mr. John G. Kerr, Barcaldine Gardens, Ledaig, Argyllshire, for a good paper on "The Potato." The papers were well received. Mr. Pirie made an appropriate reference to the death of Mr. A. D. Mackenzie, of the firm of Messrs. Mackenzie and Moncur, who was at one time a president of the association. It was agreed to record in the minutes an expression of regret, and to send a letter of condolence to Mr. Mackenzie's widow and family.

The exhibits were of considerable merit and beauty, and included a display of new frilled Pansies and of double and single Pelargoniums, sent by Messrs. Dobbie and Co., The Royal Nurseries, Edinburgh; a capital exhibit of Larkspurs, Spiræa Vesta, Erythrina Crista-galli and other plants from the Edinburgh Public Parks Department, sent by Mr. J. W. M'Hattie, superintendent; Strawberries from Murieston Farm Colony, exhibited by Mr. R. Cairns, superintendent; and Sweet Peas from Miss Burton, New Saughton Hall, Polton.

HAYWARD'S HEATH AND MID-SUSSEX HORTICULTURAL SOCIETY.

THE twenty-seventh annual exhibition took place on August 2 in Victoria Park, and it was arranged that the proceeds should benefit exclusively the Horticultural War Relief Fund. To this end also the trade at the close of the show sold their exhibits, thus tending considerably to augment the amount for such a useful purpose. Though incomparable to others of preceding years, the exhibition was, nevertheless, a very creditable one, although in no classes save those of the cottagers was competition actually keen.

The Right Hon. Lord North, Banbury, who was the only exhibitor in the class for eighteen vases of Sweet Peas, was awarded the challenge trophy (to be held for one year) offered in this class—a well-deserved award, as the blooms were of excellent quality and very finely displayed. Mr. H. M. Knight, Hayward's Heath, was similarly successful in the class for a display of Perpetual-flowering Carnations. The same exhibitor scored for six pots of Streptocarpus. W. A. Sturdy, Esq., Lindfield, was successful for a collection of hardy perennials, also for a table of fruit 6 feet by 4 feet, arranged for effect with cut flowers or foliage. In the class for a collection of vegetables, eight kinds, the honour fell to Lord North with 48 points, as against 42 obtained by Mr. L. E. Smith, Handcross.

The greatest charm of the exhibition was furnished by the exhibits from the trade, which were magnificent in their quality and splendour of display, and comprised a large stand of Carnations from Messrs. Allwood Brothers, Hayward's Heath. A grand display of Roses was staged by Mr. Elisha Hicks, Twyford, Berks, whose new single Hybrid Tea Princess Mary evoked incessant admiration, not only on account of its quality of blooms and grandeur of colour, but also for its remarkable perfume. Mr. James Box, Lindfield, and Mr. Gibbs Box, Burgess Hill, both had brilliant displays of Phloxes, Gladioli and other herbaceous flowering subjects. To all the foregoing well-deserved gold medals were awarded. A silver-gilt medal was awarded to Mr. Frank Woollard, Brighton, for a stand of Roses; also to a non-competitive exhibit from His Grace the Duke of Hamilton and Brandon, Balcombe, who, in addition to a fine table of fruit, interspersed with small vases of Orchids, staged also a fine exhibit of vegetables and a stand of Begonias. Colonel Stephenson R. Clarke, Borde Hill, was awarded a certificate of merit for a most interesting collection of hardy flowering shrubs.

ROYAL LANCASHIRE AGRICULTURAL SOCIETY.

THE horticultural section of this society continues to grow in favour. On the opening day, July 29, the pavilion was crowded with a host of delighted visitors. That the Council acted wisely when adding a horticultural section with a liberal prize-list has been abundantly proved. This season's exhibition was held in Witton Park, Blackburn, and although a smaller domain than is generally accorded to this important show, the grounds and surroundings were ample and delightful. To give a full report of a show of this magnitude requires more space than can be allotted, and owing to this our notices must be brief and some exhibits passed over, although deserving of recognition.

To begin with the Queen of Flowers, Messrs. Alex. Dickson and Sons, Hawtmark, Belfast, secured the society's large gold medal for a contribution extensive in size and of great charm. Two new Roses were honoured, Lord Kitchener receiving a first-class certificate and General French an award of merit. Mr. R. Bolton of Carnforth also gained a gold medal for a charming array of Sweet Peas arranged in an easy and delightful manner, with a tinge of greenery that added to the effect. Messrs. Alex. Dickson (gold medallists) also had an extensive display of this popular flower.

The King's Acre Nursery Company, Hereford, contributed an imposing and valuable display of fruit with tempting forms of many kinds, including huge Pears, rosy Apples and bright Peaches. The Lancashire County Council displayed a valuable collection, proving its good educational work, including growing Tomatoes (a promising seedling), culinary and Sweet Peas, Apples in pots,

and various kinds of well-grown vegetables. Messrs. Little and Ballantyne showed well-grown conifers and trees, artistically arranged, at the entrance of the tent. Messrs. W. Artindale and Sons, Sheffield, had a charming display of Violas, which delighted visitors. Messrs. S. Broadhead and Son, Huddersfield, had an interesting display of alpine plants naturally planted in a rockery. Messrs. Godfrey and Son, Exmouth, Devon, set up huge bunches of the favourite Phlox, Gladioli, &c. Mr. George Mathews, gardener to A. Leaver, Esq., Briercliffe, staged a pleasing lot of cut Begonia blooms. These various exhibits were each acknowledged by the award of the society's gold medal.

Turning to the competitive exhibits, we have the greater section, although shown in a much smaller space. Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Workop, proved himself a past-master in fruit culture, attaining to the premier position for twelve dishes, including monster Melons, enticing Grapes, rich Peaches and Nectarines. In addition to this honour the four leading awards in the Grape classes all went to this excellent cultivator. Mr. J. E. Hathaway, gardener to John Brennand, Esq., Thirsk; and Mr. J. E. Newman, gardener to R. A. Tatton, Esq., Preston, were also first prize winners in this section.

Sweet Peas require more than a passing notice, nine classes being devoted to them. Mr. William Bond, Formby, excelled in this particular sphere, winning in the premier class for eighteen vases, and also in two other classes, staging long stems with large, well-coloured flowers. Other winners of first prizes were Mr. E. R. James, Banbury; Mr. G. E. Kitchens, Wem, Salop; Mr. V. Booth, Gatley, Cheshire; and Mr. J. A. Whittaker (two), Tarn House, Skipton.

Dinner-tables consisted of about two dozen, providing plenty of material for educational purposes in varied floral forms, including the aristocratic Orchid, the queenly Rose, the popular Sweet Pea, the pleasing Gerbera, the quaint Gloriosa and many others. The leading awards went to Mrs. John Nixon, Alderley Edge; Miss Newsham, Ormskirk; and Mrs. W. Garner, Hale, all well known for their artistic capabilities.

Turning to the plant section, there were four classes, and those renowned exhibitors, Messrs. James Cypher of Cheltenham, took the leading award in three of the classes, viz., for a group of miscellaneous plants in a space of 300 square feet; twelve stove or greenhouse plants, not fewer than seven to be in bloom; and a like number in pots not exceeding 10 inches. Messrs. Blackmore and Langdon of Bath contributed a group of tuberous Begonias in the remaining class, and possibly this entry caused a greater surprise than any other in the show. The form was that of an inverted saucer, broken up by a Palm in the centre and hanging baskets at intervals. The delicacy and colouring of the massive and symmetrical blooms and the artistic staging gained hosts of admirers and words of commendation.

Other cut-flower classes included one for an exhibit in a space of 100 square feet, Mr. W. H. Garner securing the leading award, staging Gladioli, Phloxes, Carnations, Roses, &c.

The Carnation-lover was gratified by the exhibit of Messrs. C. H. Tardevin, Willaston, who staged fine blooms, pleasingly grouped.

Roses were shown by Mr. Gerald Garnett (Wyreside) and Mr. J. W. G. Smith, staging well-formed blooms, and these exhibitors obtained first prizes.

Mr. Frank Reader and Horticultural Exhibitors.

At the Royal Horticultural Hall on August 4, Mr. Frank Reader, chief cashier of the Royal Horticultural Society, was presented with a solid silver salver and a purse of gold. These had been subscribed for by horticultural exhibitors as an appreciation of the unfailing courtesy shown towards them, and assistance so willingly rendered, by Mr. Reader during the past twenty-five years. The presentation was made in the presence of a large and representative gathering by Mr. Harold Beale, who, in a business-like speech, stated that nothing ever seemed a trouble to the recipient. No matter what an exhibitor wanted, Mr. Reader was the man to go to. In replying, Mr. Reader stated that it was always a pleasure to do anything for members of the horticultural trade, and he hoped the good feeling that existed not only between those present and himself, but also between exhibitors and the Royal Horticultural Society, would long continue. Mr. F. Herbert Chapman, who had acted as secretary and treasurer, was cordially thanked for his services. The salver, which is suitably engraved, is a very handsome example of the silversmith's art.

THE GARDEN.

No. 2283.—VOL. LXXIX.

AUGUST 21, 1915.

NOTES OF THE WEEK.

Lieutenant H. M. Woolley.—It was a recent and unexpected pleasure to meet Mr. H. M. Woolley, a keen horticulturist, whose home address is Old Riffhams, Danbury, Essex. Mr. Woolley left the Royal Gardens, Kew, in March, 1908, to take up an appointment on a rubber plantation in Borneo, and he has returned to England to join the Colours. It will be remembered that his brother, then Lieutenant Woolley of the 9th London Regiment, was awarded the V.C. for gallantry on Hill 60, since when he has been promoted to captain. Lieutenant H. M. Woolley has been gazetted to the 12th Essex Reserve Battalion.

The Plantain Lilies.—Owing to their bold foliage and vigorous habit, the larger of the Plantain Lilies or Funkias are excellent for forming broad edgings to shaded pathways, as shown in the illustration. They appreciate well-drained but rich soil, when they will quickly make large tufts of striking, ornamental foliage, surmounted, in their respective seasons, by the rather small, pendulous, bell-shaped flowers. The best known are *F. Sieboldii*, with very large, glaucous leaves and creamy lilac flowers; *F. grandiflora*, with comparatively large, pure white and sweetly scented flowers; and *F. ovata*, with very large, deep green leaves and lilac blue flowers. There are also several variegated varieties of these species. *F. tardiflora* flowers during late October and November, when its pale purple blossoms are much appreciated in the outdoor garden.

Bottled Fruits and Vegetables.—The Royal Agricultural Society of England, realising the desirability of encouraging everyone to preserve as much food as possible, are offering prizes for bottled fruits and vegetables at their Manchester show next year. These prizes are offered both to amateurs who bottle fruits and vegetables for their own use, and not specially for the purposes of sale; and to fruit preservers who bottle the fruits which they offer for sale. Full particulars and conditions of entry can be obtained from the Secretary, 16, Bedford Square, London, W.C.

Lime Wood Attacked by Fungus.—At a recent meeting of the scientific committee of the Royal Horticultural Society, Mr. Bowles showed a specimen of Lime from a branch which had fallen from a tree in the avenue at Forty Hall, Enfield, in which the annual rings of wood were separated from one another. This separation had evidently been brought about by a fungus, the mycelium of which could be discerned as a thin pellicle between the rings, but could not be further identified until fruit was obtainable.

Lobelia ramosa.—This makes an excellent pot plant for conservatory decoration in early

This makes a fine, branching bush 3 feet or rather more in height, the large, funnel-shaped blossoms being produced in great profusion. These are a charming shade of rose pink, with darker venations. Both in the garden and as cut flowers for the house these Mallows are beautiful and useful, and deserve to be more extensively grown. The white Mallow is also very pretty, and when grown in association with the pink, in the proportion of about one white to three pink, the effect is particularly good. Readers should make a note of these now in their diaries, so that seeds may be ordered early next year for sowing outdoors the first week in April.

Rose Betty.—For a strong-growing and continuous-flowering garden Rose we do not know of a better variety than this. Raised by Messrs. Alex. Dickson and Sons, and first put into commerce in 1905, it quickly became a great favourite, its large clusters of long-petalled, fragrant flowers never failing to elicit admiration. The colour is coppery rose, shaded yellow, the combination creating a very charming effect. It makes a large, rather spreading bush, the stout, spiny stems withstanding the fiercest gales. Although rather too vigorous for beds, except those of large size, it is excellent as a large specimen in the mixed border or, indeed, any situation where plenty of space is available.

Collarette Dahlias.—It may surprise a good many who are not familiar with Dahlia-growing to learn that this type, the Collarettes, may not only very easily be raised from seed, but that they are just as much annuals (if by that is meant that they bloom the same year as that in which they are sown) as China Asters. In fact, treated in the same way and under exactly the same conditions, some of them are as likely as not to be in bloom the first. A good strain provides a great variety of colour, and in few of the resultant plants will the little disc of petals round the yellow composite centre be wanting. A sixpenny or a shilling packet is full of potentiality.

PLANTAIN LILIES BORDERING A SHADED PATHWAY.

summer. We saw some very good examples of it this year in a Hampshire garden. Under glass, with a minimum of heat, the growth is upright and but little branched. It flowers freely, but not in such profusion as to hide all the stems and leaves. On the contrary, these are very much in evidence, and serve as a delightful foil for the large blue flowers. *Tenuifolia* is another somewhat similar Lobelia which may be grown for the same purpose. It is taller in growth and of a deeper shade of blue, but it does not make such a nice compact plant as *ramosa*.

Pink and White Mallows.—Among the many hardy annuals that are flowering just now, none is more highly appreciated than the pink Mallow.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

A Large Fungus.—On August 10, in a small shrubbery in my garden, a fungus—I believe, *Lycoperdon giganteum*—was taken up measuring 42 inches in circumference and 10 inches in height, weighing 5lb. 14oz.—C. L.

Recipe for Bottling Green Figs Wanted.—I would be glad if any reader could give recipes for bottling or preserving green Figs. When should they be gathered and how treated? Can they be kept green and clear-looking in the bottles, as one sometimes sees them, or must they go dark?—C. E. C.

British versus Dutch Bulbs.—Let everyone who contemplates buying bulbs pause to think before they hastily buy the usual dumped Dutch

for Mr. Jeffrey, Captain Hope's gardener, believes in good cultivation for his Roses and carries his ideas into practice.—SUB ROSA.

Euphorbia Sibthorpiae.—Few of the hardy species of *Euphorbia* possess much ornamental value, but of the small number which are worth a situation in the garden *E. Sibthorpiae* takes a high place. It is a native of Greece, and though long known to botanists, is seldom seen in gardens. Of extremely robust habit, it pushes up numerous sturdy stems, which rise to a height of some 5 feet or 6 feet. The stems—at least the upper portions—are densely clothed with narrow, pointed, bluish green leaves, each quite 5 inches long. The plant is at its best during March and April, and at that time the terminal shoot of each stem consists of an inflorescence, the conspicuous portion of which is the bracts, in the centre of which the inconspicuous flowers are carried. In this Spurge the bracts are of a bright greenish yellow, so that

and Thomas Moore. No praise is too high for either of these varieties, for they respond quite well to forcing treatment or otherwise while for massing outdoors we have but few more effective in their respective shades of silky carmine rose and buff orange.—H. TURNER, *Serlby Gardens, Bawtry.*

Toads in the Garden.—Re article on toads in *THE GARDEN* of July 31, Mr. E. T. Ellis does right in calling attention to the good these creatures do. But surely he is wrong when he says, "Some people think they eat young growths of annuals and other plants." Now, I wonder if these people ever saw a toad making a meal off plants. The natural food of toads are insects; and after taming a toad to come at a whistle and feed out of your hand, surely one can speak of their habits. Woodlice are a pest to the gardener, and these are their favourite food. After some years of observation, I never saw a toad take any insect when still, but always when on the move.

I go so far as to say they never take anything unless moving. Offer the most dainty morsel to the toad and watch him put his head on one side. Directly the insect moves away it is snapped up by the tongue quicker than the eye can follow. Sometimes one can induce the creature to take food by poking it about with a twig. I have seen a small portion of a plant rolled up and moved about with a stick. The toad will take it; but watch the creature's efforts to get rid of it. This alone should be sufficient proof that toads never take vegetable food in any way.—S. G. S., *Newbury.*

Some Beautiful Flower-Beds.

The flower borders in the Bournemouth Public Gardens look, as usual, very beautiful. The majority of them are very large, and contain many plants. Carpet bedding, bedding-out as it obtained about twenty-five years ago, and subtropical bedding are all represented, and all find favour with the public. It would take up too much space to note the features of all the beds as planted this year, but three of them may be explained. No hard-and-fast rule is adhered to by Mr. J. B. Stevenson, the able superintendent, and he always has some-

thing fresh for the visitors to enjoy every year. Geranium Golden Harry Hieover and blue Lobelia were evenly mixed in one case with dot plants of Fuchsias and a bordering of *Alyssum maritimum*. Zonal Pelargonium Maxime Kovalevsky (orange-coloured flowers or orange red) with dot plants of Liliiums and an edging of *Centaureas* looked grand in other beds. A very striking bed was one filled in the centre with *Alyssum maritimum*, dot plants of Fuchsias, and a very broad edging of that grand old garden plant, *Gazania splendens*. Of course, there are plenty of Fir trees in and near the Bournemouth Public Gardens. There are not many kinds of plants that will succeed under these trees. Funkias were thriving under many Firs, however, and even the old favourite Sweet William was a success. I have never seen Funkias do better. They should be more extensively used in gardens than they are, as both flowers and foliage are attractive.—G. G.

EUPHORBIA SIBTHORPÆ IN THE GLASNEVIN BOTANIC GARDENS.

produce. The great British bulb-growing centres—Guernsey, Ireland and the many large bulb farms in England—grow bulbs equal to any Dutch produce. These British firms have not only sent their best manhood to support our Armies, but they also employ British labour, which should at all costs be supported.—C. H. TAUDÉVIN.

Rose Rambling Rector.—But seldom found in catalogues or in gardens, Rose Rambling Rector is yet one which deserves the consideration of those who take pleasure in climbing Roses with small flowers. I saw a pillar of this in the gardens of Captain Hope at St. Mary's Isle, Kirkcudbrightshire, the other day. It was superb—a perfect mass of small Ranunculus-like white flowers, much more freely produced than on Thalia and of purer white. In big bunches, these, combined with the free growth which covered a tall pillar, made a picture of great beauty. It is almost superfluous to say that it was well grown,

a large plant carrying many flower-heads presents a highly ornamental appearance. *E. Sibthorpiae* is perfectly hardy at Glasnevin, where it is growing in a rather exposed position, so that it should be hardy in most parts of the country. It succeeds in any ordinary garden soil.—S. ROSE.

Bulb Notes.—As a great admirer of that excellent Tulip Prince of Austria, it was with pleasure that I noticed the Rev. Joseph Jacob's able pen, on page 385, issue August 7, recommending it for pots. It is unquestionably good, and as a second early very difficult to improve upon to those who appreciate its colour. While serving with the late Mr. W. Fyfe at Lockinge I well remember the favourable impression he formed of it both growing inside and outside, and said it would undoubtedly be much more largely grown when its good points were recognised and the price of it came down a little. I would also urge the claims to a place, for use in pots, of Proserpine

Goldfish Changing Colour.—My experience of the golden carp does not entirely agree with that of "S. G. S., Newbury," in his reply to the query from "G. M." on page 385, issue August 7. For many years I had gold and silver fish in a large tropical Water Lily tank, and also in two tanks outdoors. There were over a hundred fish in all, and many thousands were hatched every year; but the old fish are such cannibals that unless the babies were isolated, very few reached maturity. When hatched they were invariably of dark brown colour (I have never seen a black carp), and retained this colour for the first season. Early in the next spring a proportion (usually about seven out of twelve) would change colour, some becoming gold, a few silver, and others parti-coloured. The remainder continued brown for the rest of their lives. Generally speaking, there was no change in colour or marking among the sports; but in some of those which became red and brown—popularly called black and gold—the gold patches would increase a little at the expense of the black for a few years. If there is plenty of water, artificial feeding is not necessary; but with a limited supply it is necessary to supplement their natural food, and then, as "S. G. S." says, bread is one of the best foods, though the fish like a dry, flaky biscuit, such as Toast or Cream Crackers. These fish are very easily tamed, and will soon swim to the side of the tank and feed on a piece of bread held in one's fingers. As with plants, hardness can only be relative. The individual which is hardy at one place may be tender a mile away, so it is not safe to particularise any locality. Besides, much depends on the character of the pond or tank, as well as its position. In my experience goldfish do not thrive in slate tanks, even in warm districts. The water becomes too cold and hard, whereas in adjoining tanks of concrete the fish are quite happy. These fish love the sun, and will lie for hours basking in the sun-warmed water close to the surface. During very cold springs goldfish in open-air tanks and ponds are often attacked by a fungoid disease under the scales. This is generally fatal, and I am not aware of any cure, except that if the disease is seen in its early stages and the fish can be isolated in warm water, it frequently disappears, though the disease sometimes attacks fish that are in heated tanks, in which case the affected fish should be immediately caught and destroyed, as the disease is contagious.—**CECIL BARTLETT.**

The Economy of Rockwork.—I have just been reading the article by "Kurstcot" in *THE GARDEN* for August 7, page 386, and cannot help thinking that there is much therein that will prove misleading to the average reader. In the first place, your contributor claims that the "rockery appeals, and should appeal, because it is the method of culture giving the maximum result in plant cultivation on any given area of ground." In this he is wrong, and if mere economy of space is the only recommendation for the introduction of a rock garden, then he and everyone else will be well advised to abandon the idea. Even for the cultivation of alpine plants (and "Kurstcot" apparently extends his claim to all garden subjects) it is not the most economical; and if mere collections of plants are required, and these to occupy the smallest possible area, then by far the best method of cultivation is to grow them in pots or pans, as they can then be moved as desirable, and instead of the 250 mentioned by "Kurstcot," at least 400 species

can be well grown. Far, far better this than the sort of rockery he describes with its "stone burr bricks and other material." What harmony of association is there between burr bricks and alpine plants? What is there beautiful in a burr brick that we should desire it? Why will people talk of burr bricks and gardens in the same breath? If there is anything of beauty in a rock garden, surely it is in the natural association of the plants with a reproduction—as far as may be—of their natural environment. Nor does a burr brick assist in cultivation; rather the reverse, in fact. Many plants avoid as carefully as they can the partially vitrified surface, some decline to grow near burr bricks at all, and none really likes them. The coarser plants certainly cover them, but they will do that with any other rubbish.

Another quotation from "Kurstcot" is scarcely the idea that many of us hold. He says: "Too much is usually made of the rockery itself and too little of the growth it accommodates." The failure of the average rock garden is due to ignoring the true place that the stone should occupy in the scheme. So much is this the case that the stone is often so obtrusively ugly that one is tempted to overlook the plants altogether. This is rather because not enough instead of too much has been made of it. After all the volumes that have been written on the subject, it would appear to be unnecessary to reiterate the fact that the rock garden to be successful must be something more than a place to cultivate plants; indeed, for this purpose *alone* it is unnecessary. The true place of the rock garden is to reproduce those natural conditions and effects one finds in rock districts, and then, having reproduced as nearly as may be such features as make the strongest appeal to our sense of the picturesque, to plant them as nearly as possible with the vegetation we should find in such conditions in Nature. The essence of the art of rock gardening is its realism. There is nothing either realistic or picturesque in heaps of stones, bricks, or broken concrete, however thickly they may be planted with alpine or any other plants; moreover, the argument frequently used that it does not matter what material is used, because it will soon be covered, is a foolish one.

At the Royal Horticultural Society's show held at Chelsea last May a series of rock gardens were exhibited, each of which occupied less space than that mentioned by "Kurstcot." In nearly every case some particular example of natural formation was adopted, all were different, and I think it will be conceded that many of them were beautiful because they looked natural. I was on the grounds throughout the whole of the time they were in the course of construction, and can say without hesitation that all of them could have been reconstructed under normal gardening conditions in such a way that they would have made ideal homes for alpine, and yet lose nothing of the actual beauty of the stone used, or the realism of its arrangement.

Frankly, I had hoped that after the advice so frequently given in your columns by many writers of experience and proved ability in this department of horticulture (without considering my own efforts in this respect), advice and instruction that you have extended over many years, the idea of constructing a rock garden of "bricks and other material" than natural stone was as dead as a certain king, and that, as of him, it might be said, "none were left so poor as to do it honour."—**GEORGE DILLISTONE.**

THE CULTIVATION OF FUCHSIAS.

[In Answer to a Correspondent.]

THERE are very few classes of plants that can be put to as many different uses as the numerous forms of Fuchsia which we have now in our gardens. For the embellishment of the greenhouse or conservatory they may be grown either as bushes, pyramids or standards, according to individual taste. The tendency to train them in standard form is decidedly on the increase, and certainly the flowers, owing to their drooping nature, are seen to considerable advantage when grown in this way. The looser-habited kinds are also very pretty when trained to roof or rafter, under which conditions they will keep up a display of bloom throughout the entire season.

Outdoors during the summer they are invaluable, either as large specimens sunk in the turf or grouped in a bed, thickly or thinly, according to individual fancy. When disposed over the surface of a bed at such a distance that each individual has space to show its true character, and the ground underneath is clothed with some low-growing flowering plant, such as the bedding Violas or Harrison's Musk, a very pretty effect is produced. Some of the dwarf-growing Fuchsias themselves may, if preferred, be used for carpeting purposes. In any enumeration of the uses to which Fuchsias may be put, the hardy kinds must on no account be passed over, as they flower profusely during the latter part of the summer, and their small, gracefully reflexed blossoms are by some preferred to the larger ones.

A desirable feature of the different Fuchsias is their simple cultural requirements, which stands them in good stead in cottage gardens as well as in more pretentious establishments. The named varieties are readily increased by cuttings, which may be taken at any time during the growing season. The best time, however, is in the spring months, when the plants, just awakened from their winter's sleep, push out new shoots. As soon as these shoots are from 2½ inches to 3 inches long, they form very suitable cuttings. If the bottom pair of leaves is removed and the cuttings inserted into pots of light, sandy soil, they will, in a close propagating-case in a gentle heat, strike root in about a fortnight. In the summer they will strike readily without any artificial heat, provided they are kept close and shaded.

When rooted, they must be potted singly and shifted into larger pots as required. A suitable compost for all Fuchsias may be made up of two parts of loam to one part each of leaf-mould and well-decayed cow-manure, with about half a part of sand, the whole being thoroughly incorporated together. If the loam is of a rather light nature, more of it may be used. This compost may be broken up finely for the small plants, using it rougher for the larger ones. On no account should it be sifted.

If the young plants are intended to be grown as bushes, they should have the growing points pinched out in order to induce the formation of side shoots; if as pyramids, be tied to an upright stick and the development of side branches encouraged; while for standards a good stake is necessary, and the removal of all side shoots till the required height is attained. The pots

STEPS AND BRICK TERRACE IN A SURREY GARDEN.

should be well drained, as Fuchsias need a liberal quantity of water during the growing season, yet at the same time they very much resent stagnant moisture. When the pots are well furnished with roots, an occasional stimulant will be beneficial, but there will be sufficient manure in the compost before recommended to last during the earlier stages.

In the winter, Fuchsias lose their leaves, so that they may be readily kept at that season anywhere just safe from frost. They need then little or no water. Taken into the greenhouse in the spring and watered, they will, under the influence of light, air and moisture, quickly start into growth. When taken from their winter quarters, any straggling shoots may be shortened back in order to ensure good shapely specimens. A few good varieties for growing into pyramidal shape are:

Single, dark-coloured flowers: Charming, Delight, President, Royal Purple, Scarcity, Valiant and Wave of Life.

Single, with white tube and sepals and coloured corollas: Amy Lye, Beauty of Trowbridge, Jubilee Queen, Lady Heytesbury and Mrs. Marshall.

Single, white corolla: Flocon de Neige.

Double, white corolla: Ballet Girl, Duchess of Edinburgh, Molesworth and Mrs. E. G. Hill.

Double, dark corolla: Avalanche, Brilliant, Comte Leon Tolstoi, La France and Phenomenal.

Single, yellowish or buff-coloured flowers: Earl of Beaconsfield and Mrs. Rundell.

There is such a small demand for the original species that very few growers keep them in stock. It is, however, probable that your correspondent might obtain them from Messrs. H. Cannell and Sons, Eynsford, Kent.

A very interesting group of Fuchsias showing a marked departure from the ordinary garden forms was sent here from the Continent about ten years ago. Some of them have since then become popular, though the markedly Teutonic

names of a few will not be in their favour now. The best known are Andenken an H. Henkel, Clio, Coralle, Eros, Fürst O. von Wernigerode, Gartenmeister Bonstadt, Gotingen, Perle and Thalia. These appear to be of mixed parentage, and I should say that *Fuchsia corymbiflora*, *F. fulgens* and *F. triphylla* had played a part in their production.

A very pretty little hybrid which should be of especial interest to your correspondent is Benita, which has been several times shown by Messrs. W. H. Rogers and Son, Red Lodge Nursery, Southampton, by whom it was raised. The flowers are about an inch long, while the tube and sepals, which do not reflex, are of a rosy scarlet colour. The petals are bright orange scarlet. This variety is very floriferous. The parents are said to be Gartenmeister Bonstadt and *Fuchsia splendens*.

H. P.

SEASONABLE NOTES ON AURICULAS.

THE Auriculas will soon commence their second season of growth, and it is most important that they should be encouraged to make all the headway possible during the present and two succeeding months. Auricula fanciers always like to see a good autumn growth, as much depends upon this point; in fact, it is most essential if we are to secure fine heads of bloom next spring. We must also have in view the two most critical months for the Auricula, viz., November and December; but if the plants are not coddled in any way, there will be little to fear in this direction. Full exposure to the air both night and day should be the rule, and a little rain will do the alpine Auriculas no harm; but the show varieties, on account of the farina, will need protection from heavy showers.

Each plant should be afforded sufficient water to keep the soil just moist, but this must not be overdone, and we must also remember that both extremes are detrimental to the Auricula. Moderation should be the key-note. A sharp watch must be kept for insect pests, especially green fly, and, directly any are seen, the frame should be vaporised without delay. Examine the collection at intervals, and remove all dead leaves and weeds.

Offsets or Side Shoots.—The bulk of the offsets are taken in February, but any that were not large enough for removal at that date may now be given a separate existence. If the variety is a common one and additional stock is not required, they may be planted in a small nursery bed and eventually transferred to the rock garden, flower border, or any shady position. With a new or rare kind we should endeavour to secure all the offsets available, and I always get a duplicate of any rare plant as soon as possible, because there is the possibility of the plant dying and the variety being lost, a serious matter if it happens to be the only example in cultivation. Each offset is removed with a few roots, and it is then placed in a

small pot, which should have one-third of its depth filled with drainage. The rooting medium consists of good quality loam, leaf-mould, and a sprinkling of silver sand. For a week or so the frame should be kept rather close; but once root action is evident, more air can be admitted and the lights finally removed. Some of the offsets that were potted off in February are making nice sturdy plants, and the pots are filled with roots; consequently they enjoy copious supplies of water whenever the weather is dry and hot. A few of the strongest will be given a receptacle two sizes larger, and the operation will be carried out at once. The same kind of soil will be employed as advised in the article that appeared in May. Careful watering must be practised until the plants are re-established. All the plants should be looked over, and if the surface soil has become hard or sour, it may be pricked up with a pointed stick, a proceeding which is beneficial to the plants as it admits air to the soil and thereby sweetens it.

Sickly Plants.—In all collections a few examples will be found that do not make so much progress as we desire, and where they exist it is best to place them together, when they can receive individual attention. The cause may be over-watering or the other extreme, stem rot, or the brown grub, but, happily, this pest does not often make its appearance where a clean compost is used. Sickly plants, as a general rule, should be turned out of their pots and the stem examined. If this is decayed, it must be cut back to living tissue, when it can be easily ascertained if the grub is present. It should, however, be pointed out that the grub is not in every instance responsible for stem decay; but, at the same time, it is just as well to watch for it. Before repotting in fresh soil a thorough cleansing of the stem and roots is needed, and in all probability a smaller pot will suffice. Very large pots should always be avoided for plants that are not in robust health.

W. B.

WORK AMONG THE CHRYSANTHEMUMS.

The Incurved Section.—Some of the finest blooms develop when the buds are "taken" during the first week in September. There are a few varieties, however, that resemble some of the Japanese, as they require a long time to properly develop from the bud stage. The buds of these are best taken about August 20, but if taken earlier the petals are coarse, short and do not incurve neatly, but often reflex or grow straight. I strongly advise cultivators who may now possess such buds, with shoots growing from the stems lower down, to discard the buds and retain the shoots, as the latter will bear small flowers suitable for vases or for greenhouse decoration. The inexperienced cultivator may tell which buds will prove unsatisfactory by noting the following: The centres of such buds are scaly and hard; the outer petals are more forward in proportion than the inner ones, are more irregular, and borne on a short, thin, hard stem.

How to "Take" Good Buds.—It will be found that some of the buds will be surrounded by shoots, and others by smaller buds and small leaves, but not real shoots that would grow again if left. Such buds are similar to terminals, and form thus through the plants forming buds instead of free growths during the summer season. The buds should be taken now, as they will develop freely and form beautiful blooms in due course. The buds with shoots growing near them are crowns, and must be taken in the same way as recommended in the case of crown buds of the Japanese. Let the bud to be retained be quite free of all surrounding shoots or smaller buds before the latter are pinched off. It is important that the stem of the retained bud be not damaged at all, else the bloom will open freer on one side than the other. I need only say, further, take the buds gradually, removing one shoot or one bud each day until all are pinched off.

Terminal and Late-Crown Buds. Terminal buds of the Japanese section will be in fit condition to be taken now, also very late-crown buds. The first will not develop and form large blooms, but specimens that will be highly coloured and useful. The latter will, in some cases, form very nice, compact blooms, refined and well coloured. All of them will be valuable for decorative purposes during November, and some of them will be good enough to exhibit.

Surface Mulching.—As long as there is space for watering and top-dressings, continue to put on the very thin sprinklings of rich, finely sifted composts as the new roots show on the surface of the old soil.

Suckers.—Some varieties produce suckers from the base more freely than others. Except in a few instances, where the varieties may be scarce, all these suckers must be carefully removed. If left to grow, they will be 1 foot to 18 inches high by the time the blooms are

developed. Of course, they will be useless for the purpose of cuttings, and will have robbed the plants of much nutriment. Furthermore, by leaving them so long untouched, the cultivator will have done much to prevent the free growth of sturdy suckers in November and December, just when such are required. Remove all suckers regularly until the blooms are half developed. In taking out these suckers be careful not to cut off roots. Insert the knife close to each sucker and sever it just below the surface of the soil. New ones will grow in due time and be very useful for insertion as cuttings.

Tying Up the Shoots.—The Chrysanthemum grows very freely in the early part of the autumn. I now refer chiefly to late-flowering varieties; but even shoots bearing terminal or late-crown buds grow very rapidly, and so the cultivator must be ever on the watch and tie them up before the winds break off the precious buds.

Earwigs.—In some districts these pests are very numerous, and will do a great deal of harm to buds if not checked. All well-known means should be adopted to trap them. The keen cultivator will not rely solely on traps, but spend a short time every evening in looking for and killing them. Earwigs remain quite still directly a light shines on them. If the plant is touched or shaken, they drop down suddenly. Many may be caught by hand and destroyed late at night. When this work is done, tap the stems of the plants sharply. Any insects overlooked or lurking among the leaves will be shaken to the floor, when a number can be thus caught, and, even if they are not, they will not again go near the buds that night. I have found this course result in saving the buds from serious injury year after year.

Border Varieties.—Owing chiefly to the introduction of new varieties dwarf in habit, bushy, free flowering, and bearing varied and richly

coloured blooms, our borders are gayer with Chrysanthemums than was the case a few years ago. The older and taller-growing sorts were often unsightly objects when tied up like so many sheaves of Corn. That was the fault of the cultivator. Do not let us be charged with such neglect now, but stake and tie out the stems neatly and in as natural a manner as possible. This ought not to be difficult, as the habit of the plants is so good.

Plants in all stages of development from the bud stage should be freely watered with diluted manure-water about twice a week. This attention will not only improve the quality of the blooms, but the leaves also. It is not necessary to apply mulches to border plants at this season, but it is necessary to hoe the soil around the plants and keep down weeds. While the plants are flowering they should be relabelled if the old labels are decaying. The removal of faded basal leaves not only takes away convenient hiding-places for earwigs, but makes the appearance of the plants all the more attractive. AVON.

AN INTERESTING SURREY GARDEN.

THERE are some drawbacks to gardening on the very light, sandy soil of the West Surrey Hills. Drought is often badly felt, and the constant need of liberal manuring is a serious drain on the horticultural exchequer. But there are compensations, one of the most distinct being the way the soil can be worked at all times of the year and in nearly all weathers; not, as in heavy land, being baked to a brick-like surface in dry times, or becoming a pasty mass when wet that can neither be worked nor trodden on.

THE LITTLE KITCHEN IN MR. THACKERAY TURNER'S GARDEN.

A SIMPLE OPENING THROUGH THE GARDEN WALL.

Another advantage is that, while in stronger soils, plants make over-abundant height and leaf-mass, here the growth is moderate and the bloom abundant, so that, whereas we often wish for a better soil, we comfort ourselves by the reflection that, after all, we should not wish to live in any other. So it is that, when the character of the ground is recognised and the right ways adopted, one of the chief of which is deep cultivation, there may be successful gardens such as the beautiful one that Mr. Thackeray Turner has made at Westbrook, close to Godalming, the garden having, from the beginning, the inestimable advantage of being designed and carried out by an artist who is in close sympathy with all that is best in the way of hardy flowers.

The main feature of the place is a sunk garden on three concentric levels, wide flights of steps coming down on all four sides to a green space with a large octagonal central tank. This is approached by several paths, some of grass and some of sand, each having its own intention and aspect, the flanking flower borders being differently treated. Yew hedges, now well grown, separate some of the main compartments. One path leads to the walled winter garden, a pleasant small space whose solid walls of Bargate stone are high enough to give complete seclusion and protection from wind and any cold draughts, but are not so high as to shut out even the low winter sun, and whose seat, in a hooded stone-built recess, is a pleasant place of rest on any fine days of the months of winter and earliest spring. No draught comes in by the arched opening, as the path of approach is walled on each side and turns just before the entrance is reached. The sunk garden is at its best during late summer, when the circling mass of tall plants on the upper level—Delphinium, Hollyhock and

so on—cut the bounding walls of Yew with massed peaks of splendid bloom.

The southern way out of the sunk garden passes through well-grouped masses of shrubs and trees and a space of home orchard, the path leading on, as everywhere in this good garden, with the giving of that sense of expectancy, that charm of mystery, that is the best quality with which a pleasure ground can be induced. One thinks, in painful contrast, of the many widespread gardens of the duller kind of formal type, that show everything all at once, leaving nothing more to expect, nothing more to hope for. Here there are ordered lines and yet a new delight at every turn.

The stone arch in the wall that separates the inner from the outer garden shows a simple and dignified way of passing through a garden wall. The way the Rose is led is also a good lesson in training; the arch is adorned, but not smothered. At the middle point of another side of the garden wall the way from the lawn to the kitchen garden passes through a gabled summer-house; in the kitchen garden itself some quarters of useful planting are hidden by a splendid mass of Oriental and Shirley Poppies.

One of the many pleasures of a garden is the planning and invention of various devices to suit the needs of special plants and places, and at the same time to be in harmony with what is near. It is not every garden that has, in an easily accessible and easily visible spot, a space of damp ground such as is wanted for the well-being of the gorgeous forms of *Mimulus*. At Westbrook they have been exactly accommodated in a raised bed that shows in the picture of the steps up to a brick-paved terrace, just behind a plain-shaped pot of *Agapanthus* not yet in bloom. The bed is kept moist by a trickle of water from an unobtrusive tap, and, being raised, the brilliant beauty of the plants is shown to perfection. Another

instance of good invention is shown in the chimney of a little garden kitchen, where the daughters of the house practise cookery and teach it to members of a girls' club. The short chimney is cleverly built up of roofing tiles. Hip tiles form the angles, while four ridge tiles, set up on end with one to cap them, make what local builders call a "bonnet" at the top. How well poverty of soil is overcome by good cultivation is well shown by the growth of the giant *Rheum*, and especially by that of *Verbascum olympicum*, which form prominent features in this garden. When they are at their best their enormous candelabra-like spikes are a sight to see.

GERTRUDE JEKYLL, in *Country Life*.

THE SYRIAN HIBISCUS.

THE Syrian Hibiscus is one of those unfortunate plants that are known under various names. It is sometimes met with in gardens under

the name of *Althea frutex*, although it is correctly known as *Hibiscus*

syriacus, and it is said to have been introduced to this country during the latter end of the sixteenth century.

Considering that it has been known for such a very long time, it is rather surprising that it has not made greater strides in public favour. It is a hardy deciduous shrub possessing many good points that have been sadly overlooked. As a sun-loving plant it has, indeed, been put to a severe test this season. So far as the writer's observations are concerned, it has withstood the wet far better than most other outdoor shrubs, and gives promise of shortly making a brave show of flowers.

The best time to see the blooms is in the early morning. It is the flower of a day; in bright weather the blossoms begin to close about noon, and by the evening they are faded, never to open again. However, so numerous are the flower-buds produced that each faded flower may be replaced by a fresh one until all are exhausted.

There are many varieties of great diversity in colour, the bushes varying in size from 4 feet to 20 feet in height, so that they are very accommodating subjects for informal planting. A warm position in a light, sandy soil seems to suit this Hibiscus best, although it is not fastidious as to its surroundings, for it is one of the few flowering shrubs that will succeed almost in the heart of London. It is not, however, by any means a rapid grower, and in that respect is excellent for small gardens where space is limited.

A few of the most approved varieties are alba, single white, and its double form; *pæoniiflorus*, double pink; *Leopoldii*, large flowers light crimson; *Hamabo*, single pink, dark centre; *cæleste*, single blue; *Violet Clair*, double; and *Pompon Rouge*.

H. C.

THE COLOMBIAN ODONTOGLOSSUMS.

THIS group embraces some of the best in the varied genus *Odontoglossum*, whether we view them from an easily cultivated point or judge them for their decorative value. They are cool-growing Orchids, and any house where a minimum temperature of 50° Fahr. can be maintained will suit them. Blinds will be necessary throughout the spring and summer months, and the house ought to be provided with sufficient ventilators, both top and bottom. The atmosphere must be kept moist by sprinkling the stages and floors with water whenever they are dry, but in winter less atmospheric moisture is needed.

Rain-water should always be used, both for watering the plants and for spraying overhead whenever the weather is dry and hot. Ventilation is an important factor in the cultivation of all plants, and when dealing with Orchids cold draughts must always be avoided. These can be prevented by opening the top ventilators slightly and keeping the bottom ones closed, or *vice versa*. When the temperature outside

is above 50°, both sets may be open if needed, and a few ventilators may remain open during the night. Shade will be required directly the sun begins to raise the inside temperature, and the blinds may be rolled up again about half an hour before the sun ceases to shine on the glass. Insect pests must be held in check by vaporising the house about every third week, or when the presence of thrip is noticed.

Where a quantity of *Odontoglossums* are grown, a few will need repotting at intervals throughout the year; but the bulk will require attention in August and September. All those should be repotted that need more root space, also any that may be sickly, or where the soil has become sour through overwatering.

Healthy examples, if in small pots, can be moved on without much disturbance beyond removing the drainage and a little of the surface soil where it is in a bad condition. Larger specimens which, perhaps, are exhausted must be overhauled, cutting away all the dead roots and most of the leafless back pseudo-bulbs. Two or three behind each lead or growing point are ample.

In growing these Orchids, ordinary flower-pots are employed, and one-third of their depth is filled with drainage, over which is placed a thin layer of moss to ensure a free passage

for water. The soil consists of *Osmunda* fibre one-half, good fibrous peat one-fourth, and sphagnum moss one-fourth, to which is added a sprinkling of sand or finely crushed crocks. The whole is cut up tolerably fine, and all the dusty particles are removed by sifting through a sieve; then it is thoroughly mixed a few days prior to it being used. The compost is pressed moderately firm, and on no account must it be elevated above the rim of the receptacle. For a month or six weeks careful watering is necessary; but when root action is evident, the supply can be increased.

It should be stated that the proper time to repot an Orchid is when roots are seen at the base of the new growth. With some Orchids the stage of growth at which roots appear varies, but with *Odontoglossums* the shoot is partly developed.

The Colombian section of *Odontoglossums* includes the beautiful *O. crispum* with the host of its charming varieties and hybrids, *O. triumphans*, *O. andersonianum*, *O. harryanum*, *O. nævium*, *O. luteo-purpureum*, *O. Pescatorei* and *O. gloriosum*. The varieties and hybrids of *O. crispum* alone are a numerous host, and as most are quite easily managed it is difficult to understand why they are not more often found in gardens.

T. W. B.

POPPIES AND SUMMER-HOUSE FROM THE KITCHEN GARDEN AT WESTBROOK, SURREY

SEASONABLE NOTES ON VEGETABLES.

AS fast as the ground is cleared and succeeding crops arranged, it is a good plan to prepare the soil as time permits by trenching, or deep digging, and manuring. For instance, where Broad Beans are to follow early Potatoes, Carrots, or Tripoli Onions, and to be sown early in November, it will be an advantage to prepare the ground while dry, especially if it is heavy in character. The clearance, too, of Pea and Potato haulm, burning it at once, is a good plan, as not only are objectionable disease spores got rid of, but the ashes resulting are valuable.

Celery.—The present is a busy time with this crop, as growth is rapid, and the sundry details should be carried out promptly. Too often Celery does not get enough moisture at the roots; this leads to hard "stringy" material at digging-time, instead of firm, succulent, tender leaf stems. During dry weather it is difficult to give Celery

plants liberally with liquid manure to swell the fruits to their full size.

Cardoons, where required early, should be prepared for blanching, which cannot be done in less than eight weeks. Wind brown paper around the stem, over this clean haybands, and bank up with soil the length required to be blanched. The leaves should be tied together at the top, keeping them straight.

Shallots should be lifted without delay, and laid on a hurdle on a warm border to dry and thoroughly ripen off.

Leeks.—Continue to feed the plants with liquid manure. Draw the brown paper collars up gradually as growth proceeds and blanching below takes place, gradually filling in the space below with fine soil.

Cauliflowers are abundant at this season; they well repay for any extra attention in the way of liquid manure, a mulching of long strawy manure, and ample space given to each plant. Directly the heads form, they should be covered to prevent them being discoloured by the sun. Crack the midrib of the nearest leaf, bending it

all the short straw to assist fermentation. An open shed is the best place to prepare the manure, as it can be kept dry, the rank steam from the heated manure can readily pass away, and the manure become sweetened by frequent turnings. A fortnight will be required to collect and prepare the heap for a good-sized bed. Whatever shape the bed is to be, flat or ridge, the former should be fully 2 feet thick, the latter 3 feet high, with a base 4 feet wide. Build the manure quite firmly together to induce it to develop a temperature of at least 75° to 80°. As the heat declines to the former temperature, the spawn should be inserted in pieces 2 inches square about 9 inches apart, and 2 inches deep in the manure, making the latter quite firm on the surface. The surface of the bed will require soiling over in a week's time after spawning. Well-decayed turfy loam, passed through a half-inch mesh sieve, answers well; this should be put on 2 inches thick and made quite firm. Cover the soil with straw, or stable litter, to prevent it drying too quickly. If it does this, the moisture escapes through the fissures, which is all against success.

Swanmore, Hants.

E. MOLYNEUX.

A VIEW OF THE RACECOURSE GARDENS AT AUCKLAND, NEW ZEALAND.

too much water; the growth cannot well be too luxuriant. The present method of bleaching with brown paper enables the watering to be much longer continued than when soil is used. Six weeks should be allowed for the blanching with paper; two more weeks are required when soil is used.

Seakale should be kept quite free from weeds; the growth is accelerated by frequent hoeing. Examine the crowns, removing all side shoots, leaving one, or at the most two, crowns to each plant.

Peas.—Late-sown varieties like Autocrat are growing sturdily and well. Keep them well mulched with manure, and supplied with water during dry weather. Generally, birds of the tit tribe are more troublesome than any other to late-growing Peas. Place small-meshed netting over the rows. If mildew makes its appearance on the haulm, syringe at once with Seaside.

Tomatoes under glass and those in the open should have all side shoots removed, and the leaves shortened back where they cover the fruits, to enable the sun to ripen them quickly. Feed the

over the head; in this way it forms an effective screen, and is more easily done than drawing the leaves together at the top with bast.

Lettuce.—The final sowing for immediate use should be made in drills on a sheltered border, leaving the plants to mature where sown; this is so much quicker than transplanting them. Later sowings of such sorts as Brown Cos and Black-seeded Bath, with All the Year Round and Commodore Nutt, Cabbage varieties, should be made for planting out in frames for winter and spring use, and also in sheltered places in the open.

Radishes.—Sow Turnip-rooted varieties in freshly watered drills if the weather is dry, and protect from birds directly the plants show through the soil.

Parsley.—A sowing in a cold frame should be made to secure plants for winter and spring use, as in some localities Parsley does not succeed in the open.

Mushrooms.—Preparation should be made for the first beds in the Mushroom house, shed, or cellar, or even in the open at the foot of a north wall. Collect fresh horse-manure, retaining

ISEND you a photograph of the gardens and lawns at the Ellerslie Racecourse, some five miles from the city. The Auckland Racing Club's premises are spacious, beautifully situated, and well appointed and maintained, the horticultural department coming in for very liberal treatment. The principal entrance, nearly 200 yards long, consists of a wide central path for pedestrians, separated by continuous beds from side drives for horses and vehicles, these two drives being flanked by wide borders planted with flowering shrubs backed by native evergreen trees. The lawns are sheltered by handsome trees and Palms, both native and exotic, and brightened by large flower-beds.

At the time this photograph was taken the gardens were very showy in their autumn garb, among the subjects used for bedding being Cannas, Dahlias, Pentstemons, Cosmeas, "Bonfire" Salvias, Begonias, Hollyhocks, Chrysanthemum frutescens, Bouvardias, Veronicas, Hydrangeas and Roses, also various rockwork and carpet bedding plants. Some beds, which shortly before had been gay with tuberous Begonias, had just been replanted with Cyclamens and other spring-flowering plants, and the lawns presented a beautiful sward, having fully recovered from the unusually long dry summer we have just experienced. The Bouvardias were in great variety, their profusion of white, pink and scarlet starry flowers being very effective; while the heads of many of the Hydrangeas were quite a yard in circumference.

The grounds are thrown open at all times except during race meetings, and the residents and general public freely avail themselves of the privilege thus offered.

The gardens make a fine addition to the public parks with which Auckland is well furnished, and which of late years have been greatly improved by the city authorities.

Auckland, N.Z.

A. E. GRINDROD.

RACECOURSE GARDENING IN NEW ZEALAND.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Melons in Frames.—Much care is necessary in the management of Melons growing in cold frames, especially during cold, stormy weather. During these periods it is wise to discontinue wetting the foliage with the syringe. Now that the fruits are swelling, plenty of stimulants must be given. Air must be admitted to the plants with discretion during bad weather. When the fruits commence to ripen, a little air should be left on the frames at all times.

Cucumbers in Frames.—The advice given for Melons in frames in regard to airing may be applied here. The plants must be gone over regularly for the removal of superfluous growth. Cut the fruits before they become too large, and place them in a cool cellar. The plants must be liberally watered, giving plenty of stimulants while they are fruiting. An occasional light dusting of sulphur will keep the plants free from mildew.

The Early Vinery.—If the Vines are to be started early in November, some of the growth must now be removed, to encourage the wood to be perfectly matured before pruning-time. Persevere in the cleansing of the rods, especially if mealy bug is present.

Plants Under Glass.

Calanthes.—The deciduous Calanthes are now full of roots, and their pseudo-bulbs are fast developing. They must now be liberally supplied with water at the roots. Admit plenty of air to the house, and keep the plants well up to the light. They will need shading from the fierce rays of the midday sun, but shading must not be overdone.

Malmaison Carnations.—The young layers should now be sufficiently well rooted to be severed from the parent plants. Leave them a day or two after severing before potting them. A compost of loam, naturally decayed leaf-soil, wood-ashes and coarse sand will be suitable for this potting. Pot firmly and water the plants in at once. A stage near to the light in a cool house will suit them well now. Some of the most promising of last year's struck plants should be potted into larger pots.

Azaleas.—To help the flower-buds to develop, some kind of stimulant is necessary. Diluted liquid manure, soot-water and some approved artificial fertiliser may be applied alternately. Give the plants a vigorous syringing late in the afternoon during hot weather.

Camellia reticulata.—This beautiful Camellia is now forming its flower-buds, and must be given plenty of water at the roots. A little artificial manure, such as Clay's Fertilizer, alternated with soot-water, will be beneficial during this important stage. Where the buds are forming in pairs, one of them should be rubbed out.

Cyclamen.—Towards the end of the month seeds may be sown for raising a fresh batch of plants. Sow in pans of light, sandy soil, placing the seeds about an inch apart. Cover the pans with sheets of glass, and place them in a house of moderate warmth.

The Flower Garden.

Bamboos.—Large specimens of these need water at the roots to assist the development of their new canes. To make sure that the roots get thoroughly soaked, water from the hose-pipe should be allowed to run over them for several hours.

Vases.—Now that the plants have filled the vases with roots, more attention must be given to watering, for if the soil becomes thoroughly dry, the plants are sure to suffer. Some form of stimulant should be afforded at least once a week.

Plants in Tubs.—Attention must be given to watering and feeding, or the plants will not continue to flower throughout the season. Remove seed-pods, dead flowers and leaves, and secure the growths to their supports, or they will be damaged by autumnal gales.

Early Flowering Chrysanthemums.—These are now showing their flower-buds, and must be

afforded plenty of stimulants. Examine the plants carefully for aphids, and syringe with an insecticide as a precaution against this pest, which is unusually plentiful this season.

The Hardy Fruit Garden.

Early Pears.—Some of the early varieties are now ripening, and care must be exercised in sending them in the best condition to the table. Such varieties as Jargonelle and Clapp's Favourite may be used directly they are taken from the trees.

Early Apples.—Such varieties as Irish Peach, Mr. Gladstone and White Joaneting are best eaten from the tree. Lady Sudeley, Devonshire Quarrenden and Beauty of Bath will not keep for any length of time, and it is wise not to grow such kinds extensively for private use.

Figs.—These must be frequently attended to for the removal of superfluous growths. Cut out extra strong growths, retaining those of medium strength and short-jointed. When the fruits commence to ripen, they will need protection from birds and insects. Trees growing against walls must have abundance of water at the roots.

The Kitchen Garden.

Potatoes.—In this district these are promising a heavy crop. All early varieties should now be lifted and placed in a cool shed. Tubers which are needed for sets must be left on the ground for a day or two before storing them for the winter.

Beet.—This crop can now be lifted if the roots are considered large enough. They may be stored in sand or ashes in the open. The heaps must not be made too large, or they will become heated.

Carrots.—Attend to the thinning of young Carrots as soon as they are large enough. About four inches apart should be ample space for Carrots now. Light dustings of soot during showery weather will enhance their progress, as well as keep them free from pests.

Winter Onions.—This valuable crop should now be sown. Sow the seeds in drills about a foot apart. It must be seen to that the ground is quite firm before sowing. Giant Lemon Rocca, Blood Red Rocca and Leviathan may all be relied upon for present sowing.

E. HARRISS.

(Head-gardener to Lady Wantage.)
Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

Plants Under Glass.

Fuchsias.—Where an increase of stock is necessary, cuttings may be put in now. Young plants invariably grow with more vigour and flower freely, so that propagation should take place annually.

Gloxinias.—As the plants pass out of flower, remove from the show house and place in a light position in some frame or on a shelf, where they will be allowed to mature. Water should be withheld gradually. If it is desired to increase any particular variety, a few leaves may be taken off and put in sandy soil, where they will produce corms, which in turn will form plants to flower next season.

Clerodendron fallax.—As this usually produces seed freely, the plants should be looked over twice a week and the seeds picked as they ripen. Plants in flower must be kept supplied with stimulants to retain vigour and lengthen the season of flowering.

Tree Carnations.—Keep the young shoots neatly tied up as growth proceeds. Undue delay often means broken growths, which seriously cripple the plants. Thrip is still a possible pest to contend with, and, if present, fumigations on two successive nights should be given. If red spider is troublesome, some weak salt water sprayed on the plants will usually be sufficient to keep it in check.

The Hardy Fruit Garden.

Wasps.—During some seasons these insects are very destructive among most kinds of fruit. The surrounding ground should be examined for nests, which are usually not very difficult to discover if the course taken by the insects when

flying is watched. The nests must be destroyed during the late evening, when all the wasps are in them. The old method of destroying them with gas-tar is still the safest.

Fruit-Room.—As early Apples and other fruits are now ripening, this building must be thoroughly cleaned out before any fruit is admitted. It should also be well ventilated to ensure a wholesome atmosphere.

Strawberries.—Unless required for stock, the runners should all be kept closely picked off the growing plants, as they quickly impoverish the crowns. Weeds, too, must be well kept under, as they also rob the plants of much of their nourishment. Where circumstances do not allow of a new planting being made at this season, the runners should be carefully taken off and wintered in a border, where they will not occupy much room, until planting-time in the spring.

Fruit Under Glass.

Renovating Vine Borders.—As soon as the fruit is all cut, any Vines which are showing signs of exhaustion should receive attention, as, if given now, the roots will get nicely established in the new soil before the leaves fall. The Vines will then break more freely into growth, and be able to carry an average crop next season. First of all, shade the vinery; then commence lifting the roots carefully, taking extreme care of the small fibrous ones. During the operation keep them constantly syringed and covered with mats. The drainage must be examined and put in proper order before adding the new soil. Keep the vinery closed and well syringed for a fortnight or three weeks afterwards.

The Kitchen Garden.

Cucumbers.—If a crop is required during the winter-time, a few seeds must be sown now. The beds where they are to grow will require to be made up of slightly lighter soil than was used for the summer crops. Plenty of leaf-soil with a little lime refuse will help to keep it open.

Tomatoes should now be encouraged to set as many fruits as possible before the days shorten, as the fruit ripens much slower and will hang for a good length of time when ripe. Carter's Sunrise is a very reliable and free-setting variety for winter work. Outdoor Tomatoes do not ripen freely if the weather is wet and cold, so that they are sometimes better cut and hung in a glass house to finish maturing.

Parsley which was sown in the spring should be partly cut over to encourage new leaves to form for use in the winter. If some of the oldest leaves are removed, it will generally be found sufficient. The crops which were sown during June and July ought now to be thinned, and be given a small quantity of fertiliser if they are not making satisfactory progress.

The Flower Garden.

Dahlias.—Being quick growers, these plants need tying frequently. The growths, too, require regulating and reducing in number if extra fine flowers are desired. There are now so many sections of Dahlias that all tastes can be satisfied. In selecting varieties at this season for another year, it is well not to be entirely guided by blooms exhibited at shows. These are sometimes misleading, as many exhibition varieties make poor garden Dahlias.

Roses.—Mildew is usually bad at this season, and steps should be taken to prevent it developing whenever it is first noticed. There are several very reliable mildew specifics on the market, and they are not very expensive to use if applied with a sprayer. Suckers must be removed as soon as they appear, and all dead flowers picked off.

Violas.—Cuttings should be put in as soon as possible, as when they are rooted early the lights can be removed for a time during October and November; this hardens the young plants. They are then not so liable to damp off or die during the winter. To be successful, the site of the frame is rather important. It must have a south aspect, where it will get all the sunshine there is during the winter. The young shoots arising from the bases of the plants which have not flowered root more readily and make the best plants.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine,
Bart.)

Castlemilk Gardens, Lockerbie, N.B.

VEGETABLE AND FRUIT CROPS IN HOLLAND.

THE Board of Agriculture and Fisheries have received a further report, dated July 17, on the condition of fruit and vegetable crops in Holland from His Britannic Majesty's Consul-General in Rotterdam. The prospects of the fruit crops were, on the whole, satisfactory.

Apples were excellent or very good in most parts of the country. Only from the north-east of Groningen and some districts of Utrecht were moderate reports received.

Pears were very good in the Bommelerwaard, in Lower Betuwe and in Limburg, moderate in Groningen and Friesland, and good to fairly good elsewhere.

Plums.—Only Limburg and the southern parts of Utrecht reported favourably, conditions in the other provinces being from bad to moderate.

Grapes under glass were fairly good in Gelderland and in Overijssel, and good to very good elsewhere.

Peaches under glass were very good at Nijmegen, moderate at Groningen, and good in Gelderland north of the Rhine, Overijssel, Utrecht and in the Westland district; while the open-air fruit varied from moderate to fairly good.

Raspberries were good or very good everywhere.

Onions were fairly good in Groningen, Leeuwarden, Gelderland north of the Rhine and Overijssel; very good near Winschoten, Utrecht and Leiden, and good elsewhere.

Peas were very good at Beverwyk and Leiden, and moderate to good in other parts of the country.

Beans were fairly good in Groningen, Friesland, Upper Betuwe, Zealand and Limburg, and good elsewhere.

Tomatoes were good or very good in most provinces, fairly good in Groningen and Limburg, and moderate near Leiden.

THE PERENNIAL SUNFLOWERS.

In years of scorched and withered vegetation the perennial Sunflowers always prove their claim to a place in the herbaceous border. In years of plenty we are apt to look upon these flowers as coarse and scarcely worthy of consideration; but now, when the Phloxes have shed their fugacious blooms and the bulk of the Michaelmas Daisies and early Chrysanthemums are in the bud stage, we are only too glad to welcome the bright yellow blossoms of the perennial Sunflowers. That refined, tall and graceful variety Miss Mellish is, always a beautiful sight, and in common with other members of the family appears to have been quite happy during the protracted heat and drought of June and the subsequent rainy spell. H. G. Moon, though not so well known, is equally good, and possesses the additional merit of a dwarfer habit, attaining a height of about four feet. True, its flower-stems are not quite so long, but as a border plant it is almost unequalled in its kind. Of similar height is *Helianthus rigidus grandiflorus*, the Prairie Sunflower, the beautiful golden yellow flowers with their central boss of brownish crimson creating a bright patch of colour even when planted in the poorest soil. Apart from their value in the garden during a dry season these perennial Sunflowers are admirably adapted for indoor decorations. They should, however, be cut early in the morning, have their stems slit upwards for about two inches,

and then be immersed in water for two hours. Treated thus, they seldom fail to take up sufficient moisture when placed in vases to keep them fresh for several days. Unless this or some other special treatment is given, the flowers have a tantalising habit of drooping when cut and placed in water.

THE SOPHORA TREE.

ONE of the most interesting of our hardy trees during September is *Sophora japonica*. Although this was introduced to this country as long ago as 1753, it does not appear to have become very popular, as it is seldom that really good specimens may be seen. It forms a large, spreading tree of symmetrical form, and during September is covered with its racemes of creamy white, Pea-shaped blossoms. This year, in common with many other little-known trees and shrubs, it is giving promise of a good display. The dark green pinnate foliage provides a pleasant setting to the delicate-coloured blossoms, the buds of which are sometimes used by the Chinese for dyeing materials yellow. A much newer *Sophora* to this country, and one that also hails from China, is *viciifolia*. This has much smaller and more finely cut pinnate leaves, and the racemes of flowers are also on a smaller scale, these being pale lavender or mauve in colour. Plants at present in this country have only attained the dimensions of large, spreading, slightly spiny shrubs, and it is doubtful if they will ever make large trees. These *Sophoras* appear to appreciate well-drained, warm soil.

H.

BOOKS.

School Gardening.*—During the past twenty years a great change has come over our system of education. The three "R's" only a few years ago were considered the Alpha and Omega on school work. The system, however, that finds more favour to-day is learning by doing. The kindergarten system is largely responsible for the advance of this method of teaching, and the introduction of woodwork, domestic subjects and gardening is simply an extension of handwork from the lower to the higher standards. Gardening has not been introduced into schools with the idea of turning out thousands of gardeners every year; but it has for its object the training of the hand and eye, and more particularly the training of the powers of observation, without which no child can make real progress in any subject. Gardening has its utilitarian side, too, and many a future gardener and small holder will be grateful for the practical training he received at school; and in many cases the first desire for gardening as a profession may be traced to the school lessons in this special subject. Mr. Logan, in the book under review, has grasped the true meaning of school gardening as distinct from gardening in the broader sense. The lessons are well thought out, and teachers will find very much to help them, not only in the management of the garden, but in the science lessons of the classroom. The questions given at the end of each chapter are excellent, and the children should be encouraged to answer these from their own observations. Gardening, if taught on the lines suggested by

* "School Gardening," by Alexander Logan. London: Macmillan and Co.; price 1s. 6d.

Mr. Logan, should not (as some people still imagine) hinder progress in such subjects as drawing, brushwork, arithmetic and composition, but should make these more practical and real.

Generally speaking, the book is well written and free from errors; but he would be a clever man indeed who could produce a perfect work. On page 38 children are advised to make drills for small seeds with the fingers or small wooden pegs. We think this is impractical. Again, we fail to see why it is necessary to obtain a seed catalogue for school work from a wholesale firm, as advised on page 36. We cannot agree with the list of tools for twenty boys as given in the appendix, even on the score of economy. To quote one example, ten Dutch hoes are recommended for twenty boys, or one between two workers. Mr. Logan in another part of the book emphasises the necessity for constant stirring of the surface soil during the summer, and our experience shows that there is no better tool for this purpose than the Dutch hoe.

The Mutation Factor in Evolution, with Particular Reference to *Oenothera*.*—How do new plants arise? What is the real origin of new characters in plants and animals? These questions have puzzled men since the beginning of intelligent acquaintance with living things. Many are the theories which have been brought forward, great the volume of words which have flowed, and are we yet any nearer to the solution of the mystery? Lamarck, Darwin, Weissmann, de Vries, Mendel—all have been hailed as the discoverers of the true source of origin of species. None has proved sufficient to explain all things, but each has stimulated thought and experiment, and perhaps each has brought nearer the day when we shall be able to understand why and how plants take on new forms; but the full knowledge is not ours yet. The author of this lucid exposition of one of the factors of evolution—"the mutation factor" as its developer, de Vries, called it—has done much to clear up difficulties in the way of accepting the idea he explains, for he has shown that the "mutations" (which are almost the same as sports, perhaps exactly the same, but arising from seed) are an outward expression of profound changes in the constitution of the most intimate parts of the cell, and he has produced a most interesting and instructive book which no student of plant life from an evolutionary standpoint and no breeder of plants along scientific lines can afford to ignore or pass with scant concern.

THE EDITOR'S TABLE.

Buddleia Colvillei from Middlesex.—Mr. F. M. Elgood of The Close, Northwood, R.S.O., Middlesex, sends a flowering spray of *Buddleia Colvillei*. This certainly does not flower very freely, except in the Southern and Western Counties, although we have seen it at one or two places in Suffolk. Mr. Elgood writes: "I send for your table a spray of *Buddleia Colvillei* from a plant which has been in my garden for three years, but has not previously flowered. It appears to be the only flower this year on the plant, which is now about six feet high and as much across. A native of the Sikkim Himalaya, the shrub was discovered by Sir Joseph Hooker in 1849, who described it

* "The Mutation Factor in Evolution, with Particular Reference to *Oenothera*," by R. Ruggles Gates, Ph.D., F.L.S. 8vo, xiv. + 353 pp. London: Macmillan and Co., 1915; price 10s. net.

as 'the handsomest of all Himalayan shrubs' (*vide* Mr. W. J. Bean's book). As it is probably unusual for it to flower in England north of the Thames, I thought you might be interested to see it. The plant is growing quite in the open, unprotected, except by other shrubs, and the subsoil is clay."

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish expert advice.

The Editor welcomes photographs, articles and notes, but he will not be responsible for their safe return. All reasonable care, however, will be taken, and where stamps are enclosed, he will endeavour to return non-accepted contributions.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

The Editor will not be responsible for the return of artistic or literary contributions which he may not be able to use, and the receipt of a proof must not be taken as evidence that an article is accepted. Publication in THE GARDEN will alone be recognised as acceptance.

Offices: 20, Tavistock Street, Covent Garden, W.C.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

DIVIDING VIOLETS (R. N. S.).—If you will take our advice, you will not rely on divided examples of these plants at all, and for preference make cuttings of the unflowered runners that are so plentiful in September or thereabouts. By inserting these 2 inches asunder in sandy soil in a frame at that season, they make ideal plants for putting out the following early April in well-cultivated ground. Divided stock at any season is starting with partially exhausted stock; whereas the unflowered runner, apart from the advantages of youth and vigour, possesses the additional advantage which the concentration of the entire energies of the plant to a solitary crown affords, and, while not inconsiderable, also ensures perpetual youth if indulged in from year to year. Moreover, it is both a simple and easy—it is also the best—means of propagating these plants.

TREES AND SHRUBS.

BUDDLEIA VARIABILIS MAGNIFICA (*An Incomplete Gardener*).—The best way to treat this shrub is to cut it hard back in the spring, say, about the second week in March. This will induce it to form strong young growths, which will flower in the August of the same year. If pruned in the autumn, new growth is apt to be formed rather too early in the spring, and is liable to become damaged.

INFORMATION ABOUT ROBINIA (K. J., *Balham*).—The Robinia shoot described in your letter is evidently a shoot of *R. Pseudacacia*, *R. hispida* being frequently worked upon it. It ought to be removed at once. *R. Pseudacacia* is, of course, the False Acacia of gardens. The Manna Ash bears a seed similar in shape to that of the common Ash, but it is smaller and borne in larger clusters than the fruits of the ordinary Ash. The Manna Ash can be procured from any of the principal nurserymen in this country.

TRIMMING A HOLLY (C. E. C.).—Yes; it is possible to trim an old Holly into shape. The best time for the

work is April, for if it is cut fairly hard at that time and many of the leaves are removed, new shoots will soon appear; whereas if it is cut hard back now, it will remain leafless and ugly all the winter, and the ends of some of the cut branches will most likely die. Hedges, however, that simply require clipping may be pruned now. It is unwise to clip specimen Hollies severely; they present a much better appearance if the branches are left free and natural. We therefore advise you to remove the inequalities of growth and tie some of the lower branches into position to help to fill the space made by the crowding of other shrubs, but not to try to secure a hard, formal outline. As a rule, the inequalities can be reduced by thinning the branches well in the places where they are overgrown.

INFORMATION ABOUT YEW HEDGE (C. E. C.).—Providing your Yew hedge appears to be well established it may be lightly clipped at the present time; but if it is not very ragged, it would be as well to defer the work until next April. The top ought certainly to be cut back a little, for that will tend to thicken up the lower parts of the hedge; in fact, your main object for two or three years should be to encourage the filling up of gaps. Branches tied across openings will usually accomplish that. After you have once secured a well-furnished base, the addition of height growth will become a very simple matter. As soon as the flowers of a Lavender hedge are over, the flower-stalks should be cut back to the branches. A little pruning should be done in February to regulate growth, but no other pruning will be necessary. Pruned in such a way, the flowering will not suffer.

ABOUT CLIMBING PLANTS (*Subscriber*).—Hydrangea petiolaris is a self-clinging, close-growing climber that would do very well against either your house or the other wall; it is, however, deciduous. There are few close-growing evergreen climbers outside the Ivy, most of the plants used for the purpose being bushy plants adapted for walls. *Pyracantha coccinea* is a very useful and beautiful evergreen. It flowers well in May, and produces orange scarlet fruit in the autumn. We advise you to use that with a plant of *Wistaria multijuga alba* if you have room for it. There are many nurserymen who make a speciality of climbing plants, but most of them deal in small plants only. Any nurserymen who advertise in THE GARDEN can be depended upon.

IVY PLANTS FOR NEW WALLS (M. C.).—Any good loamy soil will be quite suitable for your Ivy plants. Dig the ground over for a space of 2 feet square, and have a space of 9 inches to 12 inches left clear round the base of each plant when the pavement is put down. The distance apart to place the plants will depend entirely upon the size of those you procure. About three feet apart would, however, do very well. Plants in pots can be procured, and they could be planted at once. Water well until they are established and new roots formed. Do not make the ground very hard at planting-time, although it must be well firmed about the roots. If the soil is good, there is no necessity to add manure to it. If poor, however, well-decayed farmyard manure should be used.

THE GREENHOUSE.

GERANIUM BLOSSOMS BRANCHING (M. M.).—We cannot give information to anonymous correspondents (see rules). If you send your name and address and repeat questions we shall be pleased to assist you.

PANCRATIUM FRAGRANS LOSING FRAGRANCE (J. S.).—We have never met with a case of *Pancretium fragrans* becoming less fragrant year by year, and can, unfortunately, throw no light on the matter. Furthermore, we have taken the opinion of successful cultivators of these plants, and as such an experience has not fallen to their share, they are unable to enlighten us. Are you sure that the individual plants which throw up such enormous flower-heads are those whose fragrance used to be so remarkable? If so, the case of your *Pancretiums* must be put down as parallel with that of the common Musk, which in most districts seems to have lost its old-time perfume.

CLIMBING PLANTS FOR VINERY WALL (*Enquirer*).—*Plumbago capensis* stands fairly well when cut, but we think the great objection to it is that it flowers in the summer, when the Vines are at their densest. You ask for other Geraniums, and we would suggest *Souvenir de Charles Turner* (Ivy-leaved) and one of the strong-growing members of the Zonal section, such as *Le Colosse*, clear red, semi-double. Under the conditions named you would have no more continuous-blooming subjects than *Abutilons*, of which *Boule de Neige* (white) and *Golden Fleece* (yellow) can be especially recommended. *Clematis indivisa*, which bears a great profusion of star-like white blossoms in the spring, might suit your purpose, or *Rhynchospermum jasminoides*, whose white, Jasmine-like, highly fragrant blossoms are borne early in the year. This last will in time clothe a wall beautifully, but in its earlier stages it is of rather slow growth.

CARNATION MRS. H. BURNETT SPORTING (J. J. C.).—The blooms of the Perpetual-flowering Carnation Mrs. Burnett are not affected by any disease, but you have simply obtained a sport, and have undoubtedly lost your true stock by propagating the sport. Darwin said, "of all the causes which induce variability, excess of food, whether or not changed by Nature, is probably the most powerful." Many of our best varieties in commerce to-day are sports; for instance, *Salmon Enchantress* and *Enchantress Supreme*. As a rule, a variety throws off these sports when it is becoming old. In some cases

they are valuable, but in your case useless, being much inferior to their parent. Furthermore, it is quite common for Carnation Mrs. Burnett to behave in the manner it has done with you. Lady Northcliffe and Empire Day are both superior varieties to Mrs. Burnett.

FRUIT GARDEN.

APPLE SHOOT WITH RING (*Cenymen*).—The ring is a ring of eggs of the lackey moth. This moth always lays her eggs on the caterpillars' food plant in this bracelet fashion. All such rings should be cut off and promptly burned.

NECTARINE RIVERS' EARLY SPLITTING (J. H.).—The following are the chief causes of Nectarines splitting: (1) Heavy watering at the time the fruits are reaching maturity, causing too rapid a circulation of sap for the moment. The last heavy watering should be applied before they arrive at this stage, applying at the same time a mulching of half-decayed manure to the surface of the soil over the roots. By doing this the soil will retain sufficient moisture to carry the tree through until the fruit has been gathered. (2) Too high a temperature and too close and moist an atmosphere at this stage will have the same result. (3) Wet, close and muggy weather, such as we have had for so long, unless the precaution is taken of occasionally drying the air when it is very bad by applying heat to the hot-water pipes. (4) Sometimes too light a crop is responsible, especially on young and vigorous trees, the roots pumping up more sap than the fruit can assimilate.

KITCHEN GARDEN.

MAKING A KITCHEN GARDEN PATH (E. M. Wild).—A fairly satisfactory path can be made of tar and clinkers or cinders. After making a good bottom of hard material, such as bricks or large clinkers, take cinders or clinkers broken into about inch pieces and remove the dust; then mix the whole with boiling tar and spread while hot. Roll with a wet roller, and on the surface place about half an inch of finer cinders mixed with tar in the same way. Roll it well, and, when set, spray the surface with boiling tar, over which fine sand should be sown at once and then rolled. Do not use the path until it is well set. Should the surface fracture in a year's time, spray again with hot tar and cover with sand.

HERBS AND THEIR CULTIVATION (C. E. C.).—Herbs can be grown in any good kitchen garden soil. It is usual to give up a border to them, as they are more easily looked after when grown together. Each kind should be isolated, and the weaker ones should be so placed that they are not likely to be crowded by coarser-growing neighbours. It is wise to renew the plants occasionally, as young plants are usually more satisfactory than old ones. The crop may be gathered when fully developed. As a rule, when flowers are showing is a suitable time. Tie the stems in small bundles and hang them up against a wall or in an airy shed to dry. Those that are hung outdoors should be removed to shelter on the approach of wet weather. When thoroughly dry, they may be powdered and placed in jars, or be hung up in a dry room for winter use.

INFORMATION ABOUT VEGETABLES (Mrs. G. M. V.).—Giant Rocca Onions should be pulled up now and ripened on the ground in the sun like ordinary Onions. You will find they will not keep very long, and should be used or sold before the winter. Tripoli and White Italian Onions may be sown now. Plant out as many as you require in October or any time during the autumn. These will stand the winter where planted, and come into use next year the same time as the Giant Rocca is doing this year. After you have planted all you want, thin out those left in the seed-bed to within 10 inches apart. They will come in at the same time. The thinnings may be bunched and sold, or given away. They will be of no use for pickling. Onions sown now for pulling in a green state through the autumn and winter would be saleable if bunched and marketed. In that case they would not require thinning in the ordinary way, but should be pulled up, bunched and sold as soon as large enough. There is nothing better than the Giant Rocca for this purpose. As regards Brussels Sprouts, the larger and stronger the plants are, the better. Do not cut them in any way.

MISCELLANEOUS.

KEEPING CATS OFF PLANTS (*Hall*).—We do not know of any preparation that will keep cats off plants if the animals can get into the garden. We keep a well-trained Irish terrier, who does the duty effectively. Perhaps some reader may have found some substance that can be effectively sprayed over the plants; if so, we shall be glad to publish it. A tax on cats would be welcomed by garden-lovers.

NAMES OF PLANTS.—Mrs. Norris.—*Dendrobium moschatum*; seedling *Geranium*, cannot match.—G. R. P.—*Nicotiana rustica* (Syrian Tobacco), not native; *Galinsoga parviflora*, introduced from North America.—L. H.—1, *Thuya plicata* (Lobbi); 2 and 3, *Cupressus lawsoniana*; 4, *Juniperus virginiana*; 5, *Cupressus lawsoniana*; 6, *C. pisifera*; 7, *C. p. squarrosa*; 8, *C. lawsoniana*; 9, *C. lawsoniana* variety; 10, *Cydonia japonica*; 11, *Crataegus Pyracantha*; 12, *Yucca gloriosa*.—W. H. S.—1, *Cupressus macrocarpa*; 2, *Deutzia scabra* flore pleno; 3, *Abies nobilis glauca*; 4, *Olearia Haastii*; 5, *Desfontainia spinosa*; 6, *Begonia fuchsoides*; 7, *Sedum spectabile*.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

THE outstanding feature of this meeting, held on August 17, was the remarkable exhibit of vegetables from Elstree, which has probably never been equalled. Hardy flowers were prominent and good. Orchids were in a minority, though several excellent novelties were on view and received awards.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), and Messrs. W. H. Page, J. W. Moorman, George Harrow, J. W. Barr, W. J. Bean, E. A. Bowles, John Green, G. Reuthe, T. Stevenson, J. F. McLeod, J. Jennings, Charles Dixon, Arthur Turner, Charles E. Shea, J. T. Bennett-Poë, C. E. Pearson, G. Paul, J. Hudson, E. H. Jenkins, W. P. Thomson, J. Dickson and R. Hooper Pearson.

As demonstrating the exceeding splendour, value and longevity of the herbaceous Phloxes in a year congenial to their needs, Mr. James Box, Lindfield Nurseries, Hayward's Heath, again staged a superb bank of them in the highest perfection. Though of the greatest decorative value in the garden, they are highly ornamental in the exhibition arena, and of exceptional value when cut for home decoration; hence are among the indispensables of the garden. Some of the more imposing masses were *Widar* (Parma violet, with white centre), Dr. Königshofer (brilliant orange scarlet), Frau Ant. Buchner (white, immense truss), Mrs. E. H. Jenkins (snow white), Tapis Blanc (one of the purest whites, and dwarf withal), Fort de France (rosy salmon) *Violetta* (very large), Gloire de Maroc (fine late purple), Météore (salmon pink, white centre, one of the best), General van Heutsz (scarlet), Dr. Charcot (violet, with lighter centre), Arthur Rauc (fine salmon) and Mme. Vopelius (white, suffused salmon). Mr. Box also staged seedling varieties of great promise. In another group were staged a considerable variety of herbaceous plants, such good things as *Asclepias tuberosa*, *Sparaxis pulcherrima*, *Stenanthium robustum* (with graceful white plumes), *Potentilla Gibson's Scarlet*, and *Delphiniums* being well shown. The group was bordered with hardy Heaths in variety.

Messrs. W. Cuthbert and Sons, Highgate, N., were responsible for a flowering group of herbaceous plants, arranging imposing masses of many seasonable things inclusive of *Gladioli* and *Lilies*. Of the latter we noted good flowering examples of *L. Henryii*. Of *Gladioli*, the pink-flowered *America* rose up in a great pyramid in the centre, and with *Artemisia lactiflora* and *Bamboos* constituted quite a feature. *Dracopcephalum imbricatum* (spikes of rose-coloured flowers) and *Veronica verticillata* (white) were also noted. Phloxes were well shown, and *Crinum Powellii* was in excellent condition.

Mr. J. C. Allgrove, Middle Green, Langley, Slough, staged a superb gathering of *Thalictrum Delavayii*, without doubt the most elegant new hardy plant seen for many years. Four feet or five feet high and endowed with elegant Fern-like foliage, the wealth and profusion of its deep mauve coloured flowers render it both graceful and unique. *Podophyllum Emodii* and *P. E. Purdom's* variety were both shown.

Messrs. J. Cheal and Sons, Crawley, filled a table with examples of cut shrubs and herbaceous plants, the former including *Buddleia variabilis magnifica*, *B. v. amplissima*, and *B. v. veitchiana*. *Ceanothus Gloire de Versailles*, *C. Ceres*, *C. Arnoldii*, and the rather uncommon *C. albus plenus*, which, by the way, is of a pinky shade, were all beautiful. *Hypericum moserianum Henryii* (rich golden) forms a lovely bush 4 feet high, covered with golden orange flowers. *Catalpa bignonioides purpurea* was also interesting and good. *Hippophaë salicifolia* and *H. rhamnoides* were both on view. *Tricuspidaria dependens* (white flowered) was also noteworthy. The herbaceous section included Phloxes and the Crawley Dahlias in variety.

Mr. John Pigg, Royston, Herts, staged a splendid lot of Roses, arranging a great centre of Mme. Edouard Herriot, of splendid colour and in the pink of condition. Duchess of Wellington (rich yellow), Mrs. Andrew Carnegie (white), Mme. Hoste (creamy white), Lady Pirrie, and Rayon d'Or (rich golden) were also in imposing groups. Irish Elegance was also very charming among many sorts.

Messrs. H. B. May and Sons, Edmonton, arranged a table of greenhouse plants and flowers, the dominant feature of which were groupings of well-grown *Bouvardias* in variety. The best of these were Hogarth fl. pl., *Humboldtii corymbiflora*, President Garfield, Elegans (scarlet), President Cleveland (rich scarlet), Prior Beauty (fine pink), and Princess of Wales. The compact bushes were covered with flowers.

Messrs. John Peed and Sons, West Norwood, S.E., had an excellent table of tuberous Begonias, evidencing a capital strain of these popular greenhouse flowers. Excellent in variety, good cultivation was also demonstrated. White, yellow, salmon, orange, scarlet, and crimson were among the chief colours shown.

Mr. W. Wells, jun., Merstham, filled a table with cut spikes of *Delphiniums*, the result jointly of a second flowering and spring-divided stock. It was an object-lesson of some importance to the gardener, and those desiring a succession of these indispensable garden flowers should not overlook it.

Messrs. James Kelway and Son, Langport, again showed an excellent lot of *Gladioli*, arranging a double table, which formed a great attraction. The large-flowered kinds were much in evidence, and in their great variety, constituted a feature of the exhibition. Prince of Orange, Mrs.

Asquith (creamy white), *Empoclus* (salmon scarlet), White Swan, Eugen Sandow (scarlet, white throat), Flame of War, Lady Aberdeen (yellow, cream and rose), Golden Measure (very handsome), Mrs. G. W. Willock (white, suffused rose), and Lady Muriel Digby (soft primrose, crimson feathered base), were among the more important. The hybrids from *primulinus* were also a noteworthy feature.

The Misses Hopkins, Shepperton-on-Thames, displayed alpine and hardy plants in season.

Mr. G. W. Miller, Wisbech, displayed an extensive collection of herbaceous and bulbous plants. Notable things included *Lilium Henryii*, *Commelina celestis* (rich blue), *Origanum pulchrum*, *Veronica subsessilis*, *Eucomis punctata*, *Veratrum nigrum*, *Delphinium Belladonna* giganteum and *Agapanthus albus*. Hybrid *Verbascons* were well shown, as were also Phloxes.

Phloxes, *Senecio veitchiana*, *S. Clivorum*, *Veronica subsessilis*, *Gaillardias*, *Geums* and *Cimicifuga simplex* were the chief of an exhibit from Messrs. Rich and Co., Bath. *Crinum intermedium* was also well shown.

Mr. G. Reuthe, Keston, contributed a variety of hardy plants, alpine and shrubs. *Escallonia oregana* (pink), *Berberidopsis corallina*, *Erica maweara*, *Astilbe simplicifolia* (fairy racemes of pinky white flowers), *Origanum Siphyleum* (a very charming plant), *Magnolia fusca*, *Eucryphia pinnatifolia*, *Erica ciliaris* and *Crinums* were among important things.

Messrs. R. H. Bath, Wisbech, had a superb exhibit of *Lobelia cardinalis* de Brinsen, a delightful variety with coppery foliage and brilliant rosy carmine spikes of flowers: a glorious plant for the summer garden in cool, moist places.

FRUIT AND VEGETABLE COMMITTEE.

Present: J. Cheal, Esq. (chairman), and Messrs. W. Bates, J. Willard, Edwin Beckett, A. Grubb, A. R. Allan, A. Bullock, J. Jacques, E. A. Bunyard, Owen Thomas and W. Poupert.

Messrs. Bide and Sons, Alma Nurseries, Farnham, showed Tomato The Recruit in very fine form. Of moderate size, it is also of good colour, and by the bunches shown is a great cropper.

The Hon. Vicary Gibbs, Aldenham House, Elstree (gardener, Mr. E. Beckett), sent a superb collection of vegetables, every item of which was the acme of perfection. Comprehensive and embracing in the highest degree, the excellence of the exhibits commanded attention before all else, and it is doubtful if even Mr. Beckett has ever displayed finer produce. Everything the garden is capable of producing was contained in the exhibit, though we may select Peas Alderman, Quite Content, Gladstone and Duke of Albany as representative of this great race. Tomatoes Peachblow (of a novel colour), Perfection, Duke of York, and Coronation (golden) were very fine. Intermediate and Long Carrots were superb; while Leeks, Marrows, Onions and much more was in high excellence. A feature of the exhibit was the remarkable colour effect produced, and in this respect we do not remember to have seen anything half so fine. This was chiefly produced by Capsicums, Tomatoes, Beans, Carrots and other things, the perfect blending of all constituting one great harmonious whole. A gold medal was deservedly awarded, with a Lindley medal for culture.

ORCHID COMMITTEE.

Present: Sir Harry J. Veitch (chairman), Sir Jeremiah Colman, and Messrs. J. O'Brien, Gurney Wilson, W. Bolton, R. A. Rolfe, R. Thwaites, Pantia Ralli, T. Armstrong, Walter Cobb, J. Charlesworth, W. H. Hatcher, J. E. Shill, C. H. Curtis, W. P. Bound, Arthur Dye, W. H. White and S. W. Flory.

Messrs. Sander and Sons, St. Albans, showed *Anguloa Cliftonii*, *Brassia foetida*, *Cattleya aurea*, *Laelio-Cattleya Irenus*, *Vanda teres Andersonii*, *Anguloa burnea* (white) and *Cœlogyne mooreana* among many interesting kinds.

Messrs. Stuart Low and Co., Enfield, had excellent examples of *Cattleya gigas*, *Cattleya hardyana* His Majesty, *Aerides Fieldingii* and *Odontoglossum nebulosum* (white, dark spotted at base) with *Odontiodas* and others.

J. Gurney Fowler, Esq., Tunbridge Wells, had an exceedingly choice lot of novelties, *Cattleyas* being prominent. *Odontoglossum President Poincaré* is an exceptionally dark variety with white-lobed lip.

Messrs. Charlesworth and Co., Hayward's Heath, had some lovely *Odontiodas* and *Odontoglossums*, with *Cattleya gaskelliana alba* and others.

Messrs. Hassall and Co., Southgate, N., showed three excellent forms of *Cattleya Sybil*, crosses between *C. aurea* and *C. iridescens*. They were very beautiful and distinct.

AUCHENCAIRN FLOWER SHOW.

DESPITE the war conditions, a bright little flower show was held at the seaside watering-place of Auchencairn, Kirkcudbright, a few days ago, and commanded a good measure of support from exhibitors and visitors. The entries were almost up to the usual; the quality was high; and the only weak section seemed to be that for pot plants, which were neither strong in numbers nor in quality. Vegetables were an excellent feature, and Potatoes, Peas, Cabbages, and Onions were capitally shown. Fruit was finer than usual; and cut flowers were excellent, especially the Sweet Peas and Roses, though the competition in the latter was small. It is unnecessary to detail the prizes, but it may be said that Mr. W. Haining, Drungans, was the most successful in the show, and that the same exhibitor won the prize for the best basket of five varieties of vegetables. Other leading winners were Mr. R. Clark, Mr. J. M'Sherry, Mr. W. Alexander, Mr. J. B. Moodie, Mr. A. Campbell, Mrs. Carnochan, and Mr. J. M'Kie.

HIGHCLIFFE GARDENERS' ASSOCIATION.

THERE was a good attendance of the members of this association on Monday, August 9, when Mr. W. Marjoram, gardener to Sir Alfred Cooper, Ossemsley Manor, gave a lecture on "The Shanking and Shrivelling of Grapes." The lecturer first referred to neglected Vines, old ones with roots growing in a cold subsoil, and advocated lifting of the roots in the autumn, keeping them moist while exposed, wrapped in wet mats, spreading them out in new fibrous loam near the surface, and making the soil very firm. All long, bare roots should be notched before they are replanted. Mr. Marjoram advocated narrow borders not more than 4 feet wide for young Vines the first year. There must be good drainage, and the soil should be well firmed. Organic manure should not be put in, but wood-ashes. The new rods should be short-jointed, of medium thickness, and well ripened. The lecturer said he gave very little front ventilation before the Grapes began to ripen, and not much air at night, except in the case of Madresfield Court; but in all cases he urged the need for early morning ventilation. His object was to prevent the Grapes being chilled, and for this reason, too, he used water that had been exposed to the temperature of the house for a time, and not from underground wells.

There was a free discussion at the close of the lecture, Mr. Marjoram ably answering numerous questions put to him. Messrs. W. Goddard, W. Weaver, G. Garner, Griffin, Rogers, J. Murray and E. Bell took part in the discussion. Votes of thanks were cordially passed to the lecturer and the chairman, Mr. Cuell.

East Anglian Horticultural Club.—At the August meeting of this club a paper was given by Mr. T. Notley, gardener to E. Gurney Buxton, Esq., Catton Hall, which he styled "Melon Notes." It did not take long for the hearers to grasp the fact that Mr. Notley was dealing with the subject in a most practical manner and from every point of cultivation. The matter was afterwards threshed out more fully by an excellent discussion. There was a good exhibition, a class for the true old type of Crimson Clove Carnations being a notable feature.

United Horticultural Benefit and Provident Society.—The monthly meeting of this society was held at the Royal Horticultural Society's Hall on Monday, August 9, Mr. Charles H. Curtis in the chair. Three new members were elected. One member withdrew £2 14s. 6d., double the amount of interest. The sum of £74 6s. 9d. was passed for payment to the nominee of a deceased member, and one member was granted 5s. a week for life from the Distress Fund. The sick pay for the month on the ordinary side amounted to £56 10s. 3d., on the State Section to £24 15s., and maternity claims to £12. Two hundred and ten members are now serving with the Forces, and an important new rule is under discussion regarding the contributions and benefits of these members.

The Countess of Selkirk's Garden Prizes.

The Countess of Selkirk having again continued her prizes for the best-kept gardens in the Kirkcudbright district of the late Earl of Selkirk's estates, they were awarded the other day. Mr. William Hutchinson, gardener to C. E. Galbraith, Esq., Terregles, with the co-operation of Mr. W. McGuffog, Lady Selkirk's gardener, acted as judge. The gardens were, as a rule, in excellent condition, and reflected much credit on the competitors. The prizes in the St. Mary's Isle section went as follows: First, Mrs. Dorrance, Mute Hill; second, Mrs. Grahame, Auchenfleur; third, Mrs. Tait, Mute Hill; fourth, Mrs. Kelly, Burnfoot; very highly commended, Mrs. Dorrance, The Stell; highly commended, Miss Dickson, The Doon; commended, Mrs. Johnstone, Mrs. Thomson, Mrs. M'Lellan and Mrs. Milligan. Balmae section: First, Mrs. Boyle, Craikness; second, Mrs. Caldwell, Dromore; third, Mrs. M'Lellan, Dromore; fourth, Mrs. Beattie, Balmae Stables.

THE GARDEN.

No. 2284.—VOL. LXXIX.

AUGUST 28, 1915.

NOTES OF THE WEEK.

"The Garden" in the Fighting Line.—

On page 421 we publish a letter from Private H. W. Bennett, gardener to Colonel Parker, Chapel-en-le-Frith, Derbyshire, in which he describes a very interesting method that he used to adopt to obtain new Potatoes during the winter months. We think it speaks well for the spirit of our soldiers that they should, while engaged in fighting for their country, still retain a keen interest in matters relating to horticulture. It will be noticed that Mr. Bennett states that copies of THE GARDEN would be welcome to a great many of the men at the Front, if people in this country would send them out. We are having some copies despatched to our friend, and we hope all our readers who have friends or relatives at the Front who are interested in horticulture will post copies to them regularly.

Narcissus minimus.—At once the smallest and dwarfest of trumpet Daffodils, and probably also the earliest to flower, this dainty miniature kind always commands attention when, from almost grassy blades at 3 inches or so high, the rich golden yellow flowers appear in February or March. As perfectly modelled as the finest of its race, it is as worthy the attention of the cultivator as the best, though its sphere of usefulness would not lay in the same direction. For the alpine house or rock garden, however, it is one of the most fascinating of early flowering plants, and as such receives a fair share of admiration. By reason of its dwarfness and small size it should be freely colonised in the rock garden and allowed to become established. The late Peter Barr, on a tour in Spain in 1887, found it growing among Gorse; hence rich soils would not appear to be to its liking. It is, however, not greatly fastidious, and thrives in sandy loam, or this mingled with peat. Flowering so early in the year, it is important to plant early—not later than September. Happily, it is one of the cheapest, and may be indulged in by the hundred or thousand at small cost.

Viola bosniaca.—This small Viola is a new species from Bosnia. It is very floriferous and is easily raised from seed, from which it evidently comes quite true, or with so little variation as "makes no matter." It blooms the same season

as it is sown. Although we have not wintered it, it is given in seed lists as a hardy perennial. Its colour may be described as a rose with just a suspicion of blue in it. When the flowers first open, they have a small white eye; but it dies out with age. It grows about two inches in height and spreads quickly. It ought to be as popular as the famous *V. gracilis*.

An Early Sunflower.—*Helianthus Nuttallii*, a little-known species of Sunflower, is the earliest to flower in our gardens, and for this reason should be more often seen. About three feet high, the stems are sufficiently substantial for exposed sites without tying. It is very ornamental, not particular in its requirements, and is

make charming subjects as pot plants in early spring, and they are among the most satisfactory of flowers for cutting, as they last so well in water, and their erect, non-branching habit lends itself admirably to effective arrangement. The most pleasing of the four varieties is the white and orange, which is known in lists as *S. retusus albus*. It comes fairly true from seed. Seed for pot work in spring should be sown at any time now.

A Good Early Dessert Apple.—Why is it that so many good varieties of fruits, vegetables and Roses exist for years without getting better known? How many of our readers know or grow Apple Langley Pippin? A tree that we planted about five years ago on the advice of Mr. J. C. Allgrove, who has now taken over the fruit nursery of Messrs. J. Veitch and Sons at Langley, is this year carrying a crop of about a bushel of excellent dessert fruits. These are of medium size, pale yellow, striped with red, very crisp and sweet. They commence to ripen the second week in August, and continue until about the middle of September. When sent out by Messrs. Veitch, this splendid early Apple, said to be the result of crossing Cox's Orange Pippin with the variety Mr. Gladstone, received an award of merit. It is the best early dessert variety we know.

Nemesias.—These may fairly be classed among modern annuals. Not only is it a comparatively short time since the *strumosa* hybrids were first put into commerce, but no flower has had

AN ESTABLISHED COLONY OF NARCISSUS MINIMUS. BULBS MAY BE PLANTED NOW.

very valuable for cutting, its golden flowers commencing to come in June and continuing until September. It is a native of North-West America, whence it was introduced in 1899.

Schizanthus retusus.—No *Schizanthus* is better adapted for growing as a pot plant for early flowering under glass than *retusus*. Yet it is not nearly so much grown as are the hybrid forms of *pinnatus* and *wisetonensis*. The colour of the type is what might be described as a glowing rose, with a rich orange blotch on the prominent upper petal. There are, however, varietal forms, one of which is a pure rose self, while another is a pure white, and, a third, a white with a similar orange blotch to that of the type. All of them

more improvements made in it by careful selection, crossing or hybridisation with new species. We have lately noticed in several gardens that some varieties have stood the wet weather of July and August very well. We hope our experience is general, for no annual is more pleasing, and not many are more lasting. The pretty little dainty Blue Gem is charming where pale blue flowers are wanted; while the orange of the more robust and manly looking Orange Prince makes a very striking and effective patch of gay colour. These are two of the best of the named selections. In one garden we were told that next year the two are to be planted in combination, the orange in the centre and the rather dwarfer blue round it.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Cypripedium Calceolus.—In a letter from me which you inserted in your issue of August 14 upon *Cypripedium Calceolus*, there is an omission in the middle of line 16, page 399 (no doubt my fault). After "adjacent shrubs" and before "Below the whole" there should have been "Beneath this (the leaf-soil) were 4 inches of rough river sand."—W. H. ST. QUINTIN.

Rambling Rose Sander's White.—This is a delightful Rose, and one of the best of the small-flowered white varieties. At Castlemilk, the fine garden of Sir Robert W. Buchanan Jardine, Bart., it is doing splendidly, and is much admired because of its free flowering and the beauty of the small white flowers. It has been sent out by Messrs. Sander and Sons of St. Albans, and that they think highly of it is evidenced by the name.—ESS.

A Lavender Harvest.—I am enclosing a photograph of our Lavender harvest, which may interest some of your readers. It is not often so much of it is grown in a private garden. It flourishes exceedingly with us, was cut on July 14, and brought down to the granary on a large farm cart. It was there spread out to dry, and is now in process of being shredded from the stems.—M. B. MIREHOUSE, *The Hall, Angle, Pembroke.*

Chrysanthemum maximum Caledonia. This handsome Marguerite is larger than King Edward, but is not so large as to be clumsy, while it is made more graceful by the laciniation of the ray petals. It is a good grower, flowers freely, and is pure white. It was raised by Mr. William Angus of Penicuik, and has done very well in my garden since its introduction a few years ago. We have too many varieties, but *Caledonia* deserves a place, I think, in the number chosen for retention when making a reduction of one's plants.—S. A.

A Gentian Note.—It seems most remarkable how *Gentiana acaulis* succeeds in some places while in others it is an absolute failure. I have tried it in different positions, but have not so far succeeded in growing it satisfactorily, so it is hard to say when a flower will be seen. Yet it may interest some to know that *G. verna* flowers with me—is in flower now. Is not this usually considered the more difficult of the two, thus making their vagaries the more pronounced? *G. verna* is planted in sandy soil in full sun. Incidentally, a friend of mine in the Midlands, who succeeds admirably with *G. acaulis*, told me his secret was to see that it had plenty of moisture during February and March. The conditions reported by "Enthusiast" on page 397 of a successful cultivator would appear to be the very opposite of those of my friend.—C. TURNER.

The Toad in the Garden.—Since writing my note on this subject I have had some further experience with my own special toad. On Wednesday afternoon I was in the vinery and saw a toad that greatly resembled the one I had taken from the structure a week or two ago. Once more the

toad was taken to a hedge bank across the garden and a corner of a field about 300 feet from the door of the vinery. About an hour afterwards, while watering some young Strawberry plants, I was surprised to meet the toad on his way back to the vinery. I pointed him out to my wife, and we watched, without in any way interfering with the toad. He walked along the path, turned off at right angles, and went straight to the vinery door. I opened the latter and he went in. I think this time he shall stay and enjoy the haunts he evidently favours and takes so much trouble to gain.—GEORGE GARNER.

Linaria aparinoides splendens and Annuals in General.—There are some lovely species and varieties among the Toadflaxes. *Linaria alpina* is an ornament to any rockery, annuals

A LAVENDER HARVEST IN A READER'S GARDEN AT PEMBROKE.

barred, notwithstanding. So is the one we have seen grown under the above long name for the herbaceous border, annuals barred, notwithstanding. Why on earth, when Nature mixes up annuals, biennials and perennials, should man be so chary about doing it? St. Paul's dictum about the different parts of the human body, saying they do not want each other, comes in here. Why are perennials so stand-offish when they are taken a little notice of? This long-named Toadflax is a medley of all manner of colours, blue and scarlet being absentees. It grows from 1 foot to 18 inches in height, it is very easily raised from seed, and when it has done its "bit" it can be rooted up and its "place be no more found," for a skilful manipulator will so arrange matters that the growth of a neighbour will hide it.—JOSEPH JACOB.

Olearia Haastii.—After a considerable test of the hardiness of the *Olearias*, I find that *O. Haastii* and *O. stellulata*, with *O. nummularifolia*, are the hardiest with me. All of them, however, were cut to the ground about two winters ago, but both *O. Haastii* and *O. stellulata* broke away from the base, while *O. ilicifolia* and several others were killed outright. *O. Haastii* is a most valuable plant. In spring and summer its glossy leaves make a pretty bush, and in late July and early August it gives a wealth of flowers, borne in such profusion in August that a good plant may be seen so covered with flowers that hardly a leaf is visible because of the multitude of creamy white blooms. This Daisy Bush is a plant of real worth, easily raised by means of cuttings, and plentiful in nurseries, though not so common in the villa and cottage garden as it ought to be, well known though it is to gardeners. As a shrub for the many it takes a high place.—S. ARNOTT.

AUGUST, 9 P.M.

Indigo islets of beautiful form
Float upon sea green and peach-tinted seas;
Black stands our group of tall, towering Elms,
O'er which we watch lovely Venus arise.

Suddenly near us the young owls float by
Restlessly calling as darkness enthralls;
Lustrous the heavens are spangled on high;
Swift through their mazes a leonid falls.

Lilies, entangled in pale Passion Flower,
Mingle their sweets with the Jasmine above;
Purest of pleasures, at night-time to roam,
Led by white blossoms, in garden we love.
M. C. S.

Erica cinerea coccinea.—There are several good varieties of the well-known British Heath, *Erica cinerea*, but anyone who has seen *E. c. coccinea* must admit that it is an easy first of the species, with its profusion of flowers of what I might term "fiery purple." These dwarf Heaths, to see them to full advantage, should be planted in good-sized clumps, as I saw this excellent variety in the rock garden at the Royal Botanic Garden, Edinburgh.

Ferula communis.—This noble herbaceous plant, equally suitable for the wild garden, the back of the wide herbaceous border, or as a specimen on the lawn, is not so well known as it deserves to be. Attaining a height of about ten feet and flowering in June or July, it will be seen that it is a rapid grower, and consequently requires liberal treatment. Its finely cut foliage alone entitles it to a place in any garden, but its great golden umbels towering aloft lift it quite out of the ordinary level, both figuratively and literally. Like the whole of the species, it is indigenous to the Mediterranean region, and proves quite hardy even in Scotland. *F. tingitana*, the Algiers *Ferula*, although not quite so striking as the common species, is more refined-looking. Nicholson suggests that the generic name of these Giant Fennels may have been derived from "ferio," to strike, the Orientals sometimes using the stout stems as rods.—CALEDONIA.

Loganberries and Raspberries in the Autumn. "H," page 402, issue August 14, gives a valuable reminder to cultivators of these plants as to what they should do to them now. In this district there are many plantations altogether overcrowded, and the plants deteriorate every year instead of maintaining a normal strength, as they undoubtedly would do if given correct treatment. Loganberries do remarkably well when planted and trained in a sunny position and treated as advised by "H." A cultivator assured me recently that in his case they were more remunerative than Raspberries.—AVON.

Eucalyptus in Flower in Norfolk.—As I write this I have before me some sprays of *Eucalyptus globulus* profusely covered with their quaint flowers. These were grown in the garden of Herbert Day, Esq., Newmarket Road, Norwich. Mr. W. Coan, the gardener, tells me he planted the tree about ten years ago, when it was one year old from seed. There are several good specimens about the grounds, but this one seems to have done the best, and has reached 20 feet high. No protection is given them in winter. The fact of it flowering has created quite a keen local interest. I was wondering if such an event had been chronicled before, north of the Thames at least.—AYTCH PEA.

Shirley Poppies as Cut Flowers.—I was interested to see the note on this subject on the front page of a recent issue of THE GARDEN. I am sure many readers will welcome a recipe for making these lovely flowers last in water. There are several other ways of making them last, which I give in case they may be of interest, but the duration of the flowers is in every case not so long, one or two days being the maximum. The first method is to cut when nearly full blown and immediately seal the end of the stem by putting it into a gas flame for a minute or two. The second method is similar. Dip the ends into boiling water to seal them. The third method, which I have heard is also very good, is to roll the ends of the stems in fine dust as soon as they start to exude. This last method is said to give the longest duration. In this garden we have many fresh Poppies out in bloom every day, and each morning it is necessary to go round with a knife and cut off a number of seed-vessels. My own opinion is that this is one of the prettiest and most charming of all our hardy annuals.—E. T. ELLIS, *Weetwood, Ecclesall, Sheffield.*

Border Carnations : Autumn Planting versus Spring Planting.—I suppose each of these systems has its advocates, and while I have no theory on the subject, I may be allowed to record a very recent experience. Until the present season I had invariably practised spring planting, with fairly successful results, my method being that of potting up the rooted layers in autumn and wintering them in a shallow cold frame with the lights well tilted up back and front continuously. During the winter of 1913-14, however, we had a week or so of frosty weather, and a mat was thrown over the Carnations. On removing the mat I was shocked to find that the mice had decapitated about 75 per cent. of the entire stock. This determined me to give autumn planting a trial. Being unable to clear the quarter intended for them of summer flowers till late in September, we were unable to plant the layers till the first week in October, yet, notwithstanding the late date of planting, we have stronger and more healthy "grass" and finer flowers than ever we had before. About

5 per cent. of the plants failed to grow. I should perhaps add that our soil is naturally a heavy yellow clay, but the top soil has been improved to a considerable depth by the addition of sand, old potting soil, and other material.—CHARLES COMFORT, *Broomfield Gardens, Midlothian.*

The New Rose Hadley.—The recent report of the Ontario Rose Society's Show made reference to the new American variety Hadley, and having flowered it outdoors this season, a note regarding it may be of interest. Hadley is the outcome of a well-known Rose forcer's efforts to produce an ideal red forcing Rose. It is not put forward as filling the bill, but it is, nevertheless, a very fine variety. Its merits as a forcer have already been proved, but it is chiefly as a garden Rose that it will win or fail in this country. My own plants were not received until May, after a full month in the packing case, due to the great congestion at the Liverpool Docks. Being very small and on their own roots, the plants were nursed in a frame until the end of June. Since they were planted out they have made wonderfully good growth, and have produced several small but charming flowers. The colour is wonderfully rich, reminding one of some of the famous old Hybrid Perpetuals, and I venture to hazard that when available as budded stock, Hadley will make its way into popular favour. I may mention also that Hoosier Beauty, the American novelty which gained a National Rose Society's gold medal last spring, promises well as an outdoor variety. It is a wonderful colour, and the perfume is delightful. Several other varieties from the United States of America under test will, I think, in the future attract public attention, judging by their behaviour after the severe treatment they had been subjected to.—T. A. W.

New Potatoes in Winter : A Letter from the Front.—I have read with great interest your article in THE GARDEN for July 24 re Potatoes for autumn. A very favourite way of mine at home used to be as follows: When lifting the early crops, such as Early Regent and Sutton's Ashleaf, I picked out seed size and good stores; then what are often called pig Potatoes, which included small and bad-shaped or green ones, were placed on a bed of leaf-mould in some warm corner of the estate or paddock, and covered with dry leaves and bottle straw; or I have even chopped Oat straw till all were covered about a foot deep. I allowed them to draw their own moisture from the ground they were on. When frost set in, litter was added to keep it out or too much wet. This work I always had finished by the end of August. I omitted to say the tubers were laid about two inches apart on the bed, and, providing one had a nice breadth of ground, quite a decent supply of new Potatoes could be had for Christmas and the New Year. When commencing to "lift" the crop (which is a very interesting game), start at one corner of the bed and do the lifting and picking with the hands. I have had dishes of very sweet little Potatoes well into March, which are far more creditable than the so-called sand Potatoes. While doing my "bit" out here, I have to thank my friend, R. T. Barratt, Esq., Chapel-en-le-Frith, for supplying the paper, as I am a regular reader of THE GARDEN when at home. Plenty of garden-lovers would be pleased of surplus copies of the paper if people at home only realised how short we are of something interesting.—2369 PRIVATE H. W. BENNETT, *A Company, 6th Sherwood Foresters, British Expeditionary Force.*

THE ECONOMY OF ROCK-WORK.

IN the excellent article under this title in your issue of August 7, "Kurstcot" alludes but slightly to the economy of a rock garden, and does not say where he thinks it comes in. I do not agree that you get a greater result in plant cultivation in a given space. Rock plants are mostly small, and therefore you can get a greater number of different kinds into a small space; but you can get a much greater number of similar-sized plants into the same space on a border not encumbered with pieces of rock, and therefore a much finer display of colour.

If there really is economy in rockwork, it surely lies in the labour, the saving of digging and feeding a border, the propagation and planting out of young plants, necessary even in the case of perennials, or the mowing of lawns or verges. A good deal of labour is, however, required in rockwork if it is not to become a wilderness, with all the best things smothered; but rock labour can be done at almost any time, and therefore the amateur can, and generally does, work far more in it himself.

I am a very keen amateur gardener myself, and keener on rockwork than on the rest, though not to the exclusion of proper border effects, &c. If I, therefore, criticise some of "Kurstcot's" further remarks, I reflect my own experience and my own fancy, which, naturally, must differ from that of other people at times. But I know I can claim some success to justify myself.

First, then, I do not agree that rockery steps should be made simply with soil. Steps and little paths go together, and should, in my opinion, be made of something, preferably slabs of rock, in which no plants can grow. I refer to the centre, of course, whatever happens at the sides, and I say that centre ought to average not less than 2 feet, even in a small rockery, and stiff-growing plants ought to be put at the sides, not trailers or spreading plants, because it goes to one's heart to put one's foot on to little favourites, and still more so when other people do it whom one is showing round. If there is good soil below, there is sure to be a large crop of seedlings or runners coming up between the stones very quickly. I am just now trying to get rid of a maze of Campanulas, Gentians, Primulas, &c., in just such a place, so I speak feelingly.

The next point is perhaps more a matter of opinion, and that is the remark that there will be 250 varieties of plants in a space 20 feet square, coupled with the further remark that a genus should be represented by all suitable species. The allusion to the library can surely not hold here. In the latter case, the great point is the quality of the matter in the books which may appeal to the individual brain, whereas the garden can only appeal through the eye. Or if the eye has to be struck by the method of a library, the desired effect would not be attained by collecting all the different works of some favourite author in all sorts of editions and different coloured bindings, and then arranging them methodically side by side on the same shelf! A sadly restless effect would be the result, which is exactly what happens in a garden when too many different kinds of plants are put into too small a space. Besides, there is the difficulty of very different

requirements of the different species, no doubt covered by the word "suitable," which, however, will probably be overlooked by most collecting amateurs. I am constantly doing it myself. Finally, it is surely better for amateurs to get to know how to treat a few species successfully and with the proper gardening effect of peaceful-

too sharp to retain as borders. Such are best terraced, and undoubtedly rocks are vastly better than terrace walls. These can be made to look very like natural rock cropping out of the surface; but the faces *must* have enough stone to look like rock, which can still be made to hold a crowd of small things. The tops of the terraces require

A CHARMING SUCCULENT-LEAVED PLANT.

(MESEMBRYANTHEMUM CRASSULINUM.)

ALTHOUGH several members of the Figwort family may be used with good effect on the rock garden, none is more suitable than *Mesembryanthemum crassulinum*. It is of neat, compact habit, forming quite a thick cushion of succulent foliage, above which are borne its pure white flowers, an inch in diameter, during June and July, and will often continue until late autumn, making it a valuable plant for the rockery. It is a native of South Africa, and a plant seldom seen. The illustration is of a plant growing on the rock garden in the Botanic Garden, Cambridge, where it has grown now for several years without any protection. It appears to be quite hardy and is one of the best of the genus. F. G. PRESTON.

THE PICTORIAL USE OF BEDDING PLANTS.

SOME thirty years ago, what we commonly call bedding plants, meaning tender things put out for summer use, were almost in exclusive use in our gardens, usurping the place of the good hardy plants in places of small and moderate size, and even invading the little roadside gardens of labourers' cottages. Then came the much-needed revolution and the restoration to favour of the fine hardy plants that we have now learnt to know and use so well. But in some cases the influence of the change has done injustice to some of the best garden plants of the late summer. It was not the fault of the scarlet Geranium, yellow Calceolaria and blue Lobelia, to name three showy things that were formerly forced upon our view in a wearisome repetition that ended by becoming detestable, especially when displayed in the form of a target-like circular bed, or, still worse, a senselessly waved ribbon border. The plants themselves, put to better use, are still among the best of our summer ornaments, and capable of giving delight in the place of something nearly approaching disgust. The whole difference consists in the matter of arrangement and of good grouping for colour effect. Some notes on a recent experimental planting, with good hope of further bettering within the next year or two, may be of use to some of those whose gardens are of such a calibre that, without undue strain, they can house and propagate the needful plants. These will be—to name some of the more important—Dahlias, Cannas, Gladioli, Geraniums, Salvias, Begonias, Verbenas, Calceolarias and Heliotrope, with Pentstemons, Snapdragons and Lobelia cardinalis, and half-hardy annuals, of these the most useful being the various kinds and colours of African Marigolds and some of the dwarf French Marigolds, China Asters in a very restricted range of colouring, and Ageratum.

Though all these fine things are in place in the formal parterre, yet their more enjoyable use is in free groups in wide flower-borders. The purpose of such a border or garden space is to have a brilliant display from the middle of July to the end of September. So long as this is attained, it does not matter how it is done; that is a question of ways and means that will largely be answered by the skill, taste and ingenuity of either the gardener or the owner, or, best of

A WHITE-FLOWERED FIGWORT, MESEMBRYANTHEMUM CRASSULINUM, IN THE CAMBRIDGE BOTANIC GARDEN.

ness than to have a big collection, largely of labels recording failures.

I maintain there should be comparatively broad stretches of well-blended colours to be pleasing. Then an occasional gap in which something new has been tried, singly at first, and failed does not matter. If it is a success, it should be propagated and made to replace some less satisfactory section of the rock garden. I know, of course, that, even this way, a large number of species can be put into 20 square feet, but they would not come to more than forty or fifty, with perhaps another thirty thrown in for single specimens, either on trial or as landmarks in special places.

Finally, at the risk of making this article too long, I cannot agree with the remark that the essential part of a garden is plants—at least, not in all rock gardens. Such dogmas have misled many a beginner, and valuable time and ground has been wasted, which in a rock garden it is heartbreaking work to correct.

Rock gardens might be classified into three groups, two of them necessary to get the best effect out of a given piece of land, and one of them unnecessary, because it is only the wish to have a rock garden in a certain spot where any other scheme would do perfectly well. This I dismiss, not in the least from lack of sympathy, but because it is beside the question.

Of the two necessary ones, the first is evidently the one which has led "Kurstcot" to build his. I refer to sharp slopes, too difficult to mow and

no stones, or only a few, according as to whether the owner think the faces enough for small rock plants and has larger bushy stuff on the flats, or wants nothing but small alpines. But the faces *must* appear solid rock, with fissures and broken bits, or the effect will be a rockery and not a rock garden.

The second necessary rock garden is brought about by your being on the rock and having, perhaps, an ugly piece of quarried face to negotiate. People say, "How delightful to have the rock garden ready formed!" Let them try. Nothing will come of it till you have built up a great deal. But that rock face is a feature, and you must preserve a good deal of it. So a lot of rock must show. It can be covered by hanging Aubrietias, Lithospermum, Genista sagittata, &c.; but much rock must always show, and will look much better than it would do if you had made a pudding of it and started ever so far from the base, building up in an even slope so as not to show much rock.

I have all these things to contend with in my garden, but it is the pleasure of my spare time to do it. It is, however, hard work, and especially hard thinking, so I hope "Kurstcot" will forgive my criticism. I hope some day to write again and tell how I have got over some great troubles which my rock has caused me (it is on the surface in many places, and only 12 inches to 18 inches below in others); but I am always glad and never ashamed to show anyone the result.

Alderley Edge.

C. H. S.

all, by the two in frequent council. A certain number of the plants should be in pots for plunging, such as Fuchsias, Bouvardias, Campanula pyramidalis, Plumbago capensis, Daturas, Hydrangeas and the three indispensable Lilies, namely, longiflorum, speciosum and auratum, with an amply overlapping quantity in reserve for any shifts that may be desirable. Of *Lilium speciosum*, one of the most beautiful kinds, and one that is generally neglected, is the variety *punctatum*, whose general effect is a pale pink. This neglect is probably owing to the prominent pushing in trade catalogues of the stronger-coloured kinds; but the pure white and this delicate pink are not only more charming in themselves, but are also more easy to use in association with the colours of other plants. As a suggestion for the use of the late summer flowers, it may be assumed that some wide borders have to be treated, such as those of the present experiment. In this case the further portions are a little raised, and there is a rather bold permanent planting of *Yuccas* of the three most useful kinds, namely, *gloriosa*, *recurva* and *filamentosa*, the first two being of large size; also of the large *Euphorbia Wulfenii*. These masses of grey foliage are an excellent groundwork for white Snapdragons and nearly white Pentstemons, also for the pinks and purples of pink *Verbena* and Ivy Geranium *Mme. Crousse* and *Heliotrope*. There are also drifts of pale foliage of the small variegated sweet Geranium and of a capital old garden plant that is much neglected, the variegated form of *Mentha rotundifolia*; it is of extreme value, with flowers of white, pale yellow, pale pink or purple colourings, quite hardy but all the better for being used as a summer bedding plant from autumn-struck cuttings.

The flowers are arranged in bold drifts, running in the direction of a rather acute diagonal with the line of the path. This has an advantage over any kind of block-shaped grouping, giving a greater sense of freedom in the use of the plants and larger effects of colour mass when seen from either end. The strongest colour comes about midway in the length, the plants here being the fine dark-leaved *Canna Adrien Rubini* with crimson-leaved *Amarantus*, interdrifted with scarlet *Lobelia* and *Gladiolus brenchleyensis*. At the front edge, for some 2 feet in width, and running back here and there for a yard or so, always in the same direction as the diagonals, are the splendid scarlet Geraniums *Paul Crampel* and *Raspail Improved*—*Paul Crampel* slightly the better of the two, for though it is equally brilliant, it has a softer quality and is less violent. Geraniums of softer scarlet follow—a fine one is *Mrs. Bartleman*; this eases down the colour to the salmon shade of *Geranium King of Denmark*. Here are *Cannas* of moderate scarlet and soft flame colour, and the fine *Gladiolus William Faulkner*, nearly matching *King of Denmark*. Red Pentstemons and Snapdragons are here intergrouped. Following are the lighter salmon Geraniums *Wilhelmina* and *Countess of Osterwitz*, softening down to the still paler *Mme. Lemoine*,

a fine old Geranium with handsomely zoned leaf, and the quite pale, almost blush white *Lady Harwich* and *Bridal Bouquet*. All these Geraniums form a thick bordering, and here and there run up between the drifts of taller plants. But among the pale Geraniums comes again the variegated *Mint*, associating charmingly both with them and with the *Hydrangeas* plunged in the border further back, and the bold groups of the lovely pale *Gladioli La Parisienne*, *Leo Errera* and some with yellow grounds. Here, also, are yellow *Cannas* with bright green foliage, white Lilies (*speciosum* following *longiflorum*), and, at the back, variegated *Maize* and *Lilium auratum*. Between some of the drifts of scarlet flowers is a considerable planting of a most useful plant, a garden variety of the rather large, native *Sedum Telephium*. Its greyish mass is first useful as a foil to the strong colours, and, as the season advances, the widespread heads of bloom turn to a quiet chocolate red that harmonises delightfully with the brilliant colouring near. The use of such between-plants is of great value—a value that becomes more and more apparent every succeeding year that it is practised. It is impossible, within the limits of an article of reasonable length, to describe all the desirable combinations of the summer flowers; but these notes may give some useful suggestions for treatment which will become all the more interesting when worked out by those who are in sympathy with such ways of gardening. Suffice it to repeat that, though for gardens in general hardy perennial

A BEAUTIFUL GLOBE DAISY.

(*GLOBULARIA INCANESCENTS*.)

WITH one exception (the shrubby *G. Alypum*) all the Globe Daisies are dwarf hardy perennials of an evergreen character. The flowers are borne in round heads, from which character the common name is derived, and they are usually blue or white in colour. There are about a dozen kinds found in Europe, mostly in the Mediterranean region, one of the best known and widely spread species being *G. cordifolia*, forming a mat of neat foliage and producing small heads of blue flowers on stalks 2 inches or 3 inches long. The smallest is *G. nana* from the Pyrenees, a choice little plant, but sometimes difficult to keep.

G. incanescens, the most charming plant in the genus, comes from the Pennine Alps, and forms cushions of dark green foliage, the leaves of which are oval and less than half an inch across. As may be seen in the illustration, the flowers, which are pale blue and half an inch in diameter, are produced freely and last for a long time in perfection. It is a first-rate rock plant, either for the moraine or a well-drained pocket. It may be increased by division in the early autumn or spring. W. I.

ANNUAL FLOWERS FOR AUTUMN SOWING.

By far too many keen lovers of hardy flowers those kinds of annual duration are looked upon as

THE CHARMING LITTLE GLOBE DAISY, *GLOBULARIA INCANESCENTS*.

plants are by far the most desirable, yet, when the conditions are favourable and the resources of the garden are not overstrained, pictures of flower beauty of a more brilliant and, within a season, more durable nature can be made with the fine plants that are suited for putting out in summer.

G. JEKYLL, in *Country Life*.

plants only suitable for sowing during the genial days of spring. It is true that not a few of our annuals, including many classed by seedsmen as "hardy," cannot be successfully reared if the seeds are sown at any other time; but, on the other hand, there are a number of kinds that will provide us with glorious drifts of colour from

May onwards, providing the seeds are sown during the next few weeks.

The success of such, however, depends very largely upon circumstances, much more so, indeed, than cultural skill, though necessarily this is to some extent brought into play. Soil, locality, altitude and the weather experienced during the trying days of winter all act their part in determining the success or otherwise of autumn-sown annuals. Thus it would be folly to commit seeds of such plants to soil that is naturally retentive of moisture, and which during practically the whole of the winter is in a state of saturation. In such soil many perennial plants succumb, and the small annuals are bound to "go under."

Localities that are naturally damp, such as the West Coast of England and Scotland, are also bad for the majority of annuals during the winter months, and the same applies with equal force to low-lying districts that are frequently visited by cold, dank fogs. From the foregoing negatives it will be seen that to grow autumn-sown annuals successfully, well-drained and naturally dry soil is necessary, together with a reasonably dry atmosphere and an open position.

In many chalky and sandy soils, which are comparatively dry in winter and almost devoid of moisture in summer, it is well-nigh impossible to secure annual flowers from spring sowings, and here it is that the advantage of autumn sowing comes in. In addition we get a floral display some weeks in advance of that obtained from spring-sown plants, and at a time when a hiatus occurs between the flowering of the spring bulbs and the hardy herbaceous plants.

In many seedrooms there will be partly filled packets of annual seeds that were left over from the spring sowing, and such of these as may be suitable ought to be consigned to Mother Earth during the next few weeks, early September being a good time for most localities. Some of our leading seedsmen make a speciality of flower seeds for autumn sowing, so that no great difficulty need be encountered in procuring a supply. When sowing these flowers in spring, it is of the greatest importance to scatter the seeds thinly, but it is even more essential in the case of those sown at the present time. Of equal importance is a thin covering of soil. The seeds of most annual flowers are small, and although they may in the spring months, when growth is very active, force their way through 2 inches of soil, they are not likely to do so now. Just sufficient soil to keep the seeds from blowing away is enough, and lest anyone may doubt this I would remind them of Nature's way; self-sown seeds have no covering, except a little dust or other refuse that may be washed or blown on to them. Sweet Peas, with their larger seeds, are, however, an exception to this shallow sowing, although even these will do with an inch-thick covering of soil. At the outset reference was made to the necessity

for choosing suitable kinds of annuals for autumn sowing, and I will name some that may be relied upon to give a good account of themselves in those gardens where the conditions, as before enumerated, are favourable. There are many other kinds that would probably do well in certain localities, and it is well worth while proceeding tentatively with any that are known to withstand a moderate amount of frost and damp. The Sweet Pea has already been mentioned, and so well does this do when sown in autumn that most growers prefer this season to the spring. *Nemophila insignis*, *Cornflowers*, *Larkspurs*, *Candytuft*, *Silene pendula* and its double form, *Bartonia aurea*, *Poppies*, *Clarkias*, *Godetias*, *Virginian*

summer months, when it puts forth its profusion of lavender blue blossoms, it is particularly pleasing. Grown as an edging to a pathway, as shown in the illustration, it makes a charming garden feature, and its beauty is enhanced if the path itself is of genuine York paving stone. In recent years Mr. G. Dillistone has made excellent use of this *Nepeta* in many gardens that his firm has designed and laid out, mixing it freely with pink China Roses. Where a more temporary association of pink is desired, one would suggest dwarf pink Mallows, the colour of which harmonises beautifully with the foliage and flowers of the *Nepeta*. The latter is quite easy to grow, and succeeds well in sandy or loamy soil, propagation being readily effected by division during the autumn or early spring.

NEPETA MUSSINII AS A PATHWAY EDGING. THE FOLIAGE IS GREY AND THE FLOWERS BLUE.

NEPETA MUSSINII AS A PATHWAY EDGING.

It would be difficult to find a more generally useful plant than that shown in the accompanying illustration. This is *Nepeta Mussinii*, a very old inhabitant of our gardens, and one that deserves to be more widely grown than it is at present. At all seasons of the year its neat tufts of silvery grey foliage are attractive, while during the

preferable.) These and *Schizanthuses* make a wonderful display together.

***Godetias.**—Another extremely useful and showy family.

Larkspurs.—The taller varieties give the best results. A bold group of rich blue is very telling.

***Nasturtiums.**—These give a mass of flowers if not grown in too rich a soil. The small-foliaged ones should be chosen and those having decided tones of colour.

Nicotianas.—Sutton's Miniature White is a gem for pot culture. *Affinis* and *Sanderæ* are also useful.

***Nemesias.**—Wonderfully free and showy. Effective for groundwork or edging.

ANNUAL FLOWERS FOR THE GREENHOUSE.

"ARE the merits of some annuals sufficiently recognised?" is a question of some importance when, combined with the production of a wealth of bloom, strict economy has to be practised, as in many gardens to-day, owing to the exceptional circumstances employers of labour have to face. The usefulness of the *Schizanthus* needs no comment, but some other annuals almost equally desirable as pot plants may justly claim more attention. The following varieties can be safely recommended, and where it is only convenient to grow a few, those marked with an asterisk should receive first consideration:

Alonsoas.—Those with orange and scarlet shades of colour are best.

***Antirrhinums.**—The Intermediate strain is most suitable. Some pale shades are apt to be a little "washy." The new pink *Nelrose* is very nice.

Asters.—Useful for the autumn. Grow in the reserve garden and transfer to flowering pots.

Candytuft.—The tall ones make excellent edging plants for groups.

***Clarkias.**—Impossible to speak too highly of. (*Elegans* variety

Phlox Drummondii.—I can only speak of one as proved, and that is Sutton's Purity.

***Salpiglossis.**—Owing to the many brilliant shades, this is probably one of the coming plants for pots.

Stocks.—The lovely scent emitted from a few flowering plants is of itself sufficient recommendation.

Venidium calandulaceum.—A plant which does well in pots. It is bright yellow with an orange tone, and perhaps somewhat resembles Gazania. Very free flowering.

dampness and fog must be guarded against, the latter especially so.

From the seedling stage to the flowering one nearly all annuals appreciate a light and open rooting medium and only moderately firm potting. If there is added to the compost for the final potting a little soot, wood-ash and bone-meal, the results therefrom will be beneficial. Unless for some definite purpose, large pots should be avoided, for some wonderful plants may be grown in 5-inch and 6-inch pots. Alonsoas, Phlox Purity and Nemesis may well be grown in 4½-inch pots.

though it may be a trifle untidy, for this is much to be preferred to violating Nature altogether.

Serlby Hall Gardens, Bawtry. H. TURNER.

ROSE ALBERIC BARBIER.

I do not suppose that the famous French raiser, M. Barbier, when he secured this charming Rambler Rose, imagined for one moment that it was destined to become one of the greatest favourites of Rose-lovers in this country. Although sent out so comparatively recently as 1900, it

THE EARLY-FLOWERING WICHURAIANA ROSE ALBERIC BARBIER ON POSTS AND CHAINS.

Cultural Hints.—For a spring display a pinch of seed should be sown in August, September and October in a cold frame, using a light compost over some well-drained pots or pans. The seedlings may remain in the cold frame on a bed of ashes close to the glass after being pricked off, until atmospheric conditions render it necessary to remove them to safer and drier quarters. Only a few are so fortunate as to be able to devote an entire structure to annuals during the winter, so shelves in Carnation and fruit houses must be made use of, as a rule. Coddling of the plants is not at all necessary, but at the same time

Stocks, to look well, should have three allowed to a 4½-inch pot, and five are not too many for a 6-inch pot. This does not apply to Brompton Stocks. It is advisable to pinch Clarkias once or twice during the early stages of growth, as then a better habit is obtained. Should specimen plants be required, grow three or five together, finally using for them 7-inch and 8-inch pots respectively. Stimulants are not necessary for annuals until the flowering pot is well filled with roots. When staking, use the least possible number of stakes, and try to allow each plant to retain something of its natural habit, even

may now be found in eight gardens out of ten where any serious attempt at Rose-growing is made, a fact that speaks in eloquent terms for the variety. Although a wichuraiana hybrid, it is among those that bloom early, its long, graceful shoots and glossy green foliage being surmounted towards the end of June by its beautiful, creamy yellow blooms, which are produced in great profusion. For clothing a rough pergola or forming a screen it is excellent, as it is a very rapid grower and quickly fulfils the desired object. Unfortunately, it flowers but once during the year, but this is, after all, a little fault.

S. S.

SOME HINTS ON PENTSTEMONS.

IN but few instances during the last few years has a race of plants become as popular as the above. This is due to the species being quite outclassed for decorative effect by the introduction of numerous florist or garden varieties. The majority of these are now recognised as being in the front rank of bedding plants, while for planting in the mixed flower border, or in the foreground of the shrubbery, few subjects are more useful. When in flower they are all remarkably handsome, their massive spikes being freely produced in the richest and most delicate hues. For cutting they are invaluable, and worthy of planting in quantity where effect is not the chief consideration.

The Species.—Although not so frequently met with, the species are very beautiful, but they are rather more fastidious in their requirements than

those that can justly claim attention is Southgate Gem. In this Pentstemon we have probably the finest yet sent out. When not overcrowded and in a good position it presents a striking picture with its light, graceful flower-spikes of brilliant scarlet, the throat being almost white. It rarely extends over 3 feet in height, and its habit of growth bears a near approach to perfection. A fitting companion to it is Pink Bedder, the colour of which is a delightful shade of salmon pink. White Bedder is of dwarfer habit than the foregoing, but it is very compact, and fine for massing. In Newbury Gem we have a very hardy variety of neat branching habit, with freedom of growth and flowering, and a lengthy season of beauty. In colour it is a brilliant glowing scarlet, and whether intended to be grown solely for cutting or for bedding purposes, it seldom fails to give the desired satisfaction. White and Pink Newbury Gem possess similar good qualities.

Varieties more robust and bearing somewhat larger flowers are very conspicuous when planted

further shift into pots two sizes larger when the roots show signs of wanting more space. When the weather is favourable in April they are best planted out about twelve inches apart in soil that has been dug in winter, and liberally enriched with well-rotted manure.

F. J. TOWNEND.

The Gardens, Brentwood, Moorgate, Rotherham.

NEW AND RARE PLANTS.

FIRST-CLASS CERTIFICATES.

Cattleya hardyana variety *His Majesty*.—

A remarkably handsome variety, rich in colour and of the largest size. The rosy purple sepals and petals are very telling in tone, the rich crimson purple lip conspicuously marked by golden-coloured blotches at the sides. From Messrs. Low and Co., Jarvisbrook, Sussex.

Odontoglossum President Poincare.—The flowers of this striking novelty are characterised by rare substance, with, in addition, well-imbricated sepals, which adds weight to its

other good qualities. Save for the white-tipped sepals and petals and a large white lip, the flower is wholly coloured dark heliotrope, which renders it very distinct. The petals, too, are distinctly toothed at the margin.

Odontonia Charlesworthii

Fowler's Variety (*Odontoglossum*

Uro-Skinneri × *Miltonia vexillaria*).

This distinct bi-generic hybrid leans largely to the last-named genus in form, a modified *Miltonia*, indeed, coloured rosy purple and copiously freckled with white.

AWARDS OF MERIT.

Cattleya drapsiana vinosa (C.

dowiana aurea × C. *Mrs. Pitt*).—Only the plant remained of this, the inflorescence having been removed.

Cattleya Sybil variety *rotundobellum* (C. *iridescens* × C. *aurea*).—

The sepals and petals are buff-coloured with salmon suffusion, lip crimson purple, and golden-coloured throat. These four excellent novelties were shown by J. Gurney Fowler, Esq., Pembury, Kent.

Laelio-Cattleya Golden Queen.—

The sepals and petals are of apricot or deep buff tone, the heavily fringed, undulated lip of rich purple and freely lined with gold at the throat. From Messrs. Flory and Black, Slough.

Poterium obtusatum.—A striking "Burnet" novelty from Japan, which will be welcome at this season for the warmth of its long, rosy red inflorescences. These are gracefully arching, columnar in outline, and quite distinct from any other of its tribe. Height, 2½ feet to 3 feet. A useful addition to hardy border plants. From Messrs. Barr and Sons, Covent Garden, W.C.

Dahlia Patrol (Collarette).—The outer florets are coloured ruby crimson, the inner ones nearly pure white. A shapely and distinct variety.

Dahlia Geraldine Edwards (Cactus).—A refined and distinct variety of delicate blush pink colour with long, narrow, almost thread-like florets. These were from Messrs. James Stredwick and Son, St. Leonards, Sussex.

The whole of the foregoing novelties were exhibited before the Royal Horticultural Society on August 17, when the awards were made.

THE MAGNIFICENT COLLECTION OF VEGETABLES SHOWN BY MR. E. BECKETT IN LONDON LAST WEEK. AWARDED A GOLD MEDAL AND A LINDLEY MEDAL FOR CULTURE.

the garden forms. In districts where the soil is heavy and retentive of moisture, they do not flourish well when treated strictly as perennials. In all but the most favoured localities a warm, sheltered position, such as at the foot of a south wall, must be provided for them. Usually the best results are obtained where the soil is naturally light or chalky and spring planting out is preferable even then.

One of the best species is *P. barbata*, growing about 2½ feet high and bearing spikes of bright red, tubular flowers over a lengthy period. A richly coloured form of this is *P. coccinea*. Of dwarfer habit is *P. glaber* and *P. Menziesii*, both producing violet or purple flowers with perfect freedom. *P. roseus* is a charming rose-flowered form of *P. glaber*. *P. Scouleri* is noteworthy for its long spikes of violet blue flowers, but it must be planted in a warm sunny position, where it will attain a height of 4 feet when in flower.

Garden Varieties.—Among the florist varieties the greatest difficulty is which not to grow, so numerous are the really good forms. One of

in bold groups or large beds. In *Crimson Gem* we have a most suitable variety for either purpose. When well grown it is perhaps the finest of its type, the massive pyramidal flower-spikes of crimson-scarlet, often 3 feet in length, being most effective in any position. Another handsome crimson is *King George V*. This Pentstemon, though not exactly a self colour, as the last named, is nevertheless very charming with the few white stripes in the throat.

Propagation.—The usual method of increasing the stock of these plants is by taking cuttings about the last week in September and inserting them in sandy soil in a cold frame. After watering them thoroughly, put on the lights and keep them close till rooted, taking care in the meantime to shade from bright sunshine. Throughout the winter endeavour to keep them sturdy by admitting all the fresh air possible; very little water will be needed until the turn of the year. Where very large specimens are required, it is a good plan to pot them up when rooted, and, if possible, give a

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Pot Fruit Trees.—This method of growing fruit under glass is becoming more popular every year. The selection of varieties is of the utmost importance, as some kinds are quite unsuitable for growing in pots. Peaches, Nectarines and Plums are the most useful and profitable to grow. Of Peaches, Peregrine, Dr. Hogg and Marchioness of Downshire are all suitable for pot culture. Of Nectarines, Cardinal, Early Rivers', Dryden, Pine-apple and Humboldt are thoroughly reliable. Plums may be represented by Early Transparent Gage, Jefferson Gage, Green Gage, Denniston's Superb Gage and Kirke's Blue. A cultural point which needs special mention at this time of year is the treatment of the trees after they have fruited. They require just as much care in regard to watering when they have fruited as they did while the fruits were maturing. Trees which are required for forcing must be repotted now, and every encouragement given them to mature their buds, or failure will be sure to ensue.

Plants Under Glass.

Perpetual - Flowering Carnations.—Plants growing outdoors must be placed under glass should the weather become cold and wet. A light, airy structure is necessary for their well-being during the dull winter months. Fumigate them occasionally to keep them free from aphids; and should there be evidence of rust, syringe them once a week with one of the specifics recommended for this purpose.

Caladiums.—As the foliage of these plants begins to show signs of exhaustion, water should be given less frequently than hitherto. The plants must now be gradually induced to rest.

Crotons.—Some of the plants which are becoming too large can be discarded. All growth suitable for cuttings may be made use of. Cuttings will root readily in the propagating-case, providing there is a sharp bottom-heat. The plants in the stove must now be well exposed to the sun, or their foliage will be deficient in colour.

Dracænas.—These are always useful where large quantities of plants are needed for house decoration. A batch of young plants should be propagated annually. The best method of propagation is by cutting up the stems of old plants and laying them in boxes of sand. Place the boxes in heat and keep the sand moist, when young shoots will soon be forthcoming.

Salvia splendens.—This useful plant will now be well rooted, and must be liberally supplied with stimulants. The flower-spikes will soon be developing, and care must be taken that they are free from aphids and red spider. Before bringing the plants indoors, lay them on their sides and syringe them with an insecticide.

The Flower Garden.

The Flower Border.—Those annuals which are required for flowering early next summer should be sown now in boxes and placed in a cold frame. Annuals flowering at the present time require regular attention to tying and the removal of dead flowers and foliage. In the event of a continued spell of drought, all flower borders must be watered at least once a week.

Climbing Plants.—Those growing against walls require regular attention to watering, as heavy rains often fail to reach the roots. A mulch of some moisture-retaining material will be of considerable benefit to plants growing on walls. Many climbing plants are often disfigured by attacks of red spider, but these can be prevented by syringing with an insecticide.

Polyanthuses.—These are among the most useful spring bedding plants we have. Give the young seedlings every encouragement to make strong plants before bedding-time arrives. The plants which were pricked into boxes should now be ready to plant in the open. After planting, sprinkle them every evening when the weather is dry and hot to promote a healthy growth.

The Hardy Fruit Garden.

Morello Cherries.—When the fruits have been cleared from the trees, all surplus growth may be removed. If this work is done now, there will be little pruning required during the winter. The advantage of pruning now is that the remaining growth will have a better chance to mature. It is a common mistake to leave too much growth in the trees; a distance of 6 inches is none too much between the shoots. After pruning, the foliage should be thoroughly washed with an insecticide.

The Fruit-Room.—This important structure requires a thorough cleaning annually, and, if not already cleaned, it should be done at once. The shelves and all woodwork must be well washed with soapy water, and the walls cleansed and limewashed. I have seen paper or straw used on the shelves on which to lay the fruit, but this is a mistake. So long as the shelves are perfectly clean, nothing is needed on which to lay the fruit.

The Kitchen Garden.

Leeks.—These may still be planted where ground is available. Bearing in mind that all vegetables will be of double their usual value during the coming winter and spring, there must be no vacant ground left anywhere. The Leek should be specially favoured in this respect, as it keeps so long in good condition.

Vegetable Marrows.—At no time do Marrows require so much attention to watering and feeding as the present, for there are usually many fruits maturing on the plants at this time of year. Liquid manure should be given frequently. Cut the fruits before they have grown too large, and remove all growth which is not wanted.

General Work.—Small sowings of Mustard and Cress may be made frequently in cold frames, or in a sheltered position outdoors. Radishes must also be sown frequently to keep up a regular supply of fresh roots. Celery must be watered with liquid manure, as also must Runner Beans and Peas. Exhausted crops should not be allowed to remain on the ground. A good fire will consume almost everything, and the ashes are always useful.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Flower Garden.

Lilium candidum.—Bulbs of this charming Lily are now on the market, and should be planted without delay, so that they may get well rooted and be allowed to develop their autumnal growth before winter arrives. This Lilium resents frequent disturbance at the root, but on some soils it quickly deteriorates, and it becomes necessary to replant. Some well-rotted manure and leaf-soil should be put in the soil first, but not in such a manner that the actual bulbs will come in contact with it. Planted in the herbaceous border, they brighten up the garden at a period when there is a gap between summer and autumn subjects. For cutting purposes they should be planted in different sites or aspects to get a longer season of flower.

Heliotropes.—If plants are required as standards, there must be no delay after this date in getting the cuttings put in, especially if tall plants are needed. Apart from this, it is safer to secure the cuttings now, as a very few degrees of frost kill the plants.

The Hardy Fruit Garden.

Gathering Fruit.—The early varieties of Apples and Pears are in season, and should be gathered before they fall off. Some varieties of Apples are much better if used at once, while others are improved by being kept a few days in the fruit-room. It is very important that the fruit is dry and thoroughly ripe when gathered.

Raspberries.—Excepting the late autumn-fruiting varieties, the young canes should be reduced to the number needed for fruiting next year. This should be done at once, at the same time removing the old canes which have finished

fruiting. To assist in the ripening of the young canes, they should be spread out and tied singly to the wires.

Fruit Under Glass.

Strawberries.—The potting of any late-layered plants which are to be forced must now be soon completed if they are to be a success, as it is essential for them to become well established in their pots before being introduced to heat. All runners must be kept closely picked off as soon as they appear. During dry weather the plants should be well syringed to ward off attacks from red spider.

Late Vineries.—The Grapes now ripening should be given the necessary treatment for them to develop a high finish and colour. Some varieties, such as Gros Colmar and Mrs. Pince's Muscat, are rather difficult to get entirely black, as one likes to see them. This is sometimes owing to the lack of certain essentials in the soil, such as iron. Where this is the case, a note should now be made of it, so that it can be applied in the form of sulphate of iron when the Vines are dormant. The bad or exhausted condition of a border, also overcropping, are very often the cause of Grapes not colouring properly. Keep a moderate amount of heat in the pipes during sunless weather, and ventilate freely on all favourable occasions.

The Kitchen Garden.

Lettuces.—A good number of plants should be pricked out in a sheltered border for use during October and throughout November. The length of time they will keep will largely depend upon the weather; but, if possible, they should be protected from continuous rains to prevent damping.

Celery.—The main crop will now be ready for the first earthing-up, and should be first of all cleared of any small outside leaves, then tied with some material, such as thin raffia, which will decay after the soil has settled. If worms are troublesome, a light sprinkling of Vaporite, if applied before earthing-up commences, will tend to keep them out of the plants.

Cauliflower plants should be looked over occasionally, and any heads which have grown nearly large enough for use can be covered by bending over one or two of the inner leaves to keep them white.

French Beans.—If these are required during winter, a start should now be made by sowing either in pots or in beds in heated pits. Osborne's Forcing and Canadian Wonder are both good varieties for winter. Climbing French Beans could likewise be sown where these are favoured.

Spinach.—More should be sown to furnish leaves during early spring. The earlier-sown lot should now be thinned, leaving a space of 4 inches or 5 inches between the plants.

Onions.—Make a sowing of some varieties recommended to be sown at this season, such as Giant Rocca or any of the Tripoli varieties. These are very useful during spring and onwards.

Plants Under Glass.

Caladiums.—As the majority of these plants are fast losing colour and showing signs of maturing their foliage, they will be better removed to a drier atmosphere than where they have been growing. Withhold water by degrees, but not sufficiently to shrivel the plants excessively. The corms should be left in the soil and wintered in a fairly dry shed where the temperature does not fall below 50°.

Salvia splendens.—If there is accommodation indoors, these plants should now be taken in, away from danger of frost. They must still be fed liberally until they are in full flower. Those which have been planted outdoors should be gone round with a spade some days previous to lifting. After being potted, stand in the shade of a wall and keep well syringed.

Arum Lilies.—Whether planted out or left in their flowering pots, these Lilies will now be showing signs of active growth, and should be immediately potted up in good, new soil. After potting, stand in a frame for a time, where they can be readily protected if frost should threaten.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

SOME GOOD HARDY SHRUBS.

DURING recent years hardy flowering shrubs have become highly popular on account of their usefulness as decorative subjects in the flower garden or pleasure grounds. Once they are planted in a suitable position, they require a minimum of attention, and season after season they continue to produce a rich display of beautiful blossoms. Of course, a little attention in the way of pruning and manuring will be amply repaid by a much finer display than would be the case if they were left to their own sweet will. It is in the matter of pruning that many amateurs, and gardeners too, feel a good deal at sea, as different shrubs require to be differently treated. The season for planting will soon be with us, and perhaps it may not be altogether inopportune if I just mention a few shrubs which I have found satisfactory in every way.

Escallonia philippiana is one of the choicest hardy dwarf shrubs we have, growing freely in any fairly good soil. It has small shining green leaves, among which the white flowers are closely studded along the whole length of the shoots. It may be grown as a bush in the open or trained against a wall, and in either position it is exceedingly attractive.

Escallonia langleyensis is, if I mistake not, a hybrid, its parents being the variety just named and *E. macrantha*, and it has the growth and style of flowering of *E. philippiana* and the colour of *E. macrantha*, a bright rosy carmine. These two varieties make excellent companions, and succeed under similar treatment.

Ceanothus azureus is a Mexican shrub of great beauty, and well worthy of the attention of all hardy plant lovers. The flowers are quite small, but are produced in great quantities on an elongated thyrse in such a manner that they, at a short distance away, look like hairy brushes, pale blue in colour. The *Ceanothuses* succeed best on a warm wall, in which position they continue to flower till frost sets in. The variety *Gloire de Versailles* is perhaps the most desirable.

Choisya ternata (the Mexican Orange Flower) is a very distinct and beautiful evergreen shrub, with pure white, fragrant flowers resembling Orange blossom, and borne in large clusters. This excellent shrub requires to be planted in a sheltered spot, especially in the North, as it is of doubtful hardiness. It also requires good compost in which to grow. A mixture of good loam, leaf-mould and sand seems to suit its needs.

Buddleia variabilis is another splendid shrub, especially where autumn display is required. The varieties *magnifica*, *superba* and *veitchiana* are excellent, and few shrubs are more effective when in flower. The flowers are carried on densely packed spikes often 18 inches in length. The colours are deep violet and rosy purple, each flower having an orange yellow centre. The plants require a good deal of room, as they are rampant growers, often reaching 8 feet or 9 feet in height, and carry their graceful plumes at the extremities of the shoots. They require to be cut down hard every spring so as to get good, strong growths.

Robinia hispida (the Rose Acacia) is a beautiful flower; but, unfortunately, the habit of the plant is somewhat ungainly, which to a certain extent mars its beauty. However, it is well worthy of

consideration on account of its lovely flowers, which are produced in long, graceful racemes rosy pink in colour. The branches of the *Robinia* are exceedingly brittle; therefore it should never be planted in exposed situations.

South Ayrshire.

W. L.

STONE SPLITTING IN PEACHES AND NECTARINES

THERE are two reasons, one or both of which may be responsible for this evil; an unsuitable border may be one, while the other may be due to sudden fluctuations of temperature during the early stages of fruit forming. Of the two, it is usually the first named which is at fault, in which case all other efforts to keep the tree in order are of no avail, as everything depends on the roots being vigorous and plentiful in soil that suits them.

But, on the other hand, judicious management must accompany the best of borders, or stone splitting will be an evil to reckon with. This for the main part consists of avoiding sudden rises of temperature. The importance of this is the more easily understood when it is realised how tender the walls of the stones are in their early stages of growth, and consequently quite unable to withstand any sudden expanding force within them, such as takes place when rapid rises in temperature are allowed. The prevention of this during the early part of the year is not an easy matter, as it often happens that the days which favour us with sudden bursts of sunshine also give us more than is agreeable of biting winds. To open the ventilators on such days without causing disaster to the tender foliage requires more than usual care; but still, it is only by such means and the regulating of the heat in the hot-water pipes that the temperature can be kept anything like steady.

Watering is also a detail that calls for good judgment, and while it is not good practice to allow the border to become too dry at this stage, it is equally as injurious if it should be kept too wet. In fact, during the stoning period it is the better plan to practise moderation, to keep the tree from becoming unduly excited. Along with a free circulation of air, it is advisable to aim at a lower rather than a higher temperature, to give the walls of the stones time to harden, so that they will not suffer from the pressure that is within them, which, providing the action of the tree is normal, will be slow and in accordance with Nature, where stone splitting is not an evil to reckon with.

With such precautionary measures as these—and the stoning period shows no signs of being improved upon—it is practically safe to lay the blame on to an unhealthy root action. For this the border is responsible in most cases, and where there are no sure grounds for thinking otherwise, the best plan is to remake it at the earliest opportunity.

Renovating Borders.—It may, perhaps, be useful to set out briefly a few of the necessary details. Formerly it was the custom to make very wide and deep borders, and it must be said of these that the returns were not so unsatisfactory as the present-day style would lead one to expect. But time has proved that they were a waste of good turf and labour, and that better results are obtained when the

roots are confined in a smaller space, where feeding and top-dressing can be effectively carried out during the period of crop developing. In making a new border, the dimensions I should adhere to would be about ten feet wide and three feet deep, with a slope of a few inches to the sun. This depth provides for a 6-inch layer of broken brickbats and rough stones for drainage purposes. To confine the roots to this space, it is advisable to build a retaining wall 9 inches thick, and unless the substratum is of chalk or limestone, a base of concrete about three inches thick should be provided. This base should have a fall to the front of not less than half an inch to the foot, and terminate in a main drain level with the surface, having a fall sufficient to empty itself freely into a tank laid for the purpose, and from which a quantity of valuable liquid manure will be available for the garden during a season. The drainage material should be covered with thin turves, grass side downwards, so as to prevent the fine soil being washed into the drainage.

In regard to the compost, the plainer it is the better. Manures, except in the form of phosphates, should be avoided, but lime is absolutely necessary for the successful management of all stone fruits, and particularly in the case of Peaches and Nectarines, as these have a greater demand on lime than any other similar fruits, on account of their large stones. A good compost for these trees is one that consists mainly of good fibrous loam. It should be chopped into pieces about three inches square, and to every five cartloads of this add a load of screened old lime rubble and half a load of wood-ashes. Unless the soil be of very poor quality, no organic manure should be used; but should it be necessary, it may be given in the form of stable manure, without straw, at the rate of one load to five loads of soil. This will not be required in every case, but there are few soils that will not benefit from crushed bones given in the proportion of about two and a half hundred-weight to an average cartloads of soil. All these ingredients should be well mixed together and protected from heavy rains till required; but it is well to remember that the earlier the border is made, the warmer is the soil, and once in the house it remains in that condition, which means much to the tree in early spring. A border made on these lines is well drained and free from all matter that tends to incite sappy growth. But this is not all. Fluctuations of temperature must be avoided, or stone splitting will still be troublesome.

F. J. T.

TWO GOOD YELLOW-FLOWERED SHRUBS.

DURING the latter part of July and well into August, when flowering shrubs are none too plentiful, there are two which are perfectly hardy and ought to be more extensively grown. The least known of the two is the Mount Etna Broom, *Cytisus ætensis*. It is the quickest grower of all the Brooms, two specimens that I have, which were planted from 5-inch pots less than four years ago, now standing 8 feet high. The stems are long and slender, of semi-pendulous habit, and a pleasing shade of green; hence even in the winter the shrubs are by no means unattractive. For several weeks these shrubs have been cascades of yellow, the rather small, pea-shaped flowers being produced very lavishly. Although they open so comparatively late in the season, seeds

ripen well in normal years, and seedlings spring up in large quantities if the soil beneath the shrubs is cultivated. The other good yellow-flowered shrub that I have in mind is the Spanish Broom, *Spartium junceum*. This is a very old plant in our gardens, having been introduced to this country from Southern Europe as long ago as 1548. If left alone it will make a rather gaunt shrub from 8 feet to 12 feet high, its large and brilliant yellow flowers being produced in abundance from the end of June until nearly the end of August. The stems are cylindrical and Rush-like, and leaves small and few in number. Both this and the Mount Etna Broom are excellent for planting in sandy soil, where few other shrubs will grow, though both will make large specimens more rapidly in soil of better character. Planting should be done while the seedlings are small, and these are best obtained in pots, as the shrubs resent any disturbance of their roots, particularly when they are several years old. F. W. H.

COLOUR CHARTS.

A REPLY FROM AMERICA.

IN discussing the mooted question of colour standardisation and colour charts in *THE GARDEN* for March 27 and April 3, Mr. George Dillistone sets forth a number of objections to the use of a colour chart, which, it would seem, may be answered and overcome by the use of a little common sense.

To begin with, Mr. Dillistone mentions the substitution by the Royal Horticultural Society of Dr. Robert Ridgway's chart, "Colour Standards and Nomenclature," for the once recommended "Répertoire des Couleurs," and says that, when he sees Dr. Ridgway's chart and compares it with the French one, he expects to find many discrepancies. He will. They differ almost entirely in nomenclature, and there are fewer colours in the Ridgway chart.

As to the difference in colour perception, Dr. Ridgway's colours are combined by the use of the spectral discs, and are compiled by formula, and not "by eye." When it comes to the "matching up" of colour and flower, there will, of course, often be differences of opinion; but this is one of the points where common sense must come into play. If one considered the vagaries of the colour blind or the colour dull, there would be no colour standard and no colour nomenclature, any more than there would be a standard of musical pitch if we relied upon the varying opinions of the tone deaf. The compared opinions of a few good garden colorists ought to determine the standard colour of a flower quite as satisfactorily as the compared opinions of any other group of scientists can determine any other standard.

Now, in regard to all the fussy details of bright or cloudy days, different soils, the difference in hue of the same variety of flower at different flowering seasons, &c., there is but the one answer: Let us do the best we can. Mr. Dillistone objects that no one will want to purchase flowers from a description such as "'Rép. des Coul.,' p. 221; Nos. 2 to 3; Centre, p. 11." Of course not. But could you not imagine buying a *Phlox* described as follows: "Eosine pink (16): mass effect, a little paler." Or, if a more detailed description were desired, as it might be in a technical catalogue, "*Hemerocallis fulva*,

English red (7i), marked Morocco red (5k), throat deep chrome yellow (17b); mass effect, Brazil red (5i)." That is, if one *must* have the "pickling" markings; in the main, "mass effect" is best. Quite true, one can no more describe the bloom on a Tulip, the glistening tones of the *Fleur-de-Lys*, the velvet of the deepest red *Sweet William*, than one can put a name to that "livelier Iris" which "changes on the burnished dove." Why try? No more can one compare the texture of the petal, which has so much to do with its apparent colour, with that of any paper. Why hope to do so? Spectrum red is spectrum red, whether of velvet, paper, or glass; the same with all true colours. No two flowers on the same plant, even, will be identical in hue and tone throughout. The very best that can be done is for students of colour in all countries to match up the flowers to a good chart (we hope, Ridgway's) as accurately as they can in a clear light, not full sunlight, compare the mass effect to the very best of their ability, and "let it go at that." Under no circumstance of light or shade would we then have everything of a rose hue listed as "crimson," from Bee Balm (which is nearly pure spectrum red) to *Lychnis Viscaria splendens* and *Spiræa Anthony Waterer*; nor would the pale violet *Violas* or *Phlox divaricata* be sold to the unwary as "blue."

One American dealer asserts "you cannot have a standard of nomenclature." Why not? He describes the *Darwin Tulip Philippe de Commines* as "velvety maroon purple." Is it any harder to call it "velvety violet carmine, very dark"? Or to call the Cottage Tulip Miss Ellen Willmott "palest baryta yellow," which it is, according to Ridgway; instead of "soft primrose yellow," which it is not, as the primrose is a much greener yellow? Or, if "baryta" is a strange term, to call it, for simplification, the "palest tint of lemon chrome," which is the same thing? We call colours by some name, why not by a standard, and correct name? One person may now call "crimson" the same hue that another calls "carmine," and a third "cherry colour," which is foolish on the face of it.

Mr. Dillistone speaks of the difficulty of correct colour printing. Dr. Ridgway's chart is prepared as follows (for example, and speaking briefly): It is found by years of experiment that proportion A of standard dye No. 1 (names, &c., are all given in the preface to the chart) mixed with proportion B of dye No. 2 will give spectrum red, as measured by the colour wheel and the Maxwell discs, not by any guesswork. This pigment is then evenly applied by hand to a very large sheet of paper, which has a soft and not a shiny finish. This sheet is then cut into as many small sections as there are numbers of copies of the chart in an edition, and mounted on grey paper for binding; hence there is no "colour printing," and the colours are accurate.

The question of expense is also brought up. The regular Ridgway chart costs 8dol. This is a large price for the average individual to pay, but Dr. Ridgway will sell 500 copies of the work, in a lot, to garden clubs or similar organisations for 4dol. each. Clubs or horticultural societies could easily combine to order such a number if the chart were generally adopted, and dealers could easily afford the 8dol. At present Messrs. Kelway and Son advertise in their catalogue that they have in their office a copy of the Royal Horticultural Society's chart, and that customers wishing to order by colour number from this

chart may do so. The Ridgway chart could be used in the same manner. Should England and America combine to use this chart, other nations would soon adopt it (as it is by far the simplest chart yet shown), and the nomenclature could be literally translated.

Mr. Dillistone's own confession concerning the confusion of colour names is in itself a plea for a standard of nomenclature, and when so simple, compact and scientifically correct a chart is already on the market, why go all around Robin Hood's barn, waste time, energy and language, and hopelessly retard artistic and scientific colour scheming in the garden by hunting aimlessly for another one? MARY YOUNGS.

(Secretary, Shedowa Garden Club.)

Long Island, U.S.A.

THE NATIVE LADY'S SLIPPER.

(*CYPRIPEDIUM CALCEOLUS*.)

IN "The Flora of the Alps" Mr. A. W. Bennett says this is one of the most striking of European plants, and, further, that it is met with occasionally in stony woods at a moderately high elevation in Switzerland, Jura, Tyrol, Lombardy, Dauphiny and the Pyrenees, but is nowhere abundant. It is well known to botanists that this most interesting plant is occasionally to be found in this country. While botanising recently in the Yorkshire highlands I had the good fortune to find this plant growing in considerable abundance, one patch alone consisting of at least twenty plants. For upwards of thirty years I have been on the look-out for this plant in its native habitat, Yorkshire, the first records of which we find in the books of Parkinson (1640) and Ray (1670).

Ingleborough appears to be the centre of distribution of this delightful British plant. Its habitat was known to the late Abraham Stansfield, the celebrated British Fern grower of Todmorden, and also to John Nowell, a well-known cryptogamic botanist. It was also known to James Percival, a working man botanist; and two other persons well known to me knew of the habitat of this rare British plant. In each case it has a different station. It has also been recorded from Durham and Westmorland, always upon the same geological formation, Yoredale or mountain limestone, with Ingleborough as the centre of distribution. It must, therefore, be interesting to the numerous readers of *THE GARDEN* to know that this plant is still to be found wild in our Yorkshire highlands.

As far as I can learn, it is always found growing under similar conditions, viz., in shady woods in rough, rocky ground, and nearly always growing with Lily of the Valley. Now, these two plants are very much alike in a wild state, and he must be a very keen-sighted person who happens to find this, "Our Lady's Slipper," as it was known in the days before the Reformation.

The plants that I saw could not be lifted without a pickaxe, so that will give one an idea as to the ground in which they were growing. I have made three journeys to see if the plants would flower this season. At first sight they had every appearance of blooming this year. But not a single flower appeared; indeed, I am told that in its European habitats it seldom flowers. But if it should do so, the blooms last on the plant

for from thirty to forty days. This, then, is some compensation for its shyness in blooming

Your correspondent Lucy Joshua, on page 361, in your issue of July 24, describes this plant as growing in sphagnum. This must be a mistake, as the sphagnum is not usually a limestone plant. One of the well-known stations for this plant is in some woods near Engelberg. I have several times looked for it in these woods, but have not had the good fortune to see it growing there. The conditions there, however, are exactly similar to those which obtain in our Yorkshire highlands—the same sorts of trees, the same undergrowth filled with Lily of the Valley and Dog's Mercury.

In regard to the cultivation of this plant, which is said to prefer limestone, I have seen it grown, and successfully grown, here in Southport, flowering well each succeeding year on the top of a dry rockery composed chiefly of sandy soil. Here at Kew it does equally well in ordinary peaty soil. The only extra attention which the plant receives is a little shade during the flowering period. My soil is almost devoid of lime, so it is at once apparent that lime is not an essential element in the cultivation of this, the most interesting of all our European plants.

W. H. STANSFIELD.

Brantwood, Kew, Southport.

HOW TO PROLONG THE STRAWBERRY SEASON.

THE arrival of several nurserymen's lists of Strawberry plants serves as a reminder that during the next week or two is the best time of the year for making new beds of this useful fruit. Strong runners planted at this time become well established before the winter, and will, if the elements prove normal, give a good crop of berries during June and July of next year. This, really, is the great advantage of early autumn planting. If the work is deferred until the spring, very little fruit will be available next year, and a loss of practically twelve months will result. Any reasonably good soil will grow excellent Strawberries, but it must be deeply dug and well manured, especially if the plants are to remain for two or three years. Treading afterwards to consolidate the surface before planting also is essential, as the plants appreciate a firm rooting medium. The distance apart to set them will depend upon the time they are to remain. If the one year system is adopted, *i.e.*, a new bed is made every August and destroyed the following year after the fruit has been gathered, 2 feet between the rows and 15 inches between the plants will suffice; but for more permanent beds, 2 feet 6 inches and 18 inches respectively must be allowed. Of varieties there are now a large number, yet for nearly all purposes four, or at the most five, will suffice. For a good all-round and early Strawberry, Royal Sovereign has not yet been surpassed. It thrives nearly anywhere, always crops well and, as the fruit is firm, it is excellent for market. Its rather acid flavour is a point against it, though many prefer this to the sweeter varieties. Vicomtesse Héricart de Thury is a good early Strawberry. It is rather small, but a heavy cropper, and the fruit is sweet and of excellent flavour. To follow this and Royal Sovereign, either The Bedford or Bedford

Champion should be selected. My experience of the former is that it does well the first year, but cannot be relied upon after that; hence to get it good a new bed should be made each year. Bedford Champion is slightly earlier, a heavy cropper, and does well during the first, second and third years. The quality of both leaves nothing to be desired. For a late variety choose Laxton's Latest or Givon's Late Prolific. Both are excellent in every way. With the varieties named it is easily possible to have good Strawberries for at least two months, instead of only a fortnight or three weeks, where only one variety is grown. One would think that market growers would find it pay them well to grow the late varieties named, as prices, when the fruits were ready, would be much higher than at the height of the season.

F. W. H.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

TREES AND SHRUBS.

OAK SEEDLINGS (R. F. C.).—The Oak seedlings can be lifted and planted in nursery rows, but it would be as well to leave them where they are until early October. Take them up carefully and plant them in rows a foot apart, and the plants 6 inches apart in the rows. After two years in that position they should be lifted and either planted out permanently or replanted in the nursery, giving more room between the rows and plants. If any roots are broken, cut them off beyond the wounds with a sharp knife. Should any of the plants become stunted, cut them back to the ground line. New shoots will then be formed, and the strongest and straightest can be reserved for the future trees, the others being removed when a few inches long.

MAGNOLIA STEMS UNHEALTHY (H. T.).—We do not know of any particular bark disease that attacks Magnolias. *M. grandiflora*, when growing against a warm wall, is sometimes attacked by mealy bug, and is cleaned by syringing with a paraffin wash. From what is said of the disease, we imagine that it must be a species of chermes, such as attacks various kinds of conifers or is closely allied to those species. It would be advisable to scrub the trunk with a strong soft soap solution into which a little paraffin has been mixed; then syringe the remainder of the plant with a similar wash. The present year is a particularly bad one for insect pests on trees, many kinds that are usually quite free from insects being badly infested at the present time. On the other hand, the eruptions may be due to some other cause, and the best plan would be to send a small section of bark if you do not think that they are due to insect agency.

THE GREENHOUSE.

THE BOTTLE-BRUSH FLOWER (F. H., Lancs.).—The Bottle-brush Flower is commonly known as *Metrosideros floribunda*, but its correct name is *Callistemon salignus*. It is a native of Australia, whence it was introduced during the early years of the last century. This *Callistemon* is propagated by cuttings of the half-ripened shoots taken off at a length of about three inches and dibbled into well-drained pots filled firmly with a mixture of peat and sand sifted through a quarter-inch mesh sieve. They must then be placed in a structure in which a temperature somewhat above that of an ordinary greenhouse is maintained, and covered with a bell-glass, or put into a propagating-case. The cuttings will take a couple of months or so to root, when they must be gradually

inured to the ordinary atmosphere of the structure. Then they should be potted singly into small pots in a compost made up of equal parts of peat and loam, with about half a part of sand. When the roots have taken hold of the new soil, the tops of the plants should be pinched out in order to ensure a bushy habit of growth. Established plants may be treated much as Azaleas; that is to say, after flowering, any straggling shoots may be shortened back and the plants encouraged to grow. During the summer they may be stood out of doors. Annual repotting is by no means necessary, but an occasional stimulant will be beneficial. They need a minimum temperature of 45° in the winter.

FRUIT GARDEN.

CHERRY SHOOT FOR EXAMINATION (C. W. L.).—The shoot sent is not sufficient to enable us to say to what the trouble with the Cherries is due. It appears to lie behind the part from which the twig was cut, and possibly may be the result of gumming.

PEACHES DROPPING THEIR FRUIT (A. Dawson).—The kernels of the Peach stones are decayed, and no doubt this is the cause of the fruit dropping off prematurely. The decayed condition of the kernels, we believe, is due to the defective fertilisation of the flowers. To guard against this trouble in future, be mindful of fertilising the blossom of your trees with the pollen of some other healthy growing one which may be in bloom at the same time, or by its own if no other is to be had.

MISCELLANEOUS.

WOODEN TRAYS AND STANDS FOR STORING APPLES AND POTATOES (T. H. Thornely).—Messrs. H. Blacknell, Fleet Saw Mills, Fleet, Hants, will give you all particulars and prices relating to these. Saturate the haybands in a strong solution of Tobacco water.

CELERY LEAVES ATTACKED (Emsworth).—The Celery leaves are badly attacked by the Celery leaf rust, due to the fungus *Septoria petroselinii* var. *Apii*. Spraying with Bordeaux or Burgundy mixture will be the best method of checking it so long as it has not made much headway on the plants; but if it has progressed far, it will be useless to attempt much now, we fear. Spraying should have been commenced in May.

OBITUARY.

MATTHEW CAMPBELL, BLANTYRE.

WE have received with much regret the information that Mr. Matthew Campbell, of the firm of Messrs. M. Campbell and Sons, Blantyre, Lanarkshire, died on August 20. Mr. Campbell, who was in his eightieth year, was one of the best known of Scottish nurserymen, especially among exhibitors and frequenters of shows, where his familiar figure was always welcome and where his presence as a judge or as an exhibitor was received with pleasure and satisfaction. At the Auchinraith Nurseries florist's flowers were a leading feature and the quality and cultivation were of the highest kind, as was evidenced by the awards gained at the principal shows and by the magnificent displays made of collections of Dahlias, Carnations, &c. As a judge Mr. Campbell was held in high esteem, everyone feeling that he was one with a full acquaintance with the classes he took in hand, and that each and every exhibit would have justice done to it. He was much respected in business and private life. Before beginning business he had a long experience in private gardens, and was gardener at Mauldslee Castle before going to Blantyre.

TRADE NOTE.

Now that readers will be busy potting up bulbs for flowering during the winter months, we would draw attention to the special bulb catalogue which is issued by Robert Sydenham, Limited, Tenby Street, Birmingham. In addition to prices of all kinds of suitable bulbs, there are valuable particulars included concerning the growing of bulbs in fibre, a feature for which this firm has for many years been renowned. This year we are interested to notice that they are putting on the market Professor Bottomley's manure named Humogen. This is stated to be a particularly good fertiliser for bulbs, and it certainly is well worth giving a trial. We understand that a copy of this interesting catalogue will be sent post free to any reader who cares to apply for it.

THE GARDEN.

No. 2285.—VOL. LXXIX.

SEPTEMBER 4, 1915.

NOTES OF THE WEEK.

The Death of Mr. F. W. Harvey.—Just as we go to press we learn, with infinite regret, of the sudden death of our Editor, Mr. F. W. Harvey. Mr. Harvey had been ailing slightly for a few days, when his illness was diagnosed as an abscess on the brain. An immediate operation was necessary, from which he did not long rally, and he succumbed, a week later, on Tuesday, August 31. An appreciation of Mr. Harvey's life and career will appear in our next issue. In the meantime we feel sure that our readers and Mr. Harvey's innumerable friends in the horticultural world will echo our feelings of sincere regret at his untimely end. He was a most lovable, upright and conscientious man, and with his death a deal of valuable knowledge goes out of the world.

A Gardener's Son Wins the V.C.—In the recently issued lists of Naval V.C.'s will be seen the name of Able Seaman W. C. Williams of H.M.S. Hussar. He was a son of Mr. W. Williams, a foreman in Messrs. Pillinger's Nursery, Chepstow, a position he has held for upwards of twenty-seven years. W. C. Williams won his V.C. at the historic landing at "V." Beach in Gallipoli. The lighters which were to form the bridge had broken adrift, and Williams, in assisting, held on to a line in the water for over an hour under heavy fire until killed. Much sympathy will be extended to Mr. Williams in his sad loss.

Flower Seeds for the Front.—Messrs. Webb and Sons, Limited, Seedsmen, Stourbridge, recently received the following communication from the Commandant of one of the large base camps for British troops in France: "I write to thank you again for the flower seeds you sent for the soldiers; they all came up and have made a splendid show." Messrs. Webb say the seeds were not sown until June, so the result testifies both to the favourable climatic conditions of the district and the cultural skill of our soldiers.

A Dwarf Bedding Dahlia.—In several of the Liverpool parks and the Botanic Garden the dwarf red Dahlia Aggie Hutt is freely used as a bedding plant. Bushy in growth and only from 1½ feet to 2 feet high, it is effectively planted in association with Fuchsias, Geraniums, and the general run of bedding plants. As a companion to Chrysanthemum (Double White Marguerite) Mrs. F. Sander, Dahlia Aggie Hutt is particularly

effective. In both form, size and colour the flowers resemble a one-time popular favourite, Glare of the Garden, while it has also the free-flowering quality of that variety, and displays the blooms well above the foliage.

Delphiniums.—The fine display of secondary spikes of Delphiniums which Mr. W. Wells put up at Vincent Square on August 17 was useful from several points of view. One was the difference in the type of spikes and their

a rich deep pure blue with a light grey-brown eye. In each case the arrangement of the blooms on the spike was loose and light-looking, and just what ladies like for cutting.

Rose Sander's White.—As stated by "Ess," page 420, this is a desirable free-flowering, late climbing Rose of excellent quality. While the blooms are young, each carries a tinge of yellow in the centre, and, what is of great importance, has a lovely perfume given out by the central anthers.

The Colour of Eryngium giganteum.

Respecting the excellent illustration of *Eryngium giganteum* on page 395 of THE GARDEN, August 14, Messrs. Bees, Limited, Mill Street, Liverpool, very kindly point out that the colour is not steely blue, but ivory white, sometimes shaded pale biscuit or buff. Possibly our contributor had Oliver's Sea Holly in mind, or *E. alpinum*, an even more magnificent plant. A feature worth mentioning is the facility with which Sea Hollies can be dried for winter decoration without losing their attractiveness.

A Handsome Japanese Windflower.

There are many varieties of *Anemone japonica*, and of them none can excel the variety Kentish White. We are reminded of the refined beauty of this variety by the arrival of a box of medium-sized blooms sent by the raisers, Messrs. George Bunyard and Co., Limited, The Royal Nurseries, Maidstone. The flowers are inclined to petalody, and the larger they are, the more double they appear. It is well to note that this variety requires a dry situation in winter, since it is a little tender compared to any of the other japonica varieties. However, it is well worth the slight extra care that is necessary.

A Useful Late-Flowering Shrub.

Clethra alnifolia, the Sweet Pepper Bush, is an attractive hardy shrub, a native of Eastern North America. A deciduous shrub some 4 feet to 6 feet or more

greater or less fitness for garden decoration or for cutting for the house. Putting on one side the exceptional cases of extra large receptacles, there is no doubt but that the looser spikes are far the most pleasing in what may be called everybody's sized vases. Three varieties stood out in the collection as being especially adapted for such purposes: *Moerheimii*, which is a pure white sport from the old and well-known lovely light blue *Belladonna*; *Capri*, an extremely taking very pale blue with an ivory white eye; and Mrs. Thompson.

in height, the bushes are very conspicuous at the present time, being freely clothed with racemes of white flowers. Members of the Natural Order Ericaceae, the *Clethras* thrive under somewhat similar conditions to *Rhododendrons*, including a peaty soil. Seeds, cuttings and layering each provide a ready means of propagation. *Clethra alnifolia paniculata* is an equally desirable plant with slightly longer flower-spikes; it is rather stronger in growth and a little later in flowering.

THE LATE MR. F. W. HARVEY.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

A Good Wall Plant.—Let me advise your correspondent "Subscriber" to grow Lardiz-

CARPENTERIA CALIFORNICA IN A SCOTTISH GARDEN.

abala biternata, a very handsome evergreen and a capital wall plant. Buddleia Colvillei will certainly thrive a long way north of the Southern Counties. It flowers freely here and grows with amazing quickness.—F. A. STURGE, Wrexham.

Some Notes on Endive.—This is a vegetable which one does not often see in gardens, so I offer no excuse for sending up this little note about it. It is one of the easiest vegetables to grow, though, like Spinach, it is apt to run to seed, and may be used, blanched, as an addition to the salad-bowl, or, unblanched, may be cooked (boiled) in the same manner as Lettuce. This vegetable does best on land well dressed with stable manure, and although sowings may with advantage be made in the spring, the present is undoubtedly a suitable time to sow. The position chosen should be one of light shade, and the seed sown in shallow drills 9 inches apart. When the young plants are of a convenient size, plant them out singly, 6 inches apart, in rows a foot asunder in semi-shade again, and keep the hoe and water-pot going in dry weather. Blanch by tying up, or by putting a slate on to the plants. Endive, like Lettuce, must be grown quickly and be well supplied with water, or it will bolt to seed. If sown in September, it can be used in the very late autumn or during the following winter and spring. The best sorts to grow for summer consumption are Digswell's Prize and White Curled; and the best for winter, Green Curled and Batavian.—E. E. T.

Cats in Gardens.—On page 417 of THE GARDEN, issue August 21, there is a reply to "Hall" on the subject of keeping cats off plants. The advice given is: "We keep a well-trained Irish terrier, who does the duty effectively." While

asking pardon for questioning this advice, I think "Hall" would be well advised to think carefully before he adopts it. I can well imagine the exciting chases which would take place during the first few days after the terrier had been introduced, and the consequent damage. I think if "Hall" sinks some wide-necked bottles up to the rims in the ground and puts a little strong ammonia in each (putting the bottles, if possible, near the place or places where the cats enter the garden), he will have no more trouble. Experience shows that when cats have smelt the ammonia, they do not return to the garden in a hurry, and this is generally the most safe and sure plan to adopt.—E. T. ELLIS, Weetwood, Ecclesall, Sheffield.

Rose Blush Rambler and Carpenteria.—The enclosed photographs may interest you. Rose Blush Rambler is the plant of which I sent you a photograph last year and was not suitable for reproduction. The Carpenteria, except for the shelter of the wall, gets no protection of any kind in winter. I have had it for eight or nine years, and it flowers freely every year. It is not usually considered very hardy, but it might be grown more generally than it is, and is one of the most beautiful of flowering shrubs. We are 450 feet above sea level and thirty-six miles from it.—R., Galashiels.

Tomato Plants Diseased.—Plants grown under glass and forced on through not ventilating the structures amply up to the middle of July developed the disease in the leaves very badly indeed during the last week in July. Other plants, more freely ventilated by day and much less at night, have not suffered much from the disease. Outside plants, which were carefully hardened before being planted out, have not been touched by it. The specimens first referred to were rendered very tender through lack of ventilation, and then, when the cold nights and very moist atmosphere of July came, the leaves were soon attacked. The hardily grown plants throughout withstood the disease much better. Since the warmer nights of August came, and the greater amount of sunshine, the worst affected plants have recovered, especially where lateral shoots have been allowed to grow near the top. These observations refer to plants grown in the same district.—G. G.

An Interesting Surrey Garden. The article by Miss Gertrude Jekyll and the charming photographs which appeared in THE GARDEN for August 21 are very interesting and instructive. I have recently visited some old gardens where arches, walls and suitable flowering subjects harmonise as they do in the garden at Westbrook, Surrey. Such notes and photographs are highly educational, especially in these days when

so many lovers of gardens are doing their best to introduce similar features. In doing this in many modern gardens, much careful forethought is needful, else failure will result. There is, on the other hand, a splendid opportunity in many old-world gardens to make such features more prominent by the judicious planting of hardy subjects and by minor alterations and additions, without in the least spoiling their general appearance, and the time for carrying out such work is fast approaching.—Avon

The Crinums.—These are much hardier than is generally supposed. Our stock plants in the open have never been killed by frost, and we only protect them with ashes or Cocoanut fibre when severe weather sets in; just now they are splendid. C. Powellii, rosy, is 3 feet to 4 feet, and C. P. album is 3 feet, with stout stems and exquisite white bell-shaped flowers, the plants giving dozens of spikes. Our soil is light, over greensand stone. In heavier land some drainage would be needed, but generally they should be largely grown in the Southern Counties with success. They are most welcome in mid-August.—GEORGE BUNYARD, Maidstone.

A Beautiful Perennial.—I must write in praise of the beautiful perennial Hunnemannia fumariæ-folia. Early and late the golden blossoms shine bright. All the plants in one bed were from a plant that seeded with me. The foliage is so uncommon. I grow it in sunshine—ordinary soil suits it. Sir F. Moore tells me that it does not "do" at the Glasnevin Gardens. For fear of a hard winter it might be well to pot a few plants in late autumn and shelter them in a cool greenhouse, sowing their seeds. For those Rose-growers who have plenty of space, I recommend them to plant Betty and Duchess of Wellington.—FREDERICK LAWLESS, Maretimo, Blackrock, County Dublin.

Rose Gloire des Rosomanes.—This old pillar Rose has been pretty well relegated to the rear rank by such varieties as Ards Pillar and Carmine

ROSE BLUSH RAMBLER CLOTHING A WALL.

Pillar, although several nurserymen still offer it for sale. To the younger men who may not know it, I would recommend Gloire des Rosomanes as a very desirable semi-double crimson of great vigour and coming early into flower. With us it generally shows flower about the first week in June, but it was a week later this year.—CHARLES COMFORT, *Midlothian*.

The Single Sweet Rockets.—Although perhaps not admissible in the select mixed border as the double varieties are, yet the single Sweet Rockets have much to recommend them, and should find a place either in the informal garden or the strictly wild garden if for nothing else but their delicious perfume. I would like to point out that it is necessary to get seed from a reliable source, as there are some forms much superior to others as regards the density of the flower-spikes, and, in the case of the purple variety, as to the shade of colour, some forms being a dull, soulless purple, while others are a bright purple. Like most other biennials, the best results are obtained when the plants are transferred to their flowering quarters in the autumn.—CALEDONIA.

Birds and Ripe Fruits.—Now that various kinds of Pears are ripening, no doubt the birds will do their best to get more than their share. Not only do birds eat great quantities of fruit every year, but they spoil quite as much by pecking and rendering it unfit for use by the owners. I have frequently been assured that if I put down vessels of water, the birds would not touch the fruit. Having a Mulberry tree growing by the side of a large pond, I once asked, when the old tale was repeated to me, why it was that the birds preferred the Mulberries to the water in the pond? I well remember an enthusiastic amateur gardener pointing out a splendid Cherry tree on the end of a building. He had also been advised to provide plenty of water for the birds and save his Cherries; but neither the vessels of water, carefully put about, nor a little faulty net kept away the birds. "No," he said, "they leave the water and creep in under the net." I think it would be the best policy to trust to sound nets, well fixed, and not to water. Usually the good people who advocate the water remedy have no fruit for the birds to eat.—G. G.

Labels in Flower Borders.—There is generally most grumbling when plants are not labelled and visitors admire the flowers but cannot find out what kinds they are. I am now taking exception to the labels themselves, which may, in my humble opinion, be an eyesore. I lately visited a large garden in which there was recently made a magnificent water garden and rockery. It seemed to me that nearly every plant was labelled. I did not object to that feature, but the labels were placed with such regularity that one could see scores of them from one point, arranged in such precise order as to draw one's attention away from the plants to them generally. Surely some better plan could have been adopted. The labels to the plants could have been placed in a prominent position enough to permit of all visitors reading the names on them when standing in front of the specimens, but not so that they could see a whole army of them from the same spot and practically all facing the same direction.—AVON.

Spiræa Aitchisonii.—For some years I regretted the purchase of *Spiræa Aitchisonii*, which refused to bloom, much to my disappointment. It was, indeed, under contemplation to eject it from the garden as "a cumberer of the ground." How-

ever, it received a respite, and a few years ago proved that it was worthy of this consideration, as it then began to yield its flat heads of white flowers in considerable quantities. From that time *S. Aitchisonii* has gone on increasing in beauty and favour, and now is looked upon as a shrub well recompensing me for the space it occupies. In a corner by a 6-foot wall it has long overtopped the wall, and this year is upwards of 12 feet high. It looks well with its good foliage, reminding one of that of an Ash, but is still finer when it is in flower. It now blooms quite freely every year. During July it gave many heads of flowers, and on August 9 was still in bloom, although its pristine beauty of blossom was much reduced. It has plenty of sun, and is in a fairly dry soil.—S. ARNOTT, *Dumfries*.

Wichuraiana Rose Debutante for Arches.—Going through a capital collection of Rambler Roses—*wichuraiana* and *Polyantha*—in the gardens of Captain Hope at St. Mary's Isle, Kirkcudbrightshire, the other day, undoubtedly the finest sight of all was presented by an arch of *Débutante*. It is almost impossible to do justice to the beauty of this arch, which spanned one of the broad paths in the gardens and was absolutely laden with clusters of soft pink flowers. It is a Rose which I have known for a long time (it was sent out by Mr. M. H. Walsh in 1905), but I have never seen it in such perfect beauty as on this occasion. What gives it much of its value for an arch does not appear so well on a pillar. This is the pendent habit of the clusters of flowers, which hang down from the arch in a charming way, reminding one of the *Wistaria* in this feature. *Débutante* is also a very free grower, and will soon cover an arch. Mr. Jeffrey, Captain Hope's gardener, grows it over an arch built up of iron tubes, attached to each other by wire. He is of opinion that these are preferable to solid iron rods, and that Roses on these are not so liable to be injured by frost as on the latter.—SUB ROSA.

Preserving Green Figs.—A correspondent in THE GARDEN of August 21 asks for a way of bottling and preserving Green Figs, and I send her a recipe. If you care for details of bottling, I shall be pleased to send them. The Fig preserve is an original recipe and has been well tested. The following is the recipe: "There are several ways of dealing with this fruit. If the Figs have attained their full size and are nearly ripe, they can be bottled in the ordinary way, using a weak syrup. Or they may be made into a delicious preserve. Have ready a pan of boiling water in which a small pinch of bicarbonate of soda has been dissolved. Dip the Figs in this and allow them to boil for five minutes. Take them out and leave them to drain on a sieve. Weigh the fruit, and allow three-quarters of a pound of sugar for each pound of fruit. Take a quarter of the sugar and dissolve it in a pint of water to every four pounds of fruit. Boil the syrup and, when it is clear, place the Figs in it and simmer gently for fifteen minutes; then remove from the fire and leave till the next day. Drain off the syrup, boil it up with the rest of the sugar, and simmer the Figs till they look clear; then set aside for six hours and boil them for half an hour, very slowly. Place the Figs in jars, boil the syrup until it is thick and 'syrupy' looking, and pour it over the Figs. This is a delicious preserve, but it must not be eaten until it has been kept for six months. The Figs, if nearly ripe, can be made into a delicious jam. Greener fruit can be stewed, flavoured with ginger, and eaten with custard."—H. T. C.

LACHENALIAS.

BY THE REV. JOSEPH JACOB.

THIS is the time when the bulbs of these attractive little flowers should be potted. Between the coming of the grouse and the partridge is the ideal fortnight for the operation. Every week that passes after that is a nail in their coffin. How seldom one sees well-grown plants, and what caricatures are the miserable-looking cut blooms that traders sometimes treat us to at the Royal Horticultural Society's Tuesday meetings in the early months of the year! No plants need good and proper treatment more than these. Their requirements are very simple, but very necessary, and, if these cannot be given, their culture should not be attempted.

The three bed-rock essentials are: (1) *Early* planting. Do not attempt it after September is past. (2) *Cool* and *airy* quarters during the winter months. The temperature may vary between 38° to 40° at night to 50° to 55° in the daytime. Plenty of air, but no cold draughts. (3) *Thorough* ripening of the bulbs in the summer. The other points which contribute to their well-being are rich, light, well-drained soil; keeping the pots as long as possible in a perfectly cold frame (only at the approach of frost should they be housed); and feeding the plants in January and onwards with a weak stimulant. *Pendula* is an exception, and should be housed earlier than the others, as it may easily be had in flower for Christmas, when red flowers always seem peculiarly appropriate. Tricolor and quadricolor are now far surpassed by many of the newer varieties; but I do not think *pendula gigantea* (syn. *aureliana*) is such a pleasing shade of colour as the dull *pendula*.

My selections are: (1) *Pendula*, dull orange red (141.1 in the "Répertoire des Couleurs"). (2) *Nelsoni*, rich yellow. (3) *Cawston Gem*, greenish yellow, with narrow red edge to bells. (4) *Ruth Lane*, palish yellow bells, open-mouthed, with a narrow margin of bright claret. (5) *His Reverence*, the best of the greenish yellow selfs. (6) *Brightness*, rich yellow, with a wide edge of claret; red tops to the spikes. There are several more very good indeed, such as *Rose Barton*, *Shiner*, *W. E. Gumbleton*, *John Geoghegan*, *luteola maculata* and *St. Patrick*, but I am a little doubtful if all are in commerce.

A GOOD GREENHOUSE BEGONIA.

FEW warm-house plants are more delightful than *Begonia* President Carnot when well grown, and few bloom for such an extended period. I have cultivated it here for the last ten years, with considerable success, and so a few notes on my methods of treatment may be of interest to others who are thinking of trying it. The cuttings are particularly easy to root, and may be inserted at almost any time. Personally, I strike a few each winter at the time I cut back the plants, and scarcely one fails to root. The soil for the cuttings is of no great account, any light, sandy material sufficing; but a mixture of peat, loam and sand will favour rapid striking. I insert three or four cuttings round the edge of a 5-inch pot, and as soon as they are well rooted, pot off singly into 4-inch pots, soil of much the same kind being employed.

When these small pots are well filled with roots, give a shift into the 7-inch size, using richer and

VERONICA SPICATA IN THE ROYAL HORTICULTURAL SOCIETY'S ROCK GARDEN AT WISLEY.

rougher compost. A good mixture for the purpose is equal parts of good fibrous loam and fibrous brown peat, with half a part of leaf-mould and sufficient coarse sharp sand to ensure the other ingredients being kept sweet. As with all other Begonias, however, too much sand must be avoided, or the mite may prove troublesome. Should the loam be of poor quality, add a small quantity of dry manure and a good dusting of bone-meal. As a rule, this shift will suffice for the first year. As growth advances, stake and tie the shoots neatly, and in due time fine bunches of bloom will appear, these lasting for some time.

In the beginning of the following year the plants should be kept on the dry side for ten days, and then be cut back to about nine inches from the pot. As soon as growth starts again, give a shift into pots 10 inches in diameter, using the same kind of compost. As growth advances, strong stakes 6 feet in length must be provided, and the shoots loosely but securely fastened thereto. By the month of July gentle feeding with weak liquid manure, or, better still, liquid made with Ichthemic Guano, should be administered twice a week. If these hints are followed, there will be a fine show of bloom right up till Christmas or longer.

Subsequent treatment consists in cutting the plants down to from 12 inches to 15 inches from the soil each spring and top-dressing liberally with fresh soil and Thomson's Plant Manure, allowing a tablespoonful of the latter to each plant. Other small details of culture are to provide a little shade—if not for the tops, at least for the pots and the lower parts of the stems—and careful watering, as dryness at the roots is apt to cause the flowers to drop and the foliage to become yellow. I have sometimes seen this Begonia trained as a climber, but have seldom seen it succeed thus. Here I train it to 6-foot Bamboos, and set the plants close to a cement back wall of a lean-to stove, or, rather, intermediate house,

and in this position they thrive and bloom luxuriantly.

Preston House Gardens, Linlithgow. C. BLAIR.

THE VERONICAS OR SPEEDWELLS.

THE plants that are members of this family are a large and widespread host, and among them we find some of the most interesting and useful of our outdoor garden flowers. They naturally divide themselves into two distinct sections, the one comprising those that are of a decidedly shrubby character, and the other those that have stems of a succulent, and therefore less enduring nature. The shrubby Speedwells are, perhaps, the best known, most of them hailing from New Zealand. They are evergreen, and among them we find some exceedingly useful winter-flowering subjects. For instance, *V. speciosa* and *V. Andersonii*, with their several varieties, frequently continue their floral display until well into January, the spikes of purple, rose, or deep blue blossoms showing up well above the dull green foliage. All the shrubby Veronicas must, however, be given soil that is perfectly drained and contains a good percentage of sand. They all, with the exception of the tall-growing *V. Traversii*, ought to be planted in positions sheltered from cold north or east winds, as they are none too hardy during severe spells of hard weather. *V. Traversii* is, however, quite hardy in the London district, where it will quickly make a neat bush about 4 feet high and nearly as much in diameter, its rather small spikes of very pale lilac flowers being produced in great profusion during June and July.

The Willow-leaved Speedwell, *V. salicifolia*, is also a good dwarf shrub for warm places. It

grows about 2 feet high and has long, narrow leaves, and flowers of white or purplish hue. The variegated-leaved form of *V. Andersonii* is among the most beautiful of the few really good variegated plants, and one finds it extensively and alas! indiscriminately used for summer bedding effects in the London parks. In its place it is excellent, but too often it is obviously misplaced.

These shrubby Veronicas are not difficult to propagate. Cuttings made during the next few weeks from young shoots, and planted in sandy soil in a cold frame in a manner similar to that adopted for bedding *Calceolarias* and *Pentstemons*, will quickly root and soon form nice little shrubs. A good number ought to be rooted every autumn, so that if a severe winter is experienced and casualties among the older plants heavy, there will be sufficient young ones to take their places.

When we come to the soft-wooded section of the Speedwells, we find a great deal of variation in stature and habit. Thus, such species as *V. repens* and *V. rupestris* are trailing plants admirably

adapted for the rock garden; while *V. longifolia* and its variety *subsessilis* attain a height of 2 feet or even more, and are among the best of our blue flowers for the mixed border. Like the shrubby species, these herbaceous Speedwells appreciate soil that is of a porous character, though the stronger-growing kinds, such as *longifolia*, will not give of their best unless the soil has been well manured. Most of them seed freely, and if this is allowed to ripen and fall, plenty of seedlings can usually be found near the old plants.

The accompanying illustrations, from photographs taken a few weeks ago, represent two beautiful Speedwells growing in the Royal Horticultural Society's gardens at Wisley. One is *V. spicata*, a charming plant with pale blue flowers, these, however, varying in their intensity on different plants. It is growing in a position facing east and is now about a foot high. The other illustration shows its white variety, *V. spicata alba*. This plant faces south-west and is about 18 inches high. Both species and variety continue to flower over a long period, and may be regarded as two of the most useful summer-flowering plants that are available for the rock garden. As an indication of their rapid growth, it may be interesting to mention that both were planted only a little more than a year ago.

The type plant, *V. spicata*, is really a native of Britain, though its habitat is limited to a few localities. It has been found in Suffolk, Cambridgeshire and Wales, and possibly in one or two other counties, but it is known to very few botanists except as a garden plant. In a wild state its flower-spikes seldom attain a height of more than 6 inches, and even under cultivation it is not often that they grow so tall as those on the plant illustrated.

Another very beautiful Speedwell is *V. incana*. This has stems and foliage of a charming silvery grey hue, and in June, when producing its spikes of deep purple flowers, is as handsome a plant as

one could wish for. It is good for either a border or a prominent position in the rock garden, and is best increased by division early in the spring.

In addition to repens and rupestris, already mentioned, *V. gentianoides*, with greyish-coloured flowers; *V. prostrata*, with spreading, neat tufts of deep green foliage and deep blue blossoms; *V. saxatilis*, a plant sometimes found wild in Scotland, its blue, striped violet flowers being very attractive; and *V. taurica*, a dense tufty plant with gentian blue blossoms, are all excellent for the rock garden. Most have proved variable under cultivation, and varieties with flowers of colours other than those named can be obtained if required.

Practically all the Speedwells are to be had from any good nursery firm, and as they are by no means expensive, one has no hesitation in putting forth a plea for their extended cultivation. As already indicated, none calls for any special skill on the part of the cultivator, hence they are excellent plants for the novice to secure. Except for the removal of old flower-heads as soon as the blossoms fade, the shrubby kinds do not require pruning, unless an odd branch or two have to be shortened to prevent them encroaching too much on other plants.

F. W. H.

PERGOLAS OF ROSES AND OTHER CLIMBERS.

THE Rose pergola has become such a popular feature of the up-to-date garden that we are inclined to wonder how our fathers got on without it, but it is questionable whether planting a pergola entirely with Roses is the most economical or the best way of utilising such a structure. For three or four weeks during the latter part of June and during July, when the Roses are in full bloom, a Rose-clad pergola is certainly a wonderful sight, and it would be difficult to imagine anything more beautiful, but the season of beauty is soon over, for many of the best kinds bear all their flowers at one time, and, at the outside, are in good condition for three weeks or a month, the remainder of the year being given up to foliage or bare stems. But by clothing a pergola with a mixture of Roses and other climbers it is possible to secure flowers, ornamental fruit or coloured foliage over a considerable portion of the year, although at no particular period may the effect be quite so entrancing as that of a pergola of Roses about the end of June. General interest will, however, compensate for this defect.

The planting of a mixed pergola needs some considerable forethought regarding a suitable mixture of Roses and other plants, and here the dimensions of the structure play an important part, for on a fairly high and moderately wide pergola many more plants can be grown than on one which is cramped for space. Length, of course, must determine height and width to a

certain extent, a long structure calling for greater height and width than a short one. While no hard-and-fast rule can be laid down, a minimum height and width of 8 feet may be allowed for a pergola up to 50 feet long, while 12 feet in height and width would be required for a structure between 50 yards and 100 yards in length.

In arranging plants to provide an effective display over as long a period as possible, it might be argued that the best plan would be to plant a Rose and some other climber in companionship at each pillar, so that one plant would bloom in advance of the other. In theory such an arrangement would be quite correct, but in practice it is not very feasible, for the two plants are likely to require attention at different times of the year, and to prune one may injure the flowering wood of the other; moreover, the branches may become so intertwined that it will be impossible to control one without injuring the other. Therefore it is better to give each arch up to Roses or other plants; but there is no reason why two Roses or two kinds of Clematis should not appear on each arch, one from each pillar, if the maximum variety of plants is desired. Alternate arches of Roses and other climbers may be tried with good results. One point to consider when planting is the provision of really good soil, for the plants can only be expected to give their best when they are treated in a generous manner.

Suitable subjects for clothing pergolas are as follows: Commencing with Roses, we will first consider a few kinds which have a prolonged flowering period. The old Gloire de Dijon is one of the best in this respect, for it blooms well in June and again in August, while blooms may also be found between whiles. William Allen Richardson is another variety with a long flowering period, and although considered to be tender in some gardens, there are many places where it can be grown. Longworth Rambler and Cheshunt Hybrid are two useful red-flowered kinds with a

lengthy time of flowering; and other useful sorts are Ards Pillar, crimson; Climbing Caroline Testout, salmon pink; Climbing Mrs. W. J. Grant, salmon pink; Dawn, rosy pink; and Grüss an Teplitz, red. Among the wichuraiana Roses are many kinds with a long flowering time, particularly those which have Tea Roses for their male parent. Good ones are Alberic Barbier, yellow; Edmond Proust, coppery carmine, Elise Robichon, buff yellow, shaded rose; François Foucard, lemon; and Paul Transon, rosy pink. Most of these are very vigorous and require plenty of room. Good climbing Roses with a short flowering period, but which bloom very profusely, are: Wichuraiana varieties—Delight, bright carmine; Dorothy Perkins, pink; Excelsa, double red; Gardenia, cream; Hiawatha, crimson; Lady Godiva, salmon pink; Minnehaha, pink; and Shower of Gold, golden. All of these bloom in July. Other useful climbing sorts flowering in June and early July are: American Pillar, rose pink; Blush Rambler, blush; Crimson Rambler, crimson; Dawson Rose, pink; Electra, yellow, then cream; Graf Zeppelin, coral red; Hélène, mauve with yellow base; Mrs. F. W. Flight, rose pink; Philadelphia Rambler, crimson; Tea Rambler, pink; The Lion, crimson; and Wallflower, crimson.

Other climbers suitable for pergolas are: Jasminum nudiflorum, a climber of moderate growth which bears its golden blossoms from leafless branches between November and February. Forsythia suspensa—the form with slender, pendent branches should be selected for the purpose; its long, graceful branches are loaded with pretty bell-shaped, yellow blossoms during April. Cydonia japonica, although not strictly a climber, can be trained as such, with effective results, on the pillars and cross-bars of a pergola. Its rich red flowers begin to expand during midwinter, and it is at its best about March or April. It can be used on quite small structures,

A WHITE SPEEDWELL, VERONICA SPICATA ALBA, AT WISLEY.

as it stands pruning well. *Wistaria chinensis* is an excellent pergola plant, and the same may be said of *W. multijuga* and the white variety of each species. The racemes of fragrant mauve or white flowers, as the case may be, never look more pleasing than when hanging from the cross-bars of a pergola. When once the space is well covered with branches, a stunted, spur-like system of growth must be encouraged, the young shoots being repeatedly cut back.

The Clematis family offers a wide choice of subjects. Such species as *C. montana*, with white flowers, and its variety *rubens*, with red blossoms, in May; *C. tangutica*, with yellow flowers during summer; *C. Flammula*, with fragrant white blossoms; and its variety *rubro-marginata*, with red and white blooms during August and September; *C. alpina*, with mauve, pink or white flowers in April and May; and *C. jouiniana*, with white, violet-tinged blossoms in August and September, are all worth considering. Then we have the

reddish purple; Marcel Moser, lavender with carmine violet band; and Nellie Moser, white with a reddish band on each segment of the flower. Jackmanii varieties: Alexandra, violet blue; Earl of Beaconsfield, purple; Gipsy Queen, violet purple; Jackmanii superba, purple; Mme. Grange, crimson violet; Mme. Baron Veillard, lilac rose; Mme. Edouard André, red; magnifica, reddish purple; Snow White, white; and Ville de Lyon, red. *Viticella alba*, white; *rubra*, red; *grandiflora*, red; and the type, purple, are free-flowering kinds of the *Viticella* group.

Among Honeysuckles, good kinds for pergolas are *Lonicera japonica* and varieties *flexuosa* and *halleana*, *L. Periclymenum* and the new *L. tragophylla*. All bloom during summer. *Jasminum officinale* is a strong-growing, summer-flowering climber with fragrant white flowers, and *J. humile* is a yellow-blossomed plant of less vigour which also blooms in summer. The common Passion Flower (*Passiflora carulea*) is suitable for pergolas

able period, but there are numerous other subjects that can be requisitioned. As pergola plants have usually to be severely pruned once a year, such pruning should be done immediately after the close of the flowering season. W. D.

THE SHRUBBY BUCKEYE (ÆSCULUS PARVIFLORA.)

THIS is one of the most distinct and valuable Horse Chestnuts cultivated in our gardens. Its usual habit is that of a large shrub, 7 feet to 10 feet or more in height, and generally exceeding these dimensions in diameter; leaflets mostly in fives; the flowers in long, cylindrical panicles up to some 10 inches long, white, with tinted pink stamens, and red anthers. The inflorescences last for some time in beauty, as the flowers open in succession on the branched panicles. The flowering season is the second half of July and during August, a period when comparatively few trees and shrubs blossom in our pleasure grounds.

The Shrubby Buckeye is usually propagated by division, the bushes, when established, increasing freely by the development of suckers. It is only occasionally that fruits mature in this country. For lawn specimens and groups in the shrubbery border, or on the borderland of the pleasure grounds and woodland, the value of *Æsculus parviflora* cannot be too highly praised. It is worth while trenching the ground previous to planting, and adding some good loam if the soil is poor.

A native of the South-Eastern United States, the Shrubby Buckeye is said to have been first introduced in 1785. A. O.

WATER GARDENING

AS an adjunct to the garden proper, water gardening as we know it to-day is quite a modern idea. Forty or so years ago it was a rarity in any form in gardens large or small, while its introduction into gardens of limited

size is, probably, not yet a couple of decades old. Formerly, the aquatic department of a hardy plant nursery was, doubtless, the least profitable, its neglected condition telling its own tale. To-day, as for some years past, a different story could be told, the attention bestowed upon the plants and the special receptacles for their cultivation affording proof that all is well. In a large degree, doubtless, this change has been brought about by the advent of the new Marliac Water Lilies some years ago, their irresistible beauty fascinating all who saw them. Then, by degrees, water gardening, like rock gardening, crept into the exhibition arena, where, either well done or suggestively, its possibilities, its added beauty and interest, presented to thousands of garden-lovers at first hand, assured it an immediate as well as growing future. Quite naturally, the coming of the water garden made way for waterside gardening also, a combination of the two, as the illustration on the next page so well portrays, often attended

A BEAUTIFUL AND LATE FLOWERING HORSE CHESTNUT, ÆSCULUS PARVIFLORA.

wide range of garden varieties of the florida, patens, lanuginosa, Jackmanii and Viticella types to call upon. These offer a wide range of colour from white to mauve, purple or red, the flowers being large and produced freely over a long period. The florida and patens groups bloom during May and June and require very little pruning. A few good ones are: Belle of Woking, silver grey, double; Duchess of Edinburgh, white, double; Fair Rosamond, blush white; Lady Londesborough, silver grey with reddish bar; Mlle. Toriana, rose, flushed pale purple; Mrs. G. Jackman, satin white with creamy bar; Miss Bateman, white, double; Proteus, purplish rose, double; and Sir Garnet Wolseley, blue with plum red bar. Good varieties of the lanuginosa group are: Alba magna, white; Beauty of Worcester, bluish; Gloire de St. Julien, lavender blue; Grand Duchess, lilac heliotrope; Henryii, creamy white; candida, white; Lord Nevill, blue; La Gaule, white; Louis van Houtte, violet; Mme. van Houtte,

in the warmer parts of the country, and for similar places the white-flowered *Solanum jasminoides* is excellent, for it blooms throughout the greater part of the summer. *Akebia quinata* and *A. lobata* are a pair of vigorous climbers which bear reddish purple flowers in April in advance of the leaves; while *Celastrus articulatus* is remarkable for showy fruits during autumn and early winter. It requires plenty of room. The Vitis are excellent for pergolas, but they have to rely upon foliage as an attraction. A few good ones are *Coignetia*, *Labrusca*, *Thomsonii*, *armata*, *henryana*, *Thunbergii*, *leeoides* and *megalophylla*. *Aristolochia Sipho* is also more remarkable for its large rounded leaves than for its flowers. *Polygonum baldschuanicum* is a very vigorous climber which produces white flowers and fruits with great freedom. It should only be planted, however, where it can have abundance of room. The plants mentioned will be sufficient to enable anyone to furnish a pergola so that it will be of interest for a consider-

with the happiest results. The advantages of the dual style referred to are many and various. In the first place, a new and interesting feature is added to the garden, and not infrequently, also, to a portion where probably nothing but disorder or neglect existed before. If amid suitable environment, even though on a small scale, picture-making effects, like those shown in the illustration, will be readily secured. In addition, not a few plants hitherto excluded from the garden by force of circumstances, or carrying on a wretched existence amid alien conditions, will find their true home, and, while revelling in their new surroundings and affording pleasure, provide that touch of repose so much to be desired in this particular phase of gardening. Hence as much of Nature as is possible should enter into the scheme, to the masking of all that is artificial and obtrusive to the eye.

In a large number of instances the water garden, of necessity, will be a purely artificial thing, albeit it may be the intent of its owner to make it look quite natural. To achieve this end, the operator cannot do better than consult Nature, from whom the best object-lessons are obtainable, free of cost. Take a walk beside a rivulet or streamlet and note its meandering informal outline. Mark the way Nature has garnished it with turf or herbage to the water's edge. Make a little sketch of the scene or carry the picture away in the mind's eye. It is all that is wanted as the basis of a good start.

Where it is desired to grow a few Water Lilies, a depth of 2 feet of water will be found ample for many; frequently less than this suffices. Its form can only be decided by individual circumstances, but whether it be a miniature pool or rivulet, it is essential that it be made watertight. In some districts puddled clay will do quite well. In the main, however, good cement concrete will be found the most reliable, therefore cheapest in the long run. In Nature, lake, pond, or streamlet occupies a depression amid its surroundings. Its artificial

counterpart should, as far as possible, be similarly circumstanced. Where this is so, it is quite easy to garnish the sides and to arrange for a partial flooding or saturating of the slightly raised banks near.

For small water areas *Nymphaea odorata* and its varieties should be grown, though *N. Marliacea carnea*, *N. M. Chromatella* and others succeed well for a time. For the rest, between *Gunnera* and *Bog Pimpernel* there is a great host. Sites devoid of

tree life near may be rendered more natural by planting tall graceful Bamboos, Meadow-sweets, Knotgrass and like things. The Royal Fern (*Osmunda*) is productive of fine effect. In the wettest places, American Swamp Lilies, bog-loving Primulas, Siberian Irises and Cardinal Flower (*Lobelia*) should all find places. Grouping rather than much variety is most to be desired; repetitions should be avoided.

E. H. JENKINS.

WATER LILIES IN A STREAMSIDE GARDEN.

CULTURAL NOTES ON VIOLAS.

THE Violas, which are closely allied to the Pansies, form most delightful plants for any part of the garden, and, as they are perfectly hardy, there is no reason whatever why they should not play an important part in the garden.

There are a vast number of varieties in existence, the colours ranging from pure white to a very dark blue. *Viola gracilis* (deep violet in colour, and *V. g. Snowdrift* (white) produce very small but numerous flowers, and the plants themselves have an exceedingly dwarf habit. These two varieties are very suitable for rockery work. *Viola Maggie Mott* (light mauve), *V. White Swan* (pure white), *V. Mrs. Chichester* (a mixture of white and blue) and *V. Moseley Perfection* (yellow) are four very good varieties worth growing; these have much larger flowers and are more robust growing than *V. gracilis*, and are very suitable for beds, borders and other places.

Practically all the Violas will grow in any soil, but light sandy soil is more essential to their growth, for in that of a heavy nature the roots cannot grow so freely.

Propagation.—There are three ways of increasing a stock of Violas, viz., by seeds, layers and cuttings. The former method cannot be relied on, as seedlings do not always come true; but the last two will be found reliable ways of increasing them. Layers can be obtained by simply pressing the long growths in the soil and leaving them for a few weeks, when they can be severed from the old plants and planted out where required.

When propagating these Violas from cuttings it is advisable to procure the young growths thrown up from the base, as these strike more readily than the old ones. October and November are the best months to take them. When the cuttings are about to be taken, and there are no young shoots at the base, the old ones should be cut back about 1½ inches from the base; then, if the plant is healthy, it will put forth young growths vigorously. When these are from 2 inches to 3 inches in length they can be slipped off as low as possible, and cut square just below a leaf joint, cutting off the leaves with the exception of just a few at the tip. These cuttings when procured should be placed in rows in a cold frame about half filled with equal parts of soil and leaf-mould, with a little silver sand added.

A distance of 3 inches between the rows and 2 inches to 3 inches between the cuttings will be found to be none too much. If these cuttings are looked after during the winter and plenty of air is admitted on mild days, by early spring they should have made nice sturdy plants, which can be planted out where required.

F. J. CLARK.

Dropmore Gardens, Maidenhead, Berks.

A BEAUTIFUL NATIVE ORCHIS.

WHEN writing of native plants for the waterside in *THE GARDEN* dated August 7, I very stupidly omitted to mention the beautiful Marsh Orchis, *O. latifolia*. It would be difficult indeed to find a wild plant more interesting or possessing more charm than this, and owing to its preference for damp, marshy spots it is essentially a plant for the waterside. That its merits have been appreciated by good gardeners is shown by the fact that one more often finds

ORCHIS LATIFOLIA, A BEAUTIFUL NATIVE PLANT WITH PURPLE FLOWERS.

it as a cultivated plant in gardens than as a native in our marshland, though it is by no means uncommon in the wild state. Some idea of its loveliness under cultivation—where, by the way, its flower-spikes are usually much larger than on the wildings—will be gleaned from the accompanying illustration, which represents a colony of this Orchis in the Royal Horticultural Society's gardens at Wisley. The roots were planted a little over three years ago in a damp, peaty spot with a north-west exposure, and the magnificent flower-spikes testify to the success of this treatment. The spikes, when the photograph was taken early in July, were about 18 inches high, the bright purple flowers creating a welcome bit of colour amid the deep green foliage of surrounding

vegetation. It has proved a variable plant under cultivation, but for the waterside in semi-wild places the native plant is best. As most nurserymen have stocks of this Orchis, there is no difficulty in obtaining plants and no excuse for rooting up wild ones for transference to the garden.

THE DOUBLE-FLOWED HEATHER.

It is not generally known that a double-flowered form of the common Ling or Heather (*Calluna vulgaris*) can be obtained from a few sources. It is a very charming little hard-wooded plant of moderately vigorous habit, and can be relied upon to do well where a fair amount of peat or leaf-soil is incorporated with the natural soil, providing the latter is well drained and free from lime. This double-flowered Heather possesses the same habit as the common form, and the flowers are the same colour, but quite double, each forming a tiny, full-centred rosette. It is known to botanists under the name of *Calluna vulgaris flore pleno*. Those who wish to grow a good white Heather can scarcely make a better selection than the one known as *C. v. alba Serlei*. This flowers freely, is quite hardy, and the blossoms are pure white. Another variety with good white flowers is *alba tomentosa*, a rather tall-growing, partly erect plant of distinct habit. An interesting form of the common Heather, principally on account of its foliage, is *cuprea*. This, as its name implies, has foliage of a bronzy copper tint, and makes a welcome change where hardy Heaths and Ling are grown on anything like an extensive scale.

THE AUSTRALIAN BLUE-BELL CREEPER.

ALTHOUGH the beautiful shrub known under the above popular name cannot be regarded as entirely hardy in this country, it is more so than is generally supposed, and in many localities in the Southern and Western Counties it can be induced to thrive if given the protection of a wall or close-boarded fence. Blue-flowered shrubs in the outdoor garden are by no means plentiful; hence any trouble that is taken to induce this shrub to flower well is fully repaid. Under the botanical name of *Sollya heterophylla* it has been known in this country for some years, but its common name adequately describes the character of its flowers, which resemble closely, in general outline and delicate poise, the common Harebell of our fields and hedgerows. They are, however, of a deeper shade of sky blue, and a well-grown plant in full blossom is a sight worth going a long way to see, even during a hot July day, this being the month in which it flowers. Owing to its semi-rambling nature, this shrub is well adapted for training on walls, and, where possible, a southern or western aspect should be chosen. The most suitable soil is a mixture of good loam and peat, and thorough drainage is essential.

H.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Strawberries in Pots.—Should the weather continue wet for a long spell, the pots must be placed on their sides to prevent the soil becoming too wet. Give the plants plenty of room, so that the crowns may become thoroughly matured by the autumn. Remove all side growths and runners. At the same time turn the pots to prevent the roots from growing through the drainage holes. The earliest-potted plants will now be in need of a little stimulant. As a preventive against mildew and red spider, the foliage should be syringed with soft soapy water and sulphur.

Tomatoes.—Plants which are standing outdoors must now be placed under glass. If they have set three or four trusses of fruits, the leading growth should be stopped. At this stage a top-dressing of some rich soil will be necessary to assist the fruits to mature. Some of the largest leaves may be removed to expose the fruits to the light. The winter-fruiting plants should now be ready for their final pots, or they may be planted out if convenient houses are available. This latter method is the most satisfactory, as the plants will continue to fruit for a much longer period than when grown in pots. Fumigate occasionally to keep them free from white fly.

Plants Under Glass.

Chrysanthemums.—The most forward of the large-flowered kinds must now be placed indoors, as too much moisture will cause decay of the petals. If they are not wanted early, a house with a northern aspect will suit them best. Shelter will soon be needed for the main batch of plants, and this should be prepared so that there shall be little delay should frost be imminent. The late varieties must be left outdoors as long as possible, but a temporary protection should be ready for emergencies.

Climbing Roses.—The plants which are required for early flowering must be given every encouragement to ripen their growth. All growth which is not wanted should be cut out regularly, so that the flowering wood may be well exposed to the light. Give the roots plenty of stimulants, and, if not already done, top-dress them with horse or cow manure.

Gloriosa superba.—This beautiful climber will soon be past its best, and the plants must then be induced to rest. Water ought to be given less frequently, and when the foliage has died down, the pots may be placed in a dry situation for the winter.

The Flower Garden.

Fuchsias.—These must be liberally treated in the matter of watering and feeding, or they will fail to flower till the end of the season. Cuttings may be inserted now for next season's stock. The variety Mrs. Rundell is excellent for vases, and old plants of this may be used effectively if plunged in grass in suitable places. The cuttings need a little warmth from a hot-bed to help them to root freely.

Standard Fuchsias.—These are most effective when employed with suitable subjects. We have used the variety Mrs. Rundell this season with Begonia Major Hope and a groundwork of Alyssum Snow Carpet, the whole making a very striking bed. For standards the most promising cuttings must be selected and grown on gently all through the winter.

General Work.—Persevere with the work of striking cuttings of the various bedding plants. Calceolarias, Veronica Andersonii, Violas, Pansies, Lavender, Mesembryanthemums, Phloxes and Pentstemons must all be inserted now. Cold frames will be suitable to protect all these plants during the winter. It is a waste of time to grow Antirrhinums from cuttings, as seedlings may be relied upon for almost any purpose.

Sweet Peas.—The early batches of Sweet Peas may now be cleared from the ground. Any seed which it is intended to save must be put in a dry place till it is thoroughly ripe. The ground must be prepared at once for autumn sowing.

The Hardy Fruit Garden.

Vines.—The season has been very unfavourable for the maturing of outdoor Grapes, and unless all the minor cultural details are regularly attended to, the fruit will fail to ripen. Mildew has been very prevalent, owing, no doubt, to the continued spell of dull, wet weather. Keep all growths regularly pinched, so that all the light possible may reach the fruits.

Strawberries.—The autumn-fruiting kinds will need constant attention to keep them fruiting till the end of the season. It may be necessary to place a little fresh, clean straw under the fruits. Keep a sharp look-out for slugs, which are always abundant at this time of the year, and remove runners and weeds.

Figs.—The fruits must be protected from birds and insects. Fish-netting should be placed over the trees to keep out birds, and to trap wasps and flies jars of sweetened beer may be hung about the trees. Trees growing against walls need plenty of water.

The Kitchen Garden.

French Beans.—In the event of dull, wet weather, the plants in cold pits must be covered with lights, or the flowers will damp off. If the plants are too crowded, the foliage may with advantage be thinned.

Onions.—The main crop of Onions may now be lifted. Let them remain on the ground till they are thoroughly dry before placing them in the store. For storing for the winter, select only the bulbs which give promise of keeping well. The remainder may be used first.

Winter Spinach.—To promote a healthy growth, well-seasoned soot may be dusted between the plants previous to hoeing. Thin the plants to 6 inches apart when large enough.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

The Flower Garden.

Pentstemons.—The chief batch of cuttings should now be put in. As some varieties do not produce freely the suitable growths for propagation, pinching is necessary to obtain sufficient stock. By propagating now, the plants grow sufficiently during the autumn to allow of them being pinched; this ensures a much greater number of flowering growths the following season. It is possible, however, to strike Pentstemons until the short winter days.

Antirrhinums.—More vigorous plants are undoubtedly obtained from seedlings, but when a variety has to be produced true to colour, cuttings can be put in cold frames similarly to the Pentstemons. Shade and keep the frames closed until the cuttings have rooted; then admit air gradually.

Early Flowering Chrysanthemums.—Many varieties being now in full flower, it is sometimes most disappointing to have them ruined by a single night's frost, especially when there is sometimes no return of it for several weeks. If wires and stakes are put up neatly, they are not unsightly; these prevent the plants becoming broken when they are being covered to protect them from frost.

Bulbs.—The planting season now being at hand, orders should be placed to ensure early delivery. Many of the old bulbs which were lifted will again do service, but a finer display is ensured by adding new bulbs.

Plants Under Glass.

Begonia Gloire de Lorraine.—More staking and tying becomes necessary as the plants develop their growths. Green raffia, not being so conspicuous as other tying materials, should be used when tying. Fumigate at frequent intervals to keep down insect life, and continue to remove flower-buds as they appear, unless the plants are required for use during October. Now that the pots are getting full of roots, stimulants may be given with more freedom, taking care not to injure or disfigure the foliage when applying them.

The plants will require shading for a few weeks longer.

Freeseias should be removed to a shelf near the glass, or placed in a shallow frame, as soon as growth on all the bulbs has started. This will encourage strong, sturdy growths, eventually producing better flowers. These plants to flower well must be kept cool and watered with care. Later batches of bulbs should be potted up to ensure a longer succession of flowers.

Show Pelargoniums.—If these plants were pruned after flowering and rested, they will now be ready for repotting. Shake off most of the old soil and repot into similar-sized pots, using a good compost of loam, leaf-mould and sand. The plants should be syringed for a time to encourage them to break freely.

Chrysanthemums now forming buds should be frequently top-dressed as soon as it is seen the previous application has been taken possession of by the roots. Only a very light dressing of soil ought to be given at one time, but it should be rich in plant food. Any growths appearing at the base of the plants should be removed when disbudding, as they absorb energy from the plants.

The Hardy Fruit Garden.

Strawberries.—The completion of planting young plants should be hastened, to allow them to become well established before winter arrives. Runners must be kept closely picked off and the hoe used freely. If the older plants have had all the runners removed, the ground between the plants could be lightly forked over, taking care not in any way to injure the roots.

Peaches.—Should the young growths not have been tied in by this date, it will be necessary to tie any growths aside which may be shading the ripening fruit. To protect from birds, it will be necessary to cover the trees with nets. Water the borders well if there is any suspicion of dryness at the roots.

Fruit Under Glass.

Melons.—With the shortening days and reduced sun power, more artificial heat is required for the late crops. Especially is this the case during any wet period. Try to maintain a night temperature of from 65° to 70°, and be more sparing in the application of water, both at the roots and when damping down. When saving seed from any special Melon, great care is necessary that the flowers are fertilised by pollen taken from the same variety.

Pot Figs.—If the plants have finished ripening their fruit, the maturing of the wood will now be greatly helped if they are removed to a sunny position outdoors. If mealy bug is in existence, go over the trees with methylated spirit, applying it with a small brush. Water should now be applied with discretion, and as soon as severe frosts threaten, the plants must be removed indoors.

The Kitchen Garden.

Cauliflower.—Make a good sowing of Early London or Early Erfurt Cauliflower for use next June and July. Do not sow on a very rich piece of ground. As soon as large enough to handle, prick out the seedlings in cold frames, and do not coddle the plants. Slugs are likely to be troublesome, so that a dusting of soot will be necessary to protect the plants.

Beetroot.—The earliest-sown crop should now be lifted. After being pulled up, give the tops a slight twist to remove the leaves. Do not cut them with a knife, or the roots will be ruined.

Carrots.—The late-sown crops should be thinned slightly to allow larger roots to form on the remaining plants. Earlier crops could be lifted and stored, in order to clear the ground.

Turnips, too, which were lately sown must be thinned, and the hoe used freely to encourage a quick growth.

Endive.—When the plants get large enough to handle, prick out in cold frames where they can be protected during severe frost. A distance of 7 inches or 8 inches apart will be sufficient to leave between the plants, and dust with soot to protect them from slugs.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

TRIALS OF PEAS AND PHLOXES AT WISLEY.

THE Council of the Royal Horticultural Society have approved the following recommendations of the fruit and vegetable committee for awards to early Peas, and of the floral committee for awards to herbaceous Phloxes, tried this season at the Society's Gardens at Wisley. The names in parentheses indicate the present senders.

PEAS.

PREVIOUS AWARDS CONFIRMED.

First-class Certificate, given in 1872 to William I. (Messrs. Sutton, Barr).

Award of Merit, given in 1901 to Sutton's Harbinger (Messrs. Sutton); 1908 to Dawn (Messrs. Carter); 1901 to Duchess of York (Messrs. Sutton); 1898 to Thomas Laxton (Messrs. Barr).

NEW AWARDS.

Award of Merit.—A 1 (Messrs. Sutton and Sons); First of the Season (Messrs. Cooper Taber); World's Record (Messrs. Sutton); Giant Express (Messrs. Carter).

Highly Commended.—American Wonder (Messrs. Sutton); Dobbie's Express (Messrs. Dobbie and Co.); The Pilot, Hawlmark Selection (Messrs. Alex. Dickson); Kelvedon Wonder (Messrs. Hurst); Chantecler (Messrs. Hurst); Model (Messrs. Hurst); May Queen (Messrs. Sutton); Early Queen (Messrs. Barr and Sons); Bountiful (Messrs. Sutton); British Lion (Messrs. Alex. Dickson); Sixty Days (Messrs. Carter and Co.).

HERBACEOUS PHLOXES.

PREVIOUS AWARDS CONFIRMED.

Award of Merit, given in 1897 to Coquelicot (Messrs. Wells, Barr, Box, Forbes); 1910 to Elizabeth Campbell (Messrs. Pfitzer, Wells, Barr, Box, Forbes, Ruys, Jones); 1910 to Frau Antonin Buchner (Messrs. Wells, Barr, Box, Ruys, Forbes, Jones); 1907 to George A. Ströhlein (Messrs. Barr, Box, Forbes, Jones); 1899 to Le Mahdi (Messrs. Wells, Barr, Box, Jones); 1897 to Miss Pemberton (Messrs. Forbes); 1906 to Tapis Blanc (Messrs. Aldersey, Barr, Box, Forbes, Jones).

Highly Commended, given in 1892 to Henri Mürger (Messrs. Barr); 1908 to Jules Cambon (Messrs. Barr, Box, Jones); 1892 to Paul Bert (Messrs. Barr, Forbes); 1892 to William Robinson (Messrs. Barr).

Commended, given in 1892 to John Forbes (Messrs. Forbes); 1892 to Pantheon (Messrs. Barr, Box).

NEW AWARDS.

Award of Merit.—Antonin Mercie (Messrs. Wells, Barr, Box, Jones); Aubrey Alder (Messrs. Wells); Esperance (Messrs. Wells); Europe (Messrs. Pfitzer, Box, Ruys, Jones); Lady Grisel (Messrs. Barr); La Neige (Messrs. Forbes, Box); Météore (Messrs. Barr, Box, Jones); Selma (Messrs. Wells, Barr, Box, Ruys, Jones).

Highly Commended.—Aegir (Messrs. Jones); Arthur Ranc (Messrs. Wells, Box, Forbes, Jones); Aurora (Messrs. Box, Forbes, Jones); Baron von Dedem (Messrs. Wells, Box, Ruys, Forbes, Jones); Braga (Messrs. Box, Jones); Derviche (Messrs. Wells, Barr); Distinction (Messrs. Wells, Jones); Dr. Königshofer (Messrs. Pfitzer, Box, Ruys, Jones); Fort de France (Messrs. Wells, Barr, Box); Frau Grimm (Messrs. Pfitzer); General van Heutsz (Messrs. Wells, Barr, Box, Ruys, Forbes, Jones); Goliath (Messrs. Barr, Box, Ruys, Jones); Helmuth

Hirth (Messrs. Pfitzer); J. E. Suckling (Messrs. Wells); Jules Sandeau (Messrs. Box, Ruys); Lady Satanelle (Messrs. Wells, Barr); Lady Tate (Messrs. Forbes); Mrs. E. H. Jenkins (Messrs. Box, Forbes); Pharaon (Messrs. Barr, Box); Rose Queen (Messrs. Wells, Jones); Seduction (Messrs. Forbes); Sergeant Lovy (Messrs. Barr, Forbes); Sheriff Ivory (Messrs. Wells, Box); Viktor Stoessel (Messrs. Pfitzer); Widar (Messrs. Box, Jones).

Commended.—Champignol (Messrs. Barr); Daniel Leseuer (Messrs. Wells, Box, Forbes); Flora Hornung (Messrs. Wells, Box, Forbes); Josephine Gerbaux (Messrs. Box, Jones); L'Aiglon (Messrs. Barr, Jones); Marvel (Messrs. Forbes); Oculata (Messrs. Jones); Reichsgraf von Hochberg (Messrs. Barr, Box, Ruys, Forbes); William Scott (Messrs. Forbes).

W. WILKS, Secretary.

THE ROME CONVENTION AND THE HORTICULTURAL INDUSTRY.

AT a Conference held in Rome in 1914, representatives of this country signed a convention setting forth restrictions on the trade in plants that they were prepared to recommend their Governments to carry out. The restrictions, if agreed to, will very seriously affect the horticultural trade of this country. They have, however, not yet been carried out, nor has this country assented to them, but sooner or later the subject will come up again, and it behoves the horticultural industry in this country to be ready for that time.

If this country assents to this convention, how will it affect the trade? First, all nurseries and establishments supplying plants, seeds, &c., will be registered, licensed and inspected. Secondly, all nurseries will have to notify at once the appearance of certain scheduled diseases. Thirdly, they will have to adopt standard methods of dealing with certain diseases, spraying, fumigating, tipping or the like. Fourthly, their methods of packing and transport will be inspected and controlled. Fifthly, they will have to obtain, for each consignment of living plants destined for sale or for export, a certificate from an inspector as to its freedom from certain diseases, or as to the nursery itself being free from certain diseases.

This last will, perhaps, be the most troublesome, as it involves the inspection of each consignment by an inspector before it is packed and after it is packed. The consignment must be packed according to the instructions, and the certificate specifying its contents must go with it.

A further clause in the convention lays down that plants cannot be imported from any country that either does not adhere to the convention or that has no service of officials for giving certificates, so that all importation of any plant at all, say, from China or Tibet, would appear to be absolutely stopped.

There is no question but that this procedure is going to be troublesome. Is it worth it? If this country does not adhere to the convention, what will happen? Its export trade in plants with adhering countries will cease to a large extent, if not wholly. It will be unable to send any living plants into any of the twenty-five countries that have joined the convention. It will be able to send plants to the United States,

but only by carrying out a similar procedure in order to satisfy their requirements. Whether to adhere or not is evidently a very difficult question, and a joint committee, formed under the auspices of the Royal Horticultural Society, has been engaged on this problem. Clearly there are many things to be taken into account. What diseases are there which we do not desire to be admitted into this country? Where do they come from and how? Have we suffered in the past from introduced diseases? Will the convention's restrictions keep diseases out, or will they simply restrict trade and be of no use?

To answer these questions we must have information, and we are using this interval to get that information, so that when the time arrives for discussion the trade can take up a definite position and back it with facts. We have collected information about the diseases and pests which have been carried from country to country in the past and what carried them. We have information about the restrictions on trade at present in force. We have information about the diseases which do not exist in this country and which we do not want admitted; but we have no information as to the trade itself in this country, and this is a necessary part of the enquiry.

Particularly we require this: What is the position of the industry as regards imports and exports respectively? What are these, where do they go to, where do they come from? Are the imports of new wild plants from, say, China, more important than the imports of cultivated new varieties from Europe? If a clause in the convention concerns, let us say, the importation of Japanese Maples and deciduous nursery stock from Japan, are we affected or not?

There are countless points of this sort which can only be answered by a knowledge of what the imports and exports are, what kinds of plants, of what value and amount, where from and where to, and whether the imported plants are from the forest or jungle or from foreign nurseries.

In the hope of getting this information the Royal Horticultural Society has addressed a letter to every firm dealing in live plants. Attached are forms so prepared that each firm may give, with the least trouble, the information that the committee wants, and the committee very strongly urges all members of the trade to give the information asked for. Sooner or later a decision will have to be taken.

The Board of Agriculture has intimated that it will not adhere to the convention if it be against the interests of the trade, and it is extremely important that the trade should have the necessary information on which to judge whether to recommend adherence to the convention, whether to stand aside, or whether to ask the Government to seek to modify it.

It is impossible in a single article to make clear what the effect of the convention will be, but I propose in the next to explain the regulations already adopted in France in anticipation of this convention being adopted. Whether this country adheres or not, the effect will be far-reaching, and we hope the trade will give the committee the help it needs by filling up the forms and returning them when completed to the Secretary, Royal Horticultural Society. The information will be treated as strictly confidential, and the only use made of it will be to compile tables of the total imports and exports of living plants, with the countries of origin or destination.

H. M. LEFROY.

BOOKS.

The Principles of Agriculture Through the School and Home Garden.*—The author is Supervisor of Agricultural Nature Study and Director of Rural School Extension, Chico State Normal School, California (title-page). His conception of the place of the school is a high one, but probably a sound one, so far as we are able to follow it in the preface, and we fully agree with his hope that teachers will "use the garden, not for the sake of the garden itself, but that it may lead the children into the life of the State."

The book itself sets out to teach principles, not processes, of agriculture, and one finds many suggestions for experiments demonstrating principles; but at the same time a large part of the book gives directions concerning common garden processes, many of which are illustrated. Still, the directions are often not sufficiently explicit to be really useful to the beginner. Little details which make all the difference between neat and effective and slovenly and indifferent work are often omitted. Not only is the garden considered, but the rural home, too, comes in for its share of attention. The weather, the cow, poultry and pigeon raising, public health, and the mosquito and house fly all have chapters devoted to them. The older children in primary schools would undoubtedly benefit greatly by studying the book and reading it with a sympathetic teacher, also by making the experiments it suggests, and carefully carrying out the instructions it gives for growing plants, under efficient supervision. Teachers themselves are likely to profit, too, by the perusal of the book, for it is in many places very suggestive and helpful, not only for the persons for whom it is immediately intended—the youngsters in American rural schools—but for all teachers of young people everywhere.

A LETTER FROM THE ROYAL HORTICULTURAL SOCIETY.

A YEAR ago the President and Council of the Royal Horticultural Society expressed to the Fellows their opinion that in troublous times, such as we are at present passing through, counsels of perfection cannot always be carried into effect. At the same time it is none the less the duty of those who are placed in a responsible position, and who can exercise any influence in the country, to give the best advice in their power, leaving it to the judgment of individuals to act upon it as far as they are able and see fit.

The letter further went on to say that it was already evident that not only actual gardeners, but all who in any way were dependent for a living upon horticulture will be certain to suffer seriously from the indirect effects of the war.

It is known how loyally Fellows of the society responded to this appeal, and nurserymen and seedsmen throughout the country have been deeply grateful for the effort Fellows have made to maintain, as far as they reasonably could, the upkeep of their gardens, adjusted to the times.

* "The Principles of Agriculture Through the School and Home Garden," by C. A. Stebbins, M.S. 8vo, xxviii + 380 pp. New York: The Macmillan Company, 1913; price 4s. 6d. net.

There has recently appeared in the public Press correspondence urging the entire cessation of all garden expenditure, and though the letters have more pointedly aimed at public parks and gardens, such expressions are apt to be dangerous, inasmuch as the gardening public at large may be likely to interpret and apply them to themselves individually. Indeed, that this is happening is evident from correspondence recently received on the subject from prominent and well-known firms, who tell us that their trade is very seriously depressed, and who point out that an entire cessation of trade means not only temporary financial loss, but the irretrievable sacrifice of many years of labour spent in introducing new and improving older fruits and vegetables for our use, and flowers, trees and shrubs for our solace and enjoyment. They rightly feel that, as they have catered for our highest happiness in times past, it is hardly right that they should now be brought to a position in which they can no longer even retain their employes' services. Most of their younger men have enlisted, and they ask, not for the usual trade, but for just sufficient support to keep them going and to meet current expenses which cannot be suspended.

The President and Council feel that in drawing the attention of Fellows to this trade aspect of the question they are but again advising that medium policy which, in the long run, is always the wisest, and Fellows are urged not to forget this when framing their economies.

W. WILKS, Secretary.

EARLY PLANTING OF BULBS.

FOR many years various writers have urged the necessity of planting and potting certain bulbs as early as possible. The advice was quite sound, but, unfortunately, many amateurs have gone from one extreme to another, for while in the past they often neglected to place their orders until after the proper time for planting had gone by, they now demand from the poor harassed grower or merchant delivery of bulbs before it is possible to despatch them. I feel sure that no one who is not conversant with the work of growing, cleaning and sorting large stocks of bulbs can have any idea of the time which must elapse between the lifting of the bulbs and getting them ready to send out. Again, supposing a grower has managed to get all his own stocks ready for despatch in good time—say, the third week in August—he will certainly be kept waiting by other growers who have not been able to get through their work so promptly. For it must not be supposed that the cleverest growers with the best of soil are able to grow every variety (even of one class of bulb) to perfection. He must, if he aims at supplying the best of everything, purchase from others all that he cannot grow to the best advantage. As an illustration, though growing a very large collection of Daffodils, I find it necessary to buy from some fifteen other growers in England, Holland and the Channel Islands, in order to have the best bulbs of each variety.

It will thus be seen that all bulb merchants are more or less dependent upon others, and although their own stocks may be ready in good time, some of the growers with whom they deal

are sure to be late and thus keep them back. Customers eager to plant early often say, "Never mind about the bulbs being dried or cleaned; send them as they are." Have these ardent ones ever considered the enormous amount of extra time it takes to hunt out even a small number of bulbs from some hundreds or thousands of trays before the stocks have been cleaned, sorted and properly arranged for despatch work? If they have not, I would say that it may take quite four times as long to execute an order thus prematurely as it would under proper conditions. What is difficult and hindering in normal seasons is this year simply impossible, for what with the great shortage of labour owing to the war, and the awful weather experienced during the lifting and harvesting time, the preparation of bulbs for sale has unavoidably been delayed later than usual.

I would therefore beg of all who are impatiently awaiting the arrival of their bulbs to take into consideration the difficulties the poor bulb grower or merchant has to contend with, especially in the present troublous times, and to exercise as much patience and forbearance as lie in their power.

ONE OF THE HARASSED GROWERS.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

CAMPANULA ARVATICA (C. H. S., Alderley Edge).—This Spanish species is quite distinct from the Scotch-raised hybrid, *C. haylodgensis*, in many ways, though more particularly colour, habit, flower production—solitary in *arvatica* and several on a stem in *haylodgensis*—and form of flower and leaf. The nearest approach to *C. arvatica* is *C. waldsteiniana*, and while in flower, form, colour and general effect it might well be described as a glorified form of it, the two are widely distinct in their leaf characteristics and in other ways. Had you sent a small flowering example of what you have as *C. haylodgensis*, we could have told you whether you possessed the true plant or not. You might probably like to do this even now and so clear the matter up.

TREES AND SHRUBS.

SHRUBS FOR ISLAND BED (A. W. R.).—The following plants are likely to give satisfactory results in your island bed. If you prefer Laburnums to other trees, plant Laburnum Watereri; but if you do not mind odd trees; use Laburnum Watereri, Prunus serrulata James H. Veitch and P. Avium flore pleno. Large-growing Lilacs such as Marie Legraye (white), Charles X. (reddish lilac) and Souvenir de Louis Späth (dark red) will do very well towards the centre, and further forward you might use Berberis stenophylla (orange), B. Darwinii (orange), Ribes sanguineum splendens (red), Spiraea arguta (white), Diervilla Abel Carrière (red), D. Eva Rathke (red), Azaleas in variety, Viburnum tomentosum plicatum (white), Cytisus scoparius andeanus (gold and brown), Spiraea japonica Anthony Waterer (red, dwarf), Erica mediterranea hybrida (reddish, dwarf), Daphne Mezereum (red) and Hamamelis mollis (yellow). Any Rhododendrons you may wish to use could be intermixed. With such a bed it would probably be advisable to include a larger number of species, rather than form large groups of a few kinds, as the interest could be spread over a longer period.

SPECIMEN FOR IDENTIFICATION (Y. E. R. P.).—The specimen sent for identification is *Thuya plicata*, sometimes called *T. gigantea* and *T. Lobbi*. Plants 8 feet high will be difficult to transplant, and the work can only be done successfully by exercising great care. Much depends upon the character of the soil, for if it is moderately firm it will adhere to the roots much better than if it is very light; and a great aid to success is to keep a considerable amount of soil attached to the roots. The work may be attempted during late September or early October. Dig round the plants at a distance of 3 feet from the stems, and then fork the soil away from the ball until roots are found. Bind the soil round with a piece of canvas, then undermine half the ball, roll a piece of canvas and pass it under the ball, tilt the plant over and draw the roll of canvas through. Lift the plant by means of the canvas and carry it to its new home. If the ball seems loose, leave the canvas beneath, unwrap the sides, and fill the soil in carefully. Water well, and stake to keep the plant from being blown about. If you find that the soil cannot be kept to the roots of the first plant, it would be inadvisable to attempt to move the others. In moving the plant keep it as upright as possible.

MISCELLANEOUS.

SOOT FOR SLUGS (J. Gibson).—This is a very good article to dress your soil with, but we should advise applying it in spring. Give the soil a good dressing of lime in October. That known as slaked lime is best. About six ounces to a square yard would be a good dressing. The soot can be dusted on the ground until the latter is quite black, and you can then fork it lightly in.

NAMES OF PLANTS.—S. Brown.—*Phormium tenax* vetchianum.—A. E. S.—*Pyrus Aria* (White Beam).—Boris.—*Arenaria peploides* (Sea Purslane).—Thomas H. Horrell.—A. *Geranium pratense* flore pleno; B. *Thymus baccata* (Yew); C. *Juniperus chinensis*.

NAMES OF FRUIT.—T. W. Hunt.—The Apple is White Astrachan, and this variety and some of the Codlins will root in the manner you describe.—R. M. E. Y.—1, Williams' Favourite; 2, Lemon Pippin; 3, Red Ingestre.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

The fortnightly meeting held on August 31 was a small one, the outstanding feature being a unique collection of shrubs from Elstree. *Montbretias* from Norfolk and a collection of fruit from Welwyn were other items of importance in a rather spare gathering.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), and Messrs. J. Green, G. Harrow, G. Reuthe, J. W. Moorman, J. F. McLeod, W. Howe, J. Jennings, W. H. Page, C. Dixon, H. J. Jones, C. E. Pearson, C. E. Shea, J. T. Bennett-Poë, W. P. Thomson, E. H. Jenkins, T. Stevenson, A. Turner and James Hudson.

The outstanding feature of this meeting was the unique collection of new shrubs which occupied the whole of the northern side of the hall, and which came from the equally unique collection of the Hon. Vicary Gibbs, Elstree, Herts (gardener, Mr. E. Beckett). Without doubt it was the finest thing of the kind yet seen at one of these exhibitions, and while rich in variety was equally so in novelties as yet practically unknown. Some idea of the extent of the collection may be gathered from the fact that nearly 300 species were included in it, and in the majority of instances in specimen form, giving a good idea of their value. Not many things were in flower, yet, despite this, their ornamental character and importance could not be gainsaid. From so comprehensive a collection it is only possible to give a few notable kinds, and of these we select at a glance *Cunninghamia lanceolata*, an *Araucaria*-like subject of distinction. Others of note included *Cotoneaster horizontalis pur-pusilla*, which forms a prostrate bush covered with red berries, suited to bold rockwork. *Lonicera nitida*, various species of *Jasminum*, *Xanthoxylon* sp., unnamed; *Cydonia Mallardi*, full of big green fruits; *Potentilla Veitchii*, *Rosa sericea*, *Vitis Henryii*, *Philostegia viburnoides*, *Berberis Wilsonae*, *B. aggregata*, *Viburnum cinnamomifolium*, very distinct; *Ilex Perny* and *Cotoneaster obscura* were among important things. Of bolder form were *Ailantus vilmosiniana*, *Actinidia chinensis* and *Liriodendron chinense*. An admirable collection, for which a gold medal was deservedly awarded.

Messrs. J. Peed and Son, West Norwood, S.E., displayed a remarkable table of *Streptocarpus*, an excellent strain, in which there were rose, purple, violet, pink, pure white and other shades freely staged in groups. Some mottled or variegated varieties were very charming.

Messrs. H. B. May and Sons, Edmonton, displayed a table of *Bouvardia* and *Ferns*, the former including *Priory Beauty* (pink), *Hogarth fl. pl.* (scarlet), *President Cleveland* (brilliant scarlet), *elephas* and *Princess of Wales* (pale pink). *Polypodium aureum* var. *mandarinum*, *P. glaucum* var. *Mayi cristatum*, with *Nephrolepis* in variety and choice *Palms*, contributed to an attractive and interesting group.

Mr. G. Reuthe, Keston, Kent, had a most interesting lot of hardy plants, of which *Crinum* in variety, *Eucryphia pinnatifida*, *Buddleia* of sorts, *Cyclamen hederifolium* album, *Lilium Henryii*, *Conandron ramondoides*, *Parnassias*, *Liatris pycnostachya*, *L. spicata*, *Senecio*

pulcher and *Phygelius capensis* were among the most important. *Diantha cærulea* is a new Chinese plant with violet-coloured, cup-formed blossoms. It is a charming plant. *Lapagerias* from the open were very fine.

The Rev. J. H. Pemberton, Havering-atte-Bower, Romford, showed some charming roses, the best of which were *Clytemnestra*, *Danæ* (creamy yellow), *Queen Alexandra* (a lovely single), *Moonlight* (white), and *Clarissa* (yellow and cream). All save *Queen Alexandra* are of the *Cluster* and *Perpetual-flowering* sorts. Lady Pirrie, Hugh Dickson and General Macarthur were well shown.

Mr. W. Wells, jun., Merstham, showed a nice lot of *Delphiniums* in the cut state, chiefly the result of secondary spikes. Many popular varieties, as *Queen Wilhelmina*, *Mrs. Creighton*, *Emily*, *La France*, *The Alake*, *Rev. E. Lascelles* and *Merstham Glory* (fine light blue) were all well shown.

The Misses Hopkins, Shepperton-on-Thames, displayed a small collection of alpinæ, of which *Sempervivum arachnoideum*, *Sedum pulchellum*, *Lobelia*, hardy *Heaths* and *Tuicium* were a few.

Mr. G. W. Miller, Wisbech, showed an interesting lot of herbaceous plants in the cut state. *Pyrethrums*, *Tristomas*, *Delphiniums*, the newer *Astilbes*, *Montbretia* Star of the East, *Eucomis punctata*, *Heucheras*, *Gladiolus* princeps and others were all well shown. *Apple Red Victoria*, *Late Gooseberry Omega*, and the *Strawberry-Raspberry* were included in the group.

S. Morris, Esq., Earlham Hall, Norwich (gardener, Mr. G. Henley), staged an excellent table of *Montbretias* in many beautiful varieties. *Queen Elizabeth*, *Queen Anne* (light orange), *Westwick* (dark orange with ring of deeper orange), *Pageant* (clear orange) and *Queen Adelaide* (very dark orange) were among the best.

Messrs. J. Cheal and Son, Crawley, exhibited the *Star Dahlias* very finely: *White Star*, *Crawley Star* (cerise) and *Yellow Star* were among the more important. Single *Dahlias* and *Cactus* varieties in many forms were all well staged. F. W. Fellowes (orange) and Mary Purrier (crimson) were very fine. The exhibit also included a variety of *Pompon* and some *Collarette* varieties. Cut shrubs were also a feature.

ORCHID COMMITTEE.

Present: J. Gurney Fowler, Esq. (chairman), Sir Harry J. Veitch, Sir Jeremiah Colman, and Messrs. J. O'Brien, R. A. Rolfe, Pantia Ralli, T. Armstrong, A. McBean, Walter Cobb; W. H. Hatcher, C. H. Curtis, J. E. Shill, W. H. White, S. W. Flory, W. Bolton and Gurney Wilson.

Messrs. Charlesworth and Co., Hayward's Heath, showed *Odontoglossum wilckeanum*; *Vanda cærulea*, *Cattleya gaskelliana* alba, *C. dowiana* aurea, *Sophrocattleya* *Lacina* (very deep coloured) and *Odontodia* Red Cross. *Odontoglossum Aireworth* and *Lelia Bella* were very charming.

Messrs. Hassall and Co., Southgate, N., showed a few nice things. *Cattleya Sybil*, C. Lord Rothschild alba (a lovely combination of white, gold and purple, with heavily fringed lip) and *C. Adula* (rosy salmon and purple lip) were included.

Mr. R. G. Thwaites, Streatham Hill, showed plants of *Odontodia Vuylstekeae*, *O. chessingtonensis*, *O. devosiana* (a richly coloured, well-branched form), together with choice *Cattleyas*.

Messrs. Flory and Black, Slough, showed *Brassia* *Cattleya* *Miquel* and *B.-C. André Maron*, two very fine and imposing varieties.

FRUIT AND VEGETABLE COMMITTEE.

Present: J. Cheal, Esq. (chairman), and Messrs. W. Bates, J. Willard, E. Beckett, W. Pope, H. Markham, A. R. Allan, H. J. Wright, A. Bullock, A. W. Metcalfe, P. C. M. Veitch, E. A. Bunyard, Owen Thomas and W. Poupert.

Messrs. Sutton and Sons, Reading, had an extraordinary collection of *Runner Beans*, some thirty or so varieties being staged. Sutton's Best of All, with 16-inch long pods, formed a grand centre-piece, while Sutton's A 1, Sutton's Scarlet, Ne Plus Ultra, Hackwood Park, Sutton's Prizewinner and Veitch's Scarlet were of exceptional merit. There were many varieties of ornamental value, while a further series showed the development of the *Runner Bean* through many years.

Messrs. S. Spooner and Sons, Hounslow, showed a capital collection of *Apples*, *James Grieve*, *Cardinal*, *Domino*, *Red Quarrenden*, *Rougemont*, *Red Hawthornden*, *Lady Sudeley* (very rich in colour), *Stirling Castle*, *Williams' Favourite*, *Duchess' Favourite* and *Baron Wolsley* being noted among many sorts. *Blackberries*, *Strawberry-Raspberry* and other fruits were shown.

Baskets of *Tomato Peachblow* came from Mr. F. Herbert Chapman, Rye. The fruits exhibited a remarkable variation, with leanings or reversions to the originals from which they came. They were most interesting and attractive.

A comprehensive collection of fruit, for which a silver-gilt Knightian medal was awarded, came from C. A. Cain, Esq., The Node, Welwyn (gardener, Mr. T. Pateman). *Morello Cherries*, *Kirke's Plum* (one of the finest dessert sorts), *Lord Napier* and *Pine-apple Nectarines*, *Green Gage* and *Transparent Gage* *Plums*, *Nectarine Violette* *Hative*, *Royal George* and *Bellegarde* *Peaches*, with *Figs*, were admirably shown. *Madresfield Court*, *Muscat* *Hamburgh*, *Muscat* of *Alexandria* and *Apple Tower* *Grapes* were admirable.

Mr. J. C. Allgrove, Langley Green, Slough, had *Plum Allgrove's Superb* (in excellent condition), with fruiting trees of the same. *Apples* *Lady Sudeley*, *James Grieve*, and *St. Everard* were also on view. *Pears* *Clapp's Favourite* and *Dr. Jules Guyot* were also noted. All were in excellent condition.

DUMFRIES AND DISTRICT HORTICULTURAL SOCIETY.

THE annual show of this society was originally intended to last over two days, but the continuance of the war led to a reconsideration of the arrangements. It was ultimately decided to hold the exhibition on the first, and a sale for war relief funds on the second, day. This proved a success, as the show and sale held in St. Mary's Hall, Dumfries, on August 27 and 28 were both successful. Trade and other exhibits had to be restricted in numbers and space, the only larger hall being occupied by the military. Trade exhibits were those of Messrs. Barr and Hunter, Maxwelltown; Mr. John Croall, Dumfries; Messrs. R. B. Laird, Dickson and Co., Edinburgh; and Messrs. J. Palmer and Son, Annan. Gold medals were awarded to the first three and a silver medal to Messrs. Palmer. A gold medal was also awarded to Mr. J. Jeffrey, gardener to Sir R. W. Buchanan Jardine, Bart., Castlemilk, for a superb exhibit of *Sweet Peas*. In most of the competitive classes there was a strong competition. The most successful exhibitor in the whole show was Mr. E. A. Grigor, Dalswinton, who thus won, for the second time in succession, the large silver cup of the society. There was a good competition in the class for dinner-table decorations, Mr. G. F. Hallett, Netherby, Longtown, coming first. In other open classes, Mr. Grigor, Mr. J. Henderson, Elmbank, Dumfries; and Mr. J. Houlston, Northfield, were the most successful. In the gardeners' and amateurs' classes for pot plants, Mr. Grigor, Mr. D. J. Maxwell, Newtonairs; Mr. J. Houlston and Mr. Henderson were the leading winners in a rather small section. Cut flowers were among the finest ever shown in Dumfries. Mr. J. M'Gill, Kirkcubright, Newabbey, won for a table of flowers cut from the open, and Mr. D. Campbell, Capenoch, led with herbaceous plants. The other first prizes in this section fell to Mr. D. J. Maxwell, Newtonairs; Mr. Campbell; Mr. D. Whitelaw, Lochbarbriggs; Mr. M'Gill, Mr. Henderson and Mr. Grigor. Fruit was very good, *Grapes* being specially fine. Mr. Campbell had the best collection of fruit and the best *Plums*. Mr. J. Cluckie, Arbigland, won for *Muscat Grapes*; the other firsts for *Grapes* going to Mr. Grigor. Mr. Hallett led with *Peaches*; Mr. Grigor with *Nectarines*; Mr. W. Scott, Drumpark, with *Melons*, *dessert Pears* and *dessert Apples*. Mr. Grigor had the best collection of *Apples*, and Mr. J. A. Mather, Hastings Hall, won with *culinary Apples*. Vegetables formed a capital section, Mr. Hallett having the best collection and Mr. Grigor the best *Potatoes*. Other first prizes were won by Mr. Maxwell, Mr. Grigor, Mr. J. Chalmers, Steilston; Mr. J. Cluckie, and Mr. W. Kerr, Dalswinton Village.

Sweet Peas were the finest feature of the show and were of exceptional merit. Mr. G. L. Moffat, Mayfield, Lockerbie, was most successful with several magnificent exhibits. The other first prizes were principally won by Mr. Grigor. Amateurs showed well in classes confined to themselves, but space does not permit of details. Mrs. Johnstone-Douglas, Comlongan Castle, opened the show, Sir James Crichton-Browne presiding. The sale on the second day was highly successful, Sir Geoffrey Barton performing the opening ceremony.

HIGHCLIFFE GARDENERS' ASSOCIATION.

E. HUNTLY HOOPER, Esq., J.P., and Lady Maud Hooper extended a cordial invitation to the members of this association to visit their residence, Shelly Hill, to tea and games on August 25. The weather was fine and the muster of members a full one. Mr. E. T. Griffin, the able head-gardener, received them at his residence and first conducted them round the kitchen and fruit garden and the hothouses. Here *Potatoes* and *Runner Beans*, *Celery* and *Onions* were splendid crops, and the batch of strong *Chrysanthemums* gave promise of a good display of blossom in due course. Mr. Huntly Hooper met the members on the lawn and conducted them round the pleasure grounds. The *Rose* garden was gay with clean, highly coloured blooms; the *Liliums* were strong and stately, bearing large flowers; the herbaceous plants and the annuals were at their best and made a charming display. Lady Maud Hooper favours large masses of colours, distinct, confining the colours to separate beds: there are blue borders, scarlet borders, &c., and these surround clumps of shrubs which form capital backgrounds. The terrace garden was gay with bedding-out subjects, *Heliotrope*, fibrous-rooted *Begonias*, *Antirrhinums* and *Calceolarias* being particularly noteworthy.

Mr. W. Sturrock, who has for some years been manager at Larchfield Nurseries, Dumfries, for Messrs. W. Learmont and Son, has relinquished his appointment to proceed to the United States to enter upon fruit farming. Mr. Sturrock has been a general favourite among his horticultural and other friends in and around Dumfries, and has done good service in the operations of the Dumfries and District Horticultural Society and the Dumfries and Galloway Gardeners' Association, of both of which bodies he was an active member and office-bearer. The good wishes of the many who regret his departure will go with Mr. and Mrs. Sturrock for their happiness and prosperity in their new enterprise.

THE GARDEN.

No. 2286.—VOL. LXXIX.

SEPTEMBER II, 1915.

NOTES OF THE WEEK.

The War Horticultural Relief Fund.—This fund is being promoted by the Royal Horticultural Society to assist horticulturists in the countries of our Allies, whose gardens and nurseries have been devastated by the enemy, to rebuild their businesses on conclusion of hostilities. It is gratifying to learn that this fund is making progress, and that a total of £5,234 18s. has been received as a result of the appeal made to Fellows of the society. More funds, however, are required, and it is now hoped that a wider gardening public will respond. Donations may either be paid at once to the Treasurer of the Royal Horticultural Society, Vincent Square, Westminster (to the account of the War Horticultural Relief Fund), or they may be promised only and actual payment delayed until Peace is in sight.

Wanted: More Exhibitors of Vegetables.—It is very remarkable that while exhibitors of hardy and greenhouse flowers are innumerable, the exhibitors of the kitchen garden produce are few and far between. Utility, especially at this time, should take first place, as Mr. Herbert Chapman ably points out in his interesting article on "Exhibiting Vegetables" on page 446 of this issue. Good exhibits of vegetables are an incentive to the sound cultivation of vegetable crops, and we look for fresh names among the exhibitors at the Royal Horticultural Society's Show of vegetables to be held at Vincent Square on September 28.

Linaria alpina.—This is classed as an annual by the Rev. J. Jacob in his note in THE GARDEN for August 28. It is, however, a true perennial, though it is not included in the "Kew Hand List of Herbaceous Plants." Doubtless it is liable to be killed off in winter, but 50 per cent. survive on a retaining wall, and I have marked one plant of the rose-coloured variety which is at least six years old and going strong.—HERBERT MAXWELL Monreith.

A Potato Trial.—At a recent meeting of the Highcliffe Gardeners' Association, Mr. W. Weaver, hon. secretary, brought samples of five varieties of Potatoes grown on a trial plot in the Chewton Glen Gardens. In each case 14lb. of sets were planted. The following was the yield of the crops: The Factor, 266lb.; Up-to-Date, 196lb.; Acquisition, 250lb.; Duchess of Cornwall, 224lb.; and White City, 220lb. The samples showed excellent quality throughout.

Humboldt's Lily.—We are reminded of the exquisite beauty of this Californian Lily by the arrival of a photograph (unfortunately not suitable for reproduction) sent by D. F. Alderson, Esq., Park House, Worksop. The flower-spikes are shown carrying more than twenty blooms each. *Lilium Humboldtii* has flowers of a magnificent reddish golden colour, spotted purple. Our correspondent is successful in growing this Lily in 12-inch pots without heat, but in favoured

appointments that I think your readers may like to know of their effect. Their colour, being so unusual and unreal, did not recommend them to me when I first read about them, but, having seen them used, I am converted.—W.

Daffodil Olympia.—This is a remarkably fine Daffodil—one of the very best. If the name of Engleheart will go down to posterity as the raiser of White Lady, the name of van Waveren will very likely be remembered in like manner as the raiser of Olympia. As the illustration shows, it is a large trumpet variety—not of that smooth and even appearance which delights the heart of the exhibitor, but of a bolder and more *négligée* look. In colour it is of much the same shade of yellow as Emperor; if anything, rather deeper. It is a good increaser, of a most robust constitution, and equally useful as a border or pot plant. I would not advise it for early forcing like Golden Spur, but for bringing into flower from mid-February onwards it is a fine subject.

Sowing Cyclamen.—This is an excellent time to make a sowing of this useful greenhouse plant, and it will be well to observe from the outset that there must be no coddling. Sow in shallow pans in a mixture of good loam, leaf-mould and sand. Make this moderately firm and dibble the seeds in about an inch apart and a quarter of an inch deep. Cover the pan with a piece of glass, and shade till germination takes place. As the seedlings usually come up irregularly, dibble them into 2½-inch pots as they appear. Keep them growing on in a moist atmosphere, and have them sufficiently close to the glass to prevent them from becoming drawn.

Fragrance in Mignonette.—Of all the many families of the floral world which ought to be sweet scented, none would suffer more in popular estimation than Mignonette were it to be withdrawn. The popularity of scentless Roses and scentless Carnations must often make thinking people

wonder if the cry for fragrance is not very largely a creation of the horticultural writer. However this may be, it cannot be the case with a flower whose sweet savour won it its spurs. The modern seed list has several varieties of this annual to offer. A garden trial will reveal the fact that there is a vast difference in their respective sweetnesses. One advertised as white is nearly devoid of scent. Beware of white, then, when ordering.

THE TRUMPET DAFFODIL OLYMPIA. MAGNIFICENT IN FORM, COLOUR AND SIZE.

gardens it will thrive in a cool, moist, half-shaded peaty site among dwarf shrubs, and the same may be said of *Lilium parda'inum* and *L. superbum*.

Slate Grey or Blue Poppies.—Remembering, after reading in THE GARDEN last year of some slate grey or blue Poppies, I was much interested to see a vase of them on a dinner-table lately. They looked so beautiful on the white tablecloth and toned in so well with the usual table

OUR LATE EDITOR: A FEW APPRECIATIONS.

From Mr. S. Arnott.

I HAVE known Mr. Harvey for many years, and had the utmost admiration for his sincerity, uprightness and consideration. He was a true friend in every sense of the word, and I deeply mourn his early death. His loss to horticulture will be a great one.

Extracts from a letter from Mr. W. A. Bilney.

"IN the course of a long life I have known much sadness, but I have never known anything sadder than the death of Mr. Harvey. Little did I think when I saw him, on the eve of going North, that it would be the last time we should ever meet. Mr. Harvey was a man who deserved to succeed, and he would have got higher up the horticultural ladder if he had lived. A straighter and pleasanter man I never knew, and I feel his death most keenly. Mr. Harvey was not a mere journalist; he was a real gardener who had his heart and soul in his garden."

From Mr. F. J. Chittenden.

THE news of Mr. Harvey's sudden death came as a great surprise to me, as I had not known of the serious nature of his illness. I have known him many years, first as a youth eager to learn all he could in the gardening classes at what was then the County Technical Laboratories, Chelmsford, and then as a painstaking and industrious gardener in the experimental garden attached to that institution, and an earnest debater at the discussions which formed a feature of the courses of instruction.

Wherever his work lay, his genial trustworthiness enabled him to gain the confidence and appreciation of those who were connected with it, and they never found him fail. His passing, almost at the beginning of what bid fair to be a career of great usefulness, will be a great sorrow to all who knew him, and not least to me.

From the Rev. Joseph Jacob.

EVER since I began to write for the horticultural Press I have been thrown into personal contact with our late Editor, while of recent years, since he was appointed to the proud position he held at his death, I have seldom visited London without having a chat. I often used to chaff him about editors having a jolly good time, but, all the same, I knew how hard he worked for his paper. I think I may claim for his efforts a full measure of success. THE GARDEN has improved greatly of late years. I know there are many readers who will bear me out in this. He did good work for gardens and gardeners, for his energies and sympathies were not confined to his desk or to his writings.

My London visits will never be quite the same now he is gone. There will be a gap on show Tuesdays, and a memory only will remain, but that memory will recall a quiet, courteous, kindly, unassuming friend, ever ready to help anyone in a difficulty; a man full of love for his home and garden, and one with a real liking for his profession, in which, had longer life been vouchsafed to him, he would have left an even more enduring name.

From Mr. E. H. Jenkins.

To a large number of the readers of THE GARDEN, as well as to a host of intimate and admiring friends, the news of the sudden death of the Editor of this journal in the early morning of August 31 came as a staggering blow.

To THE GARDEN he was devoted in a dual sense that few perhaps realised, and a much larger number knew not of at all. He made his own private garden a more than useful adjunct to his journal, rendering it, indeed, in some measure at least, a sort of storehouse from which information and object-lessons, could be drawn at will.

And now he is no more. A young and promising career has been suddenly and unexpectedly terminated. Respected everywhere for an uprightness beyond reproach, his loss will be much more keenly felt by those who were privileged with his friendship. To such his early death is indeed a great personal loss.

From Mr. C. Wakely.

MR. HARVEY was a native of Stebbing, a quiet country village in Essex. After leaving school he worked for Mr. Philpott, a seed and fruit grower.

While thus engaged he joined an evening gardening class arranged by the Local Education Committee, his employer being the teacher. It was there that I first met him, and advised him to attend the central courses of instruction in horticulture arranged by the Essex Education Committee at Chelmsford. This he did during the year 1899. Here he proved an apt pupil, and soon made good progress in work and study.

A few months later an under-gardener was required for the County Gardens, and he was selected for the post.

After about four years spent in the County Gardens, he proceeded to the Royal Gardens, Kew, in order to gain a wider knowledge of plant life.

Having worked more than a year at Kew, he obtained an appointment on the staff of the *Gardener*, in July, 1905. Later he accepted the post of Assistant Editor of THE GARDEN. On the resignation of the late Mr. E. T. Cook, Mr. Harvey became Editor.

His career closes at an early age. His comparatively rapid progress to the Editor's chair serves to prove both his ability and application. His work has brought him into touch with many plant-lovers, by whom he will be missed and mourned.

From Mr. W. Watson.

WHEN Mr. Harvey left Kew ten years ago he had been with us two years. He came with an excellent recommendation from Mr. C. Wakely of the Essex County Council, in whose garden he had been as second man for nearly three years, and he more than justified it, for at Kew he was studious as well as keen and efficient at the practical work; the sort of man that would make his mark in almost any calling. He was not of the showy type; rather one of the kind that wait to be pushed to the front, and when they get there surprise people by revealing unusual knowledge and fitness. Those who knew Harvey liked and respected him; certainly I did, and I knew him very well.

From the Rev. David R. Williamson.

THE late Mr. F. W. Harvey was one of my kindest and most considerate friends. Under his editorship it was a perfect privilege to contribute to THE GARDEN. I seldom sent him a contribution, that he did not at once acknowledge. He will be greatly mourned by all contributors.

THE sudden and lamentable death of Mr. F. W. Harvey was briefly referred to in our last issue. From the day of his appointment as Editor of this journal it was my privilege to work in association with him as Sub-Editor, and his death, to me, came as a great shock. Mr. Harvey was an exceptional man, exceptional in his devotion to duty and in his determination, so far as it is humanly possible, to be absolutely fair to all with whom he was brought in contact. He took almost a personal interest in the gardening troubles of any reader of this journal, and extracted no small amount of pleasure in being able to assist them in solving their difficulties. It is impossible to print a tithe of the expressions of regret that we have received from our readers. Mr. Wakely has kindly furnished some facts dealing with Mr. Harvey's early life, to which can be added some particulars of his horticultural appointments and work. He was the author of "Fruit Growing for Beginners," and he edited "The Hardy Flower Book," "The Small Rock Garden," and "Gardening for Beginners" (sixth edition). He was a member of the Floral Committee of the Royal Horticultural Society; a member of the Council of the National Rose Society; chairman of the National Sweet Pea Society in 1914; and a member of the Committee of the Kew Guild. His life full of promise closes at the early age of thirty-three years.

H. COWLEY.

The Funeral.

MR. HARVEY was laid to rest in Romford Cemetery on the afternoon of September 4. A considerable number of horticultural and other friends joined in the procession at the cemetery gates. The service was choral, the Rev. Joseph Jacob, who made a special journey from Whitchurch, Salop, reading the Lesson. Among those who gathered around the grave were A. C. Bartlett, A. E. Burgess (Surrey Education Committee), F. Herbert Chapman, Rifleman H. Cowley (Assistant Editor of THE GARDEN), E. H. Christy (Chairman of the National Sweet Pea Society), H. Calkin (*Country Life*), C. H. Curtis (*Gardeners' Magazine*), Walter Dallimore (Royal Gardens, Kew), Walter Easlea (National Rose Society), E. H. Jenkins (Floral Committee, Royal Horticultural Society), E. G. Quick, A. Osborn (Kew Guild), R. Pinches (Horticultural Club), and W. H. Young. Upwards of thirty beautiful floral tributes were sent, and, apart from those from his widow and son and his relatives, were others from the staff of *Country Life* and THE GARDEN, C. H. Curtis and family, Messrs. Barr and Sons, F. Herbert Chapman, the Floral Committee of the Royal Horticultural Society, E. H. Jenkins and family, the National Sweet Pea Society, W. H. Young, "Friends of the 8.44" (Mr. Harvey's usual train), A. C. Bartlett, Walter Easlea, the Kew Guild, and the Gidea Park Horticultural Society.

TREE LEAVES.

HOW TO MAKE GOOD USE OF THEM.

IN districts where tree leaves are to be had in abundance throughout the autumn, they should be more appreciated this winter than usual. As a rule, sufficient are stored to supply the demands for leaf-soil for potting and similar purposes, the remainder being scattered about in woods and odd places. In one large garden I had charge of, I generally had carted in more than a hundred tons of freshly fallen leaves every winter; it would not have been difficult to have had carted in twice the weight. The leaves were used for the forcing of Rhubarb and Seakale, for early Potatoes in frames, also for early Carrots in frames; and for leaf-mould, Oak and Beech leaves were selected. Many tons of leaves were also spread in the stock yards and, in due course, were converted into excellent manure.

One autumn I had an idea of making still further use of the leaves—I always had three distinct heaps: one of well rotted, one of partially rotted, and one of fresh leaves—by levelling the surface of the last two heaps and raising early Potatoes and Carrots, on them, thus utilising the gentle heat they engendered. On the surface of the leaves, ordinary soil was wheeled and spread out about 9 inches deep.

Movable frames were placed on the choicer vegetables, and dry litter spread on the Potatoes in frosty weather. The heat arising from the bed of leaves kept the crops safe from about 6° of frost without any covering. The planting of the tubers and the sowing of seeds were carried out in January and early in February. All this work did not interfere with the decomposition of the leaves; in fact, it hastened it for other uses afterwards.

Cultivators who can should not neglect the ingathering of tree leaves this autumn; they may be mixed with the old leaves of last autumn that have not rotted. Old potting and other soils should also be placed in a heap in readiness for spreading out on the leaves in due course. Make the heap, in the first instance, about 5 feet high; as the leaves heat they will settle down, and the soil placed on them will also cause them to sink down.

In addition to Potatoes and Carrots, early Turnips, Lettuces and Radishes may be raised. When these are gathered, put on a couple of inches of soil and grow Spinach, Lettuces and Radishes throughout the summer of 1916; also Vegetable Marrows and Ridge Cucumbers.

If carefully managed, the cultivator will be astonished at the amount of useful and high-class produce he will secure. Oak leaves certainly make the best quality leaf mould, and where these are not obtainable preference should be given to Beech leaves. Leaf mould is a necessity in gardens, and no opportunity should be missed in laying in a store during the autumn. G. G.

A BEAUTIFUL ORCHID.

(*RENANTHERA STORIEI*.)

THIS rare and beautiful Orchid is now flowering for the first time in the Kew collection, where it has been much admired by many visitors who have passed through the Orchid-houses. Although seldom seen in cultivation, it is by no means a new plant, as it was first described by Reichenbach in 1880, and is also recorded as flowering in the late Sir Trevor Lawrence's collection at Burford in June, 1896.

The plant in question is 4 feet high, while the branching inflorescence is bearing forty-six flowers. Individually, the flowers are 2½ inches long and 2 inches broad, the dorsal sepals of an orange red colour, mottled with crimson, the lower sepals dark crimson with velvety, blood red blotches,

A FEW HINTS ABOUT ROSE MILDEW.

By EDWARD MAWLEY, V.M.H.

MILDEW is one of the greatest and most persistent enemies that it falls to the lot of the earnest rosarian to contend against. For years I fought it successfully with flowers of sulphur, by dusting it lightly over the foliage in the evening from a small bag made of fine muslin. As years went on I came across some sulphur bellows, which enabled me to get over the work more quickly and made it more effectual, as the lower surfaces of the leaves were reached by the sulphur as well as the upper. The more modern plan is to use some form of liquid fungicide and spray the plants with it. This plan has certainly the advantage of not disfiguring the foliage and flowers. But, after all, the sulphur

AN INTERESTING ORCHID, *RENANTHERA STORIEI*, FLOWERING AT KEW FOR THE FIRST TIME.

and the small crimson lip is marked with yellow bars. The dark green, fleshy leaves are from 8 inches to 10 inches long, and 1½ inches broad.

This *Renanthera* should be given the same treatment under which *Vandas* thrive, that is, a fairly high temperature, with an abundance of moisture during the summer months, but only sufficient water should be given to prevent the stems and leaves from shrivelling in winter. At all times the plant should be exposed to as much light as possible, shading only during the hottest sunshine. It should be potted in equal parts of *Osmunda* fibre and sphagnum, with an abundance of drainage.

R. storiei is closely allied to the better-known *R. coccinea*, but it is a much finer species in having larger flowers, which are more brilliantly coloured. Like *R. coccinea*, it is very shy in producing flowers. It is a native of the Philippine Islands, and is figured in the *Botanical Magazine*, t. 7537. W. T. KEW.

treatment has its advantages, too, for on the next and following days after its application, whenever the sun is shining, the whole of the Rose garden and all parts of each plant become enveloped in a subtle sulphurous atmosphere which I found proved very detrimental to the progress of the enemy.

Towards the end of the long drought in the early summer of the present year, a bad attack of mildew set in all at once in my Rose garden. I could not understand why this should be until I looked at the trace taken from my thermograph, when I found that on several nights the temperature had been steadily falling until 6 a.m., and had afterwards risen rapidly as the day advanced. On the coldest of these nights the thermometer on the grass fell to freezing point. I at once mixed up some V2 K, a local remedy for mildew prepared by Messrs. William Cooper and Nephews of Berkhamsted. This I applied by means of the Boundary Chemical Company's "Demon" Sprayer to the whole of my 2,000 Rose plants,

taking care that no part of any of them should be missed.

After all this trouble had been taken, the next day I visited a friend's garden only a few hundred yards away, at the same level and on the same side of the hill as my own, where I found

the Roses were only very slightly troubled with mildew. I afterwards descended to the churchyard just below this garden, and there, too, the Roses I had planted some years ago were in the same happy condition. The lesson to be learnt from this contrast is, of course, that a Rose garden like my own, surrounded on all sides by shrubs or trees, although apparently sufficiently open, owing to its closer atmosphere favours mildew and other kindred ailments to which most of our cultivated Roses are heir; whereas a freely exposed position is far better for their well-being, although it may not display their beauties to the same advantage. On the other hand, where possible, all extreme conditions should be avoided, for a cold draughty site is even worse than a moderately sheltered one.

But to return to mildew and its remedies. It is often thought that one really good spraying, such as I have previously described, with a suitable remedy is sufficient to last for pretty well the whole year; whereas the spraying should be repeated at all events every ten days or a fortnight afterwards throughout the rest of the Rose season, if any satisfactory results are to be obtained. I once went to see a friend's Rose garden at Shepperton where there was not a speck of mildew anywhere to be seen. On enquiring the reason, the lady informed me that she herself sprayed the whole of her 200 Roses every evening. I do not remember what remedy she used, but it certainly did not appear to have any ill-effects upon the plants themselves, which looked remarkably healthy and strong. Not only should the spraying be continued at regular intervals throughout the season, but the most important point of all is that it should be begun directly after the plants have been pruned in the spring.

In order to show that spraying will restore even Rose plants badly affected with mildew to comparative health, I may state that at the bottom of my Rose garden is a shrubbery, on the other or south side of which is the drive to the house. Along the edge of this shrubbery, on that side, are scattered here and there a dozen or more plants of the Old Red Damask Rose, peeping out here and there from under the shrubs. After spraying my Rose garden as before described, I happened to catch sight of these Damask Roses, and a pitiable sight they presented, for much of the foliage was absolutely white with mildew—just as if it had been dusted over with flour. I at once set to work and sprayed them—drenched them, I should say—with a strong solution of $\frac{1}{2}$ K. In about a week's time I gave them a similar dose, and in a fortnight from the date of the first spraying they were virtually restored to health and flowered freely. No doubt the tougher foliage of these Damask Roses, as compared with that of most of our modern Roses, enabled them to withstand the drastic treatment I had dealt out to them.

There is one point about spraying that I had almost forgotten to mention, and yet which is of considerable importance, as it tends to prolong the life of the sprayer and keeps it in really good working order, and that is, as soon as the spraying is finished, some clear water—if hot, so much the better—or, even better still, some petrol, should be drawn up by the sprayer and sprayed through it,

in order to get rid of any sediment from the spraying fluid that may have been left in it. The sprayer should then be hung up in a clean and dry place until again wanted.

EXHIBITING VEGETABLES.

EXHIBITS of vegetables have been few at this year's leading shows. One scarcely knows why, for in this war-time one would imagine that utility would take a first place, and undoubtedly the recent seed trade in vegetables has been a useful item. It is curious that, although exhibitors of flowers and flowering plants are legion, the leading and regular exhibitors of vegetables may perhaps be counted on the fingers of one, or, at most, of both hands. I have often racked my brains as to why this is. Mr. Edwin Beckett (ably seconded by his lieutenant, Mr. Pritchard) has been, perhaps, the first man to reduce the exhibiting of vegetables to a fine art; and I can well understand the foreign visitors at the International Show at Chelsea a few years back standing and marvelling, as I saw them, before his beautifully displayed selection of choice and perfectly grown esculents, especially as their own things were put up so very indifferently, the French being, to me, the worst offenders and my greatest disappointment, after all I had heard and read of French vegetable gardening. It absolutely pained me to go into the French tent and see the way their produce, lavish enough in quantity, was simply lumped upon the tables.

I have sometimes been asked what is the secret of successful vegetable exhibiting, and what is the method to pursue. I always reply that I do not know how it is done, but that the man who is most successful in making his produce look appetising is the surest to get home. My friend Mr. Beckett has a knack of putting up his things, so that when I come and survey them, they (the salad items especially) instantly make me feel hungry.

Of course, nearly everyone has now for a long time been aware that mere size is only a comparative factor. Flavour should, of course, be the great desideratum; but as we cannot taste the good things, am I not right in saying that the important point is to make them look as appetising as possible on the stage? There can, of course, be no rule-of-thumb method in doing this, and practice and experience are the only guides.

Colour is a difficult thing to get satisfactory. When one comes to think of it, it is remarkable what a small proportion of our vegetables exhibit bright colours, and a few judiciously distributed dishes, such as of Tomatoes and Capsicums, always light up and give brightness to the otherwise prevailing shades of green. There are doubts as to the strict legitimacy, perhaps, of using Ornamental Beet, but, after all, it is a vegetable garnish, and I myself see no objection to it from that point of view, while it is undoubtedly a very helpful adjunct where bits of bold colour are wanted here and there.

I am looking forward with intense interest to the forthcoming large show of vegetable produce at the Royal Horticultural Hall this month. Perhaps it will be the means of obtaining a few useful recruits to the at present somewhat small corps of outstanding exhibitors of vegetables. One hopes so.

F. HERBERT CHAPMAN.

SEASONABLE NOTES ON VEGETABLES.

French Beans growing in frames should have protection at night, as at this time of the year the temperature falls nearly to freezing point, which would cause a check to the growth of the plants. If there is danger of the plants becoming too crowded thin them either by removing a whole plant here and there or by reducing their size. Keep the roots well supplied with water—those in bearing would be benefited by occasional soakings with liquid manure—cease syringing the plants at night and close the frames early to conserve solar heat.

Cabbage.—The main batch of plants may now be put out on ground specially prepared for them by digging, or on ground previously occupied by Onions, which, having been well prepared for that crop, is in good condition to carry a green crop like Cabbage. Clear the ground of weeds by hoeing, and draw drills 2 inches deep in which to put the plants. Here they are easily watered, should a spell of dry weather prevail after planting. Plant thickly with a view to economising space; alternate plants can be removed early in the spring, thus giving an extra early crop. Where slugs are troublesome, sprinkle finely sifted coal ashes around each plant; these are the best preventive of these pests.

Carrots.—Towards the end of the month the main crop should be lifted and stored in ashes or sand in the open, or in a shed or cellar. Do not put too many roots in a heap, especially if they are large. The later-sown batch, if they have not attained full size, may remain. If they are left in the ground after they are fully matured, they commence a second growth by emitting roots all over the Carrot itself, which weakens the flavour and, naturally, deteriorates the quality. Thin those sown in frames directly they are large enough to handle; this will induce the stockier growth of those remaining.

Endive.—The earliest-growing plants in the open should be blanched at once, either by lifting and placing them in beds of soil in the Mushroom-house or shed, or in frames, where light must be excluded by closely covering the glass with mats. An inverted flower-pot with the hole covered, turned over the plants, will suffice in the open, or long slates or boards may be placed on the top of the plants. The largest plants may be tied up in the centre, covering the hearts with the outer leaves. A later batch should be pricked out in frames and encouraged to grow rapidly for winter and spring use.

Onions.—The early main crop should now be lifted, laid on the surface to dry for a few days the bulbs may then be placed on a dry gravel path, boards, or wattle hurdles. This is a good method of thoroughly drying them off, as air passes under them, maturing the skins, which is all-important for their future keeping. The larger bulbs of the Ailsa Craig type should be lifted with a fork, as their roots will have penetrated deep into the soil. Any bulbs not quite matured may be hastened by partially lifting, thus giving a check to further growth. Handle carefully to avoid bruising the skin. If the weather is dry, leave the bulbs in the open for a few days. Afterwards place them in boxes on wood wool in a greenhouse or vinery to thoroughly mature. As the necks die down, tie them neatly as near to the bulbs as possible, making the necks look quite small.

Potatoes.—The haulm that a short time since was so vigorous has rapidly decayed, owing to an attack of disease. Whether the tubers will suffer seriously in consequence cannot yet be determined. In any case it is wise to take all possible steps to prevent such a catastrophe. All early and second-early varieties should be carefully lifted at once, removing any tubers that show the slightest sign of decay. Thoroughly dry them by exposure before storing them away in sheds, cellars, or clamps. Select tubers for next year's planting; those weighing about 2oz. are regarded as the most suitable. Late varieties should have their tops pulled up where the tubers are not sufficiently ripe for lifting, as the removal of the haulm may prevent the spores of disease reaching the tubers. If, however, the skin of the tubers is firm and not easily removed by handling, it would be wise to lift the whole batch, carefully looking them over to detect any diseased parts.

Spinach.—Make another, the final, sowing of the Prickly variety in drills a foot apart. Well surface stir the ground in which earlier-sown batches are growing to accelerate and firmly establish the growth before winter arrives. If previous sown batches of plants are too thick, remove the weaker ones to encourage a sturdier growth to those remaining.

Turnips.—A final sowing should be made of the usual winter and spring varieties, such as Prizetaker, Chirk Castle and Black Stone.

Asparagus.—The newly planted roots are still growing vigorously, even throwing up heads now. Firmly secure the tops so that they will not be broken off at the neck. The easiest way of doing this is to run wire or string about 3 feet high around the bed, or firmly thrust in the ground among the plants short Pea stakes, which prevent the swaying of the plants, no matter how heavy they become.

Swanmore.

E. MOLYNEUX.

COLCHICUMS AND AUTUMN-FLOWERING CROCUSES IN GRASS.

ALTHOUGH everyone who has a garden of any pretensions tries to produce a beautiful floral feature during the early months of the year by naturalising bulbs in grass, few people take advantage of the autumn-flowering Crocuses and Colchicums to produce a similar effect in September and October, yet a very striking picture may be made by their aid. Planted among grass they thrive quite as well as the spring-flowering kinds, and require similar treatment. The colours vary from crimson to white in the Colchicums, and from blue to yellow and white in the Crocuses. Colchicum autumnale and its varieties *C. speciosum*, *C. byzantinum* and *C. variegatum* may all be used, while good Crocuses are *C. speciosum*, *C. longiflorus*, *C. pulchellus*, *C. sativus* and *C. asturicus*. Some bulb-dealers make a speciality of supplying mixed bulbs of both genera for naturalising. The illustration on this page of *Colchicum speciosum* is prepared from a photograph taken in the beautiful grounds at Gunnersbury House Gardens, where autumn flowers form a pleasing feature.

NEW AND RARE PLANTS.

FIRST-CLASS CERTIFICATES.

Catasetum Bungeorthii.—A particularly well-grown example of this rarely seen species, bearing a nine-flowered raceme, was shown. The handsome, somewhat cupped flowers are of a fine ivory white, with the faintest suspicion of pink in the centre. From Sir Jeremiah Colman, Reigate (gardener, Mr. W. Collier).

Cattleya Sybil variety W. R. Lee (*C. iridescens* × *C. aurea*).—A remarkably handsome hybrid of quite unique colouring. The sepals and petals are orange coloured, reticulated with salmon, thus affording an almost unique combination. The handsome lip is of crimson purple, and self coloured save for the delicate veins and lines of yellow near the throat. Exhibited by W. R. Lee, Esq., Plumpton Hall, Heywood (gardener, Mr. Branch).

Sophro-Cattleya Sylvia (*S.-C. Doris* × *Cattleya hardyana*).—This remarkable hybrid only carried

coloured base. Shown by S. Morris, Esq., Earham House, Norwich.

Cydonia Mallardi.—A 12-feet high example of this was shown in fruit. The fruits are of large egg size and of olive green colour.

Berberis Sargentiae.—A highly ornamental evergreen species, and valuable on that account. It is also distinct. The 3-inch long leaves are ovate-lanceolate, toothed, and firm and leathery to the touch. It is well armed with pale yellow, nearly 2-inch long spines. These two novelties were from the Hon. Vicary Gibbs, Aldenham House, Elstree (gardener, Mr. E. Beckett).

Dahlia Caprice.—A decorative variety, single, pure white, and strikingly bordered with crimson. It is very distinct. From Mr. Charles Turner, Slough.

Dahlia Warneford (Decorative).—A pure white variety of handsome proportions. From Mr. J. T. West, Brentwood.

Dahlia Primrose Queen (Collarette).—Of pale yellow colour with white inner florets. Quite

THE MEADOW SAFFRON (*COLCHICUM SPECIOSUM*) NATURALISED IN GRASS

one flower, wholly coloured reddish purple, with deeper plum purple lip of dusky hue and throat yellow lined at the base. Exhibited by J. Gurney Fowler, Esq., Pembury, Kent.

Himalayan Blackberry.—Having been grown and tested at Wisley, this handsome, free-cropping sort was there awarded a first-class certificate, which is now confirmed.

AWARDS OF MERIT.

Lælio-Cattleya eximea delicatissima (*Lælia purpurata* × *Cattleya Warneri*).—An unusually attractive and decorative form, the two scapes carrying seven fully expanded flowers of large size. The sepals are white; lip violet purple with white centre; throat yellow. A very free flowering and showy variety. From J. Gurney Fowler, Esq.

Cattleya hardyana alba.—The white sepals are of unusual length, the red purple lip blotched with white and yellow near the throat. From J. Gurney Fowler, Esq.

Eschscholtzia The Geisha.—A remarkably good coloured variety. Internally a pure orange tone prevails; externally the colour is of intense orange crimson. A most striking novelty. From Messrs. James Carter and Co., Raynes Park, S.W.

Montbretia Queen Elizabeth.—A good and distinct variety of dark orange tone with lighter-

distinct. Exhibited by Messrs. J. Cheal and Son, Crawley.

Dahlia Yellow Star.—This belongs to the Crawley Star set and is a counterpart of the others save in colour, which is rich yellow. The disc is orange. From Messrs. J. Cheal and Son, Crawley.

Dahlia Scarlet Queen (Collarette).—A distinct and showy variety of large size; the inner florets are yellow. Shown by Messrs. Dobbie and Co., Edinburgh.

Dahlia Herald (Collarette).—This is of rose pink colour, white inner florets and rich yellow disc.

Dahlia Miss Judd (Cactus).—A shapely variety of yellow to primrose colouring.

Dahlia Washington (Cactus).—Of ruby crimson tone throughout, with fine incurving florets. These three were shown by Messrs. James Stredwick and Sons, St. Leonards-on-Sea.

The above-named Dahlias were adjudicated upon by a joint committee of the floral committee of the Royal Horticultural Society and the National Dahlia Society, and therefore carry the award of merit of the former and first-class certificate of the latter.

The whole of the foregoing novelties were before the Royal Horticultural Society on August 31, when the awards were made.

CLEMATISES AND THEIR CULTIVATION.

ALTHOUGH these plants provide us with some of the most beautiful climbers that are hardy in this country, their cultivation does not seem to be well understood. It is true that in some gardens Clematises will, when once planted, romp away in a delightful, free-and-easy manner, and give but little trouble to their owners, but in others any amount of coaxing will not induce them to do more than eke out a miserable existence. Even when they are established, their management appears to be but little understood, and for this reason we propose to draw attention to a few of the more salient points in their cultivation.

Naturally, the soil in which they are to grow must be the first consideration, and here a lesson may be taken from the wild Clematis, or Traveller's Joy of our hedgerows, a plant that is largely used as a stock on which to graft the many beautiful garden varieties that are in existence. This wild Clematis is usually found growing in the banks of hedgerows where thorough drainage is assured, and where its roots are shaded during the hot days of summer from the direct rays of the sun. The character of the soil in such positions may, and frequently does, vary considerably, but almost invariably it will be found to contain a fairly large percentage of lime. This, then, may reasonably lead us to suppose that the Clematises of our gardens require soil that is exceptionally well drained, and which also contains a fair proportion of lime, a supposition that is borne out in practice. It does not seem to matter much what the bulk of the soil is, providing it is not excessively poor or abnormal in some other way, so long as it is deeply worked, well drained and contains a sufficiency of lime. A good form in which to add this substance is as old mortar; a peck or two well mixed with the soil for each plant will not be too much.

Planting, again, is another serious cultural detail, as on its successful completion success will largely depend. We have no doubt that one of the chief reasons for these plants dying off suddenly after they have apparently become established and are growing away freely is too deep planting, and possibly grafting instead of layering being the method of propagation. The roots should be carefully spread out, and ought not to be covered with more than 2 inches of soil, even less being sufficient where that of a clayey texture exists. The season for planting may be autumn or spring,

but we prefer the latter, the end of February or early March being a good time. Growth at that season is about to commence, and the plants soon make themselves at home in the new soil. The positions in which Clematises are planted will, of course, depend largely on individual tastes, but if against a south wall, some provision for shading the soil over the roots during very hot weather should be made. A low-growing annual, such as Mignonette or Alyssum maritimum, may be sown over the roots for this purpose without fear of injuring the climbers. But Clematises look far better when allowed to scramble naturally over rustic

open in May and June, Belle of Woking being a notable example. The flowers of this set are born on wood that was formed the previous year hence it will be readily seen that to cut away growth in autumn or spring would mean the destruction of many embryo flowers. Any thinning out of old wood that is necessary may be done immediately after flowering without any danger of cutting away incipient buds. Similar treatment should be given to those which have originated from *C. patens*, a native of China and Japan. These also flower in June, Fair Rosamond being a well-known member of this set. When we come to

the large-flowered varieties of *C. lanuginosa*, which flower from July onwards well into the autumn, we find they are produced mostly on young shoots, and the proper method of pruning these is to cut back fairly close all side shoots in February. A few of the main stems may also be cut to within 1 foot or 2 feet of the soil if desired; this will induce young shoots to spring up from the base and so hide the bare stems that are rather characteristic of these large-flowered Clematises, of which Lord Nevill and Louis van Houtte are examples. The Jackmannii varieties need similar treatment; but such early flowering species as *montana* and its variety *rubra* only need an occasional thinning of the old wood after flowering.

ORIENTAL LILIES IN SCOTLAND.

OWING to the long prevalence of almost tropical heat in the month of June, Oriental and Occidental Lilies did not attain this season, in South-West Scotland at least, to their normal dimensions. In all probability they would have proved a disastrous failure but for the beneficent rains that came quite providentially for agriculture and for horticulture in the beginning of July.

It is entirely owing to their influence that late varieties, like those of the *auratum* and *speciosum* species, have so greatly improved. Here at Kirk House, in the beautiful Wigtownshire

Parish of Kirkmaiden, I have grown the *longiflorum* and *speciosum* for the most part in a small conservatory, where such splendid representatives of these as *longiflorum giganteum* and *speciosum Kratzeri* and *magnificum* have been a greatly gratifying success, the flowers being at once numerous and commanding in their size.

In Logan Gardens a glorious group of *paradinum* hybrids, of fascinating aspect and intensely glowing colours, attracted my attention when last I was there. *Lilium giganteum* (from the Himalayas) also, though not, perhaps, quite so lofty in stature as in former seasons, presented quite an impressive appearance.

CLEMATIS OVER A GARDEN ARCH.

poles or fences, or even over old evergreens or deciduous trees.

Probably the least understood phase in the cultivation of Clematises is their pruning. In the majority of gardens they are allowed to follow their own sweet will, and this certainly is preferable to cutting them in a haphazard way and without full knowledge of their flowering period. Roughly, our garden Clematises may be divided into five sections, and if we know to which section a plant belongs, its pruning will be a simple matter. In the *florida* section, *i.e.*, varieties that have originated from the Japanese Clematis *florida*, we get white, blue, and rose-purple flowers, that

These fine Lilies, like the Magnolias, which also luxuriate in those gardens, receive every possible attention from Mr. Kenneth A. McDouall and his highly capable head-gardener, Mr. R. Findlay. About two months ago I had the privilege of visiting the gardens at Lochinch Castle. At that time the Lilies were suffering from drought, but the Countess of Stair recently wrote me that since then, owing to the advent of the rain, they have, like the Roses and herbaceous plants, greatly improved. *Lilium giganteum* and *L. auratum* platyphyllum, grown in a wood, usually attain there to a quite abnormal height. The finest Lilies this season in Kirkmaiden Manse Garden have been *candidum*, *Hansonii*, *pardalinum* var. *Burbankii*, and *szovitzianum*. DAVID R. WILLIAMSON.

SWEET LAVENDER.

Of the old street cries of London that may still be heard during the season is "Sweet Lavender," for at the present time a few housewives still adhere to the custom of putting some spikes of its dried flowers in the linen closet, and in this way impart a pleasing perfume to its contents. The plant itself is not so well known to the Londoner, though large quantities are grown in the neighbourhoods of Mitcham and Hitchin. The flowers

there produced are not only retailed in a dry state, but many of them are distilled in order to obtain the Old English Lavender water.

Planted as a hedge it forms a really delightful feature, not only during the flowering period, but also throughout the year, as the greyish tone of its foliage serves in the summer as a foil to bright-coloured flowers. Not only as a hedge plant is it seen to advantage, but in many other parts of the garden it is equally effective. Associated with dark-leaved evergreens the Lavender, from its direct contrast, is most striking. Being fond of a well-drained situation it is well fitted for the bolder parts of a sunny rockwork, while a bed or mass of Lavender alone is always attractive. From the sober tone of its foliage it harmonises well with old walls, and where such exist in a garden a suitable spot for the Lavender may be at once suggested. In the same respect it is equally in keeping with ancient dwellings, old ruins and similar places. It was once my good fortune to see the sloping banks on either side of a sunken path completely clothed with Lavender, and at all times, but particularly during the eve of a hot summer's day, it formed a most delightful and soothing retreat, while its flowers were much sought after for indoor use. With regard to the flowers and the time for cutting, they must not be too fully expanded before separating them from the plant, otherwise many of the blooms will very quickly drop. As might be expected from a native of Southern

Europe, the Lavender prefers a well-drained, warm soil, rather than a cold and heavy one; in fact, stagnant moisture of any kind is quickly injurious to it. On sloping banks and similar positions, especially where fully exposed to the sun, Lavender will thrive better than most shrubs, for a shrub indeed it is, though not of so lasting a nature as many of them are. Old plants are liable to die off suddenly, and even when this does not happen both the foliage and flowers are inferior to those on younger and more vigorous specimens. In a general way, after the Lavender has reached the age of six years it is more satisfactory to replace the old plants by younger ones.

There is no difficulty about this, as cuttings strike root very readily if put into a cold frame in August or in a warm, sheltered border out of doors in September. The border should be well dug, and the cuttings, from 8 inches to 1 foot in length, must be firmly inserted in the ground for half that distance. The buried portion should have the leaves cut off with a sharp knife or pair of scissors.

The following autumn these cuttings will be well rooted and ready to transplant into their permanent quarters, or put in nursery beds for another season. Cuttings put in the frame can be planted out the following spring. A good deal may be done to extend the life of the Lavender longer than if allowed to grow untouched by pruning it back moderately directly after the flowering season is over.

A LOW LAVENDER HEDGE IN A SURREY GARDEN.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Peaches and Nectarines.—Any trees which have been unsatisfactory in cropping should be examined at the roots, and, if necessary, they should be lifted or partially lifted and planted in fresh soil. If the work is carried out carefully, next year's crop will be considerably improved. A trench about 3 feet wide should first be taken out as far away from the stem of the trees as possible. The soil may then be carefully removed from about the roots with a fork. If it is necessary to lift the whole of the roots, great care must be taken so that as few as possible are damaged. See that the drainage is in good order before putting in the new soil. To facilitate the work of planting, have all the materials at hand before the work commences. Do not add more soil than is absolutely necessary at one time, and see that it is rammed quite firmly.

Young Trees.—Trees which have been planted in recent years need lifting occasionally to encourage the formation of fibrous roots. The soil must not be too wet or too dry when this work is to be done, or the lifting will not be done satisfactorily. Carefully reduce the ball of roots to a convenient size for lifting, cutting well back all strong-growing roots. Before replanting the trees, see that the soil directly beneath them is made quite firm, and allow 2 inches or 3 inches for sinking. When finished, give the soil a thorough watering and syringe the foliage two or three times a day. Trees which have been very much disturbed at the roots should be shaded till they have recovered from the check.

Plants Under Glass.

Tulips.—To be successful with the forcing of Tulips, the bulbs must be potted as soon as they can be procured. When potted, plunge them in ashes in the open. Some of the most useful varieties for pot culture are the Duc Van Thols, Proserpine, Vermilion Brilliant, Mon Trésor, Rose Gris-de-lin, Pink Beauty, Prince of Austria, La Candeur and Murillo. For late flowering some of the Darwin varieties are excellent. Clara Butt, Orange King and Mr. Farncombe Sanders may all be relied upon for this purpose, but they must not be forced too hard.

Narcissi.—These must also be potted early if they are required to flower early. Varieties of known merit must be selected for forcing, or disappointment will follow. Paper-White, Golden Spur, Emperor, Empress, Sir Watkin, Mme. de Graaff, Barrii conspicuus, Mrs. Langtry, Poeticus ornatus and Poetaz Elvira are all useful for pot culture. The latter variety must not be forced too early.

Liliums.—L. Harrisii and L. longiflorum may be potted singly into 6-inch pots, leaving room for a top-dressing of soil when the pots are full of roots. Place the pots closely together in a cold frame and cover them with fibre. When growth has commenced they may be placed near to the glass in a cool house.

Fuchsias.—Few plants are more useful than the Fuchsia for the summer decoration of the conservatory. A batch of cuttings should be rooted annually. Choose those shoots which are free from flower-buds and insert them in a sandy compost around the sides of 5-inch pots. Plunge the pots in a hotbed of moderate warmth, and shade them from bright sun till rooted.

Housing Plants.—The houses used for sheltering plants which are at present in cold frames must be prepared for their reception. The glass must be washed both inside and out. Such subjects as Cyclamen, Primulas, Bouvardias and Pelargoniums must be placed quite near the glass in a light structure. Admit plenty of air whenever outdoor conditions will allow.

The Flower Garden.

Border Carnations.—Where it is intended to plant these out in the autumn, the ground must be prepared at once. A heavy soil should have a quantity of light materials dug into it. Leaf-mould, burnt garden refuse, or old potting soil will considerably improve a heavy, retentive soil. A border facing south or west which does not

lie too wet will suit the Carnation. Here we find it best to pot up the plants and winter them in cold frames.

Next Season's Bedding.—Certain modifications and alterations are annually needed in the flower garden, and the present is perhaps the most suitable time to map out next season's programme. The months of July and August were continuously wet, causing many plants to make much growth and little flower. Antirrhinums were little affected by the rain, and now that they can be relied upon to come true from seed, they should be planted largely, as they revel in almost any kind of weather. Begonias, too, have done remarkably well, likewise Salvia Glory of Zurich and S. Blue Beard. Pelargoniums, except those which are planted in vases, have done badly, as is usual in a wet season.

The Hardy Fruit Garden.

Peaches and Nectarines.—The fruits must be examined carefully every morning and gathered before they are too ripe. The late varieties must be well exposed to the light, or they will fail to ripen perfectly. The trees which have been cleared of their fruits may have all the old fruiting wood removed, except that which is required for extension. This will help the remaining young wood to ripen.

Apples.—The varieties which are perfectly ripe must be gathered, or many of the fruits will be spoiled by insects. Most of the early cooking sorts should be gathered by this date. They will keep best in the fruit-room. The latest varieties must not be gathered before they are ripe, or they will not keep well. The seeds of the fruits should become brown before it can safely be said that the fruits are ripe enough to gather.

The Kitchen Garden.

Potatoes.—The continued wet weather will, no doubt, favour disease, especially on heavy land. When the haulm has ripened, lose no time in burning it. If the crop is ready for lifting, this should be done at once and the tubers placed carefully in their winter quarters.

Cabbage.—When the plants of the first sowing are large enough to put out, let this be done before they become drawn. Plant about 15 inches apart each way. An open situation is the best on which to plant Cabbage at this time of year. To promote healthy growth, the soil must be moved with the hoe at regular intervals.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

Plants Under Glass.

Violets.—If the best results are to be obtained with Violets during winter, it is essential that they become well established in their flowering quarters before the very short days arrive. Plenty of light and abundance of ventilation are the two chief factors. Artificial heat is not necessary. Before commencing to lift the plants, the soil in the frames should be brought up to within 6 inches or 8 inches of the lights, where double varieties are to be planted; and in the case of single sorts, such as Princess of Wales, it will require to be left about a foot from the glass. The plants should be lifted intact with a good ball of soil, and watered well after planting. The frames must be shaded and kept shut for a few days, using the syringe freely in bright weather. Afterwards remove the lights until severe frost or heavy rains compel them to be put on again.

Chrysanthemums.—Any forward plants which have buds showing colour will be better removed indoors to a well-ventilated greenhouse, whatever the weather may be, as either rain or dew will tend to cause the petals to damp. Feeding should be discontinued when plants reach this stage. If mildew is troublesome, sulphur must be applied.

Malmaison and Tree Carnations must be given all the light possible, and not be shaded unless they show signs of flagging. Although abundance of air

is necessary, it should be seen that the temperature is not allowed to drop below 50°. During cold nights more heat should be turned on, and the ventilators slightly opened to prevent a stagnant or too damp atmosphere.

Permanent Shading on most glass houses can be removed, unless there is any prospect of continued sunshine, when it may remain a few days longer. Blinds need not be taken down yet, as they are sometimes needed during the middle of the day when the sun is most powerful.

The Kitchen Garden.

French Beans.—The late-sown crops will need some protection in the event of frost coming, as a very few degrees are sufficient to ruin the plants. Frames are best and more easily handled, but mats or other light covering materials are generally sufficient protection from the slight frosts which usually occur in late September and during October.

Tomatoes which have been growing outdoors in pots must be removed under glass, where they will have better conditions for ripening their fruit. Ample ventilation must be given. Continue to give additional food to assist in the swelling of more fruit.

Onions.—If the weather should be wet, it will be best to put all Onions under cover in some open or well-ventilated shed. Should fine weather prevail, the Onions will benefit from lying exposed to the sun several days before being taken indoors.

The Flower Garden.

Naturalised Bulbs in Grass.—Most Narcissi are quite at home when planted in grass where they can be allowed to mature their foliage. The present is the best time to plant, before the rush of spring bedding time arrives. To get the best effect they must be planted in bold masses of separate varieties, and not in formal clumps.

Seeds.—Where seed of annuals or any flowering plants has to be saved, care should be taken that it is secured in dry weather and before any has been allowed to drop. After gathering, expose to the sun outdoors for a few hours each day to get it thoroughly ripe and dry.

Propagation by cuttings of practically all plants required must be hastened before the season gets too far advanced. Cuttings already rooted must be given an abundance of air. In many cases the lights are better removed altogether, only using them during heavy rains or when frost threatens.

The Hardy Fruit Garden.

Plums.—Where the crop is very heavy, the quality of the remaining fruit will be much improved if the trees are relieved of a number of the fruits before ripening actually takes place. These, although not ripe, can be used in the kitchen. Particularly does this apply to free-bearing varieties, such as Victoria. It is an excellent Plum for bottling before it is quite ripe.

Fruit Under Glass.

Strawberries in Pots.—The earliest-potted plants are developing their crowns, and where very early fruit is required, a selection should be made of the best for this purpose. Every encouragement should be given to aid development by keeping off all runners and applying food judiciously. In very wet weather it sometimes becomes necessary to lay the plants on their sides until the rain ceases, otherwise they become waterlogged and thereby injured.

Peaches and Nectarines.—Most trees having now been cleared of their fruit, every encouragement should be given to assist in the thorough ripening of the young wood. Plenty of ventilation is necessary. With increased ventilation and the fully developed foliage the trees at this season absorb an enormous quantity of moisture at the roots, so that where, earlier in the season, a watering would have served the trees for a month, it may now be necessary to apply the same every ten days or a fortnight. Neglect of this means bud dropping and consequent failure of next year's crop.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

THE BULB ORDER IN 1915

BY THE REV. JOSEPH JACOB.

ONE of the annual events of the gardener's year is, in all well-regulated establishments, the making out and the giving of the bulb order. That term, by general consent, is understood to refer primarily, at all events, to the flowers of winter, spring and early summer, whose resting states are bulbs, corms, or, less frequently, tubers. The bulb catalogues arrive from various parts of Great Britain, Ireland and Holland. Lists are carefully made out and the orders duly despatched.

This autumn, however, presents an entirely new factor, which must be taken into consideration. It is nothing less than "Should a bulb order be given at all?" In other words, "Must doing without bulbs be one of my economies?"

I hold no brief for the dealers, but the following considerations have convinced me that the proper answer to the question is "No, certainly not; but (and I fear it is a big 'but') no money should be sent out of the United Kingdom."

However well in times past foreign firms have served us, in this period of stress and strain we *must* husband our resources and keep all the money we can at home. Let us leave it to our *dealers* to do all the necessary buying from elsewhere; but *let amateurs give all their orders to their own countrymen*. No one knows what money may yet have to be found for the war, but whatever it is, we will have to produce it *ourselves*. Hence, if an order is to be given, we must buy at home.

Again, few people, except those who have actually been brought into personal contact with its manifold operations, know what carrying on a bulb farm means. The labour entailed is very great, for the yearly round of lifting, sorting and planting must go on. The picture of a scene I witnessed last July at Messrs. R. H. Bath's at Wisbech gives one an idea of what has to be got through and how it is being accomplished. Luckily for them, they have been able to get women to do a great part of the work, but female labour is almost as costly as male, and to satisfy its just claims money has to be found. That money must come either from a depletion of capital or the profits on trading.

Once again, take the position of our horticultural firms. Their profits are dependent on the sales of seeds and bulbs. Take this latter source away, and "carrying on" becomes a very serious problem, more especially when it is borne in mind that supplies have been purchased to meet a presumed demand. Hence, wherever possible, let some sort of an order be given. Any pleasure that the flowers bring will be intensified when it is remembered that the money spent upon them has helped with the wages.

Lastly, suppose a decision has been made to buy, as I hope it will have been, the problem will be how to make one pound go as far as two. It will accordingly be good news to hear that both Hyacinths and Darwin Tulips are much reduced

in price, and that with regard to most other bulbs the same is true to a lesser extent.

This will be one help. The only other thing to be done is to buy cheap varieties. Some of the best Hyacinths, Tulips and Daffodils are among the lowest in price. Readers of THE GARDEN know the name of Mr. E. M. Crosfield. We were standing before *Thalictrum diptercarpum* at the last Holland House Show. Had he got it? "I never buy a difficult thing." Now, if ever, with the labour shortage must we avoid difficult things. Now, if ever, must we go in for whatever is easiest to manage and whatever will grow with a minimum of care. Very many cheap bulbs not only fulfil these requirements, but are pleasing in themselves. Appended are a few suggestions which may be useful.

Hyacinths.—Grand Maître (porcelain blue) and Schotel (light blue). General de Wet (pale pink) and Lady Derby (rose). L'Innocence (pure white) and Princess Metternich (double blush).

Early Tulips.—Rose Gris-de-lin (rose and white), Thomas Moore (orange and terra-cotta,

Second List: White Lady, Blackwell, Horace, Lucifer, Glory of Leiden and Mme. de Graaff.

I have in both lists only indicated varieties which are good doers and which in any good garden soil will take care of themselves.

KNIPHOFIAS OR TORCH LILIES.

THESE plants are known by various names, such as Tritomas, Torch Lilies and Red-hot Pokers. They are of great value as hardy border plants, and deserve to be much more extensively grown than they are by amateur cultivators. Usually one sees them grown in huge clumps, and very effective they are; but when left to attain to large dimensions, the centre portion becomes exhausted, and this deterioration results in a shortage of flower-spikes and in diminished strength and brilliancy of colour of those that grow.

Where space is available, a grand effect is obtained by grouping the Pampas Grass, the Kniphofia and *Prunus pissardii*, the latter as standards 18 feet apart, the Pampas Grass and Kniphofias filling up

A VIEW OF MESSRS. R. H. BATH'S BULB FARM AT WISBECH.

good for cutting especially), Artus (red, fine for bedding), Prince de Ligny (yellow, for cutting), Yellow Prince (yellow) and Prince of Austria (orange scarlet).

Darwin Tulips.—The following are a real good cheap six: Fra Angelico (dark shining maroon), Clara Butt (pink), King Harold (maroon), Baronne de la Tonnaye (rose, edged blush), Margaret (blush with pink interior) and Pride of Haarlem (cerise). If a more brilliant colour is wanted than that of King Harold, Loveliness (a pretty, clear rosy scarlet) might be substituted.

Daffodils.—Perhaps the most useful thing to do will be to give the names of six varieties, none of which costs more than a shilling a dozen, and then a second list of six which might be used to supplement the first and which are rather more costly, but none of which exceeds five shillings for twelve.

First List: Emperor, Empress, Barrii conspicuus, Sir Watkin, Aspasia and Poeticus recurvus.

the available space in such a way as to allow of every specimen being distinctly seen. Large beds on lawns or park grounds, measuring 50 feet or more across, are the most suitable for arrangements of the kind referred to. In hardy plant borders small clumps are desirable; individual plants should be planted 1 foot or a little more apart. Three and five plants, respectively, would form smaller clumps, and all should be lifted and replanted after the soil has been trenched, before they get very much matted together. These plants possess immense masses of roots and thrive best in a deep, light loam.

The following Kniphofias are good varieties to plant: *K. grandiflora*, *K. grandis*, coral, shaded orange; *K. nobilis*, scarlet and yellow; *K. Sandersonii*, orange red; *K. Leichtlinii*, vermilion red and yellow; *K. Northia*, pale yellow and tinted red; *K. carnea*, yellow; and *K. præcox*, scarlet and yellow. The last two are splendid for autumn flowering.

AVON.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

The Hardiness of *Salvia rutilans*.—The Pine-apple-scented *Salvia* is a very attractive plant, either grown indoors for its bright red flowers or planted out in the summer for the sake of its Pineapple-scented leaves. It is grown here for the latter purpose, the plants being thrown away in the autumn like other half-hardy plants. Last autumn, however, a few plants were allowed to remain in the ground in a small detached garden chiefly planted with scented flowers. I was much surprised in the spring to find that these plants had survived the winter and were making young growth. The little garden is sheltered from the north by a hedge. The winter was an open one, but we had 12° of frost or more on one or two occasions. —CHARLES COMFORT, *Broomfield, Midlothian*.

Recipe for Bottling Green Figs.—In your issue of August 21, page 408, "C. E. C." enquires whether any reader can give recipes for the bottling of green Figs. I find Figs can quite easily be preserved by the sterilisation process, provided the vacuum bottle is used. In proceeding to bottle Figs, gather them before they are quite ripe, unripe fruit being better for this purpose. Pack them firmly in the bottles by pressing them down with a glass rod about 12 inches long, and cover with cold water up to the neck or shoulder; then adjust the rubber rings, glass stoppers and spring clips. The bottles and contents are then ready for sterilising. Place them in any vessel with a false bottom and cover with water. The vessel should then be put over a fire and the temperature raised slowly—never more than 2° per minute—until it reaches 150° Fahr. After the temperature has reached 150°, let it remain at this for an hour, when the bottles are then ready to store away in a dark cupboard. When a syrup is used to cover the fruit, dissolve 1lb. or 2lb. of sugar in a quart of cold water; sugar should never be placed among the fruit undissolved, or the result would be a cloudy liquid. When dissolved, before pouring it over the fruit, the liquid will be quite clear and transparent after sterilising. Sometimes Figs and other fruits become dark in colour and the liquid cloudy, which is due to the bottles not being hermetically sealed, or it may be owing to the temperature having been brought up too rapidly and too high.—G. W. STUART. [Green Figs may also be made into a delicious preserve, as explained by our correspondent "H. T. C." in THE GARDEN, of last week, page 433.—ED.]

Rambler Rose Debutante.—The *Wichuraiana* Rambler *Debutante*, although not a novelty, is not well enough known as a Rose for arches. It is charming on a pillar, but its true place is on an arch. The delightful pink flowers are in large bunches, and the slenderness of the branches on which they are borne makes these droop in the most elegant way from the arch; in fact, a keen flower authority said in the writer's presence that the habit of growth when in flower reminded

him of that of the *Wistaria*. It should be mentioned that this habit renders it necessary that the arches should be of good height, otherwise the pendent flowers would be in the way of passers along the path. *Débutante* is very lovely, and one of the freest flowering of a floriferous section of *Roses*.—S. AYE.

Double White Poeticus Narcissus.—I have a small patch of this lovely flower, and the plants passed out of blossom the end of the first week in June. They might with advantage, I claim, be more freely planted in gardens, for they are most valuable for cutting, and scarcely any flower is more sweetly scented. The snowy whiteness of the blossoms as noted in groups or drifts is very telling. *Gardenia*-like and *Gardenia*-flowered are terms used—and rightly so—to denote the purity and beauty of this *Narcissus*. To get good flowers it is necessary to plant in thoroughly deep, good soil, and to see that the bulbs when growing do not suffer for want of water, otherwise some of the buds go blind and do not open. A further help to their successful management and prolongation of flowering is to plant the bulbs in a cool position. A north border, if the flowers are to be grown

when in flower, so lovely is it at other times. It does well here on rockwork, or, better still, on a limestone moraine.—S. ARNOTT, *Dumfries*.

A Neglected Article of Food.—Now that economy in housekeeping is a subject that is before most of us, may I utter a protest against a form of egregious destruction and waste, and incidentally put in a plea for a very cheap and wholesome food? Just at this time the Giant Puff Ball (*Lycoperdon giganteum*) is at its prime and offers many excellent and inexpensive meals to country dwellers; but it is seldom indeed that its merits are appreciated. Our school-children are instructed as to the history of alligators and giraffes, but of the practical gifts of Nature that lie outside their own doors they are taught nothing. As I write, the fragments of a splendid Puff Ball, that might have provided a free meal for a family, lie on the road outside, where someone has trampled it under as "rank p'isen." This fungus, if picked while it is young and white fleshed, is perfectly wholesome, and, if cut into slices and fried, it makes a delicious and satisfying dish. Care, however, must be taken not to eat it when the flesh shows a yellow tinge.

Curtis wrote, "It has not the high aroma of some others, but it has a delicacy of flavour that makes it superior to any omelette I have ever eaten. It seems, furthermore, to be so digestible as to adapt itself to the most delicate stomachs. It is the South Down of mushrooms."—MAUD D. HAVILAND, in *Country Life*.

Shirley Poppies.—The methods for making these lovely flowers last in water, given on page 421, August 28, are good, but an even more excellent way is to gather them when the buds stand up straight on their stems and put them in the vases, where they will open in the course of the next day, and remain in good condition for nearly a week in rooms where there is no gas; or, if first stood up to their necks for a few hours in a tall jug full of water, they can be packed and posted to friends with most satisfactory results, especially if sent by the evening post to arrive at their destination the next morning.

I greatly delight in Shirley Poppies, and every year when they reappear I breathe a blessing on the name of the Rev. W. Wilks, who has added so great a gift to my garden. I sow them thinly broadcast, mixed with blue Cornflowers, round clumps of the old-fashioned striped Ribbon Grass. This autumn I intend to steal a few of my donkey's Oats to sow with them (I do not think Angelina will miss them) in the long border, where I (holding the same views as the Rev. J. Jacob and old Mother Nature) mix up annuals, biennials and perennials, so my Queen Anne border shows some flowers almost all the year round. I hate bare spaces of brown earth, and (still following Mother Nature, always try to cover them up as quickly as I can. In a very hot sunny border I let Creeping Jenny run round the roots everywhere; it makes a lovely low carpet of green and gold, keeps the soil cool and moist, and clashes with nothing, and when I want to plant anything I simply clear a space. Of course, I know this is absolutely shocking from a gardener's point of view, but it is successful and satisfactory in fulfilling the aim of—ANNE AMATEUR.

GIANT PUFF BALLS. NOW AT THEIR BEST, OFFER A SATISFYING DISH TO COUNTRY DWELLERS.

for cut purposes, is an ideal place, and the same aspect should be secured in the pleasure ground by planting on the northern side of trees or hedges.—C. TURNER, *Highgate*.

***Saxifraga paradoxa*.**—A good deal of time has been spent in the endeavour to put the Saxifrage known in gardens as *Saxifraga paradoxa* in its precise position, but it cannot be said that "the best" authorities agree on the question. Garden-lovers will, therefore, content themselves with calling this Saxifrage simply *Saxifraga paradoxa*. It will be prized for its beauty at all seasons. It is one of the neatest and daintiest of a class of Saxifrages of wonderful beauty—the Silvery Rockfoils, of which there are legions of species, hybrids or varieties. It makes nice, medium-sized rosettes of narrow, symmetrically arranged leathery leaves, all daintily braided with silver in the most exquisite way, so that a study of a plant composed of several rosettes gives a most pleasurable feeling. The flowers are a little disappointing, as the white petals are dulled by the yellowish colouring at and towards the base. But *S. paradoxa* can afford to be less beautiful than many of its sisters

HINTS ON TABLE DECORATION.

THE decoration of tables is a genial task, as it is not one of those that are governed by any hard-and-fast rules. In fact, the more the changes, the more is the operator's work likely to be appreciated. It is often said that anyone can do decorating if they have at hand the necessary items. This is true to a certain extent, as the mere act of placing flowers in water will serve to answer their purpose. But to decorate lightly and with effect can rarely be accomplished in this manner, though it must be acknowledged that at some of the leading exhibitions where table decoration is much in evidence, this haphazard method often finds favour. This is to be regretted, as it is very misleading in more ways than one to those who visit flower shows not merely for pleasure, but for education, as in actual practice the style sometimes adopted would never be permitted, for very often one is led to believe that everything must give way to the flowers, which is just the reverse of what is necessary.

In decorating a dinner-table it is not necessary to employ a quantity of flowers, as the effect is more pleasing when they are lightly arranged, and any overcrowding tends to prevent this. As a general rule, anything is to be avoided that obstructs the view across the table, as for obvious reasons the diners prefer to see one another. Therefore, whatever receptacles are used for the centre, they should be either low enough to be easily seen over, or tall enough to allow of a clear view beneath them. In the majority of cases tall receptacles are only essential when the table is a very long one, when perhaps three may be necessary, and for the intervening spaces some smaller ones will be needful. The arranging of these centre-pieces is considerably simplified when the branching type of flower-holder is favoured. They are also made in smaller sizes, and are very convenient for the positions suitable to them. When these are employed, much labour is saved in wiring the flowers; in fact, the entire process presents none of the difficulties that the ordinary vases and bowls do, as the tubes are arranged at different heights to set each flower to its best advantage.

These, however, are not favoured by all. Many prefer the older type in silver and glass, in which case a little more care is necessary to place the flowers to give the best effect. Many varieties in winter, among them the Perpetual-flowering Carnations, require wiring neatly to hold them erect, even in narrow vases; while for bowls, in addition to this precaution, it is advisable to use the small flower tubes, packing as many as possible tightly in their places with some fresh green moss. This arrangement is better than the wire generally made use of, as there is no danger of the effect being upset if they are accidentally moved. With some flowers it is possible to use their own foliage, but where this is not convenient, Asparagus and Maidenhair Fern should be used. Sometimes it may be advisable to lay a few flowers and a small quantity of foliage on the cloth, but in so doing the temptation to be too extravagant must be avoided. A few trails of Smilax and a flower dotted here and there without having any set design is all that is necessary. Anything approaching stiffness should be avoided.

The lighter the style, the more charming will be the result. Generally speaking, a mixture of colours are not admired, as a more pleasing effect is gained by the use of two or three, unless an exception be made during the autumn, when the foliage is at its best. At this period of the year red is always admired, and if white be the only other colour used, a charming contrast results.

Pink in its various shades is always pleasing under artificial light, and very often it requires no other colour beyond the green of its foliage; but if another shade is desired, mauve is the best. In the choice of flowers, one is not lacking during the winter season with plenty of Perpetual-flowering Carnations and winter-flowering Begonias, which for all indoor work are quite indispensable. Wherever possible, a little of their own foliage adds much to the effect of these two. Poinsettias for their brilliant scarlet are most valuable, while Salvias and the scarlet Plumbagos are equally so, the latter, especially to associate with Roman Hyacinths, being particularly pleasing. Azaleas and Camellias are useful for laying on the cloth, and when the table is a large one the arching spikes of Odontoglossums and Calanthes are seen to good effect. Forced bulbs, especially the earliest Tulips and Narcissi, one finds useful, while the charming Lily of the Valley is quite indispensable. Well-berried sprays of Holly are appreciated, but they must be very small. A good plan to secure the same effect is to take the single leaves and stick the berries on the spines. These, when placed at intervals on the cloth, are generally admired.

F. J. TOWNEND.

The Gardens, Brentwood, Moorgate, Rotherham.

BOOKS.

Fungoid Diseases of Field and Garden Crops.*

—The title of this book may be misleading to many, for it does not deal with garden plants as the ordinary amateur knows them; there are none of the diseases of the Rose, the Carnation, the Hollyhock, the Lily and so on that so often worry us, nor do Lettuce, Spinach, Onions, Celery and several other garden crops very commonly grown find any mention. On the other hand, there is a chapter devoted to the fungoid diseases of animals. The bulk of the book is given up to an account of the diseases of the Potato, grain crops, leguminous plants, the Cabbage family, and Beets and Mangels, and is therefore much more concerned with the farm than with the garden.

The early part of the book (pages 1 to 38) gives an account of fungi in general and their relation to other members of the vegetable kingdom, the making of sprays and their application, and the conditions favouring the spread of these diseases. Only one statement in this part of the book calls for criticism. We read that soda-Bordeaux mixture offers no advantage over ordinary Bordeaux mixture, and that therefore no recipe for the making of it is given. It has this very great advantage, to gardeners at any rate: the materials can be purchased anywhere in the kingdom, and they offer no difficulties in storing, such as quicklime does. If the same care is exercised in mixing the ingredients and in testing the mixture as is essential in the making of ordinary Bordeaux mixture, the making of it presents no difficulties, and the results obtained by its use seem to be at

* "Fungoid Diseases of Field and Garden Crops," by T. Milburn and E. A. Bessey. 8vo, xii. + 118 pp. London: Longmans, Green and Co., 1915; price 2s. net.

least as good as those got by the use of that most generally useful mixture. It is made by dissolving in soft water, in separate wooden vessels, 9½ oz. of copper sulphate and 110 oz. of washing soda. The two solutions, which must be cold, are then mixed, and the mixture made up to three gallons with soft water.

Turning to the later chapters of the book, we find that the main diseases of farm crops are reviewed, the symptoms, causes, and preventive and remedial measures all coming in for their share of attention. We find, however, a certain looseness of expression here and there, which will be confusing to those who know nothing of the subject of which the book treats; e.g., in the section dealing with club-root of Cabbages, we read that the symptoms of the attack are: "Abnormal tuberous swellings appear, of no fixed form, which gradually become rotten and give off a very disagreeable smell. While this is going on, the leaves lose their waxy bloom and healthy green appearance, turning yellow and stunted in growth. Finally, the whole root and leaves may become one mass of putrefaction." We might criticise this on several points, but one will suffice: we are not told where these swellings occur! In the preventive measures recommended for this disease we find an admirable list, but the most important one of them is inadequately dealt with. After stating that the disease is most prevalent on sour land, we are directed to apply "about 2 tons or more of lime per acre, immediately the Turnip crop is removed, and extra quantities where the disease was worst. Gas lime is of little value for the purpose." Turnips are not the only crop to suffer, even on farms. Our own experience teaches us that gas lime (even when it can be obtained) is of no value whatever for this purpose, and the only form in which lime is of value in this connection is that of fresh burnt lime, quicklime, live lime, unslaked lime, builder's lime, or stone lime as it is variously called. This surely ought to have been made clear, for there is no worse disease in gardens than this, and probably none more prevalent.

Turning now to the diseases of Peas, we expected to find some mention at least of the streak disease which has spread so much during recent years, but are disappointed. Similarly, we thought to find mention of the value of potash manures in strengthening plants against the attack of fungi, e.g., Beet rust, but we cannot find it.

On the whole we think this book will prove of value to those concerned with farm crops; but the almost entire absence of reference to fruits (Gooseberries are mentioned once, but not referred to in the index), flowers and many common garden vegetables reduces its value very greatly as an aid to gardeners.

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish expert advice.

The Editor welcomes photographs, articles and notes, but he will not be responsible for their safe return. All reasonable care, however, will be taken, and where stamps are enclosed, he will endeavour to return non-accepted contributions.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

The Editor will not be responsible for the return of artistic or literary contributions which he may not be able to use, and the receipt of a proof must not be taken as evidence that an article is accepted. Publication in THE GARDEN will alone be recognised as acceptance.

Offices: 20, Tavistock Street, Covent Garden, W.C.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

QUESTIONS AND ANSWERS.—The Editor endeavours to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object makes a special feature of the "Answers to Correspondents" columns. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR of THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant. Letters on business should be sent to the PUBLISHER.

FLOWER GARDEN.

HERBACEOUS PLANTS FOR CLAY SOIL (Susan).—If the soil is well cultivated, i.e., trenched 2 feet deep, well manured and limed at the outset, a clay soil over a gravel subsoil will suit many things, and in such we should without hesitation plant Delphinium, Phlox, Flag and other Irises, Sunflowers, border Campanulas, Peonies, Pyrethrum, Potentilla, Eryngium, Echinops, Kniphofia (Red-hot Poker), Michaelmas Daisy, Day Lily, Globe-flower, Gaillardia, Pentstemon, Rudbeckia, Helenium, such Lilies as candidum, croceum, umbellatum, Hansonii, excelsum, colchicum, tigrinum in variety, and, indeed, any of the stronger-growing types of these plants. In semi-shade, Hepatica and Christmas Rose should do well. Of bulbous things, Crown Imperials, Alstroemeria aurea (if given a place apart), English and Spanish Irises, and strong-growing Daffodils as Emperor, Sir Watkin, Barrii conspicuus, Mme. Plomp, Mme. de Graaff, maximus, with many others. Make a good start, and there should be little cause for failure.

WALL FLOWERS (E. H., Oxford).—It would have been helpful had you given the height and extent of the walls for which the plants are required. Walls of crumbling cement and limestone are rare, and we can only assume that the cement was of very poor quality and very much in the minority. Cement is, however, ill-suited to vegetable life generally, and if the walls through and through are formed of this, it would be well to make holes and insert a little soil to give the plants or seeds a start. If the walls are high, 7 feet to 8 feet or more, good effect could be secured by grouping, i.e., setting out one kind of plant thinly over a superficial area of 3 feet or more, so that when established a naturally formed colony would result. By repeating this in distinctive colours, whether of harmonious or sharply contrasting lines, a good effect may be secured. The best planting time is early autumn, September or October. You have not stated the aspect of the wall, which is important. The plants named, however, are suited for sunny walls, and if yours are not so circumstanced, you had better write us again. If the walls are quite vertical and were originally built as boundary or other fences, some little trouble may be experienced in establishing the plants, though in the case of moderately large building blocks of stone this would be modified. Aubrietia Dr. Mules (royal purple), A. Lavender, A. Moerheimii (pink), and A. Prichard's A. 1 (purple) are distinct. These would be best obtained in plants of distinctive colours are required. Any of the alpine Pinks, *Dianthus deltoideus, D. caesus, D. alpinus and others, Achillea umbellata, A. Huteri, A. Clavennae, and A. serbica (white leaved and white flowered), Corydalis lutea (fern-like foliage, yellow flowers), *Erinus in variety (lilac, white, &c.), *Iberis sempervirens (white), *Alyssum saxatile (yellow), *Wallflowers, *Antirrhinum, *Centranthus ruber and Campanula muralis all flower during spring and early summer. There are many others flowering later, however. Where plants are used, small pieces are best. Those marked by an asterisk may be introduced by means of seeds, which should first be mingled with a little moist soil, and in this way inserted into crack or cranny.

FRUIT GARDEN.

CORDON APPLE TREES DISEASED (Fraser).—The trees have been very badly attacked by winter moth. Spraying with lead arsenate next spring—the end of April will see the eggs hatched in the position you name, in all probability—will be the best method of dealing with them.

PEAR TREE DAMAGED (Mrs. A. C.).—It is as you say most extraordinary that the tree should have been damaged so thoroughly and so suddenly, and we cannot but think that some poisonous matter must have found its way to the tree, either poisonous fumes or weed-killer, or something of that sort. The appearance suggests fumigation with sulphur or something equally deleterious.

MISCELLANEOUS.

LITHOGRAPHIC LIMESTONE AS A FERTILISER (J. D.).—You may use the powdered stone for any purpose

for which powdered chalk may be used, but its actual fertilising value is small.

TRANSPLANTING RHODODENDRON (Rhodes).—The work could be done early in October or somewhat before that period. These plants prefer heath soil, and where this does not exist naturally, a mixture equally of finely broken peat, with leaf-soil and loam, is the best. Of this it would be well to make a bed 3 feet or so across and not less than 2½ feet in depth. In such a soil, rightly placed, a good growth should ensue next summer with a flowering to follow in 1917. The flagging you refer to might prevent the forming of flower-buds this year. If so, no flowers will follow next summer.

PLANTS FOR SMALL ROCKERY IN GREENHOUSE (Learner).—Achillea argentea, Arenaria balearica, Campanula pusilla, C. gargarica, C. fragilis, Draba aizoides, Erodium supracanum, Gypsophila cerastioides, Heeria elegans, Helxine Solierii, Herniaria alpina, Cotula dioica, Linaria alpina, Matthiola valesiaca, Onosma alba rosea, Pratia angulata, Raoulia glabra, Sagina glabra, Saxifraga Guildford Seedling, S. Alzoon rosea, S. A. balearica, S. paradoxa and S. apiculata, Sedum album, S. dasyphyllum and S. spathulifolium, Sempervivum Allionii, S. arachnoideum, S. Funckii, Silene acaulis, and Stachys corsica.

PRUNING ROSE DOROTHY PERKINS (J. Gibson).—This and most of the wichuraiana Roses should have some of the oldest growths entirely removed every year soon after flowering. Do not prune any laterals until March. Be careful to preserve all new growths, and it is a good plan to tie them out to rods so that they receive all the sun and air possible. You will obtain far better results if you relieve the plant of a good lot of the old growths, but, of course, you must not overdo it, as some of these old shoots are good for two or three years. All laterals on such old growths are best pruned fairly hard back in March, leaving the strongest laterals about 12 inches long and others in proportion to their vigour, even cutting some back to 2 inches or 3 inches.

NAME OF FRUIT.—J. M.—Plum Kirke's Blue.

NAMES OF PLANTS.—J. M.—Tall plant, wild Mignonette; we cannot name the other plant without a flower.

SOCIETIES.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL SOCIETY.

THE annual show of the above society was held in the Exhibition Hall, New City Road, Glasgow. It proved very successful and amply justified the directors in deciding to hold it as usual. Entries were almost equal to the usual, and the quality quite up to the high standard of this society's shows, and the large hall bore quite a brilliant aspect. Lady Stirling-Maxwell of Pollok opened the show, Sir John Stirling-Maxwell (president) presiding.

Trade exhibits were numerous and good. Messrs. Sutton and Sons, Reading, set up one of their effective displays of vegetables, and received a gold medal. Mr. W. Leighton, Glasgow, received a similar award for a charmingly arranged display of Carnations. Messrs. Austin and McAslan, Glasgow, sent a fine group of plants and flowers (gold medal). Messrs. John Forbes (Hawick), Limited, had a fine table of Phloxes, Carnations and other specialties.

From Messrs. James Cocker and Sons, Aberdeen, came a large display of Roses and hardy flowers (gold medal). Messrs. Hugh Dickson, Belfast, had Roses of their usual high quality (silver medal). Messrs. Hogg and Robertson, Dublin, exhibited Gladioli, &c., in many fine varieties (silver medal). Mr. D. McOmish, Crieff, staged hardy flowers. Mr. A. Brown, Blantyre, exhibited Dahlias and other florist flowers. Mr. W. Wells, jun., Merstham, set up a fine display of Delphiniums (silver medal). Messrs. Dobbie and Co., Edinburgh, exhibited admirable groups of Sweet Peas, Dahlias, and Roses, (gold medal). Good Roses came from Messrs. J. Fairley and Co., Cairneyhill, Fife. Messrs. Williamson, Gemmel and Co., Glasgow, showed an effective group of plants and flowers. Messrs. Allwood Brothers secured a gold medal for grand Carnations. Mr. John Hood, Beith, exhibited Pansies, Tomatoes, &c. Messrs. Blackmore and Langdon, Bath, sent their magnificent Begonias (gold medal). Mr. D. G. Purdie, Glasgow, showed plants and flowers (gold medal). Messrs. Sander and Sons had good Orchids (silver medal).

Pot plants were not so fine as in some former years, but, in many cases, exceptionally good plants were shown. Mr. J. Hood, Dalmore, Helensburgh, had the best group of plants; second, Mr. A. E. Davidson, Craignure. The other leading first prizes in this section were won by Mr. J. Templeton, Mr. T. Nelson, Mr. R. J. Clark, Mr. D. Halliday, Mr. W. P. Bell, Mr. C. Jenkins, Mr. T. McLean, and others.

The cut flowers were of grand quality, and in most cases the competition was very keen. In the leading class for Gladioli, Messrs. T. Mair and Son, Prestwick, had perhaps the finest twenty-four ever shown in Scotland. For twenty-four Roses, Messrs. Hugh Dickson led with beautiful blooms; for eighteen, Mr. G. A. Turnbull; for twelve, Mr. R. S. Aitken. Mr. R. C. Ferguson, Dunfermline, had the best nine vases of decorative Roses. Messrs. Hugh Dickson, Limited, were first for six vases of Roses. These classes were very fine.

Dahlias were well shown in all classes. In the leading one for Cactus, Mr. J. Smith led, Mr. Smellie being first for twelve vases. The best Collarettes came from Mr. J. Paul, and Mr. G. A. Turnbull had the best Pompons. Carnations were excellent, Mr. J. Smellie being first in the largest class.

Sweet Peas were great features, Mr. J. Smellie winning for eighteen vases. The Scottish Challenge Cup of the National Sweet Pea Society was won by Mr. James Paul. Mr. J. Smellie was first for twelve vases of early Chrysanthemums.

Mr. C. Shaw led in a good competition for twelve vases of herbaceous flowers and for twelve vases of flowers from the open border.

Mr. G. A. Turnbull had the finest twelve vases of annuals.

Begonias were superb, Mr. R. Watson having the best twelve blooms.

Pansies and Violas were numerous and good. Mr. A. Ollar was first for twenty-four Pansies and twenty-four Violas.

Baskets and bouquets, were fine as a rule.

Mr. D. Kidd, Carberry Tower, had the best decorated dinner-table.

Fruit was a magnificent display in almost every class. Mr. W. Brown, Houston, won first prize for twelve dishes in twelve varieties. Mr. J. Middleton, Callender House, led for eight bunches of Grapes. The finest collection of Pears came from Mr. A. Harvey; of Plums, from Mr. W. A. Staward; of Apples, from Mr. D. A. McIntosh, Rathgar, Dublin.

Vegetables constituted an outstanding feature, and Mr. C. Shaw's winning collection could hardly be surpassed. Mr. J. Devoy was first for the other collection.

We regret that the exigencies of space prevent further details of this grand show being published.

OBITUARY.

JOSEPH POWLEY.

THE funeral took place on August 28 at The Rosary, Norwich, of Mr. Joseph Powley, one of the old school of gardeners, whose prowess as a grower and an exhibitor was well known in days gone by. He left private service and started as a market grower at The Nurseries, Philadelphia Lane, Norwich, in 1881. Mr. Powley was well known among horticulturists throughout Norfolk and district by the fact that he was assistant secretary of the Norfolk and Norwich Horticultural Society from 1887 to 1913, and president of the East Anglian Horticultural Club from 1898 to 1909. Of this latter club he was one of its earliest promoters, and to the last took the keenest interest in every phase of its work. His experienced knowledge and advice were always at the disposal of the committee, and he liberally augmented its prize funds. During the past year he had been suffering from a malady which confined him to his house. He will be greatly missed by the gardening fraternity in the district. At the graveside, to pay a last respect, were a large number of friends and horticulturists, among whom were Messrs. J. E. T. Pollard, G. Davison, H. Perry, R. Holmes, James Everett, A. Reeves, H. Batchelor, W. H. Woods, W. Cowell, F. W. Wilby, W. Shoesmith, W. Rush and W. L. Wallis.

The War Horticultural Relief Fund.—The National Rose Society at their last meeting voted the sum of £25 towards the War Horticultural Relief Fund which is being raised by the Royal Horticultural Society. May the hope be expressed that other societies will see their way to follow the lead the National Rose Society have thus given!—W. W.

Plum Allgrove's Superb.—It is interesting to note that this variety, which recently obtained a unanimous award of merit from the fruit committee of the Royal Horticultural Society, is a sport from the well-known and rich-flavoured variety Jefferson. It is an admirable dessert Plum, with large, deep purple fruits covered with a rich bloom. The flesh is juicy and of delicious flavour, while the tree is of robust growth, good habit, and free bearing. Both gathered fruits and trees, carrying heavy crops, were shown by Mr. Allgrove, Langley Nurseries, near Slough.

* * The Yearly Subscription to THE GARDEN is: Inland, 6s. 6d.; Foreign, 8s. 9d.

THE GARDEN.

No. 2287.—VOL. LXXIX.

SEPTEMBER 18, 1915.

NOTES OF THE WEEK.

Gifts to the Gardeners' Royal Benevolent Institution.—It gives us much pleasure to announce that Mr. Joseph Rochford, a member of the committee of the Gardeners' Royal Benevolent Institution, has generously given to its funds the sum of £600 in War Loan 4½ Per Cent. Stock. This kind gift is unconditional, except that the interest therefrom is to be considered as Mr. Rochford's annual donation during his lifetime. The committee of this Institution also gratefully acknowledge the receipt of £20 from the committee of "Queen Alexandra Day."

Galanthus nivalis Scharlokii.—The Snowdrop family, in addition to species and sub-species, is also divided into colour classes, of which there are three—white, yellow, and green. That illustrated belongs to the "green" section, though its flowers are by no means wholly, or even largely, green in colour. The same is true of the "yellow" class. In both, however, there is a sufficient amount of the colour named to render their classification interesting. This variety is a comparative rarity. Snowdrops are lovers of cool places, affording pretty effects on grassy slopes, and delight in the root companionship of herbs and other plants. They should be planted now.—E. H. J.

A Fine Hardy Perennial.—A plant that well pays for its room is *Erigeron speciosus* *superbum*. With me it comes into bloom in June, the flowers lasting for weeks. Before they are quite past, new growth is pushed up, and a fresh crop of bloom follows after the old stems are cut away. At the present time (September 4) I have a plant carrying huge trusses of beautiful blue flowers, well over a yard high, and I believe I am correct in stating that this plant has never been without flower during the past three months.—T. A. W.

Rose Mme. E. Herriot.—One more season's trial proves this Rose to be one of the best of garden varieties. Truly this is perpetual-flowering. Directly one crop is past, new growth is made, with abundance of bloom even of richer colour as the autumn advances than that in summer, if possible. The flowers, too, when cut in a young state develop nicely in water. The foliage also is all that could be desired.

A Good Creeper for Warm Gardens.—*Solanum jasminoides* is a pretty climbing plant which produces its large clusters of starry white flowers in great profusion from August to November. It is

quite a common plant in Devon and Cornwall, and some fine examples can be obtained in other counties where a warm wall exists in a sheltered garden. Another good *Solanum* is *S. crispum*, which has blue flowers, and is well adapted either for a south or south-west wall. It is a strong grower and requires fairly hard pruning in November.

A Free-Flowering Violet.—For continuous flowering few Violets can equal *Viola Rydbergii*, a little-known species from North America. The

ties to be grown for trial must send thirty seeds of each variety, placed in a plain packet which is enclosed in another packet. The outer packet must bear the sender's name, also the name or description of the novelty and colour. A fee of 2s. 6d. must accompany each trial and should reach the secretary, Mr. Henry D. Tigwell, not later than October 1, 1915.

The Danger of Elm Trees.—On the afternoon of September 10 a young man, H. Littleton of North Road, Kew Gardens, was killed by the falling of a branch while sitting under an Elm tree. The branch broke with a short fracture from near the top of a very large tree of *Ulmus major* in Kew Gardens near to the Cumberland Gate. The dangerous nature of the Elm is only too well known, and it is a matter for surprise that at Kew, of all places, a seat should have been placed immediately under the largest Elm tree in the Gardens.

Tender Flowers at Hampton Court.—In the beds and borders of the historic gardens at Hampton Court are to be seen many tender flowering and foliage plants. These plants are all very well in their place—that is, in the stove or greenhouse—but they naturally appear very unhappy in the open borders. With an abundance of hardy herbaceous flowers in September, such as *Michaelmas Daisies*, *Kniphofias*, *Gladioli*, *Heleniums*, *Hyacinthus candicans*, *Salvia nemorosa*, *Mallows* in variety, *Phloxes*, *Scabiosa caucasica*, *Anemone japonica* and *Sedum spectabile*, all of which are grown at Hampton Court, surely there is no need to resort to the use of exotics like *Bougainvilleas*, *Exacums*, *Dracenas*, *Strobilanthes dyerianus* and *Acalyphas* that would be far happier under glass, and, to say the least, are instances of gross extravagance in the flower border.

The Crinums.—I was interested in the note on these plants, page 432, issue September 4, by Mr. George Bunyard. More of these plants should be grown than is the case at the present time.

Mr. Bunyard refers to their successful culture in the Southern Counties, and rightly so. In a Hampshire garden where the soil is fairly heavy and retentive of moisture, the Crinums are very well grown and flowered on gently sloping banks without any further drainage. Banks are not available, however, in every garden, but slightly raised beds form a good substitute. Some Bracken or rough litter is, in many instances, laid on the ground during the depth of winter. SOLENT.

A RARE AND BEAUTIFUL SNOWDROP, GALANTHUS NIVALIS SCHARLOKII. PLANT NOW.

flowers, which are white, slightly tinged with purple on the back of the petals, and have a conspicuous yellow eye with veins of rich purple, are borne in great profusion from early spring throughout the summer, and at the present time it is looking as gay as it has done at any other part of the season.

National Sweet Pea Society's Novelty Trials, 1916.—The above society will hold trials of novelties in 1916 as usual, and members who wish novel-

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Cotoneaster Simonsii as a Wall Plant.

This *Cotoneaster*, being of erect habit, is usually given a place in the shrubbery, where it thrives well and usually produces a good crop of its bright orange berries. It, however, yields its fruits most plentifully when grown on a south wall; moreover, the berries assume a much richer hue under these conditions. I have noticed this in a plant growing on the south front of a farmhouse near here, and the fact was again impressed upon me by seeing, in the early summer of this year, the United Free Church at Torphins, Aberdeenshire, having its south wall covered with this *Cotoneaster*, the plant being still thickly studded with its bright berries. (Here the birds usually make short work of the berries as soon as winter sets in.) On the north side of the church the *Cotoneaster* was holding its own with the Ivy, by means of which it was supporting itself to a height of about twenty feet; surely an unusual height for this plant.—CHARLES COMFORT, *Broomfield, Midlothian*.

Nepeta Mussinii.—The praise accorded to this homely plant on page 424, issue August 28, is richly deserved. Not only is it useful for the purpose named, but also for a variety of other purposes. I have carpeted a border of mixed Roses with it, and am well satisfied with the result. This year I filled a fairly wide border with Sweet William Pink Beauty, giving it a double edging of *Nepeta*. The combination and the floral results obtained were in every way so satisfactory that I shall repeat it when opportunity offers. It is valuable in the rock garden, and can be prettily associated with the pink *Tamarix*. In the herbaceous border it looks well when grown near a few clumps of pink *Heucheras*. But I think it looks prettiest of all in a dry wall, where it will form a thick drapery of a delightfully informal character. In a sunk garden where there are dry walls and where Roses abound, no better plant could be chosen. It can be propagated easily from cuttings in the summer or early autumn, either outside or in a frame. On our heavy soil I find the young plants do not thrive when planted in the autumn, so I make a point of rooting cuttings in a frame early in September and planting them out in April. It relishes dry conditions, and dampness of soil and situation must be regarded as an enemy.—WILLIAM F. ROWLES.

The Hardiness of *Viola bosniaca*.—In your issue of August 28 a correspondent asks if this charming plant is hardy in the North. As no one else has replied, and as I can partly answer the question, I write to say that I brought the plant through last winter; but it had been growing in the moraine all the summer and was covered with glass. I know it died out with a friend living close to the coast where the climate is less cold, but possibly damper; the soil in that garden is little better than sand. I think the colour of *Viola bosniaca* is better in the moraine (watered underground) than in richer garden soil, there being less suspicion of blue in the pink. The plant seeds itself and has to be weeded ruthlessly, else it would soon smother other things. The seedlings, I find, vary considerably in tone of colour, and only the best shade should be kept. I am using it this year as an edging plant, and it is a promising subject for this purpose, a big stock being

easily raised from cuttings or from seed. It is not an expensive plant now—I saw it listed at 6d. in one catalogue—and if planted in a suitable situation yields a large return. It has been described as a difficult plant to do well.—WILLIAM LOW, *Balmakewan, Marykirk, Kincardineshire, N.B.*

Recipes for Cooking Wild Rose Hips.

I think some of your readers may possibly be interested in these recipes. The "Form of Cury" was a roll of English cooking compiled about 1390 by the master cooks of Richard II., who had about two thousand cooks; it was a vellum roll containing 196 recipes. Out of this (modernised) is the following recipe for Saracen sauce: "Take Rose hips and clean them (by taking out the seeds). Take (the same amount of) blanched almonds, fry them in oil and bray them with the hips in a mortar. Boil them up with red wine, and put in sufficient sugar and powdered hot spices (such as ginger, pepper, &c.). Mix it stiff with rice-flour, colour it with alkanet, and serve." (This is to be used with meat, and can be diluted with chicken broth.) The next is a recipe for a tart of Rose hips (seventeenth century): "Take some hips, cut them and take out the seeds very clean. Wash them, season with sugar, cinnamon and ginger. Cover the tart and bake it, ice it, sprinkle sugar on, and serve it." Compote of Rose hips (this is sold by the bucketful in the Continental markets).—"Take a quantity of wild Rose hips, boil them down with as little water as possible till quite tender and mashy; then pulp them through a fine sieve. None of the seeds or hairs must go through (some people open the hips first and remove the seeds and hairs, and they wear gloves to do so, as the hairs are horribly irritating if they get under one's finger-nails). Add sugar in the proportion of three-quarters of a pound to every pound of pulp. Put the mixture into a preserving pan, let it boil up quickly until the sugar is entirely dissolved; then remove it from the fire and bottle it when it becomes coolish."—BORIS.

Destruction of Wasps.—A reader very kindly brings to our notice the following remedy for destroying wasps, which appeared in *Nature* of September 2. "You may be interested to know that while starting up a motor-cycle a few days since I accidentally discovered that benzol sprayed over a wasp instantly killed it. I tried the same experiment with petrol, with the same result. Knowing of two nests in the neighbourhood, I went that night and with a small oil gun injected two or three ounces of benzol into each nest. In the morning I found the two nests entirely destroyed. Next night I visited an open nest which had been partly destroyed by another means, and in which several hundred wasps were still living. They covered an area as large as a cheese plate, and on lighting them up showed signs of activity. One squirt full of petrol was hastily sprayed over them, and the whole lot were instantly killed. This method is so safe, simple and effective that I feel it should be generally known. The petrol or benzol acts entirely by vaporisation, and produces asphyxiation. It is not fired in any way."—A. H. MITCHELL, *Horn's Green, Knockholt, Kent*.

Violas from Layers and Cuttings.—I was somewhat surprised to read the recommendation of Mr. F. J. Clark, page 438, issue September 4, about propagating Violas from layers, and that portion in particular recommending the employing of the "long growths" for the purpose. Usually,

these long growths take a considerable time to root, and when rooted constitute indifferent and unreliable stock. Such growths cannot be other than old flowering branches, and as such would be more or less exhausted. Moreover, devoid as such growths usually are of the crow of latent eyes or buds with which the youthful unflowered branches are invariably endowed, their bases, it is next to impossible to secure healthy tufts these latter, with correct treatment, ensure. Again, these long growths are unnecessary, as the wealth of material suited to propagation at the centre of a plant plainly shows. Hence from more than one point of view they are not to be desired.

Nor is Mr. Clark quite up-to-date in recommending "October and November as the best months" to take cuttings, and he will probably be surprised to learn that for many years I made a point of planting my specimen beds during the first week of the former month—the only real way of ensuring an early flowering. The plants at that time were compact tufts of several shoots each, and were made possible by the following simple method. With the great flush of summer flower beauty past, the plants were pruned close back, divested, in fact, of all growth that had for months been flowering. The soil about the plants was pricked up, watered, and a mulch of rich soil added, finer soil of the same kind being lightly strewn into the centre. From this time the plants, failing rain, were watered almost daily, the result being, at the end of three weeks or so, a crowd of young shoots pushing freely. As a direct result of the mulching and watering to every one of these young shoots, root fibres were attached, and, a sharp upward pull detaching them, they were ready for transplanting. Thus, without the making of a single cutting, rooted plants were available in abundance in a month, and of a type—every one being of basal growth—that cannot be surpassed. In this way I have raised many thousands, all without the tedium that attends the making of cuttings. The system itself is not only good and sound and applicable to large growers and small; it is a great time-saver, while giving the operator the finest possible material for planting. By pulling out the most forward shoots as made, opportunity was afforded for a maximum production, the surprise being the number that was possible from a single plant.

Transplanted to a bed of sandy soil and cared for, the young plants soon made headway, and with new growth apparent were pinched back. This caused them to bush and make the "compact tufts" for October planting already referred to. By the end of the year these young plants were bristling with shoots over a 6-inch area, their progress often being a matter for surprise. By March the same plants were getting ready to bloom. I have even had them bristling with flower-buds while snow remained. An additional advantage accruing from the system is the hold the plants get on the soil, a hold which enables them to endure in times of drought. Mr. Clark is apparently taking his cuttings when most people have plants for sale, though it is in the interests of the general reader of *THE GARDEN* that I take exception to his remarks. The *Viola* or Tufted Pansy in its best forms is one of the finest hardy plants we possess. None is more suited to our gardens, none so prodigal of flowering or capable of giving so much for so little outlay, none more worthy, indeed, of our best endeavours.—E. H. JENKINS.

About Buddleia Colvillei.—In THE GARDEN of August 21 the statement is made that the above plant rarely flowers north of the Thames. As a matter of fact, this plant, if not so hardy as *globosa* and *variabilis* and its improved varieties, will withstand over 20° of frost without suffering. Unlike most *Buddleias* in cultivation, *Colvillei* does not flower here till five or six years old. When once the flowering period has been reached, the number of sprays increases annually. Unlike other *Buddleias*, it should, if necessary, have the lightest pruning, but is better left to itself.—ARCHIBALD BUCHAN-HEPBURN, *East Lothian*.

Treatment for Gentians.—Perhaps the conditions I named on page 397, issue August 14, are not so opposite as they appear, and the fact of planting *Gentiana acaulis* among lumps of sandstone may supply the moisture it requires, the stone holding the moisture for a considerable time. I so far have the same difficulty as Mr. Turner. I can flower *G. verna*, but not *G. acaulis*. I mean, however, to replant the latter on the plan mentioned as above.—ENTHUSIAST.

An Ayrshire Garden.—The accompanying illustration shows a small corner of our garden, which we are beautifying by replacing the edgings of wood with live edgings of Saxifrage, Thyme, Pinks and white Arabis. The Saxifrage in the picture is a yard in width and was greatly admired in the month of June. The stone edging encloses the Viola border, which is mixed with Carnations. On the rustic paling are Ayrshire Roses coming into bloom.—J. E. BLYTH, *Dalry, Ayrshire*.

Birds and Ripe Fruit.—Is "G. G." quite sure that birds are always the culprits? Personally I turn all my animosity upon the wasps. These insects put birds to shame when it comes to fruit eating. This season I could well spare a few Plums, but not content with these, the wasps attacked all my Apples, compelling me to pick them before they were nearly ripe, and have now started on my Pears. The pests do not wait for ripeness, for they are attacking the bullet-like fruits of Fertility, Louise Bonne of Jersey and other varieties. Dozens of wasp nests have been destroyed, yet the damage is heart-breaking. Messrs. Bunyard and Co.'s man informed me recently, that they have been swarmed with wasps, and this despite the destruction of nearly one hundred nests.—T. A. W.

Rose Alberic Barbier.—In THE GARDEN, August 28 issue, page 425, there is a very fine picture of *Alberic Barbier* from "S. S." with his appreciation of that splendid wickuraiana. My own specimen, which I procured as a small rooted cutting from an uncle in Hampshire a few years ago, has proved to be a perfect octopus and has thrown out its branches in five or six different directions, over walls, fences and trees, and requires practically no looking after beyond the usual cutting out of dead twigs and giving the new growth a lead. The Rose does well also as a low fence, as might have been noticed by many in the Sunk Garden at Hampton Court. I would recommend "S. S." to try it also as a covering for a sloping bank. Robert Craig, a near relation of *Alberic Barbier*, is another splendid variety of similar habits, with perhaps not so pretty a bud, but a finer full-blown flower. "S. S." might try it as I have done, very successfully.—H. G. B., *Forest Hill*.

Calceolaria Cuttings.—Many people make the great mistake of putting in frameloads of *Calceolaria* and *Pentstemon* cuttings in early September. The result is that they strike root

and begin to make soft, sappy growth during the autumn. Then follows the cold weather and frost, which no amount of coddling can prevent, and the plants are either frost-bitten and entirely killed or damaged enough to make them useless. Here we never put in any cuttings until the end of September, and sometimes it is October. They are put firmly into sandy soil and kept close for a time, and then given air on suitable occasions. We never lose our plants by winter frosts, because they are put in so late that they can make no sappy growth. So those who would be early, let them beware, for it does not pay. Cuttings so struck will stand several degrees of frost, and mats are only put on the frames in severe weather. Coddling must be rigorously avoided if sturdy plants are required.—E. T. ELLIS, *Weetwood, Ecclesall, Sheffield*.

Antirrhinums in the Bournemouth Public Gardens.—Judging from the splendid way in which these plants have flowered in the above-named gardens during the present summer, and

A VIEW IN MRS. BLYTH'S GARDEN AT DALRY, AYRSHIRE.

also in some private gardens in the district, one should not be surprised if their cultivation is increased considerably next year. In the garden fronting the Bournemouth Municipal College the *Antirrhinums* have been beautiful indeed. Scarcely a faulty plant could be found in the long lines of them growing there. Mr. J. B. Stevenson, the able superintendent, has also made good use of them in other parts under his extensive charge. In one private garden here there are two oval-shaped beds filled with dark crimson and pure white flowered *Antirrhinums*, the crimson in the centre. The strains seem to be so fine that it would be wise on the part of the owner to propagate cuttings as well as save seeds. In the same garden there are two beds filled with *Carnation Britannia*.—G. G.

FORTHCOMING EVENT.

October 5. — Royal Horticultural Society's Exhibition of British Grown Fruit, Vincent Square, Westminster. First day, 1 to 6 p.m.; second day, 10 a.m. to 6 p.m.

ANNUAL FLOWERS FOR AUTUMN SOWING.

IN a great many gardens, particularly where the soil is of a sandy or very porous character, annual flowers from seed sown in the spring seldom give good results, owing to the fact that the soil becomes parched before they have had time to make sufficient roots to send out in search of moisture. In such gardens the sowing of seeds in autumn possesses several obvious advantages. But even where spring-sown annuals do well, there is no reason why some suitable kinds should not be sown in autumn, as they flower earlier and usually better than when sown in March and April. In those gardens where the soil is heavy clay, or usually lies very wet during the winter months, it would be folly to sow seeds of annuals at present; the plants would be practically certain to succumb to wet and cold, excessive moisture being far more

injurious than frost. It is, of course, necessary to select suitable kinds for autumn sowing. Some, such as the *Tropæolums* or so-called *Nasturtiums*, cannot withstand 2° of frost, and these must be ruled out of court. The following are all quite hardy, and under anything like favourable conditions would give good returns: *Virginian Stocks*, *Godetias*, *Candytuft*, *Sweet Peas*, *Pot Marigolds*, *Cornflowers*, *Coreopsis tinctoria*, *Alpine*, *Iceland* and *Shirley Poppies*, *Eschscholtzias*, *Limnanthes Douglasii*, *Bartonia aurea*, *Gilia tricolor*, *Nigella damascena*, *Clarkias* (the old-fashioned sorts), *Collinsia bicolor*, *Sweet Sultan*, *Silene pendula compacta*, *Saponaria calabrica*, *Nemophila insignis*, *Larkspurs*, *Sweet Alyssum* and *Collomia coccinea*. September is an excellent month in which to sow, and if the weather is very dry, artificial watering must be resorted to, as it is necessary to get well-rooted plants before winter sets in. Thin sowing and early thinning of the seedlings are other points that must be borne in mind, as a sturdy, well-hardened plant is much better able to withstand cold, wet and the

THE CULINARY APPLE BISMARCK, A LATE-KEEPING VARIETY AND AN ABUNDANT CROPPER.

ravages of slugs than a weak, attenuated one. It is, however, advisable to leave about twice as many seedlings as are likely to be subsequently required.

THE TIGER IRIS.

(TIGRIDIAS OR FERRARIAS)

THE Tigridia, or Mexican Tiger Iris, is, I fear, but little known, and less cultivated, by British horticulturists, and it is on this account that I am constrained to say a word in its favour. For beauty it takes its place in the front rank, comparing not unfavourably with many of our highly prized and highly priced Orchids.

It is not absolutely hardy, but if planted in well-drained, light soil at the foot of a wall or in front of a hothouse it will stand 12° of frost with impunity. Some authorities advocate lifting the bulbs in autumn, drying and storing them, and replanting in spring. I have never tried this plan, as with a slight covering of some dry, loose litter I find they stand our severest winters in such a position as I have indicated. The only real objection that can be raised against the Tigridia is that the individual flowers only last a brief day, but when it is remembered that a good, healthy plant will open one or more of its blooms almost daily for several weeks on end, this objection must be ruled

“vexatious.” I should explain that these remarks refer chiefly to *T. Pavonia* and its varieties or hybrids, as of some of the other species I have had no practical experience.

The following are all well worth growing: *T. Pavonia* (Peacock Tiger Iris).—None of its varieties equals this in vigour; it has a large golden orange perianth, spotted bright scarlet. *T. P. alba* (the white Tiger Iris) has a pure white perianth, spotted rich crimson. *T. P. carminea* is almost self-coloured, being a lovely carmine suffused with orange. *T. P. lutea immaculata*.—This variety, as its name suggests, is also a self, the shade being a nankeen yellow. *T. P. rosea*.—I find this variety of vigorous constitution, and a persistent bloomer. Its colours are somewhat difficult to describe, and can, perhaps, best be done in the words of a Continental grower, as follows: “Petals pure white, suffused and lined with bright rose towards the edge; centre maroon with dark spots.” *T. conchiflora*, although classed as a distinct species by some, is, I believe, a variety of *T. Pavonia*. It is familiarly known as the Shell Plant; it has a deep yellow groundwork, spotted bright red. *T. P.*

immaculata is, as its name indicates, a pure white self. I have had no success with this variety, having planted bulbs of it twice without any results. I should say that newly purchased bulbs had better not be planted out till spring. Any of the foregoing can be bought for a few pence each.

Midlothian.

CHARLES COMFORT.

APPLES FRUITING ON YOUNG TREES

CERTAIN Apples are often passed over at planting-time, as they are reputed to be very slow in coming into bearing. Instances have been cited where trees of Blenheim Orange have not borne fruit until attaining the age of twenty years. While this may be true of standard trees grown upon Crab stock, it cannot apply to bush trees grown upon Paradise stock and annually transplanted. The two accompanying illustrations are of young trees grown by Mr. J. C. Allgrove, Middle Green, Langley, Slough. These trees, lifted from the open for exhibition purposes are less than 4 feet in height, and each carried over a dozen handsome fruits, while the age of the trees is only four years! The varieties are Bismarck and Charles Ross. The former is a first-class culinary variety, keeping well until March. When worked on Paradise stock, the tree is of short, sturdy growth, and succeeds well either as a cordon, espalier, pyramid, or bush tree. It prefers a rich soil, well drained. Should the soil be of a poor nature,

trees worked on Crab stock should be planted. Worked on this stock, it will also do well in standard form. This handsome and free cropping cooking Apple came to England from New Zealand about thirty-five years ago. Apple Charles Ross is a very handsome dessert variety of large size and good flavour. It bears very freely and succeeds well in any form. Its growth is vigorous and distinct. It was raised by Mr. C. Ross, when gardener at Welford Park, by crossing Cox's Orange Pippin with Peasgood's Nonsuch. It is in season during October and November.

STORING THE APPLE CROP

Gathering Fruit : A Warning.—In Kent, as in some other counties, there is more than a passing sign of a plenitude of maggot this year, and all fruits affected will sooner or later fall to the ground. Such fruits are only of service for immediate use. It so happens, however, that the uninitiated, seeing that a few fruits are brought to earth by the wind, concludes that the time is ripe for gathering the crop, and acts without further ado. Now, there is no more fertile cause of failure than the gathering of fruit before it is fully matured.

The Test of Maturity.—“How am I to know when the fruits are ready?” asks the amateur, and the enquiry is a reasonable and natural one. The professional gardener and the expert fruit-grower know by long experience; they are also acquainted with the ripening periods of many of the fruits. Not so the amateur, who, seeing the crop falling to the ground, decides that it is time to gather. Here, however, is a simple test. Cut open a fruit and examine the pips. If these are of a white colour or just assuming a brown tone they are not ripe for gathering; but if the pips are of a dark brown colour they have arrived at the mature stage, and may be gathered at any time. Even then, however, there need be no undue haste in the matter, for the fruits will continue to swell for some time yet. Moreover, ripe fruit readily parts from the tree if raised slightly from its natural position. All fruits should be quite dry when gathered; it is essential to reject any that are in the least degree damaged. Place the fruits in shallow baskets or trays as they are gathered. If deep baskets are used, the under fruits are liable to get bruised by the weight of the fruit on the top. Late-keeping varieties of Apples, such as Bismarck and Lane's Prince Albert, should not be gathered till well into the month of October.

The Penalty of Early Gathering.—This might be summed up in a few words, viz., immature and flavourless fruits. This is, of course, but the penalty of inexperience in these matters, and those interested in them cannot do better than consult a good book, such as “The Fruit Garden,” by Messrs. Owen Thomas and George Bunyard.

Storing the Fruits.—Of an importance not surpassed by the above is the storing of the fruits when gathered. The ideal fruit-storing room is a heavily thatched building of wood and reeds, with possibly a straw or heather roof. In such a place uniformly cool and moist conditions prevail, and which are absolutely essential to success. Ventilation must be provided at several places round the lower part of the building, i.e., below the lowest shelf and also at each end near the ridge, to permit a free current of air to pass right through the building. The floor should be of natural earth, which should be sprinkled with

water occasionally. This is very important to ensure keeping late fruits in good condition and prevent them from shrivelling. The shelves should be made of battens (of white deal), the edges of which should be rounded off to prevent them from marking the base of heavy fruits. The battens should be $2\frac{1}{2}$ inches wide, and placed half an inch apart to allow a free passage of air. The shelves should not be more than $2\frac{1}{2}$ feet deep, otherwise there is a difficulty in attending to the fruit at the back of the shelf when looking it over. Windows should be provided at each end of the fruit-room to give sufficient light when looking over the fruit or doing any other work required, but shutters must be placed over them so that all light is excluded, except when work is going on. Wire gauze should also be placed over the ventilators to exclude wasps. Extremes of great dryness and changeableness of atmosphere are fatal to the successful keeping of fruits. So, too, are closeness and warmth. Fruits may be well kept in cool, moderately moist sheds or cellars where the above conditions prevail and where darkness is secured. Place the fruits singly on the shelves, keeping the early and late varieties apart, and do not fail to inspect them from time to time as required.

ROSES IN YORKSHIRE.

WHEN the tragedy of August, 1914, came upon us, there must have been many hundreds of amateurs who, like myself, had already placed orders for new and experimental varieties of Roses. I hope that most of these orders remained and were executed, both for the sake of the nurserymen and the feast of bloom that has rewarded us this season.

We hoped that the appearance of bloom would coincide with a world peace, and although that desirable consummation is still to come, we know that it will come, as surely as the choicest blooms follow the hard pruning that at the time appears to be such a ruthless operation.

Juliet as a Fan-Shaped Bush.—The outstanding feature of my own garden in June was Juliet, which I had pegged down into a fan-shaped bush. This commenced to bloom on June 8, very early for Yorkshire, and quite three weeks earlier than the same tree bloomed as a maiden in 1914; while by June 18 I had no fewer than sixty-three blooms either fully out or in the half opened bud state. It was a glorious sight, and many of my friends came into the garden to inspect it; and even now, early September, there are two or three buds that will develop. Needless to say, the bush has received generous treatment from the manure heap, but it is obvious that it rewards us on the same scale.

Ten Good Roses.—Before passing to the newer varieties that have justified their place in the garden, I should like to mention again two or three varieties which I recommended in articles under this heading last year, and which have with me so abundantly justified that opinion that they ought to be mentioned again for the benefit of amateurs in this district. If I were limited to ten varieties only, I would unhesitatingly plant quantities of Lieutenant Chauré, General Macarthur and Fisher Holmes in the reds; while Mme. Ravary, Duchess of Wellington and Betty cannot be beaten for the yellow and copper tones. From these six one

gets not only quantities of bloom, but quality also. For three representative pinks I go for Lady Ashtown, Mrs. George Shawyer and, of course, Mme. Abel Chateau; while the tenth variety, and in some respects it is the most attractive of the whole lot, is Mrs. David McKee, with huge creamy yellow blooms of perfect shape that last well on the plants.

Some Newer Varieties.—Passing direct to some of the newer and, to my experience, quite new varieties, I commence with

Chateau de Clos Vougeot, a velvety scarlet of rich colour and fine texture. It appears to me to be sunproof; its colour is retained in heat or wet, and is a good grower and abundant bloomer. It has a tendency to produce horizontal shoots that are a little awkward in a well-filled bed, but it is one of the best and darkest reds I have yet grown.

Geoffrey Henslow, another red of an orange crimson tone, is a splendid garden Rose, globular in shape, though not of uniform shape with me. Yet it must be named because of its exquisite perfume. It is one of the sweetest and most powerfully perfumed Roses I know, even for a red. We want more new varieties with this quality of scent.

Dora van Tets is a beautiful little red Rose somewhat resembling Richmond and as effective in colour, but with a most fascinating perfume and a bloom that lasts well on the plant or when cut. The flowers are produced on slender, graceful stems that are the better for some slight support. The fault of this variety is its dwarf habit of growth, which debars it from a good position in the bed.

Mrs. Edward Powell is a fine scarlet Rose that with me is an excellent grower, and is obviously of great merit as a bedder. The foliage is very attractive, a vigorous reddish tint, quite free from mildew. This variety gives promise of abundant autumn bloom.

Mrs. Arthur Coxhead is another good variety. It has large flowers of perfect form, is continually in bloom and full of scent. The colour is not a favourite shade—a pale claret red that will not accord with other reds. It demands a bed to itself, and would then be better appreciated.

H. E. Richardson, a lovely dark red, has well-formed flowers of great fragrance; it is also of value as a Rose that lasts well on the tree.

King George V., by the same raisers (Messrs. Hugh Dickson), has also done well with me. A fine dark red. It has a touch of violet now and again that does not really improve it, but the blooms are of good shape, and I consider it of value as an exhibition variety.

Laurent Carle is another Rose that I would plant more of. It is a fine garden Rose, a brilliant carmine, quite distinct, and the flowers are produced on extra long and strong stems, a great quality in bedding Roses. This variety never needs support of any kind.

Mrs. Charles E. Allen.—This is another delightful Rose that is perhaps not generally well

known among amateurs. Although almost a new variety (1911), it is within reach of the most modest pocket. The colour is a delicate or pale orange, changing to salmon buff. I have had some perfect blooms, both in shape and colour, which are perfumed. It is one of those varieties which we willingly increase at the expense of the many very moderate growers, because, in addition to its other virtues, it makes good, clean foliage and is with me free from mildew.

Roundhay.

E. WATERS.

CULTIVATION OF FREESIAS

THOSE who are fond of the Freesia should procure their bulbs and pot them at once, for September is the latest month to get them into their flowering quarters. August, it is true, is better still, and even July is not too early. They shrivel and deteriorate badly when left unplanted until late in the autumn, and the careful grower will take time by the forelock.

APPLE CHARLES ROSS, AN INDISPENSABLE DESSERT VARIETY.

If I am asked what to plant, I reply that if the common sorts are going to suffice the enquirer, such things as *refracta*, *refracta alba*, and *Leichtlinii* are probably essential, as they are vigorous and also cheap. But when buying *Leichtlinii*, one may get any sort of thing, and I must confess that after many years' experience I cannot recommend a reliable source from which one can get this plant true to name. I am amused, though, to notice that the everyday Press writer rarely goes further than to recommend the several varieties I have named above. He seems to have forgotten that hybridists have been at work, and of late years some very charming new varieties have appeared, resulting from their labours. Account should be taken of such sorts as *Chapmanii*, (yellow), *Excelsior* (a very large and solid cream-coloured flower), *Tubergenii*, *Tubergenii Amethyst*, *Le Phare*, and others which are now quite moderate in price, for the *Freesia*, like the rabbit, multiplies very freely under favourable conditions, and bulbs which were quoted at so much each a very few years back may now be had at the same price, or less, per dozen.

I notice that Mr. Van Tubergen in his this year's list quotes no fewer than a score of new coloured varieties of his own raising, while other breeders are at work, and among new *Freessias* exhibited at the meetings of the Royal Horticultural Society there are frequently some pretty and interesting ones on the stand of Messrs. Barr and Sons, one named *Orange Queen*, in particular, having struck the eye of the writer. This is a very fine rich deep yellow flower, with every appearance of vigour, but not in commerce yet, I think. The few essential points in connection with the successful cultivation of the *Freesia* are now fairly well known, but will bear repetition. I had to find them all out for myself, for when I began to grow *Freessias* years ago I was just content to watch my neighbours' methods, which I now know were nearly all wrong.

The main secret of successful *Freesia*-growing, then, appears to me to be the avoidance of coddling in all its shapes and forms. After potting, do not house your plants until frosts begin to threaten. When housed, give them as much air as possible and a reasonable abundance of water, varied in the later stages with plant stimulants of a reliable kind. Finally, let the staking of the plants be as unapparent as possible, the thinner the sticks the better, and let such tying as is required be done with thin green bast or Raffiatape.

A houseful of the newer *Freessias*, in their varied shades of white, mauve, yellow, crimson and rose, is one of the most charming sights imaginable, and even just a few plants, carefully grown, will give a great deal of pleasure and delight to the cultivator.

MICHAELMAS DAISIES.

AT this time of the year, when the flower-borders, if not quite done for, are at least at their last stage before final dissolution, it is a joy to come upon a well-planted border of the perennial Asters, with their clear, fresh colouring all the more accentuated by contrast with the general sombre rustiness of the greater part of the neighbouring vegetation. For the extension

by using not more than twelve to fifteen kinds in bold drifts than by having a larger number in lesser patches.

A limited number of good kinds having been secured, the whole effect of the borders will depend upon good arrangement and good staking. It is much best, as in all other flower-border work, to do it by a plan on paper. If space can be given for a border or double border for September and another for October, both should be carefully planned; then a good range of kinds, both early and late, can be used to advantage. There are

such borders in the present writer's garden. As the one for September has a greater length than the later one, some other colours and kinds of plants are introduced, though the main effects are of the early Daisies. Here are *Asters acris* and *Amellus*, with low plants of whitish or glaucous foliage, chiefly *Stachys* and white *Pink*, near the path, with a rather thick inter-planting of *Ageratum*; then the moderate-sized *vimineus*, the pretty, smallish *Collette blanche* and some seedlings of good short habit, and, further back, the taller kinds derived mostly from *Novi-Belgii* and *Novæ-Angliæ*. It may be as well to remind readers that *Novi-Belgii* accounts for the greater number of the tall and medium tall kinds with smooth stems and leaves, and that *Novæ-Angliæ* is the parent of those, also tall and of middle height, that have the stems and leaves rough and hairy and a rather strong, characteristic scent, the varieties of *Novi-Belgii* being much the more numerous.

To return to the early Daisy border, among the kinds of medium height are the splendid *N.-A. Ryecroft Purple* and another of the same family named *Mitchellii*. At the back is one of the best, the grand *puniceus*, with its large, closely clustered heads of palest grey-lilac, and a number of the tall varieties of *Novi-Belgii*, with some groups of white *Dahlias* and in front of these the newer *Aster Mrs Tynam* about 3 feet high, of pinkish mauve colouring. Throughout the borders are groups of plants with grey foliage, such as *Phlomis fruticosa*, *Lyme-grass* and *Euphorbia Characias*, pleasantly breaking the flowery masses. Some groups of flowers of pink colouring are

admitted in this double border—*Japanese Anemone*, double *Soapwort* and the large *Stonecrop Sedum speciosum*, the last always covered with bees and butterflies. Near the middle of the length of the border on both sides is a break of palest yellow. Here the flowers are *Dahlia Lady Primrose*, pale sulphur *African Marigold*, lemon white *Snapdragon* and flowering *Golden Feather Feverfew* at the foot.

By the time the September borders begin to look a little overrun, the ones for the later kinds are brilliant with their clear, fresh beauty. Here

FREESIA CHAPMANII, A BEAUTIFUL
YELLOW HYBRID.

of the time of enjoyment of hardy flowers, as well as for their own beauty, it is well worth while to have them in a separate border in some place rather away from other gardening. If a double border can be given to them alone, it is all the better, and it will add another month to the life of the hardy flower garden. In fact, it is desirable to have two separate double borders of Michaelmas Daisies in different places. There are now such large numbers of desirable kinds that the difficulty is to choose few enough, for, unless a Daisy border is of unusual size or length, a better effect is gained

there are no other coloured flowers; the Starworts are alone, with the sole inclusion of the great white Daisy *Pyrethrum uliginosum*, whose time of flowering, being intermediate, serves equally in the borders of the two seasons. Here is again *Amellus*, a rather later variety being chosen; then the low-growing pinkish *Mme. Soynuce*, a late dwarf *Novi-Belgii* seedling and a latish vimineus, again with *Ageratum* and *Stachys* next the path. Then *J. Dickson* and *Archer Hind*, both of moderate growth; *Flora*, a home-grown seedling of pale mauve-lilac; *cordifolius elegans* and its lovely variant *Diana*, raised by the late Rev. C. Wolley-Dod; the fine old *Robert Parker*, *Top Sawyer*, *Ella*, and three of the late *Novæ-Angliæ*, namely, *J. Bowman* (reddish purple), *Constance* (violet-purple) and a pale pink *Novæ-Angliæ ruber*. There are now several varieties of this in deeper pink colourings, but there is always a danger in the reddish colouring of *Michaelmas Daisies*; it is apt to come of a heavy quality, neither good in itself nor easily employable from the artist's point of view among the fresher lilacs and purples. The older pale pink *ruber* is especially beautiful with the large white Daisy *Pyrethrum uliginosum*, and is purposely trained through and among it. *Asters Thomsonii* and *Hon. Edith Gibbs* are two

beautiful kinds that should not be omitted. In addition to those, or as alternatives, some of the fine newer *Asters* should be grown; the grand *Climax*, the double *Beauty of Colwall*; the still more recent *Queen*, *Magnet H. Adams*, and the two *Novæ-Angliæ* *Lil Fardell* and *Ryecroft Pink*. Among shorter-growing new kinds there should be *Lady Lloyd*, *Esther* and *Lovely*.

In soils of a light character, and possibly in all, it is well to divide and replant the *Asters* every year, freshly preparing and manuring the ground. If they are left for two or three years they spread considerably; then the outward overgrowth, which contains the best material for replanting, is chopped off with the spade, leaving only the less profitable part of the plant.

At the same time, some of the bolder-growing kinds and any of the white *Daisies* that come rather forward can be pinched back to half their length. This keeps them shorter and causes them to branch without delaying the flowering season. Only varieties of *cordifolius* and *Novæ-Angliæ* are not pinched, because the graceful arching form of *cordifolius* would be disturbed and because *Novæ-Angliæ* is found to be shy of blooming after being cut back. Before any

shortening, the borders should be surveyed from end to end and the pinching done where the eye requires that the plant should go back. It may be done a little more boldly than the appearance of the border actually demands in June, as the flowering sprays are apt to come forwarder than one anticipates when they are loaded with bloom and sometimes burdened with rain. G. Jekyll.

ORCHID NOTES.

CYMBIDIUMS.

THESE are showy terrestrial Orchids which may be grown in the intermediate house or among the *Cattleyas*, and I have also seen some fine examples of *C. lowianum* and *C. grandiflorum* growing in the cool greenhouse. The majority are vigorous-growing subjects, and are not adapted for small houses; but they are very useful for a corridor or where there is a central stage. They are free blooming, and the graceful arching sprays remain in full beauty for some weeks, either on the plant or in a

A BORDER OF MICHAELMAS DAISIES.

cut state, providing the water is periodically changed. If given careful attention, *Cymbidiums* will soon grow into nice, compact specimens, and a plant with upwards of a dozen scapes is a grand sight. In growing *Cymbidiums* and terrestrial Orchids generally, it should be borne in mind that a substantial and generous rooting medium must be supplied, while ample root accommodation is also essential. For large and well-rooted examples, a pot of suitable dimensions must be chosen, and, as a rule, one, two or three sizes larger will be needed, while, for exceptionally big specimens, wooden tubs are employed. The compost consists of good fibrous loam, one-half; peat or *Osmunda* fibre, one fourth; and partly decayed Oak leaves, one-fourth, with a fair sprinkling of finely crushed crocks added. This must be well mixed and used in a lumpy state for the large plants; but for seedlings it ought to be cut up rather finely until they require a pot 4 inches in diameter. During the greater part of the year *Cymbidiums* enjoy a fair quantity of water at the base, and when the

which the beautiful *C. insigne* figures as one parent embrace *Alexanderi*, *Doris*, *gottianum*, *glebelandense* and *Schlegelii*. T. W. B.

THE HEATH GARDEN AT WISLEY.

PINE woods and Heather form the leading vegetation of the country surrounding the Royal Horticultural Society's Gardens at Wisley. It needs but a glance at the bright patches of Ling, or Heather, of this Surrey moorland to convince one that this is an ideal site for a Heath garden. Backed by *Rhododendrons* and over-shadowed by Oaks and coniferous trees, the Heaths never fail to give satisfaction in these congenial surroundings. At almost any season of the year a certain amount of flower may be seen, but it is doubtful if any season is brighter than the present. Several of the Heaths now flowering are seedlings, some of them of many years' standing, and their history is lost in obscurity. Numerous self-sown seedlings appear each year,

THE POMEGRANATE.

(*PUNICA GRANATUM*.)

ONE of the special attractions in the autumnal garden is the double Pomegranate, covered at this time with its waxen blossoms in the purest scarlet. This semi-tropical shrub, too rarely seen in Britain is probably far more hardy than it obtains credit for, and if planted in a sheltered position or against a south wall, it does not appear to suffer any harm from our winters. This may be accounted for from the fact that it starts into fresh growth very late in the spring, and if only its wood is thoroughly ripened during the previous summer, it is not affected by the frosts of winter.

About the end of April the first shoots appear, clothing each twig with neat, shining leaves in the red tint of port wine, which makes the foliage very distinct and handsome until it gradually develops into bright green leaves. The globular scarlet buds, produced in abundance on the terminal sprays, first appear towards the end of July, and during August and September they open into the exquisite flowers which we usually associate with Eastern climes. Fruit, however, does not ripen well without the sunshine of the Tropics. The chill of winter comes too quickly for the Pomegranate in our gardens, though it may be possible to grow this fruit in specially warm houses. However, as a fruit Pomegranates are as disappointing as their flowers are charming, and—except in the great heat of India, when the acid water the fruit contains is refreshing—they are not worth the trouble of eating. In October the latest flower, sheltered in a corner, may be found, and then the foliage turns yellow and drops before any severe frosts affect it, after which the plant rests for nearly six months before it again starts into life. No pruning is required, for its natural shape is neat and bushy, while it is fatal to the prospect of flowers to remove the tips of the branches, on which the buds should appear the following season. Even where the Pomegranate covers a wall it should not be cut back to the conventional flat surface if flowers are required, and it does

seem a pity to sacrifice such rare blossoms to the craze for absolute tidiness which arms so many gardeners with the ruthless shears.

Young plants of this beautiful shrub should not be placed in the border until they are well furnished with ripened wood, unless they can be sheltered by a frame-light (fixed in a slanting position over them in November) during their first winter in the garden. The position for this shrub should not only be sheltered from the north and east, but fully exposed to the sunshine, with a well-drained and deep soil, to which a mulch of old hot-bed material can be added each year in April. The height it has attained in the writer's garden is about seven feet, having flourished in the same position on a sheltered southern terrace for fifteen years.

I. L. RICHMOND.

A CORNER IN THE HEATH GARDEN AT WISLEY.

repotting is finished, the surface of the soil should be 2 inches below the rim. As winter approaches, less moisture in the atmosphere and at the root will be needed, but at no time must *Cymbidiums* suffer from drought to the extent of causing the pseudo-bulbs to shrivel.

A Selection of Species and Hybrids.—*Cymbidiums* have always been popular, but their popularity has considerably increased since the reintroduction of that superb species *C. insigne*, of which there are several fine varieties. Then we have among the better-known plants *C. traceyanum*, *C. lowianum*, *C. eburneum*, *C. giganteum*, *C. devonianum* and *C. tigrinum*, the last two being characterised by their pendent scapes. Of the hybrids, *C. eburneo-lowianum* and *C. winnianum* are both distinct and handsome, while those in

some of them no doubt hybrids. Of those now flowering, the varieties of *Erica vulgaris*, the Cornish Heath (*E. vagans*), *E. Tetralix* and *E. carnea* are noticeable. The Dorset Heath (*E. ciliaris*) is one of the best of the dwarf Heathers that flower at this season, while the Scotch Heather (*E. cinerea*), is a gem among hardy Heaths. But the most distinct, and perhaps the most effective, of all the Heaths in these gardens now is *St. Dabeoc's* or the Irish Heath, whose name has been changed by botanists from *Erica* to *Daboecia* and *Menziesia polifolia*. The crimson-purple blooms of the Irish Heath are freely borne in drooping racemes, while its white counterpart is equally profuse. Both forms may be seen encroaching over a narrow pathway, as much at home as they could be on the edge of an Irish moorland. H. C.

GARDENING OF THE WEEK.

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Late Grapes.—There was a considerable shortage of sunshine during July and August which somewhat retarded the development of late Grapes. It will be necessary now to give them all the assistance possible to get them perfectly finished before the dull autumn weather sets in. Ventilate the houses with care and keep a little heat in the pipes whenever the weather is cold and dull. If the inside borders need water, choose a fine dry day, when the ventilators can be opened to their full extent. In the event of very heavy rains, the outside borders should be protected, but the protecting materials must be removed when the weather is fine.

Midseason Vines.—Any Vines which have been cleared of their crop may now be partially pruned, thus facilitating the ripening of the wood and the plumping up of the basal buds. Healthy Vines which have carried heavy crops of fruit may be given a thorough soaking of diluted farmyard drainings. Borders which need renovating may be attended to at any time now.

Melons.—These plants will need more careful attention to cultural details than is the case earlier in the season. Plants on which the fruits are approaching the ripening stage will not need so much atmospheric moisture, or the netting on the fruits will be coarse, which renders them liable to crack. Syringing should be discontinued altogether, and a little air must be admitted to the house at all times. A minimum temperature of 70° should be maintained till the fruits commence to ripen.

Plants Under Glass.

Schizanthus.—Another batch of this useful plant may now be raised. Seeds may be sown in small pots or pans and placed in a cool house till they have germinated, after which they may be grown in a cold frame till there is danger of frost.

Clarkias.—These may also be sown and given similar treatment to the above. Clarkias make splendid plants for the conservatory when given liberal treatment. Specimens 5 feet and 6 feet high may easily be grown if required. They must be grown under very cool conditions all through the winter months.

Mignonette.—Another sowing of Mignonette may also be made in small pots. If sown in 3-inch pots they may be potted into those in which they are to flower when ready. The plants will flower in 5-inch or 6-inch pots. They require the same cool conditions as advised above.

Bouvardias which are planted in a border outdoors must now be potted up and placed under glass. Take them up with a good ball of roots and pot them into 6-inch or 7-inch pots. Keep them close and shaded till they have recovered from the check, and syringe them two or three times a day.

Coleus thyrsoides.—Plants should now be well rooted in their flowering pots, and must be given some form of stimulant, increasing this in strength as growth develops. Admit plenty of air during congenial weather, leaving the ventilators open a little on the top of the house all through the night. A minimum temperature of 55° or 60° will suit them till they are in flower.

The Flower Garden.

Planting Bulbs.—The planting of many kinds of bulbs in grass is annually becoming more popular, and rightly so, for many species of bulbous plants look more at home when grown in this manner. No time should be lost in planting the bulbs when they are to hand. A quantity of Tulips and Narcissi should be grown in the reserve garden for cutting.

Climbing Roses.—The young growths must be given every chance to get well matured before the winter. Cut away all useless growth, so that light and air can penetrate right through the plants. Give them plenty of water when necessary, for growth is still active. If mildew is present, syringe with a specific.

The Hardy Fruit Garden.

Late Plums.—Wasps are unusually numerous this season, and unless late-keeping Plums are protected from these pests, very few fruits will be left to ripen. Jars of sweetened beer hung about the trees will trap many of the insects, but the most effective method of dealing with young trees is to tie sheets of tiffany over them. See that the trees on walls are well supplied with water at the roots.

Strawberries.—Plants which have fruited this season and which are to fruit next year should be mulched with farmyard manure. This will strengthen the crowns for another season. Dustings of well-seasoned soot will also be beneficial in this direction, as well as destroying slugs and snails. Runners must be kept removed as they appear. During dry weather, plants which have been put out this season must not be neglected in the matter of watering.

The Kitchen Garden.

Globe Artichokes.—Fresh plantations of these useful vegetables must be made every two or three years. The potting of suckers in the autumn forms the best method of propagation. Carefully remove the young growths from the old plants, pot them into 6-inch or 7-inch pots, and plunge them in ashes in a cold frame. They will make excellent plants for putting out in the spring.

Turnips.—Thin out the young plants as soon as they can be handled and run the hoe between the rows. Light dustings of soot or wood-ash will keep the Turnip fly in check and act as a stimulant to the plants, especially in showery weather. If necessary, another sowing might still be made on a warm border.

Cauliflowers.—A sowing may now be made in cold frames for spring supplies. Sow the seed thinly in poor soil and prick out the young plants as soon as they are large enough. To encourage a sturdy growth, admit plenty of air at all times, removing the lights altogether when the weather is favourable.

Mushrooms.—If a suitable house is available, beds should be made up every two or three weeks. The materials must be collected in a dry shed and turned every two or three days to get them into condition. When the manure is ready, make the bed by ramming the materials firmly together. Do not spawn the bed till the temperature has declined below 80°. After putting in the spawn, cover the bed with an inch or 2 inches of soil.

E. HARRISS.

(Head-gardener to Lady Wantage.)

Lockinge Gardens, Berks.

FOR NORTHERN GARDENS.

Plants Under Glass.

Chrysanthemums.—As most of the plants will be housed within the next fortnight, it will become necessary to protect the late-flowering varieties, which should, if possible, be allowed to remain outside until they have set their buds. Where they can be protected by erecting spars to hold up the covering material clear of the plants, fewer weak and drawn up flowering stems are the result. If possible, avoid overcrowding the plants, both outdoors and under glass.

Primulas and Cinerarias.—The later plants should be put into their flowering pots before becoming starved for want of pot room. Do not overpot. Any fly or other insect pests can be got rid of by fumigation, which should not be given very strong in the case of these plants or when the foliage is damp.

Begonia Gloire de Lorraine.—Where plants are required to be early in flower, the picking of flower-buds must cease. Tying requires to be done every two or three weeks. With less evaporation taking place, less water must be used in damping the floors of the houses, and syringing of the plants must be discontinued after this date. Avoid a close atmosphere and continue to use the blinds during bright weather.

Malmaison Carnations.—Layers which were potted in August—in fact, all Malmaisons—should

now be removed from the cold frames to the Carnation-houses where there is pipe heat to dispel any over-abundance of moisture. Plants left outside after this period are almost certain to fall victims to the dreaded Carnation rust.

The Kitchen Garden.

Potatoes.—Any tubers which may still be left in the ground should be lifted without further delay, as there is nothing to be gained by leaving them longer. They may be stored either in a cool shed or pit, but where rats are troublesome it will be necessary to make them secure against attacks.

Cucumbers.—Another sowing may be made to raise plants which will fruit in late winter, remembering to grow them in a much lighter compost than that used for the summer crop.

Spinach.—Later-sown crops should be thinned as they become large enough, and if the soil is not very rich, some artificial manure can be hoed in to encourage a free growth.

Celery.—The earlier crops are ready for another earthing up, which should not be delayed if good heads are required for next month.

Beetroot.—If there is any danger of this crop growing too large, the roots should be pulled up without further delay and stored. Every care must be exercised in handling the roots, otherwise, if at all bruised, they are ruined for kitchen use.

The Flower Garden.

Calceolarias.—The different varieties of Calceolaria ought now to be propagated in cold frames. If the cuttings are put in fairly thick, they take up less frame space, and consequently need less covering material during severe weather. Then it is easy to replant early in spring, when, by giving them more room, they develop into large plants.

Tender Plants which have been used outdoors for subtropical bedding must be placed indoors when there is any danger of frost. The plants which have been plunged should be closely examined to see that the drainage is in perfect order before removing them to their winter quarters.

The Grass under and around trees, which cannot be mown with machines, should be cut over before the leaves fall in any quantity. If left any later, the work is more difficult and cannot be done so well.

Fruit Under Glass.

Late Vineries.—The conditions prevailing when ripe fruit is hanging must be much drier than has been the rule up to this stage. Air should be admitted freely on all favourable occasions, although a low temperature must be avoided by keeping a circulation of heat in the pipes, regulating this in accordance with outdoor conditions. During wet weather much more pipe heat should be used. The borders when requiring water should be dealt with early on a sunny day, so that most of the surface moisture may escape through the ventilators before night.

Fruit Houses at Rest, such as early vineries and Peach-houses, should be kept clear of other occupants as far as possible. This is not practicable in many establishments, owing to the demand on space under glass. Where Chrysanthemums and other plants have to be admitted, they should be placed as thinly as possible and clear of the trees. Another objection against the practice of housing plants in fruit houses is that vermin is in many cases introduced with them, which is a permanent source of trouble to the grower.

The Hardy Fruit Garden.

Autumn-Fruiting Raspberries.—When there is danger of frost injuring the blossom, it will be necessary to protect the plants with some light covering material. As the fruit ripens, it is even more liable to be devoured by birds than the summer fruit, and should therefore be well protected with nets.

Loganberries and similar fruits should have all the old canes removed as soon as the crop is over, and the young growths may then be secured in their permanent positions. The plants then need no further attention except the application of manure during winter.

JOHN JEFFREY.

(Head-gardener to Sir R. W. Buchanan Jardine, Bart.)

Castlemilk Gardens, Lockerbie, N.B.

WANTED: GOOD HOMES.

BY THE REV. JOSEPH JACOB.

I HAVE a great many old and more newly acquired friends for which I would like to find good homes. At present they are in their boxes or bags wondering what is going to happen to them. Jenny is one, and Jenny is lucky, for when such a powerful patron as the great firm of J. R. Pearson and Sons of Lowdham backs me up, and, as it were, vouches for anyone's proper behaviour, that friend's future is well provided for. Who is Jenny? What is she? The sweetest and brightest of early Tulips, who only asks for a little pot room to be perfectly happy, but who, good little soul, is so accommodating that, although she appears to prefer pots, can make herself quite contented out of doors. That mass of lovely, lively pinky rose down the garden did come in for some nice remarks last spring and no mistake. Then there is Jenny's near relative, President Lincoln, splendidly named, the white base of the flower typifying the stainless soul of the hero, and the delicate, retiring purplish mauve of its petals his quiet strength. He asks for a home. Who will give him one? Kitchener has not had — magnificent as it is — a greater reply than President Lincoln had when he appealed to Congress. Pardon me for quoting it again, but it is wartime, and I love to think of the gardener's response.

We are coming, we are coming,
As our fathers did of yore;
We are coming, Father Abraham,
Ten hundred thousand more.

Cerise Gris-de-lin begs for a few cubic inches of earth in some kind person's greenhouse.

Somewhere in Horace, if I don't forget.

We find a wealthy man.
Whose wardrobe did five thousand suits contain;
He counted that a vast prodigious store,
But I that number have twice told and more.

The "raspberry and cream" red of Cerise Gris-de-lin's coat, with its lapels of fawn; the rich dark blood red crimson of Couleur Cardinal; the screaming, almost vulgar, red and yellow—if a flower ever can be vulgar—of Keizerskroon; the soft Tea Rose yellow of the semi-double Safrano; and the strange pink-toned claret of La Remarquable are samples quoted to prove the truth of the words Cowley put into the Tulip's mouth. Personally, I like them all but Keizerskroon. It is so aggressive and, figuratively, uses such bad language when anyone tries to be neighbourly that I would ask for a place in my readers' glass-houses for Hector instead. Keizerskroon and Hector might be labelled "vulgarity and refinement."

The claims of Cottage and Darwin Tulips may be reserved for a later date. I am more anxious about some of my other friends now—the jolly little species Crocus, which are just longing for

a nice "pocket" on some well-cared-for rockery. Will not someone have pity on them? They are such good little people—very many of them—and so little trouble. Sieberi, susianus, biflorus, tomasinianus and Imperati are real beauties, and yet most of the big firms of the British Isles treat them as if they were poor plain Wallflowers and leave them severely alone. Go where they are to be found—to Barrs, for example—and offer them a home; their smiles soon after Snowdrop-time will amply repay you. All they ask for is a quiet, sheltered nook. I wonder if Mr. "Bard" or Mr. "Ireland" would help the little people with a grand display next spring! "Please, sirs, do, do."

ORNITHOGALUM ARABICUM. A USEFUL SUBJECT FOR CUTTING.
THE FLOWERS IN THIS VASE LASTED FOUR WEEKS.

My good old friend Mr. Mallender tells me you can have too much of a good thing. When he was head-gardener at Hodsock Priory, Miss Mellish got him to plant Ornithogalum nutans in the garden, and he tells me they have been trying to get rid of it ever since. Forewarned is forearmed. A home is being found for a hundred at Whitewell Rectory this autumn. The vases of it in Bath's group at the last Chelsea Exhibition were among the belles of the show. It may have been the proximity to the gay colours of the Tulips that brought their delightful shiny, silvery green and white flower-spikes into such prominence; but, however it was, the fact remains that the suggestion a titled lady who frequently visits the Wisbech nurseries made to Mr. Leak bore good fruit, and

many are the gardens which are waiting to give it a welcome this autumn.

Ornithogalum arabicum, first cousin to the foregoing, is of an entirely different disposition. It is a somewhat shy customer and needs the warmth of a Guernsey or a Southern sun to prepare it for a display, but as the transfer from a dealer's storeroom to a reader's glass house can be effected by a very small expenditure of silver shillings, it is well worth the offer of a home. The blooms are like exquisite large, pure white Buttercups, with a shining black pearl in the centre of each. They are arranged on the stems in a sort of umbel, and to add to their other charms they have a sweet Hawthorn scent which is just strong enough to

be pleasant. Like the flowers of a Gladiolus or a Lavatera, they all open in water in orderly sequence, without any hustling one another out of the way before it has had a real good "blow" The ancients, according to Parkinson, must have been too much taken up in settling whether it was a Lily, a Hyacinth, or a Star-flower, that they neglected the chance of giving it one of those grand, long, many-worded names which its many excellences might well have suggested. Perhaps, after all, they did well to concentrate on arabicum, for, alas! it is "very impatient of our cold winters, so that it seldom prospereth or abideth with us."

Tritonia Prince of Orange is a Guernsey-born bulb that is anxious to seek its fortune abroad. Crocata, its brother, has already made the attempt, but owing to a provoking habit which it has of consistently refusing to do itself full justice except in sunshine, it has not been so widely welcomed as otherwise it might have been. Prince of Orange is a much more taking person. Sun or no sun, its bright scarlet orange blooms remain expanded and brighten its adopted homes. It asks for pot room in a cool greenhouse, as it is a very chilly subject and cannot stand cold.

The last plant on whose behalf I am going to plead for a good home is that fine old border

gentleman, Thunderbolt, the best still of all the Xiphium Irises. I have seen the beautiful creations of Van Tubergen of Haarlem and of Chapman of Rye, but none of their children surpasses this old favourite in quiet elegance. It is the Louis XIV. of the Spanish and Dutch Iris tribe, inasmuch as the rich combination of deep purple and bronze that is found in that Tulip is reproduced in the Iris. By the way, I like its name; it seems singularly appropriate for some reason that is not quite clear. Perhaps it is due to its peculiar colour, deep purple and bronze, weird and yet how beautiful! Who will provide the warm, light, rich soil that it delights in? With such accommodation as this secured, it will flourish and multiply.

THE BLACK OR BERRY-BEARING ALDER FOR GUNPOWDER.

THE following article, by Mr. W. Dallimore, which appears in the *Kew Bulletin*, No. 6, will, we think, be of special interest now that explosives are so much in demand:

"A good many complaints have been made during recent years regarding the poor prices obtained for coppice wood and the difficulty experienced in finding a market for some kinds, yet there are certain coppice woods that are not produced in sufficient quantity to supply the demand, and adequate steps do not appear to have been taken to replace plantations of unremunerative trees by more promising species.

Rhamnus Frangula is a case in point, for, although wild in the southern parts of the British Isles and at one time cultivated to some extent, it has been impossible for many years to secure the required quantity of wood in this country, and importations have been made from Belgium and Germany. The value of the wood at the present time will be appreciated from the fact that when carbonised, the charcoal is recognised as one of the most important of all charcoals used in the manufacture of explosives, its inflammable character making it peculiarly useful as an ingredient for smokeless powder.

Even before the commencement of the present war, manufacturers experienced a difficulty in securing the necessary amount of wood; therefore there appears to be good reason for landowners in this country, and particularly in the Home Counties, laying down plantations to replace coppice, which at present hardly pays working expenses.

Under normal conditions *R. Frangula* is found as a bush 6 feet to 15 feet high, with upright branches, or sometimes as a small tree 20 feet high, with a trunk 6 inches to 9 inches in diameter. The leaves are deciduous, bright green, oval, and 2 inches to 3 inches long by 1 inch to 1½ inches wide. The flowers are greenish yellow and borne in May, and they are followed by small, round fruits, which are alternately red and black when ripening.

Tall, straight shoots with few side branches are most approved for charcoal, and such shoots may be from half an inch to 2 inches in diameter; larger wood can be used, but it is usually passed over in favour of the smaller sizes. The wood is either cut in spring when the sap is flowing freely, or in winter when at rest. In the former case the bark is peeled off at once, as is done with spring-cut Willows; but in the other instance the wood is boiled or steamed before peeling. Great care is taken to keep the newly peeled wood free from dirt, and provision is made so that it does not come in contact with the ground, for any foreign matter has to be thoroughly cleaned away before the wood can be used. The wood is usually sold to the powder factories as soon as it is peeled, and in normal times the purchasers keep it for a period varying from one to three years before turning it into charcoal. To keep it clean during the process of seasoning, it is often stacked and thatched, in the same way as hay or corn, as soon as it arrives at the factories. The exclusion of particles of sand and grit from the charcoal is of vital importance; therefore,

after being thoroughly cleaned, the wood is placed in a closed cylinder for carbonisation, heat being applied from outside. It is difficult to say what the wood is worth at the present moment, but a few years ago it was quoted at from £10 to £14 a ton.

The most suitable soil for *R. Frangula* is a moderately good loam, but as a rule it may be expected to thrive where the Hazel grows well. Propagation should be conducted by means of seeds sown in boxes in a cold frame, or in beds of well-drained soil out of doors. The young plants should be placed 6 inches apart in nursery rows a foot apart, and, when about nine inches high, they should be cut back to induce several branches to appear from near the ground line. When the young plants are from 12 inches to 18 inches high, place them in permanent positions at intervals of from 4 feet to 5 feet, on ground that has been well broken up. From six to eight years' rotation will probably be found most suitable for the crop, though position and soil may make a year or two difference either way. An open position exposed to south or west is considered to be most favourable. When cutting a plantation over, care should be taken to cut the branches as close as possible to the rootstock; otherwise long, objectionable spurs will be formed. In the event of a large number of shoots being produced from cut-over plants, it is wise to remove all unnecessary ones during the first year. Growth is facilitated by keeping the ground free from coarse weeds, and by working between the plants occasionally with a cultivator while they are small. Should signs of deterioration appear in the vigour of the branches, a dressing of bone or some other manure may be applied to the land, for a little money spent in this way will be amply repaid by increased yield.

It is doubtful whether a large stock of plants could be procured in the British Isles at the present time, and the catalogue price for single plants places the few which are available outside the bounds of practical forestry. It would therefore appear likely that anyone wishing to undertake the cultivation of this plant would need to commence by sowing seeds. The fruits may be collected during August or September and placed in sand to separate the seeds from the flesh, sowing the seeds and sand together during the early spring. People who already possess large or small plantations might find the present time an excellent one for marketing the produce.

In some parts of the country *R. Frangula* is known as Dogwood, but it is quite distinct from the true Dogwood (*Cornus*), which makes an inferior charcoal, and the two plants must not be confused."

A NEW CLASSIFICATION OF ROSES.

THERE has been some talk about a new classification of Roses. The promoters of the scheme are of opinion that the barriers which at one time separated the Hybrid Perpetuals from the Hybrid Teas, and the Hybrid Teas from the Teas, have long been broken down, and that it is next to impossible to assign new Roses to their rightful groups. It is also claimed that the Hybrid Tea group has become very unwieldy, and that it includes varieties of Roses which are widely diversified, so much so that there are Roses to be found among Hybrid Teas which are totally

unlike one another for practical purposes, such as association in the same bed.

It has also been pointed out that the old designations are useless to the amateur who desires to know for what purpose any particular Rose is best suited; and to meet these several disadvantages it has been suggested that Roses be divided into what we may perhaps term "economic groups." That is to say, there shall be an exhibition group, a bedding group, a general purposes group, a fragrant group, a town garden group and a buttonhole group, besides similar groups of varieties suitable for decoration, cutting, greenhouse, walls, pillars and pergolas.

Clearly this is a step in the right direction. But if it is intended to place in each group all the suitable varieties, then the names of a great many Roses must go into three or four different groups, thus causing a great deal of overlapping or cross references.

It seems to us that the National Rose Society's "Selections of Roses for Various Purposes" provide a more practical solution of the problem. Let the Hybrid Tea, Hybrid Perpetual and all the other more or less artificial divisions go, but let us keep to an alphabetical list, and place to each name a sign or letter indicating for which economic group or groups the variety is recommended.

It will not be news to many of your readers to hear that we have carried out the spirit of this idea for many years past. But two years ago we commenced to do more. We realised the desire of the amateur for some means, other than the more or less indefinite descriptions, whereby he might readily gain an idea of the character of a Rose before deciding to purchase, and the resources of colour photography and colour printing were brought into use.

The plan adopted was to take typical blooms of six, twelve or twenty-four of the varieties recommended by the National Rose Society for various purposes, set them up on the usual show boards for convenience of photographing, and thus secure natural colour records for inclusion in the catalogue. This year there are no fewer than nineteen different economic groups represented in colours as nearly natural as the highest skill of the printer can commercially produce them.

The great point, of course, is that it is the selection committee of the National Rose Society, and not ourselves, who are responsible for the composition of these economic Rose groups, which are varied from year to year within the limits prescribed in the National Rose Society's catalogue of Roses. We shall be pleased to send a copy of our Rose book to any of your readers who desire to see it.

Liverpool.

BEEES, LIMITED.

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish expert advice.

The Editor welcomes photographs, articles and notes, but he will not be responsible for their safe return. All reasonable care, however, will be taken, and where stamps are enclosed, he will endeavour to return non-accepted contributions.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

The Editor will not be responsible for the return of artistic or literary contributions which he may not be able to use, and the receipt of a proof must not be taken as evidence that an article is accepted. Publication in THE GARDEN will alone be recognised as acceptance.

Offices: 20, Tavistock Street, Covent Garden, W.C.

ANSWERS TO CORRESPONDENTS.

FLOWER GARDEN.

VIOLAS ATTACKED (J. P.).—The enemy is no doubt the spotted snake mite. Trap it by placing halved Potatoes just beneath the soil, examining them and destroying the pests every day.

MONTBRETIA FAILING (H. B. Brooking).—The Montbretia sent is apparently suffering from the attack of a bacillus which destroys the foliage and sometimes the corolla of Gladioli as well as Montbretias. We think, however, the plants will grow out of it another year, though it would be wise to lift them and replant in a fresh place.

PERENNIALS FOR DRY BORDER (H. B. Brooking).—The Rose of Sharon would do quite well, but few other plants would thrive in its company. If, however, you desire a mixed arrangement of low-growing subjects, a considerable display of flower could be secured by planting several distinct Aubrietias, as Dr. Mules, Prichard's A 1, Lavender, Souv. de W. Ingram and Moerheimii, also Saxifrage such as apiculata and those of the Mossy section, e.g., Wallacei, Guildford Seedling and rubra sanguinea. By arranging these as carpeters for the front, with Campanula muralis, you might also plant Lilium candidum, Belladonna Lilies and Alstroemeria aurantiaca along the back in groups, and so secure a gay flowering at one or two periods of the year. If the position is a sunny one, the Aubrietias would be the better, particularly if you incline to one kind of plant, employing the varieties above named in groups.

ROSE GARDEN.

CRIMSON ROSE FOR BEDDING (M. M. K. C.).—Neither George Dickson, Hugh Dickson nor King George V. would make a good bed, as they are too vigorous in growth for this purpose. Should you desire a tall, vigorous grower, then of the three we should advise Hugh Dickson. You could partially bend over the shoots and thus induce a more free blossoming. We would advise as really good crimson bedders either Lieutenant Chauré, Mrs. Edward Powell, Louise Lillia or Florence Haswell Veitch. This latter is vigorous, but practically every growth will blossom.

RAMBLER ROSES ON HOUSE WALLS (Pangbourne).—We do not think the fact that the house possesses a stucco front would affect the Roses or induce mildew. It is more a question of root action and insufficient moisture at the roots. Roses on walls should be well watered twice a week from May to August, with occasional waterings of liquid manure. The soil should have been dug to a depth of 3 feet prior to planting. If you think this was not done, it would be a good plan to dig round the plants in November to the depth named. This can be done without disturbing the roots to any great extent, if care is exercised in carrying out the work. Strictly speaking, Rambler Roses should not be planted against houses. Rather would we advise the fast-growing Hybrid Teas, Teas, and Noisettes. Their foliage, being mostly of a glistening nature, enables them to withstand fungoid attacks. Of course, there are some Ramblers, such as American Pillar, Alberici Barbier, Miss Helyett, Gerbe Rose, Jessie, Tausendschön, &c., whose foliage is rarely attacked by mildew, but Dorothy Perkins and Crimson Rambler are generally failures if planted against hot walls.

MISCELLANEOUS.

NAMES OF FRUIT.—E. L. M. Johns.—Both of the Apples sent are Cox's Orange Pippin. The Tomatoes are attacked by Phytophthora infestans, a fungoid disease that attacks Potatoes and which is very prevalent this year.—C. W. Taylor.—1, Jolly Beggar; 2 and 7, Worcester Pearmain; 3, Wellington; 4, too poor to recognise; 5, Duchess of Oldenburg; 6, Duchess of Gloucester; 8, Gloria Mundi; 9, Beirré Chirgeau; 10, Princess; 11 and 12, Louise Bonne of Jersey.—Wm. J. Tull.—1, The Queen; 2, 8 and 9, Cox's Orange Pippin; 3 and 14, Golden Noble; 4, Braddick's Nonpareil; 5, Stirling Castle; 6, Mank's Collin; 7, Collini; 10, Lane's Prince Albert; 11, Round Winter Nonsuch; 12, Winter Quarrenden; 13, Barnack Beauty; 15, Wellington; 16 and 21, Bramley's Seedling; 17, Potts' Seedling; 18, Cox's Pomona; 19, Belle Dubois; 20, Lady Henniker; 23, Beauty of Kent; 22, Pear Louise Bonne of Jersey.—E. L.—Peach Noblesse and Brandy Apple.—J. V. Young.—Both Grapes are Black Hamburg. There are several forms of Black Hamburg. No. 2 is the form known as Frankenthal; the other is Dutch Hamburg.

NAMES OF PLANTS.—Lady Muriel Close.—Cratogeomys grandiflora.—Mrs. Lane.—Rhus typhina.—L. A. Riley.—Escallonia floribunda (E. montevidensis).—Boris.—Meliolus indica.—Robins.—Physostegia virginiana; it is quite hardy and will grow in any border.—A Subscriber.—1, Veronica Andersonii variegata; 2, flowers sometimes in late summer.—X. Y. Z.—1, Hypolepis millefolia; 2, Helichrysum arenarium; 3, Eriogonum biennis.—J. W. Young.—3, Pelargonium Emile Lemoine; 4, Lilium speciosum (L. lancifolium); 5, Begonia, cannot identify from flowers alone; 6, Begonia fuchsoides.—Boris.—The name of the Carnation is Pasquin.—Yin.—1, Acer platanoides; 2, Populus alba; 3, Platanus orientalis.—H. N.—A, Pyrus salicifolia; B, Hypericum calycinum.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

The usual fortnightly meeting held on September 14 teemed with beauty and interest. The Dahlia was in high festival, the Dahlia show being held in conjunction with the ordinary meeting. In other directions fruit trees in pots from Langley, rich in variety and of high excellence, demonstrated the possibilities of this branch of horticulture, and in justice it may be said that no finer similar exhibit has ever been staged. Sweet Peas from Edinburgh were very fine, while Perpetual-flowering Carnations, herbaceous plants and Roses—the latter very good from Waltham Cross—added not a little to the variety, beauty and interest of the meeting.

FRUIT AND VEGETABLE COMMITTEE.

Present: J. Cheal, Esq. (chairman), and Messrs. W. J. Jeffries, J. Willard, A. R. Allan, H. J. Wright, A. Bullock, J. Udale, J. Jacques, A. E. Bunyard, P. C. M. Veitch, W. Poupert, Owen Thomas, John Harrison, G. Kelf, James Vert, F. G. Treseder and James Gibson.

The superb fruit tree exhibit in pots from Mr. J. C. Allgrove, Middle Green, Langley, Slough, was the outstanding feature of the meeting, a replica, as it were, of the best of the Veitchian exhibits of these things, which in fullest measure it perpetuates in more than one sense. Arranged immediately at the right on entering, the group attracted by reason of the variety and the excellence of the display. Fruit trees in pots and gathered fruit have rarely been finer, to say which is a considerable tribute to British horticulture. Of a comprehensive character the group comprised Apples, Pears, Plums, Crabs of high ornament, Bullaces and other fruits sufficient, indeed, for all to admire and to spur to emulation. Of the Apples we were greatly struck by the splendid examples of Rev. W. Wilks, of which maiden trees of last year carried several handsome fruits. Others a year older were very fine. For culinary purposes this is calculated to prove a standard kind: it is also a good and reliable cropper. Peasgood's Nonsuch, Newton Wonder, Lane's Prince Albert, Blenheim Orange, Bramley's Seedling, Wealthy (a good sort, of rich colouring), Cox's Orange Pippin, James Grieve (a yellow skinned variety), Warner's King and Stirling Castle were all seen in notable examples. Of Pears, Souvenir du Congrès, Marguerite Marillat, Clapp's Favourite, Williams' Bon Chrétien and Triomphe de Vienne were very fine. Of Plums, many heavily cropped trees of the Langley Bullace (a cross from the Farleigh Damson and Black Orleans Plum) were loaded with fine fruits. It is a valuable addition to the hardy fruit garden. Kirke's, Grand Duke, Jefferson, Monarch, Pond's Seedling, President and Early Transparent were also excellent. Dessert Apple St. Everard and the late-keeping Pear Mrs. Seden were also noteworthy. Crab Apples Veitch's Scarlet, Montreal Beauty (yellow fruited) and John Downie were of high ornament and beauty. The baskets of gathered fruits were superb. A great attraction to an excellent exhibit.

The Marquis of Ripon, Coombe Court, Kingston Hill (gardener, Mr. T. Smith), contributed a table of gathered fruits in dishes, including Apples Emperor Alexander, Stirling Castle, Cellini, The Queen, Newton Wonder, New Hawthornden, Dutch Codlin and others. Pears were represented by Burrell Hardy, Williams' Bon Chrétien, Doyenné du Comice, Souvenir du Congrès and Marguerite Marillat, all of which were very fine.

Messrs. Bunyard and Co., Maidstone, contributed dishes of Damsons and Filberts, the former comprising such as Damson Prune, Merryweather, Langley Black Frogmore Prolific, Bradley's King and Damascene of Worcester. The Filberts included Purple Nut, Garibaldi, Bergeri (very large), and Kent Cob (of the largest size), these being some of the best.

Messrs. Whitelegg and Page, Chislehurst, Kent, showed the Merryweather Damson in capital form.

Mr. Charles Turner, Slough, exhibited dishes and fruiting sprays of Crab Apples in variety, Yellow Siberian, Dartmouth, John Downie, Transcendent, Montreal Beauty, Red Siberian, niedwetzkianna and Hyslop being noted in a rather good lot.

Messrs. Laxton Brothers, Bedford, showed Plums Bedford Prolific, Superb Gage, Bullace Gage, Delight and Bramley's King Damson. A variety of new seedling Pears were also shown.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), and Messrs. C. T. Drury, Charles E. Shea, C. E. Pearson, G. Paul, G. Reuthe, C. R. Fielder, J. F. McLeod, W. Howe, J. W. Moorman, H. J. Jones, W. Bain, C. Dixon, J. Dickson, A. Turner, W. Cuthbertson, J. T. Bennett-Poë, W. G. R. W. Wallace and E. H. Jenkins.

Messrs. H. B. May and Sons, Edmonton, contributed a table of greenhouse Ferns and Bouvardias, the latter comprising such good sorts as President Cleveland, Elegans, of Scarlets, Vreelandii (white), and Mrs. Robert Green (pink). The Ferns were also very good.

Messrs. Allwood Brothers, Hayward's Heath, showed Carnations very finely. Brilliant (white ground) and quite new in this type of the flower. Fairmount, Gorgeous, Bishton Wonder, Triumph, Mikado and Salmon Enchantress were others of note in an important lot.

Messrs. William Paul and Son, Waltham Cross, staged an admirable lot of Roses, baskets of each variety being shown in excellent condition. Among the best were Queen of Fragrance, Mme. Segond Weber, Arthur R. Goodwin (fine yellow), Imogen (cream and yellow), Sunburst (yellow), Rayon d'Or (golden), Ophelia (flesh

and pink, a glorious Rose for this season), Lady Pirrie, Duchess of Wellington (rich in colour), Mme. Edouard Herriot, Titania and Lyon. Marcella (cream) and Waltham Scarlet were especially meritorious.

Messrs. Dobbie and Co., Edinburgh, staged a remarkable exhibit of Sweet Peas, remarkable in the sense that the flowers would have done credit to an exhibitor at any season. They were also in great variety as well as excellence. King White, Seedling Pink, Elsie Herbert, Margaret Atlee, Jean Ireland, Orchid (mauve), Lavender George Herbert, Dobbie's Cream (very rich in colour), Dobbie's Orange (a grand colour now), Alfred Watkins (mauve to blue) and Princess Victoria were all very fine. In addition Gladioli were very finely shown, a strain labelled as Mair's Pedigree Seedling Gladioli at once remarkable for variety, handsome spikes and fine flowers. In not a few instances a dozen or fourteen flowers were expanded on a single spike.

Mr. G. Reuthe, Keston, Kent, contributed hardy flowers in variety, of which Colchicums, Lapageria rosea, Liatris, Erica pilosa in variety, Berberidopsis corallina, Stobaea purpurea and others were freely shown.

Messrs. Dobbie, Edinburgh, staged a wondrous variety of Dahlias, largely of the Collarette class. Incheape (maroon and white), Doon (gold and vermillion), Cloch (mauve and white), Scarlet Queen, Thames (maroon and yellow), and Carron (scarlet and gold), were very distinct.

Mr. L. R. Russell, Richmond, showed cut shrubs in variety, examples of Oak, Betula, Quercus, Hippophaë, Crataegus, Salix rosmarinifolia, Symphoricarpos, Olearia, Pittosporum and Liriodendron being noted in a capital lot.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, had a nice lot of Statice profusa with Cannas, Hæmantis coccineus and other plants.

Mr. J. B. Riding, Chingford, showed Dahlias in variety, the Parisian singles, decorative, Collarette, Peony-flowered and Pompon sorts being shown in quantity.

From Messrs. Carter Page and Co., London Wall, came a fine lot of Collarette Dahlias in many diverse colours; also Pompon and Cactus sorts in variety, with the very showy Peony-flowered sorts, which appear annually to grow in favour.

Messrs. J. Cheal and Son, Crawley, showed Transcendent Crabs, Pyrus prunifolia coccinea, hardy Heaths, Tamarisk, Veronica and other interesting things.

Mr. W. Wells, jun., Merstham, staged an excellent lot of Delphiniums, the mass of rich blue spikes being extraordinarily fine. Lizzie, King of Delphiniums, Mrs. Creighton, Capri and Rev. E. Lascelles being notable among many.

Messrs. H. J. Jones, Limited, Lewisham, filled a table with Michaelmas Daisies and Phloxes, both in considerable variety, though the Asters we shall see again, we hope, in still better form.

The Misses Hopkins, Shepperton-on-Thames, had an exhibit of seasonable hardy flowers, Gaillardias, Italian Starworts, Colchicums and other hardy flowers in variety.

Messrs. William Cutbush and Sons, Highgate, N., arranged a showy group of herbaceous plants on the floor. Lilies, Pentstemons, Michaelmas Daisies and the like being in abundance.

ORCHID COMMITTEE.

Present: J. G. Fowler, Esq. (chairman), Sir Harry J. Veitch and Messrs. J. O'Brien, W. Bolton, Gurney Wilson, J. Wilson Potter, Stuart Low, F. Sander, F. J. Hanbury, T. Armstrong, W. Cobb, J. Charlesworth, W. H. Hatcher, W. A. Bound, Arthur Dye, W. H. White, S. W. Flory and R. A. Rolfe.

Messrs. Sander and Sons, St. Albans, showed Rhynchostylis retusa, Cattleya dowiana aurea, Brasso-Cattleya Marguerite Fournie, with Cypripediums and Odontiodas.

Messrs. Stuart Low and Co., Enfield, had good plants of Cattleya gaskelliana Blue Lip, C. g. alba, Vanda caerulea and others.

Messrs. Charlesworth and Co., Hayward's Heath, contributed Cattleya Fauna, C. Adula, C. Venus var. Princess Mary and Sophro-Lælia heatonsensis, among others.

Messrs. J. and A. MacBean, Cooksbridge, showed many beautiful Orchids, Cattleyas, Oncidium and Odontiodas being freely interspersed among the whole.

DAHLIAS—COMPETITIVE.

NURSERYMEN ONLY.

Show and fancy Dahlias are not shown so freely nowadays as formerly.

Class 1, for twenty-four blooms, distinct, show Dahlias only, was represented by one exhibit only. This came from Messrs. W. Treseder, Limited, The Nurseries, Cardiff, and they were a very good lot. Purple Prince, Chieftain, Mr. Chamberlain, Warrior, David Johnston, Charles Wood, Miss Ormerod, A. Rawlings, George Rawlings and Willie Garratt were some of the best blooms.

Class 2, for twelve blooms, distinct, fancy Dahlias only, like the preceding class, found again only one exhibit, Messrs. W. Treseder, Limited, again being awarded first prize for a fair lot of flowers. Mrs. Saunders, Frank Pearce, Rev. J. B. M. Camm and Nansen were the more noteworthy sorts.

Cactus Dahlias, as usual, were splendidly shown. The leading class for eighteen varieties, distinct, six blooms of each, in bunches, was a battle of the giants. A glorious display secured premier honours for Messrs. James Stredwick and Son, St. Leonard's-on-Sea. Washington, Perseus, Searchlight, Gigantic, Fearless, A. R. Perry, Miss Stredwick, F. W. Fellowes, Dorothy Hawes, Pierrot, Miss Judd, Phenomenal, Invincible, Gossamer and Adventure were especially good and noteworthy. Messrs. J. Burrell and Co., Cambridge, were second with a quite interesting series of bunches, John Riding, Constance, Esmée, Cygnet, George Schofield and Golden Crown being the better sorts.

THE GARDEN.

No. 2288.—VOL. LXXIX.

SEPTEMBER 25, 1915.

NOTES OF THE WEEK.

A Letter from the Front.—We have received the following letter of appreciation from Private H. W. Bennett, 2369 A Company, 6th Sherwood Foresters, British Expeditionary Force: "Thank you so much for copies of THE GARDEN, which were very much appreciated by myself and friends. I should also like to thank, through the columns of your paper, the many kind people who have sent me copies of THE GARDEN for distribution, as well as very acceptable gifts of cigarettes, &c., for my gardening friends, with whom I am fighting side by side."

Crocus speciosus in the Grass.

We have a small group of plants flowering just now, and extremely pretty they are among the green carpet of grass. Apart from the general effect in the grass, the individual flowers are very telling when viewed separately. Perhaps the flowers may be described as bluish mauve, suffused with purplish veins, in the centre of which stands a much-divided stigma of a rich deep orange shade, the two colours forming a really beautiful contrast.—C. T., *Highgate*.

Wichuraiana Rose The Farquhar.—At Rouken Glen Park, Glasgow, the Wichuraiana Rose The Farquhar, sent out by Messrs. Farquhar and Co. in 1903, is one of the best of the pink-coloured Roses in the old walled garden, which is so attractive now that it has been devoted to flowers and opened to the public. The Farquhar Rose is one of the finest there, with its numerous clusters of pink flowers, which pass off almost white.—S. A.

Potato Disease.—Favoured by moist weather in August, Potato disease (*Phytophthora infestans*) has destroyed the haulm of Potato crops in many parts of the country. The dead haulm, if allowed to lie on the soil, may infect the tubers. In view, however, of the drier weather of the past few weeks, it is probable that as yet relatively few tubers have been attacked, and, consequently, that the immediate removal of diseased haulm would minimise risk of infection. As a further precaution, however, all crops should be lifted as soon as possible and carefully stored. Further particulars of this disease, with suggestions as to the storage of the crop, will be found in Special Leaflet No. 39 (Potato Disease), to be had, gratis and post free, on application to the Secretary, Board of Agriculture and Fisheries, Whitehall Place, S.W.

Use of Bracken as Litter.—In certain districts where straw is scarce or where it may be

profitably fed to stock, farmers and stock-owners should consider the possibility of using Bracken for litter. A special leaflet giving a short account of the use of Bracken has just been issued by the Board of Agriculture and Fisheries, who will send a copy to any applicant on receipt of an unstamped post-card addressed to them at Whitehall Place, London, S.W.

Storing Late Apples.—Constant attention must be given to the gathering of Apples. Varieties which are known to hang longest must, of course,

Stachys corsica and Asperula suberosa.

No rock garden or alpine lover should be without these two charming plants. The low-growing habit of *Stachys corsica*, with its long season of flowering, makes it indispensable. Especially will it appeal to the plant lover with a small moraine or rock garden; its habit is no neat and with us it has flowered continuously since June. *Asperula suberosa* is another charming plant this season. It is still in flower here, and it first opened in June. Its lovely grey foliage, soft pink flowers and tidy habit make this one of the gems of the rock garden. It should be planted on a slope where it gets ample drainage.—G. G. W., *Chislehurst*.

The Old Quarry at Springburn Park, Glasgow.

—One of the brightest of the Glasgow parks is that at Springburn, where Mr. Thompson, Mr. Whitton's lieutenant in charge, always has a display of bloom, if not outside, at least under glass. During spring, summer and autumn the old quarry, which has been converted into a rock and water garden, has been delightful and an object of pleasure to the many. The rock plants, shrubs and water-loving subjects have been planted in good masses, as is appropriate to a place of its size, and they have been exceedingly good. If they have a failing, it is one which would not be expected in a district such as that—too rapid growth, as a rule. *Nymphaeas* and other aquatics have been excellent; moisture-loving and other *Primulas* have thriven well; and *Saxifragas* and many other alpine have proved their value, even in a Glasgow park.—S. A.

Aquilegias in Pots.

—Although there are many gardens where a regular practice has been made for a long time of potting up *Aquilegias* for the decoration of the conservatory in late spring, there must be a considerable number in which it is never done. Plants which are "rising two" are the most satisfactory, but the strongest of

THE NEW GOLD MEDAL ROSE MODESTY. (See page 477.)

be left till last. When storing late-keeping Apples, care must be taken that all fruits which have been bruised or damaged by insects are removed from the good ones. The Apple crop promises to be heavy in most districts. In parts of Nottinghamshire the crop of Bramley's Seedling is a record one, and it may be a difficult matter to store all the fruits in the ordinary fruit room. The best-keeping varieties may be placed in heaps in a cellar or any other cool chamber which is not too stuffy.

the seedlings sown last February may be used with good effect in 6-inch pots, two or three, according to size, being put into each. Pot up at once and place them in shade, keeping the soil moist, not wet, so as to encourage the growth of new root fibres. They should be grown in a cold frame with abundance of air on every possible occasion, and in the last week in February or the first week in March introduced into gentle heat where they can still have plenty of air. The long-spurred varieties make very elegant specimens.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

Solanum crispum.—Concerning the pruning of this beautiful shrub, Sir Herbert Maxwell, Bart., Monreith, writes: "The advice given in a note in THE GARDEN of September 18, page 455, to prune this fine shrub 'fairly hard in November' is likely to lead to disappointment for those who follow it. As the flowers are borne on the previous year's growth, the only time to prune it, if pruned it be, is immediately after flowering in July. But it is never so lavish of flower as when left unpruned. In mild districts it does not require the protection of a wall, and should be planted in such a place as it may fill with its rampant growth."

The Flowering of Wulfenia corinthiaca.—You inserted a note of mine on May 29 on the flowering of Wulfenia corinthiaca. It may be of interest to state that the same crown that flowered so well in that month had a second flowering in July of seven fine spikes (or heads). These have duly seeded, and now in September two more spikes have flowered. This seems rather an unblushing record for so shy a subject.

Linaria alpina.—With regard to Linaria alpina, to the perennial nature of which Sir Herbert Maxwell testifies in your issue of September 11, page 443, it seeds itself so freely on my rockery as to be a (delightful) weed, and has made a solid mat of 2 feet square on a tiny moraine. On two occasions I have collected (on a Pyrenean moraine) a very attractive form of it with lemon-coloured lip instead of the usual orange. On a third occasion I failed to find a plant of it. I shall be glad to know if this is a distinct species or merely a sport. L. H. EVANS, Goodnestone, Canterbury.

A Rare British Plant.—I recently found in a field near Chessington Church, Surrey, a pure white variety of the red Bartsia (Bartsia Odontites), and as I can find no mention of it having been found in either the Floras of Surrey or Kent, or by Hooker, Bentham or Babington in their Floras of the British Isles, I think it must be of rare occurrence, and shall be glad to hear through THE GARDEN if any of your readers have met with it in their rambles.—H. CHARMAN, 1, Mill's Road, Hersham, Walton-on-Thames. [We know of no record of this having been found, and it is evidently very rare.—ED.]

"Somewhere in France."—Our soldiers are mindful of their peaceful pursuits even in time of war, and when relieved from the trenches there is nothing, to those who are interested, half so refreshing as the study of flowers and gardens. In the wreckage of gardens are seen plants of interest that bring to the warrior thoughts of home, as instanced in the following observations sent to us by Sergeant G. Cowley, 2186 D Company 8th Royal Sussex Pioneers British Expeditionary Force: "There are many gardens round here. It was only this afternoon, when I was in charge of a party making dug-outs, that I strolled round a garden and found some beautiful Gou ds. I see they have been cut now. Close by was an Almond tree laden with fine large Almonds. While working in a fresh wood yesterday, I was very much surprised to find the mauve Crocus speciosus growing wild in large quantities. Is this the home of this Crocus? [It has probably been cultivated there, or it may be an stray from a garden. Crocus speciosus is a native of

Eastern Europe and Western Asia.—ED.] I tried to get a bulb, but found they were a good way down in the earth, or, rather, leaf-mould. The flowers were as fine as any I have seen in England, and, if anything, longer on the stem."

Eucalyptus in a Norfolk Garden.—Seeing in a recent issue of THE GARDEN a correspondent writing of Eucalyptus globulus in a Norfolk garden, I enclose a specimen of Eucalyptus which is now in full flower with us, and has flowered regularly and profusely for the last five or six years. The tree is now about eleven years old and about 16 feet high. It was planted here when about 18 inches or 2 feet high, and was given by Mr. Henry Elwes of Colesborne.—(Mrs.) E. ELWES, Congham House, King's Lynn. [The

A FRUITING SPRAY OF THE HARDY
EUCALYPTUS GUNNII.

spray sent is that of Eucalyptus Gunnii. It is probably the hardiest of the various Eucalypts, and in a young state, at all events, is certainly harder than E. globulus, the subject of our previous note. We are indebted to the correspondents who have informed us of the flowering of Eucalypts in Norfolk, for such records about plants usually associated with the South and South-Western Counties are always interesting.—ED.]

Tulip Notes.—In THE GARDEN for August 21, I made mention of three good Tulips, either for forcing purposes or planting outdoors. I would now like to add a few more names of varieties which have given excellent results here outdoors, where many thousands of bulbs have been planted during the last few seasons. Among the single

earlies Golden Queen, Goldfinch, Golden Prince, King of Yellows, La Grandeur, Grace Darling, Couleur Cardinal and Keizerskroon have, as before stated, all been excellent. Couleur Cardinal is grand for massing. The best Cottage Tulips have been Mrs. Moon, Leghorn Bonnet, Moonlight, Primrose Beauty, retroflexa, Orange King, vitellina and Prince of Orange. The usefulness of some of these charming varieties for vase decoration gives them an added claim to recognition for extensive planting. Among our later friends the Darwins, the following were all good: Baronne de la Tonnaye, Clara Butt, Edmée, Fanny, General Köhler, Kate Greenaway, Peter Barr, Pride of Haarlem, Psyche, Rev. H. Ewbank and Suzon.—H. TURNER, Serlby Gardens, Bawtry.

The Pomegranate.—The interesting and instructive note by I. L. Richmond on page 462 of the issue of THE GARDEN for September 18 stirs me up to put forward the claims of another form of Pomegranate. This is the Dwarf Pomegranate, Punica Granatum nana, a charming miniature form. It is so neat in habit, and so much freer in flowering than the double form, that for a small space on a well-sheltered south wall few plants are more suitable or make a more brilliant display from August until the sharp frosts come. I grow it here on the wall of an Orchid-house, and as the path is rather narrow there, we have to keep the Pomegranate very close to the wall and shorten back more shoots than we and the plant like, and therefore in a season after it has been shorn back we lose many flowering shoots. Even then the tops of all shoots tied in bear bunches of the glowing scarlet flowers. It also makes a good pot plant for the conservatory, or for standing out in a vase or on a terrace in summer.—E. A. B., Waltham Cross.
